imitators, such as Spenser in his 'Epithalamion' and 'Prothalamion,' Milton in 'On the Morning of Christ's Nativity,' Shelley in his 'Ode to a Skylark,' Keats in his 'Ode to a Nightingale,' Tennyson in the 'Ode on the Death of the Duke of Wellington,' Coventry Patmore in the series of O.s 'To the Unknown Eros,' and a host of other poets. The second type, or Pindaric O., was introduced into Eng. literature by Abraham Cowley, who, however, did not realise that Pindar followed an exact set of rules in his stanza formations. Hence the 'false Pindaric,' in which the stanza is varied irregularly and arbitrarily to suit the poet's meaning. Among the best known of this type are Dryden's 'Alexander's Feast,' Wordsworth's 'Ode on the Intimations of Immortality,' which is possibly the finest of all, and Francis Thompson's 'Hound of Heaven.' The true Pindaric, in which stanzas are made to correspond strictly with one another, was essayed by Gray in his 'Bard' and 'Progress of Poesy,' but such complicated rhyme and rhythm schemes do not accord well with the Eng. genius, and have seldom been really successful. In modern times the O. has fallen into disfavour because of its formality, which too often degenerated into pompousness, as in the elaborate O.s written to order by the less inspired Poets Laureate. See also LYRIC.

Odell, Jonathan (1737-1818), b. New Jersey, was one of the Amer. loyalist colonists who made himself celebrated as a satirist whose verses were directed against those who led the war for independence. He studied at Princeton, entered the medical profession, and then became a minister with a par. at Burlington, New Jersey. After the outbreak of hostilities between the Amer. colonists and England, O. voiced the feelings of a large number who remained true to their allegiance to the Brit. Crown. In 1776 he wrote an ode in celebration of King George III's birthday, and had to escape to New York, where he became a chaplain in the royal army. He continued to put his muse to the service of England, his best-known production being *The American Times*, 1780. After independence was won by the colonists he remained unreconciled, and went to Nova Scotia, where he and his descendants took a part in the public life of that settlement.

Odell, Thomas (1691-1749), dramatist, b. Bucks. He wrote political lampoons for Walpole, and estab. a theatre in London in 1729. In 1738 O. was deputy-lensener of the stage. His plays are *The Chimera*, 1721 (anonymously), *The Patron*, 1729, *The Smugglers*, 1729, and *The Prodigal*, 1744.

Odenburg, see SOPRON.

Odenaalsrus, tn of the Orange Free State, S. Africa, 40 m. SW. of Koonstad. In April 1946 gold was found, the assay result of 23,047 in.-dwt. being the greatest ever recorded in S. Africa; Sir C. Oppenheimer described it as 'the most significant happening to S. Africa since the finding of diamonds in Kimberley and gold on the Witwatersrand.' (Nothing

approaching this borehole assay had ever been recorded in gold-mining in S. Africa—Rand ore, for example, running at about 250 in.-dwt.) About a dozen mines have been estab. in the dist. and there has been much regional development including a large irrigation scheme. Aerodromes have been constructed, and O. has been linked with the main railway line; a power station has been built at Vierfontein at a cost of £17,000,000. Pop. 12,463. *See* S. D. Jacobsen, *Free State and New Rand Gold*, 1940.

Odense: 1. Amt. in Denmark, on N. Fyn Is.; it includes the is. of *Baage* and *Faeno* in the Little Belt. Dairy farming is carried on. Area 700 sq. m.; pop. 196,210.

2. Cap. and important port of the above and of Fyn Is., on the Odense R., 87 m. WSW. of Copenhagen. Main industries are textiles, electrical equipment, foundries, sugar refineries, and shipbuilding yards. O. exports agric. and dairy produce. The tn has been a bishop's see since the 10th cent. King Canute II and other Dan. kings are buried in the Gothic cathedral, and it was the bp. of Hans Christian Andersen (q.v.), whose home contains a museum. Pop. 105,915.

Odenwald, mountainous region of SW. Germany, running W.-E. across S. Hesse, N. Baden-Wurtemberg, and E. Bavaria (q.v.). It lies S. of the R. Main (q.v.). The chief summits are Katzenbuckel (2057 ft), Neunkircher Höhe (1985 ft), and the Krähberg (1965 ft). It is well wooded, and there are many old castles on its heights.

Oder (Czech, and Polish *Odra*; anc't *Viadua*), riv. of Europe, which rises in Moravia (q.v.), and flows N. through the 'Moravian Gate' in the Sudetic Mts, across the Polish provs. of Opole, Wrocław, and Zielona Góra, and enters the Baltic through the Stettiner Haff (q.v.). Its prin. tribs. are the Warthe and the 2 Neisse (q.v.) rivs.; together with the Lusatian Neisse it has formed since 1946 the boundary between Germany and Poland. It has extensive canal systems connecting it with the Spree, Havel, and Vistula, and the rich industrial area of Silesia (q.v.). Length 538 m.

Oderisius (d. 1105), It. monk, was educ. at Montecassino, where he became a Benedictine and, after holding various eccles. offices, was elected abbot. A poet and a patron of scholars, he mediated between the crusaders and Alexius, the Gk emperor.

Odescaledi, Benedetto, *see* INNOCENT (popes), *Innocent XI*.

Odesa (Ukrainian *Odesa*): 1. Oblast in SW. Ukraine, adjacent to the Black Sea and including S. Bessarabia. It is largely fertile black earth lowland with some oak forests in the hilly N. There are metal-working and food industries; wheat, maize, and sunflower growing, viticulture, cattle and hog raising, and fishing are carried on. The prin. tns are O., Belgorod-Dnestrovskiy, and Izmail. The area E. of the Dniester was annexed to Russia in 1791 and formed a part of

New Russia (q.v.). Area 13,000 sq. m.; pop. (1956) under 1,943,000, mostly Ukrainians and Russians. For the hist. of S. Bessarabia *see* Bessarabia.

2. Cap. of the above (known as Khadzhibey until 1794), a major economic and cultural centre of the U.S.S.R. It lies on the O. Bay of the Black Sea. It has large engineering industries (machine tools, ships, agric. machinery, automobiles, food industry equipment, and cranes), also food, textile, and chemical industries. It is a very important transportation centre with a seaport (the second largest in the country after Leningrad), 3 railway lines and an airport. There are sev. beach and mud health resorts near by. The univ., founded in 1817 as the Richelieu Lyceum, was transformed into the univ. of Nov Russia in 1865, abolished in 1920, but re-estab. in 1933. O. has a Conservatoire (founded 1913) and many other higher educational estab., a municipal library (1830), an opera and ballet theatre (1809), a hist. museum (1825), and a picture gallery (1898). O. is one of the best-planned Russian cities and has sev. notable 19th-cent. buildings in the classical style. Pop. (1956) 607,000 (fourth in the Ukraine and thirteenth in the U.S.S.R.; 1897, 404,000; c. 1914, 630,000; 1923, 317,000; 1926, 421,000; 1939, 604,000), consisting of Russians, Ukrainians, and Jews.

Known since the 14th cent., O. belonged to Lithuania, then to the Crimean Tatars, and became Turkish in 1764; the Turkish fortress was stormed by the Russians in 1789 and annexed in 1791. It became the residence of the Viceroy of New Russia in 1805. Thanks to the *porto-franco* régime (1819-49), O. rapidly became the second largest foreign trade port in the country (grain export); industrial development dates from the second half of the 19th cent., with food and light industries at first. O. was a centre of *émigré* Gk and Bulgarian patriots, who played an important part in the liberation of their countries from the Turks. It was also a centre of the Ukrainian cultural and national movement, of Jewish culture, of the labour movement, and of social democracy. It was bombed by the Allies in 1854 during the Crimean War, and suffered sev. Jewish pogroms. Occupied by the Austrians in 1918, it changed hands sev. times during the Russian Civil War, and after a heroic defence was occupied by the Rumanians during 1941-4, becoming the cap. of Transnistria (q.v.).

Odessos, *see* VARNNA.

Odets, Clifford (1906-), Amer. playwright, b. Philadelphia, of Lithuanian origin. After an early career as an actor, he became associated with the Group Theatre in New York in 1930, and his first play *Awake and Sing* was produced by the group in 1935. In the same year he made his name with a one-act play, *Waiting for Lefty*, written for the New Theatre League. The play, based on the New York cab strike of 1934, was sensational for its social implications. Other plays include *Twilight*, *The Day I Die*, 1935, *Paradise Lost*, 1935,

Golden Boy, 1937, *Night Music*, 1940, *Clash by Night*, 1941, *The Big Knife*, 1949, *Winter Journey*, 1952, and *The Flowering Peach*, 1955. His work shows the influence of Sean O'Casey (q.v.).

Odeum, or **Odeon** (Gk *ōdeion*), among the ancients the name for a public building devoted to performances of vocal and instrumental music. The O. was smaller than the dramatic theatre, and usually roofed in. The oldest known in Greece was the Skias at Sparta (c. 600 BC). The O. of Pericles on the SE. slope of the Acropolis was completed about 445; that of Herodes Atticus or Regilla on the SW. slope of the Acropolis was built about AD 162. Domitian built the first in Rome.

Odger, George (1820-1877), trade unionist, a shoemaker who in 1862 became secretary of the London trades council. He made 5 attempts, all unsuccessful, to enter Parliament. In 1864 O. organised the meeting which resulted in the formation of the Working Men's International Association, the president of which he became in 1870.

Odhreir, in Norse mythology, name of the cauldron containing a magic potion, the mead of poets, made by the dwarfs, Fjalar and Galar, from honey mingled with the blood of Kvasir, the wisest of men. The potion conferred wisdom, knowledge of runes and magic charms, and the poetic faculty.

Odiel, see RÍO TINTO.

Odilo, St (c. 962-1049), b. of the noble family of Merceur in the Auvergne. In 991 he became abbot of Cluny, and under his rule the Cluniac houses increased from 37 to 65. Known throughout Christendom for his liberality to the poor, he was a friend of popes and princes, and the promoter of the Truce of God, and instituted in 1031 the ann. commemoration of the faithful departed. His feast is on 1 Jan.

Odilon-Barrot, see BARROT, CAMILLE HYACINTHE ODILON.

Odin, **Woden**, **Wotan**, or **Wuotan**, supreme Norse god, identified under Rom. influence with Mercury (see MERCURIUS), whose day was teutonised into 'Woden's Day' (Wednesday). O. was the source of wisdom and valour, and patron of culture and heroes. He was probably originally a storm-god, his name signifying 'mad' or 'the raging one.' He is attended by 2 ravens and 2 wolves, and rides the horse Sleipnir. He was the god of war, leader of hosts, giver of victory, in whose name the old tribes took possession of Britain, from whom both the royal houses of the rival kingdoms of Deira and Bernicia claimed descent, the great chief of Valhalla, and especially the god of those who were hanged, the gallows being known as his steed. Mimir, his uncle and the keeper of the magic cauldron, Odhreir (q.v.), gave him a potion from it, but O., by a trick gained possession of it himself. The first war of the world began by his hurling his spear, Gungnir, into the ranks of the Vanir (gods of the atmosphere). O. could take what form he chose from snake to eagle and often visited earth in disguise. He was one of the 3 sons of Borr, the son of

Bori, said to have been licked out of the salt ice-block by the cow Audhumla; his wife was Frigga and his son Balder (q.v.).

Odo: 1. **Of Beauvais**, St (801-80), gave up a military career to become a Benedictine at Corbie, becoming tutor to the sons of Charles Martel. He became Bishop of Beauvais in 861, and his reforms had great influence on the whole church of N. France. He mediated between Hincmar of Rheims and Pope Nicholas I.

2. **Of Cluny**, St (c. 879-942), Fr. abbot, b. Maine. In 909 he became a Benedictine at Banne, and in 927 became abbot of Cluny. Under his gov. the monastery began to exert its influence throughout France and in Italy. O. greatly enhanced the prestige of the Benedictine order.

3. (c. 1036-97) Bishop of Bayeux, half-brother to William the Conqueror and co-regent of England with Wm FitzOsbern in 1067. After the N. revolt had been suppressed, Kent was assigned to O., who thenceforth was one of the leading barons; but, for conspiring against Wm Rufus, he was expelled in 1088. He fled to Normandy and d. at Palermo, on the first crusade.

4. **Of Cambrai** (1050-1113), Fr. bishop, b. Orleans. In about 1090 he founded a Benedictine community at Tournai; in 1105 he was made Bishop of Cambrai, but refused to receive secular investiture, and d. in exile. He was one of the most learned Fr. scholars of the 11th cent.

5. **Of Lagery**, see URBAN (popes), *Urban II.*

Odoacer, **Odoacar**, **Odoacer**, or **Ottokar** (c. 435-93), Ger. soldier, a noble from one of the Danubian tribes. He became a captain in the imperial bodyguard at Rome, and, by leading a revolt and de-throning Romulus Augustulus, he estab. in 476 on It. soil in place of the imperial gov. a Ger. kingdom which was recognised by Zeno. He took the title of King of Italy, and reigned till his power was overthrown by Theodoric, King of the Goths, in 493. O. was then put to death.

O'Donnell, **Leopold**, **Duke of Tetuan** (c. 1809-67), Sp. general and statesman, b. Santa Cruz, Tenerife, of Irish extraction, entered the army at an early age, fighting for the queen against the Carlists in the civil war (1833). In 1840 he sided with the queen mother, Maria Christina, and shared her exile in France. He became the enemy of Espartero, whom he drove from power in 1843, but 2 years later was appointed minister of war under Espartero, and in 1859, as Prime Minister, led an expedition against the Moors, for which he received his dukedom.

O'Donovan, **John** (1809-61), historian and archaeologist, b. co. Kilkenny. He prepared a trans. of the Brehon laws, and worked on the ordnance survey of Ireland. In 1832-6 he wrote a trans. of the *Annals of Ireland by the Four Masters*, pub. 1848-51. He also trans. and ed. for the Irish Archaeological Society *The Banquet of Dun nan Gadh and the Battle of Magh Rath*, 1842. In 1845 he pub. a grammar of the Irish language.

Odontoglossum, genus of orchids, most

of which can be successfully grown in a cool house, and which, on account of the beauty of their flowers and their general grace, are the most popular orchid genus. Most of them are natives of S. America. The flowers are borne on a long spike from 5 to 40 in number, and in a few species these spikes are branched and bear a hundred or more blooms. The colours are chiefly brown, yellow, or white, and are often spotted.

Odontognathae, group of birds found only in the fossil state, and characterised by having true teeth in their jaws. It includes the important Cretaceous genera *Hesperornis* and *Ichthyornis*.

Odorico (1286-1331), It. monk, b. Pordenone or Portenau in the Friuli. He became a missionary, and travelled over the greater part of Asia. An account of his journeyings is contained in his *Life and Travels*, pub. after his death. See G. Venni, *Elogio storico alle gesta del Beato Odorico*, 1761.

Odour, Perception of, see NOSE.

Odovacar, see ODOACER.

O'Dowd, Bernard Patrick (1866-1953), Australian lawyer and poet, b. Beaufort, Victoria. He became assistant librarian of the Victorian Supreme Court from 1887 to 1913, and later was parl. draftsman. Believing that poetry should deal with contemporary questions, he gained a high reputation as an intellectualist and socialist poet. Vols. of his verse are *Dawnward*, 1903, *The Silent Land*, 1906, *Dominions of the Boundary*, 1907, and *The Bush*, 1912; his *Collected Poems* were pub. in 1941. See also AUSTRALIAN LITERATURE. See life by V. Kennedy and N. Palmer, 1954.

Odra, see ODER.

O'Duffy, Eoin (1892-1944), Irish politician and soldier, b. Monaghan and educ. as an engineer. He took a leading part in the Sinn Féin (q.v.) movement and in the Irish Republican Army (q.v.), but he broke away from de Valera (q.v.) on the estab. of the Irish Free State (q.v.). When the Fianna Fáil (q.v.) gov. was formed in 1933, O'D. was dismissed from his post of chief commissioner of the civic guard. He became an admirer of Fascist ideas after meeting Mussolini, and formed a so-called National Guard, the 'Blue-shirts,' later renamed the National Corporative Guard. This organisation was dissolved by the gov. as a subversive body. During the Sp. Civil War he led an Irish brigade to Spain to fight for Gen. Franco, but it returned after a few months. His book, *The Crusade in Spain*, appeared in 1938.

O'Dwyer, Sir Michael (1864-1940), administrator, educ. at St Stanislaus College, Tullamore, and Balliol College, Oxford. He entered the Indian civil service in 1885 and, in a long administrative career, held the posts of resident at Hyderabad (1908); agent to the governor-general for central India (1910), and governor of the Punjab (1913-19). His term of office in the last post coincided with a stormy period in the political life of the Punjab, and during the last year of his governorship the Amritsar incident

occurred in which sev. hundreds of people were killed. He was a consistent opponent of the Indian constitutional reforms, holding that they would be disadvantageous to the Muslim pop. In his book, *India as I Knew It*, 1925, he gave an account of the period during which he was governor of the Punjab, and defended his attitude at the time of the Amritsar incident. He was assassinated at Caxton Hall, Westminster, by an Indian.

Odysseus, see ULYSSES.

Odyssey, see HOMER.

Oecumenical Movement, see ECUMENICAL MOVEMENT.

Oecumenius, Bishop of Trikka in Thessaly, in the 9th or 10th cent. To him are attributed sev. commentaries in Greek on books of the N.T. His works were pub. at Paris in Greek and Latin in 1631.

Oedema, see DROPSY.

OEDIPUS AND THE SPHINX
From a vase painting.

Oedipus, son of Laius, King of Thebes, and of Jocasta, whose father, warned by an oracle that he would perish at the hands of his offspring, exposed him on Mt Cithaeron, whence he was rescued by a shepherd of King Polybus of Corinth. The child was brought up at Corinth as the king's son. When a man he was told by the Delphic oracle not to return home as he must inevitably kill his father and marry his mother. He therefore fled from Corinth, and on his way to Thebes slew Laius in a quarrel, unaware of his identity. O. then delivered the country from the Sphinx (q.v.) and was rewarded with the hand of Jocasta, by whom he had Eteocles, Polynices, Antigone, and Ismene. In punishment for this incest Thebes was devastated with a plague, and the oracle declared the country could only be delivered by the expulsion of the murderer of Laius. O. made careful inquiries, and discovered to his horror that he was guilty. Jocasta hanged herself, and O., having put out his eyes, left Thebes, led by his daughter Antigone, and d. at Colonus, near Athens. See the

Oedipus Tyrannus and *Oedipus at Colonus* of Sophocles.

Oedipus Complex, see PSYCHOANALYSIS.
O.E.E.C., see ORGANISATION FOR EUROPEAN ECONOMIC CO-OPERATION.

Oehlschläger, Adam Gottlob (1779-1850), Dan. poet and playwright, *b.* Copenhagen. Decisive in his literary development was an encounter with Henrik Steffens, who converted him to Romanticism. Immediately after meeting Steffens, O. wrote *Guldthornene*, which was in a completely different vein from his earlier work and led to his becoming the leading romantic poet of Denmark. His *Digte*, which appeared in 1803, marked the commencement of a new era in Dan. literature. Two years later he pub. 2 vols. of *Poetiske Skrifter*, and then travelled on the Continent for 4 years, writing some of his most famous N. tragedies: *Hakon Jarl*, *Baldur hin gode*, *Palnatoke*, and *Arel og Valborg*. In 1810 he returned to his native place, and was appointed to the chair of aesthetics in the Copenhagen Univ. Other pub. include the Nordic verse cycle *Helge*, 1814, *Nordensgude*, 1819, and *Dina*, 1842, the most successful of the later tragedies. In 1830-1 he pub. his autobiography, and in 1850 his reminiscences. See lives by K. Arentzen, 1879, and Y. Nielsen, 1879. See also I. Falbe-Hansen, *Oehlschlägers nordiske Digting*, 1921, and *Breve til og fra Oehlschläger*, 5 vols., 1945.

Oenone, daughter of the riv.-god Cebren and wife of Paris, son of Priam, King of Troy, who afterwards deserted her for Helen. See Ovid, *Heroides* v. and Tennyson, *Oenone*.

Oenothera, genus of hardy annuals, biennials, and perennials (family *Oenotheraceae*), natives of America. *O. biennis* is the fragrant, yellow-flowered evening primrose which has so long been grown in gardens that it has become naturalised. Some other species are, like it, night-flowering, but many, notably *O. fruticosa*, bloom only in the day. 'Spats' or mutations of *O. lamarckiana* were studied by de Vries and used as the foundation for his theory of evolution by mutation.

Oesebro (Sweden), see OEBRO.

Oersted, Hans Christian (1777-1851), Dan. physicist, *b.* Rudkøbing. He was appointed prof. of physics at Copenhagen in 1806. His greatest discovery was the result of experiments on the magnetic needle with the electric current, described in his *Experimenta circa Effectum Conflictus Electrici in Aëre Magnetica*. The O., the unit of magnetic field strength, was named after him. He also pub. a *Manual of Mechanical Physics* and wrote numerous studies in chem., popular science (especially *The Soul in Nature*, 1856), metaphysics, etc. Most of his works have been trans. into German. See life by J. C. von Hauch and P. W. Forchhammer, 1853.

Oesel, see SAAREMAA.

Oesophagus, see GULLET.

Oestridae, family of dipterous insects, consisting of large hairy flies with very short antennae enclosed in a cavity in the fore part of the head, with rudimentary

mouth parts. The larvae are nearly all parasitic on mammals, and the perfect insects are well known as the obnoxious bot-flies. The larvae of *Oestrus ovis* infest sheep; those of *Gastrophilus equi* pupate in horses; while the larvae of *Hypoderma lineata* and *H. bovis* are found in cattle.

Oestrous Cycle and **Oestrogens**. The O. C. is the reproductive cycle of female animals, especially mammals. On one or more occasions during the breeding season the female is receptive to the male and is said to be 'on heat'; this is the period of *oestrus* and is accompanied by ovulation, i.e. the discharge of an egg from the ovary. *Oestrus* is preceded by a period known as *pro-oestrus*, when the vagina swells and becomes increasingly vascular, in preparation for coition, and it is followed by the period of *post-oestrus*, when the uterus hypertrophies ready to receive the egg if fertilisation has occurred, so that *post-oestrus* then merges into pregnancy. If fertilisation has not taken place, *oestrus* is succeeded by the resting period of *anoestrus*, preparatory to a repetition of the whole O. C. The menstrual cycle of women corresponds to the O. C. of other mammals, but it is distinguished particularly by the bleeding of menstruation which is absent or inconspicuous in other species.

The changes occurring in the O. C. are brought about by a hormone or *oestrogen* produced in the ovary, and responsible also for the development of the secondary sexual characters (as for instance the breasts) at puberty. The *oestrogen* produced by the ovary is *oestrin* (or *oestrone*) with the formula $C_{18}H_{26}O_2$, but other similar synthetic compounds such as stilboestrol have now been prepared and are useful in medicine, e.g. for treating the disorders of the menopause when there is a deficiency of natural *oestrin*.

O'Faoláin, Seán (1900-), novelist and biographer, *b.* Dublin. Educ. at the National Univ. of Ireland and Harvard, he took the Republican side in the civil conflict of 1922, and was director of publicity for the Irish Republican Army. From 1930 to 1933 he was a lecturer at St Mary's Training College, Strawberry Hill, Middx., and then returned to co. Wicklow. His first book, a collection of short stories entitled *Midsummer Night's Madness*, appeared in 1932. His novels include *A Nest of Simple Folk*, 1933, *Bird Alone*, 1936, *A Purse of Coppers*, 1937, *Come Back to Erin*, 1940, and *Teressa*, 1946. Of his biographies the best is *King of the Beggars: a Life of Daniel O'Connell*, 1938; he also wrote lives of de Valera, 1933, and Constance Markievicz, 1934. He ed. the works of Thomas Moore, 1929, and the autobiography of Wolfe Tone, 1937. *She Had to do Something*, 1938, is a play, and *A Summer in Italy*, 1950, and *South to Sicily*, 1953, are travel books.

Offa (fl. 757-96), King of Mercia. He succeeded Ethelbald, and by the time he d. had re-established Mercian supremacy in S. England, the King of Wessex being his dependant, and his influence extending into Northumbria. From 784 to 796 O. had numerous contacts with Europe,

negotiating as an equal with Charlemagne. O. secured the estab. of a third Eng. archbishopric, at Lichfield (787), in an effort to consolidate Mercian ascendancy, even in the eccles. field. *See also OFFA'S DYKE.*

Offaly, inland co., prov. of Leinster, Rep. of Ireland; bounded W. by the R. Shannon. The surface on the whole is flat, the N. part being occupied by the Bog of Allen, but the Slieve Bloom Mts lie along the border between King's Co. and Queen's Co., the greatest altitude being 1732 ft. The soil is not very fertile, being either deep bog or gravelly loam, but

but left and played the cello in the orchestra of the Opéra-Comique. In 1847 he became conductor at the Théâtre Français. After 2 early attempts he produced the operetta *Pépito* in 1852, and during a quarter of a cent. he turned out about 100 light stage pieces. In 1855 he took over the management of the Théâtre Comte and renamed it the Bouffes-Parisiens. This lasted until 1861, whereafter he had no theatre of his own until 1873, when he managed the Théâtre de la Gaité until 1875. He went to the U.S.A. until 1877, but returned to Paris, where alone he found that his success was

By permission of the National Museum of Wales

OFFA'S DYKE, HERGAN, SHROPSHIRE, FROM THE WEST

there are some rich pastures near the Slieve Bloom Mts. and grazing dists. on the borders of Westmeath, which are chiefly used for sheep. Oats, barley, rye, potatoes, and turnips are grown, and cattle, sheep, pigs, and poultry bred. The chief tns are Tullamore (co. tn, pop. 6200) and Birr. Area 771 sq. m.; pop. 52,000.

Offa's Dyke, great earthwork made about AD 785 between the Dee and Severn by Offa (q.v.) of Mercia as a boundary between the English and the Welsh. It is laid out and constructed with exceptional engineering skill to take every advantage of natural features of the land. It consists of a large rampart and a ditch, the latter normally on the Welsh side.

Offenbach, Jacques (real name Jakob Levy Eberst) (1819-80), Ger.-Fr. composer, b. Offenbach-on-Main. His father was cantor at the synagogue of Cologne. O. was sent to Paris early in his youth, studying at the Conservatoire in 1833-4,

permanent. His only large-scale opera, *Les Contes d'Hoffmann*, occupied him for many years, but he left it not quite finished at his death, and it was revised and partly scored by Guiraud. He has been styled the creator of *opéra-bouffe*. His operettas include *Ba-ta-clan*, 1855, *Orphée aux enfers*, 1858 (revised 1874), *Geneviève de Brabant*, 1859 (revised 1875), *Chanson de Fortunio*, 1861, *La Belle Hélène*, 1864, *Barbe bleue*, 1866, *La Vie Parisienne*, 1866, *La Grande Duchesse de Gérolstein*, 1867, *Robinson Crusoe* (after Defoe), 1867, *La Périochole*, 1868, *L'Île de Tulipatan*, 1868, *La Princesse de Trébizonde*, 1869, *Vert-Vert*, 1869, *La Jolie Parfumeuse*, 1873, *Dick Whittington and his Cat* (London), 1874, *Le Voyage dans la lune* (after Verne), 1875, *Le Docteur Ox* (after Verne), 1877, *La Foire de Saint-Laurent*, 1877, *Madame Favart*, 1878, *La Fille du tambour-major*, 1879. *Les Contes d'Hoffmann* was produced after his death in 1881. Another opera, *The Goldsmith of Toledo* (after Hoffmann) (produced in

1919) is a pasticcio from sev. operettas. See J. Brindejont-Offenbach, *Offenbach mon grand-père*, 1940; L. MacClintock (trans.), *Orpheus in America*, 1958.

Offenbach, Ger. tn in the *Land* of Hessen (q.v.), on the Main (q.v.), 5 m. E. of Frankfurt. Its commercial prosperity is largely due to the settlement in the tn of Huguenots (q.v.) in the 17th cent. There are leather (leather museum), chemical, and engineering industries. Pop. 102,100.

Offenburg, Ger. tn in the *Land* of Baden-Württemberg (q.v.), on the Kinzig, 9 m. from its junction with the Rhine, 60 m. WSW. of Stuttgart. It has an anct church and castle, and is the centre of a fruit and wine producing dist. Pop. 27,000.

Offences, see CRIMINAL LAW.

Offensive Trades. This expression as used in the Public Health Act, 1875, denotes certain specified trades, namely, those of a blood boiler, bone boiler, fell-monger, soap boiler, tallow melter, or tripe boiler, and also any other noxious or offensive trade, business, or manuf. In dists. to which Section 51 of the Act applies O. T. will include any trade, business, or manuf. which the local authority declares by order confirmed by the ministry to be an offensive trade. To establish (see below) an offensive trade in an urb. dist. without the written consent of the dist. council renders the offender liable to a penalty of £50, and a daily penalty is incurred by those who continue without such consent to carry on an offensive trade estab. since 1875. Estab., in this context, was the subject of legislation in 1925. The Public Health Act of that year made special provision to meet the case of trades estab. after being declared O. T. With the object of abating nuisances from O. T., the Public Health Act, 1875, provides that if the medical officer of health or any 10 inhab. of a dist. or 2 legally qualified medical practitioners certify to the urb. dist. council that any melting-place, soap-house, slaughter-house, etc., is a nuisance, and dangerous to the health of the inhab., the council must proceed summarily against the owner or occupier (or even the foreman or other employee) for penalties; which penalties, on subsequent conviction, may be increased to £200. An action may also be brought in the high court for nuisance (q.v.). Local authorities also have statutory powers for regulating alkali and chemical works.

Offertory (Lat. *offertorium*, an oblation): 1. The presentation of the unconsecrated bread and wine at the altar during the Eucharist or Mass. In the Oriental and Sarum rites it was made with great ceremony and a procession.

2. Anthem recited or sung, and the prayer made at the O.

3. Sometimes, though erroneously, the alms collected at that time.

Office, Holy, or more completely the **Congregation of the Holy Office of the Inquisition**, forms a dept. of the Rom. curia for the examination of books and the trial of eccles. offences. See INQUIRITION.

Office Management, function of organising and managing clerical work in the

most efficient, constructive, and economical way consistent with good human relations with the labour involved and with the aims and objects of the businesses or gov. depts concerned, and in compliance with the legal requirements of the Companies Acts.

Careful selection is necessary for each office job, fair salary rates should be fixed, known opportunities for promotion should be open to all, and good working and welfare conditions are of first importance. From the point of view of the work to be carried out the manager must devise suitable routines and systems which will enable it to be dealt with in the most speedy and efficient manner, e.g. for gathering, collating, and recording data, whether of a financial or statistical nature or of other kinds. Correspondence both with other organisations and the public and with other depts of the same organisation must be dealt with, either as part of a routine or, if its importance requires, with individual attention. Outgoing mail must be prepared for posting and incoming mail opened, sorted, and distributed.

In order to deal with all the work efficiently the office manager should have a good knowledge of office and accounting machinery, of which the most important are the typewriter (q.v.), duplicator, and the addressing machine; also the various accounting machines, such as posting, adding, and calculating machines (q.v.). It is the function of the office manager to co-ordinate work, staff, and machinery into an organisation which operates smoothly and performs the work required of it as efficiently as possible. From this it will be apparent that the principle of div. of labour is resorted to in the modern office. Clerical routines are broken down into their component parts, and repetitive operations are grouped together.

While the function of O. M. can be readily understood it is not always clear which executive within an organisation is responsible for it. In the case of the very small organisation the managing director or principal is himself responsible for O. M. along with all the other activities of the business; as the business grows he appoints assistants, and the O. M. often becomes the part-time responsibility of someone who has other functions to perform. It is only when a business employs a large number of clerical staff that O. M. takes on a separate identity. The office is then split up into a number of separate and somewhat independent functions, such as accountancy, sales (both home and export), purchasing, and so on, according to the nature of the business. There is usually an executive responsible for each of these special functions and each has a number of staff attached to him to assist in the clerical routine. With the advances that have been made in the mechanisation of clerical work, particularly with the introduction of electronic computation (q.v.), enlightened organisations realise that it is necessary to have someone specialising in the art of executing clerical work in the most efficient

manner for all sections of the office, who must also have knowledge and experience of human behaviour in order that the staff employed will be suitable for the changing nature of the work which may be assigned to them. It is not uncommon for the overall responsibility for O. M. to be vested in either the company secretary or the accountant.

The advantage of having a specialist responsible for the management of the office routine of all sections is that the other specialist managers can devote their whole time and energies to the functions for which they are responsible. A separate manager responsible for the routine clerical work and staff in the various specialised sections of the office does, however, raise the question of split loyalties, but where difficulties arise it is now common practice in the large organisations to have an Organisation and Methods Dept which studies office methods, mechanisation, and procedures, for the purpose of advising the specialist managers on their office problems, leaving with them the full responsibility for the control of the work of the clerical staff attached to them.

The Office Management Association offers company secretaries and office managers opportunities of meeting together to discuss their office problems, and an education scheme is now available whereby a course of studies can be undertaken for a diploma in O. M. Anyone possessing this diploma is well qualified to accept responsibilities of the management of any commercial or industrial office, or to join an Organisation and Methods Dept team. See G. Mills and O. Standingford, *Office Organisation and Method*, 1950; H. C. Wylie and R. P. Brecht, *Office Organization and Management*, 3rd ed., 1953; and the journals, *Business and Office Management* (monthly).

Officer, British. This term when it stands alone is always held to refer to an O. holding the sovereign's commission. The navy, army, and air force lists contain the names of all O.s currently serving, but the status of O. holds good even after retirement from the active list. O.s whilst on full pay are forbidden to hold any municipal office, exempted from jury service, either coroner's, grand, or common juries, and may not become directors of any company. Special permission must be granted before an O. on the active list can leave the country. Although any O. can be dismissed at the sovereign's pleasure, nevertheless it is only after trial by a general court martial that an O. can be punished. See also ARMY; BRITISH ARMY, *British Army Pay*; RANK (IN THE ARMY).

Officers' Mess, see MESS.

Officers' Training Corps, see COMBINED CADET FORCE.

Official List, see STOCK EXCHANGE.

Official Receiver, or Liquidator, see BANKRUPTCY; COMPANY AND COMPANY LAW; RECEIVER.

Official Secrets. The Official Secrets Act, 1911 (which repeals and re-enacts with amendments the Act of 1889), makes

it a felony punishable with penal servitude to approach or enter any 'prohibited place' for any purpose prejudicial to the safety or interests of the State; to make any sketch, plan, model, or note calculated to be useful to an enemy; or to obtain or communicate to any other person any information which might be or which is intended to be useful to an enemy. It is not necessary to show that the offender was guilty of any particular act tending to show a purpose prejudicial to the State, and he may be convicted if, from his conduct or known character, it appears that his purpose was prejudicial to state interests. The Act also provides that any person who communicates to any unauthorised person information that has been entrusted to him in confidence by any person holding office under the Crown is guilty of a misdemeanour. The repealed Act of 1889 was passed after a Foreign Office official had disclosed a confidential diplomatic document. The law was strengthened in 1911, following a proposal by the Committee of Imperial Defence. The law was further strengthened by an Act of 1920 which makes it a misdemeanour to do certain things, either in order to gain admission into a prohibited place or for any purpose prejudicial to the safety or interests of the State. These acts include the unauthorised use of a naval, military, air force, or police uniform or one which resembles an official uniform; forging or tampering with passports or military or naval passes or permits; personating some office-holder or person to whom an official code or pass has been issued, or being in unlawful possession of any die, seal, or stamp belonging to a gov. dept, or a die, etc., so resembling an official die as to be calculated to deceive; or retaining an official document without authority to retain it; or allowing any other person to have possession of an official document issued for the use of the accused alone; or communicating a secret official code word or password; or being in unlawful possession of any such code or password. The fact that a person has been in communication with or attempted to communicate with a foreign agent, whether in Great Britain or abroad, is evidence that he has, to the prejudice of the safety and interests of the State, obtained or tried to obtain information which is calculated or intended to be useful to an enemy, and this evidence may be adduced in proceedings under Section 1 (Spying) of the prin. Act (1911). The secretary of state has power to compel, by warrant, the production of telegrams from any person who owns or controls any telegraphic cable or wireless business, when it is expedient in the public interest to compel production; and any person who carries on the business of receiving postal packets must be registered and is subject to regulations which require him to keep books giving the names and addresses of persons for whom packets are received and any instructions received as to the delivery. The Act also gives to chief officers and superintendents of police and others somewhat exceptional

powers of interrogation in cases under the Act.

Offset Printing, see LITHOGRAPHY.

O'Flaherty, Liam (1897-), novelist, b. on the Aran Is. off the coast of Galway. Intended for the priesthood, he went to Rom. Catholic schools at Rockwell and Blackrock and to the National Univ., Dublin. During the First World War he enlisted in the Irish Guards and fought in Belgium, but was invalided out in 1917. For the next few years he roamed all over the world, working variously as deck-hand, porter, clerk, and labourer. In the civil conflict of 1922 he fought for the Irish Republicans. His first novel, *Thy Neighbour's Wife*, appeared 2 years later, and was followed in 1926 by *The Informer*, which won the Tait Black Memorial Prize. Later novels are *Mr Gilhooley*, 1926, *The Assassin*, 1928, *The House of Gold*, 1929, *The Puritan*, 1931, *The Martyr*, 1933, *Famine*, 1937, and *Insurrection*, 1950. A master of the short story, in which he is more poetical and less violent than in the novel, he pub. many collections, including *Spring Sowing*, 1926, *The Tent*, 1926, *The Fairy Goose*, 1929, *The Mountain Tavern*, 1929, and *The Wild Swan*, 1932. He also wrote a life of Tim Healy, 1927, and a guide to Ireland, 1929. *Darkness*, 1926, is a tragedy, and *Two Years*, 1930, and *Shame the Devil*, 1934, are autobiographical.

Offerdingen, Heinrich von (c. 1170-1250), famous minnesinger (q.v.).

Ogam, or Ogham. This term, spelt in Old Irish *Ogam* or *Ogum*, of uncertain origin and meaning, has been applied to a peculiar form of cryptic or anct language, and more especially to a curious script, employed by the Celtic pop. of the Brit. Isles. Of the nearly 400 inscriptions still preserved, over 260 were found in the S. co.s of Ireland (mainly in Kerry and Cork), 55 in the rest of Ireland, about 40 in Wales, 1 in Cornwall, 2 in Devon, 1 in Hants (at Silchester, marking the E. limit of their distribution), about 10 on the Isle of Man, and about 25 in Scotland. There are sev. stones with O. inscriptions in the National Museum, Dublin, and in the Brit. Museum, of which that from Llywel, Brecon, bearing the name 'Macutrenas' is the best known. The great majority of these inscriptions belong to the 6th cent. AD, but some belong to the 5th and some to the 7th cent. The inscriptions found in Ireland are, with one exception, written in O. alone (in Celtic) while the inscriptions found in Wales are usually bilingual (Lat.-Celtic) and written in Rom. characters and O. script. A Runic-O. inscription was found on the Isle of Man. The inscriptions found in N.E. Scotland and in the N. Isles, chiefly on the Shetlands, are written in a variety known as 'Pictish Oghams'; they are assigned to the anct Picts, who according to some scholars spoke a non-Celtic and non-Indo-European language, and according to others were early Celts.

The O. inscriptions contain very little besides proper names, but these are of great value for the light they throw upon the early Celtic tongue. Indeed, in

orthography and the inflection of nouns, these inscriptions reveal a stage of the Celtic idiom much earlier than that of the earliest preserved MS. literature, which, partly belonging to the 6th cent. AD, is contemporary with them. The O., for instance, still makes use of letters *g, v, ng*, unknown to the MSS.; the anct inscriptions supply us with *magvi*, the genitive of the word which has yielded the term *mac*, 'son.' The direction of writing was either vertical (upwards) or horizontal. In vertical inscriptions, these begin at the bottom left-hand corner, proceed up the left-hand edge, then over the top and down on the right-hand edge.

THE OGAM MAIN CHARACTERS

The main O. alphabet consisted of 20 letters, divided into 4 groups or *aicmes*, and represented by strokes, from 1 to 5 in number, arranged in various positions about a central stem-line. The place of this chief line was sometimes filled by the edge or aris of the object (usually stone or other squared hard material), on which the letters were cut. The 'letters' of the first *aicme* (*b, l, v* or *f, s, n*) were placed under the line (assuming this to be horizontal); the second *aicme* (*h, d, t, c, q*) above it; the third *aicme* (*m, g, ng, z, r*), diagonally through it; and the fourth *aicme* (*a, o, u, e, i*) intersecting it at right angles, or by notches. There were 5 other characters *forfeda*, which were a little more complicated. They are generally interpreted as diphthongs (*ea* or *eo*, *oi*, *ia* or *io*, *ui*, and *ae*), which according to some scholars have often a consonantal value in the inscriptions (a kind of guttural *k, p, z*, etc.).

This alphabet was the basic O. script. There were sev. secondary varieties, such as the 'bird O.' (*Ēn-O.*), 'herb O.' (*Lus-O.*), 'colour O.' (*Dath-O.*), 'church O.' (*Cell-O.*), 'pig O.' (*Muc-O.*), 'son O.' (*Mac-O.*), and many others.

The use of the cryptic O. scripts continued until the Middle Ages, and the late 14th- (or 15th-) cent. *Book of Ballymote* (ed. by R. Atkinson, 1887; see also Calder's ed. of *Auricept na n-Éces*, the *Scholars' Primer*, 1917) reproduces the earliest keys

for transliteration. See J. Rhys, *Lectures on Welsh Philology*, 1879; J. MacNeill, 'The Irish Ogham Inscriptions,' in *Proceedings of the Royal Irish Academy*, 1909, *Celtic Ireland*, 1921, and *Archaisms in the Ogham Inscriptions*, 1931; R. A. S. Macalister, *Studies in Irish Epigraphy* (3 vols.), 1897-1907, *The Secret Languages of Ireland*, 1937, and *Corpus Inscriptionum Insularum Celticarum*, I, 1945; W. Keller, *Die Entstehung des Ogom* ('Beiträge,' etc.), 1938; E. MacNeill, 'The Language of the Picts,' in *Yorkshire Celtic Studies*, 1940; J. Vendryes, 'L'Écriture ogamique et ses origines,' in *Études Celtiques*, 1941; D. Diringer, *The Alphabet* (4th impression), 1953.

Ogasawara Jima, see BONIN ISLANDS.

Ogden, Charles Kay (1889-1957), linguist; educ. Cambridge, director of the Orthological Institute. In 1926, with I. A. Richards of Harvard, he began research on Basic English (q.v.), on which he has pub. sev. works. Other pub. include: with I. A. Richards and J. Wood, *The Foundations of Aesthetics*, 1922, *Bentham's Theory of Fictions*, 1932; with I. A. Richards, *The Meaning of Meaning*, 1944, and *The ABC of Psychology*, 1944.

Ogden, city of Utah, U.S.A., co. seat of Weber co., on the Weber 32 m. N. of Salt Lake City. The second largest city in the state, it is an intermountain railroad junction and an industrial and distribution centre for an irrigated agric. area. It ships livestock and has meat-packing plants and canneries. It produces beet-sugar and manufs. clothing and iron castings. It is the seat of Weber junior college. Pop. 57,112.

Ogdensburg, city and riv. port of New York, U.S.A., in St Lawrence co., on the St Lawrence R. It manufs. paper, wood, and metal products, paint, mattresses, clothing, and flour. Remington Art Memorial, with works of Frederic Remington, is here. Pop. 16,166.

Ogee, moulding formed by 2 curves, the upper concave and the lower convex. In France the ribs which in Gothic vaulting cross the vault diagonally are known as ogive ribs, and the adjective is also frequently applied to any pointed arch.

Ogerius, Oggero, or Oggieri, see OGIER.

Oggione, Oggionno, or Uggione, Marco da (c. 1470-1549), It. painter, b. Oggiono. He studied under Leonardo da Vinci, and made sev. copies of his 'The Last Supper,' one of which is in the Royal Academy. He also executed frescoes for the church of S. Maria della Pace at Milan, the 2 best being 'The Marriage at Cana' and 'The Assumption,' both of which are now in the Brera.

Ogier le Danois (It. **Uggero, Oggero, Oggieri**; Lat. **Ogerius**), hero of an anct Fr. romance whose story is probably a contribution from the store of Norman tradition. Holger, or Olger, Danske being the national hero of Denmark. He figures in Ariosto's *Orlando Furioso* and other romantic tales and poems. Some authorities say that his surname was bestowed on him because he came from Denmark, others that he took it after having conquered that country, while yet

others say that O. was a Saracen who turned Christian, and as the Fr. barons called him in jest O. *Damné* he himself insisted on being so called when he was christened. This surname agrees with the assertion that he was condemned by Charlemagne. He has been identified with the Helgi of the Edda and also with the Frankish warrior, Ottokar (or Autchar). See C. Voretzsch, *Über die Sage von Ogier dem Dänen*, 1891; P. Paris, *Recherches sur Ogier le Danois*, Bibliothèque de l'École des Chartes.

Ogilby, John (1600-76), poet and translator, b. near Edinburgh. He accompanied Strafford to Ireland and was made deputy master of the revels, but his fortunes being ruined by the Civil war, he returned to England. Having learned Latin he trans. Virgil into Eng. verse in 1654, and being successful in this attempt turned his attention to Greek and pub. trans. of Homer's *Iliad*, 1660, and *Odyssey*, 1665. Others of his works are *The Fables of Aesop Paraphrased*, 1665, and *Road Books of England and Wales*, 1675. He was entrusted with the 'poetical part' of Charles II's coronation in 1661.

Ogilvie, Sir Frederick Wolff (1893-1949), scholar and administrator, b. Valparaiso, and educ. at Balliol College, Oxford. Until 1934 he was prof. of political economy at Edinburgh Univ., when he became president and vice-chancellor of Queen's Univ., Belfast. In addition to membership of sev. councils and committees O. was director-general of the B.B.C. from 1938 to 1942, his term of office being marked by the inception of the forces programme and the expansion of the overseas service. Knighted in 1942, he became principal of Jesus College, Oxford, in 1944.

Ogilvie, John (1707-1867), lexicographer, b. Radffshire. In 1824 he entered Aberdeen Univ., and in 1831 was appointed mathematical master in Gordon's Hospital. He compiled the *Imperial Dictionary*, 1850 (supplement, 1855), *Comprehensive English Dictionary*, 1863, and the *Students' English Dictionary*, 1865.

Oglethorpe, James Edward (1696-1785), Eng. general and philanthropist, the founder of the state of Georgia, b. London. He served under Prince Eugene, and distinguished himself in the campaign against the Turks, 1716-17. In 1722 he became M.P. for Haslemere, and in 1729 was chairman of the parl. committee on debtors' prisons. In 1732 he obtained a charter for settling the colony of Georgia in America as a refuge for paupers and a barrier for Brit. colonies against Sp. aggression. He wrote *A New and accurate account of the provinces of South Carolina, Georgia, etc.*, 1733, and *An Important account of the late expedition against St Augustine*, 1742. Returning to England in 1743, he took part against the Jacobite insurrection of 1745 but was accused of failing in his military duties, and although acquitted he resigned his commission. He was a friend of Dr Johnson, Boswell, Goldsmith, Burke, and Walpole.

Oglio, see PO.

Ogmore and Garw, urb. dist. and tn of S. Wales, in Glamorgan, 4 m. SW. of Bridgend. Coal is extensively mined. Pop. of dist. 22,631.

Ogowe, riv. of W. Africa, in Fr. Equatorial Africa, rising in lat. 3° S., a little to the S. of Ngango. Its direction is N. to W., and then SW., receiving sev. tribs. on both sides, including the Lolo and the Ivindo. It enters the Atlantic by a delta after a course of 750 m.

O'Grady, Standish James (1846-1928), historian and novelist, b. Castletown Berehaven, where his father was Protestant rector. Educ. at Tipperary Grammar School and Trinity College, Dublin, where he graduated in 1868, he was called to the Bar, but soon gave up the law. He is best known for his *History of Ireland: Heroic Period*, 1878, which kindled interest in the legendary material used later by writers of the Irish Renaissance. Among his books of historical romance are *The Bog of Stara*, 1893, *In the Wake of King James*, 1896, *The Flight of the Eagle*, 1897, *In the Gates of the North*, 1901, 1921, and *Finn and his Companions*, 1921. He also ed. Sir Thomas Stafford's *Pacata Hibernia*, 1896. He owned and ed. the *Kilkenny Moderator* and the *All-Ireland Review*.

Ogulín, tn in Croatia, Yugoslavia, on the underground riv. Dobra. It is a centre for the timber and agric. produce of the heavily forested region Gorski Kotar. Pop. 12,500.

Ogyes, or **Ogygus**, son of Bocotus and one of the Bocotian aborigines. He was King of the Ilectenes, the oldest inhab. of Boeotia, which was visited during his reign by an inundation of Lake Copals. This flood is usually called after him the Ogygian.

O'Higgins, Bernardo (1778-1842), Chilean patriot, soldier, and statesman, generally known as the Liberator of Chile, natural son of Ambrosio O'H., also an administrator and soldier, of Irish birth. He led the Chilean patriot forces against the Sp. royalists (1810), and was made commander of the patriot army (1813) in succession to Juan José Carrera, who had been made general-in-chief in 1811. Carrera's republican troops twice defeated the royalist forces, but were themselves defeated in 1813. The following year O'H., with Carrera, was also defeated, at Rancagua, and both leaders fled the country. They received the support of Buenos Aires, levied an army in La Plata, and marched against the royalists, whom they completely defeated at Chacabuco (1817), and O'H. became dictator of Chile. The republicans were, however, severely defeated at Cancha Rayada, but this defeat was soon followed by the final defeat of the Spaniards at Maipú, the victory which sealed the independence of Chile. O'H.'s progressive administration was ended after a few years by a popular revolt in 1823, and he retired to Peru. See E. Orrego Vicuña, *Iconografía de O'Higgins*, 1937, and J. Eyzaguirre, *O'Higgins*, 1945.

O'Higgins, Kevin Christopher (1892-1927), Irish politician, b. Stradbally. He was educ. at Clongowes, at St Patrick's

College, Carlow, and at the National Univ. of Ireland. He was articled to his uncle, Maurice Healy, a solicitor, but did not serve out his time. He joined Sinn Féin (q.v.), and took part in the 'Easter Rising' in Dublin in 1916; whilst in prison as a result, he was elected M.P. for Queen's Co. In Cosgrave's (q.v.) gov. of 1922 he was minister for justice and vice-president of the executive council; he estab. the civic guard and put down disorder firmly. In June 1927 he became minister for external affairs also; in the following month he was assassinated near Booterstown on his way to Mass. Some consider O'H. to have been the most able figure in Irish public life. See life by T. de Vere White, 1948.

O'Higgins, prov. of central Chile, takes its name from Bernardo O'H. (q.v.). Colchagua lies to the S. and Santiago to the N. The Andes traverse the E. portion. Gold and copper (at El Teniente) are mined, cattle reared, and wine, fruit, and wheat are produced. Rancagua is the cap. Area 2745 sq. m.; pop. 224,637.

Ohio: 1. One of the United States of America, known as the Buckeye state, bounded N. by Michigan and Lake Erie, E. by Pennsylvania and W. Virginia, S. by W. Virginia and Kentucky, W. by Indiana. It is separated from W. Virginia and Kentucky by the O. Riv., which forms its boundary for 436 m. Its Lake Erie shore is 230 m. O. has no considerable elevations, being highest in the centre and sloping thence to the lakes in the N. and to the O. Riv. in the S. It is drained by numerous rivs., among which the Great and Little Miami, Scioto, and Muskingum are affluents of the O. Riv., and the Maumee, Sandusky, Huron, Vermilion, Cuyahoga, and Ashtabula empty into Lake Erie. The coal-beds of E. O. are of great extent, and there are abundant deposits of limestone. This has led to enormous expansion of iron and steel industries, and, as a consequence, the building of great machine-making plants and automobile factories. The state ranks first in the manuf. of machinery and fabricated metal products. Cleveland, Canton, Youngstown, Middletown, and Steubenville are the great steel and iron centres. Akron manufs. automobile tyres and other rubber products. The output of automobiles in Toledo and Cleveland is second only to that of Detroit. Coal, stone, cement, lime, sand and gravel, and clays are also produced, as well as bricks, tiles, clothing, furniture, spirits, and woollen and cotton goods. The soil is rich everywhere; the climate is temperate, with a liability to a cold in winter reaching sometimes below zero. The natural forests are rich in oak, black walnut, maple, etc. Cattle-breeding and dairy farming are important industries. The chief agric. products are Indian corn or maize (169,584,000 bushels in 1950), hogs, milk, cattle, wheat, eggs, hay, and soybeans. A large commerce is carried on by the O. Riv. and Lake Erie. In 1955 there were 232 airports. Railway mileage is 8400. The state is organised in 88 cos. The legislature consists of a House of

Representatives of 135 members and a Senate of 33 members, both houses being elected for 2 years. Two senators and 23 representatives are sent to Congress. The chief towns are Cleveland, 914,800; Cincinnati, 504,000; Columbus (cap.), 375,900; Toledo, 303,800; Akron, 274,600; Dayton, 243,900; Youngstown, 168,300; Canton, 116,900; Springfield, 78,500; Lakewood, 68,000; Cleveland Heights, 59,100; Hamilton, 58,000; 12.5 per cent of O.'s pop. are foreign-born, and there are great numbers of Ger. ancestry. Among the institutions of higher learning are O. State Univ. at Columbus with 20,500 students; W. Reserve Univ. at Cleveland, 8500; univ. of Cincinnati, 13,500. O. has superseded Virginia as the mother of presidents. Five men b. in O. were elected as presidents while still O. men. Two others elected as presidents of the state were b. in O. The prehistoric Mound-Builders left many remains in O., the most impressive being Serpent Mound, 1300 ft long, in Adams co. O. was first settled in 1788 and was organised and admitted as a state in 1803. Area 41,122 sq. m.; pop. 7,950,000. See J. W. Taylor, *History of State of Ohio*, 1854; W. C. Howells, *Recollections of Life in Ohio*, 1895; E. O. Randall and D. J. Ryan, *History of Ohio* (5 vols.), 1913; E. F. Roseboom and K. P. Weisenburger, *A History of Ohio*, 1934; Federal Writers' Project, *The Ohio Guide*, 1940; C. F. Wittke (ed.), *History of the State of Ohio* (6 vols.), 1941-4.

2. Riv. of U.S.A., second largest affluent of the Mississippi, formed by the union of the Allegheny and Monongahela at the W. foot of the Alleghenies, at Pittsburgh, Pennsylvania. It flows WSW. for 980 m., with a breadth of 1200 to 4000 ft. and with its tribs. drains an area of 203,900 sq. m. In its course it separates the states of O., Indiana, and Illinois from the states of W. Virginia and Kentucky. The prin. towns upon its banks are Pittsburgh, Cincinnati, Louisville (where there are falls), Wheeling, Huntington, Covington, Steubenville, and Evansville. It is navigable from Wheeling, 100 m. below Pittsburgh. The O. valley is a centre of rapidly expanding industry and the channel of a vast commerce by towboat and barge, which it shares with its chief branches, including the Tennessee, Cumberland, Wabash, and Green. See R. E. Banta, *The Ohio*, 1951.

Ohlaur, see OLAWA.

Ohlenschläger, see OEHLenschLÄGER.

Ohm, Georg Simon (1787-1854), Ger. physicist, b. Erlangen, became prof. of experimental physics at Munich Univ. in 1852. He announced his law of the theory of the voltaic current in 1825, and pub. *The Galvanic Circuit worked out Mathematically* in 1827. This work exercised an important influence on developments in electricity. In 1841 the Royal Society awarded him the Copley medal. See life by W. Gerlach, 1939.

Ohm, see OHM'S LAW and UNITS, ELECTRICAL.

Ohmmeter, portable instrument for measuring electrical resistance used largely for testing insulation resistance of installations. See ELECTRIC METERS.

Ohm's Law states that for a given electrical conductor at constant temp. the ratio between the voltage across the ends and the current in the conductor is constant. The ratio is the *resistance*, R , of the conductor. Further, if the cross-section area S is uniform, the resistance is proportional to the length l and inversely proportional to S , and it depends also on the material. Thus $R = \rho l/S$ where ρ is the *resistivity* of the material. The resistance is measured in ohms: if 1 V. across the ends of a wire gives a current of 1 A., the resistance is 1 ohm. The resistivity (or specific resistance) $\rho = RS/l$ is measured in ohm cm. In most conductors ρ increases with temp. (See CURRENT ELECTRICITY and UNITS, ELECTRICAL.)

Ohnet, Georges (1848-1918), Fr. author, b. Paris; educ. at the Lycée Bonaparte. After 1871 he was editor successively of *Le Pays* and *Constitutionnel*. In collaboration with Denayrouze O. wrote his play *Regina Sarpi*, 1875. *Serge Panine* appeared as a novel in 1881, and was crowned by the Academy. *Le Maître de forges*, a novel afterwards famous as a play, appeared in 1882. O. was popular with lovers of romance. Later novels include *Dette de Haine*, 1891, *La Femme en gris*, 1895, and *Le Crépuscule*, 1902.

Ohonamoochi, Onamuchi, or Okuni-Nushi, Jap. earth-god, sometimes identified with Daikoku, god of wealth. His great shrine at Kitzuki, in Idzumo, was the second in importance in Japan. He was son of Susanoo, god of the underworld, and resigned his throne in favour of the present emperor's ancestors.

Ohře (Ger. Eger), riv. of Germany and Czechoslovakia, which rises in the Fichtelgebirge (q.v.) and flows NE. through Cheb (q.v.) and Karlovy Vary (q.v.) to join the Labe (see ELBE) 30 m. NW. of Prague. Length 190 m.

Ohrid (Ohrida; Orid; Gk *Iáhnidos*), tn in Macedonia, Yugoslavia, near the Albanian border. It is on the beautiful mt lake of O. O. is on the site of a Gk colony, and is said to be the oldest tn in Yugoslavia. It has many medieval buildings, including a 10th-cent. fortress and an 11th-cent. church. Cyril and Methodius (qq.v.), the creators of the Slav alphabet, are believed to have worked here. Pop. 11,000.

Olch, Loch, lake (4 m. long and $\frac{1}{2}$ m. broad, with a depth of 150 ft) of Inverness-shire, Scotland, drained by the Riv. O. into Loch Ness at Fort Augustus. It forms part of the Caledonian Canal, and is famous for its trout and salmon fisheries.

Oidium, name given to the conidial form of various ascomycetous fungi (Erysiphaceae) which give rise to what are popularly known as mildews and moulds. In this stage the white cobweb-like mycelia produce simple conidiophores, from which the conidia quickly germinate and grow in chains, covering the host as with a mealy powder. The life-cycle is completed in the autumn, when ascocarps, or perithecia, arise as small black points on the mycelium and produce spores which usually remain dormant

through the winter and germinate in the following spring. In cases where the life-cycle is known the fungus is placed in its proper genus, but where the ascocarps are still undiscovered, the use of the term generically is still adopted. See MILDEW and MOULD.

Oil, see OILS AND FATS; OIL WELLS; PETROLEUM.

Oil and Petrol Engines, see DIESEL ENGINE; INTERNAL COMBUSTION ENGINE; MOTOR BOATS; MOTOR CARS; MOTOR CYCLES; MOTOR SHIPS.

Oil-beetle, name given to any species of *Meloe*, a genus of Cantharidae (q.v.), on account of the oil-like matter which it exudes.

Oil-bird, see GUACHARO.

Oil City, city of Pennsylvania, U.S.A., in Venango co., at the mouth of the Oil Creek, at its junction with the Allegheny R., 52 m. S.W. of Erie. It is one of the chief oil centres in the state. The city has been 3 times partially destroyed by flood and fire. Pop. 19,500.

Oil-drop Experiment, well-known experiment performed in 1909 by R. A. Millikan (q.v.) to determine the charge (e) of an electron (q.v.) and allowing a direct demonstration of the fact that all electric charges are integral multiples of the electronic charge. The principle of the experiment lies in the balancing of the force due to gravity acting on a charged oil-drop with the force due to an applied electric field (E) acting on the same drop in the opposite direction. For a drop of mass m gm. carrying a charge ne , where n is an integer, the force due to gravity is mg dynes (g is the acceleration due to gravity), and the electric force is neE . When the drop is held stationary $mg = neE$, and to find ne it is necessary to know m . This is found indirectly by determining the radius r of the drop from measurements of the rate of fall (v) under gravity in the absence of an electric field, for which Stokes Law gives

$$mg = 6 \pi \eta r v / (1 + b/pr)$$

where η is the coefficient of viscosity, p is the pressure, and b is an empirically derived constant. Various modifications and refinements of this method were made, in particular a redetermination of the viscosity of air was necessary to produce agreement between the values of e found by Millikan and that found from X-ray methods (q.v.). The accepted value of e is 4.803×10^{-10} electrostatic units of charge. The apparatus consists of 2 parallel plates between which an electric field is applied of sev. hundred volts per cm. Drops of oil of diameters about 10^{-4} cm. are produced by a fine spray and allowed to enter the space between the plates by way of a small hole in the upper plate. Friction during the spraying process charges the drops. Bright indirect illumination allows the movements of the drops to be observed by a low-power telescope with a graduated eyepiece. Draughts are carefully excluded, but nevertheless the drops wander considerably owing to Brownian Movement (q.v.). See also ELECTRON. See

R. A. Millikan, *Electrons (+ and -), Protons, Photons, Neutrons, and Cosmic Rays*, 1935.

Oil-fish (*Ruvettus*), genus of spiny-finned fishes of the family Gempylidae, which grow to a length of about 6 ft. The common O., *R. pretiosus*, is found in deep water in the warmer parts of the Atlantic Ocean and Mediterranean.

Oil Fuel, see FUEL, Liquid Fuel.

Oil of Vitriol, see SULPHURIC ACID.

Oil Paint, see PAINTS and PIGMENTS.

Oil Painters, Royal Institute of, was founded in 1883, and achieved the prefix Royal in 1909. Ann. exhibitions are held at galleries in Piccadilly, London.

Oil-painting, see PAINTING.

Oil Rivers, see NIGER.

Oil Rivers Protectorate, former name of the Niger Coast Protectorate. It was given to the new protectorate proclaimed over the coastal area of Nigeria following the Berlin Act, 1885, and it included most of the present coast, but not Benin or the country to the W. In 1893 the name of the protectorate was changed to Niger Coast Protectorate. See further under NIGERIA.

Oil-shale, see SHALE OIL.

Oil Tankers form one of the classes of vessels which are expressly built for the transport of a certain class of cargo, and can under ordinary circumstances be used for no other. As early as 1863 there were sailing ships on the Tyne with specially constructed tanks for the carriage of oil, but the *Vaderland*, probably the first steamship designed to carry oil, was not built by Messrs Palmer, until 1872. Another early steamship of this type was the *Zoroaster*, built in Sweden in 1877, in which the oil tanks were separate from the hull; later vessels were built in which the plating of the hull itself formed the tank. The *Gluckauf* (2300 tons gross), built on the Tyne in 1886, is regarded as being the forerunner of the tanker of to-day, with machinery aft, and the hull divided into separate tanks by transverse and longitudinal bulkheads. At this time the hull was transversely framed, but in 1908 longitudinal framing, giving a stronger but lighter hull, was introduced. To-day tankers are built with longitudinal framing or on the combined system of transverse and longitudinal framing; the number of longitudinal bulkheads is invariably two. The first motor tanker was the Shell vessel *Vulcanus*, built in Holland in 1911. The Diesel engine has since been extensively used as the propelling machinery of tankers, but with the modern development of the giant tanker (see SHIPS and SHIPBUILDING), and with the modern demand for high-speed steam-driven pumps, steam turbines have reasserted their advantages. Ideally, oil can be transported in bulk more cheaply in one large vessel than in two small ones; a factor which, in the 'oil hungry' world of to-day, has led to the development of vessels of over 100,000 tons d.w.; in practice limitations imposed by port facilities, by berth and canal depths, and by the shortage of suitably large dry docks require that large numbers of

vessels of smaller size should be available. The standard general-purpose tanker in Great Britain is a turbine steamer of about 18,000 tons d.w. capable of 14½ knots, with steam-driven pumps. The modern tanker with machinery aft has a very characteristic profile, with forecastle, midship bridge structure, and poop with two or more decks. Combination vessels, able to carry oil in side and bottom tanks, or ore in central holds, are built. The design of a large tanker with a nuclear power plant was projected in Great Britain in 1957. For statistics see SHIPS AND SHIPBUILDING. See Laurence Dunn, *The World's Tankers*, 1956.

Oil Wells. The word 'oil' is applied in this case to rock oil or petroleum, which is found in various places at lesser or greater depths in the earth's crust. It most commonly occupies the pore spaces between the grains of sedimentary rocks. Two factors are essential to hold the petroleum in its reservoir. Firstly a suitable impervious 'cap' rock or seal to prevent its escape into higher layers, and, secondly, a 'structural' or 'stratigraphical' closure to trap the oil and prevent its further movement within the layer. The deposits are usually associated with water and gas—the water, being the heaviest, occupying the lower part of the structure. The method used in the recovering of petroleum from these natural reservoirs is by the sinking of wells.

The art of well-drilling dates back to 221 bc when it was first practised in China, where brine wells as deep as 3500 ft were drilled with equipment of a very primitive nature. The first well sunk with the definite object of obtaining oil, using other than hand power, was drilled at Titusville, Pennsylvania, in 1859 by Col. Drake. Investigations by geologists in a given area determine whether conditions in geological time have favoured the formation of oil. If so the terrain is studied for evidence of the types of structure in which oil is known to occur. Air surveying is widely used. Gravimeters are employed to measure differences in gravitational force resulting from variations in the densities of the rock layers beneath the surface. Rock layers can also be mapped by seismic methods. An explosion is set off at the surface, and sound waves reflected from the formations below are recorded by sensitive instruments to provide evidence of the depth and nature of the strata. Measurement of the earth's magnetic field and chemical analysis of surface soils may also be useful. Observations, if favourable, are checked by small-diameter borings.

The first well in an oil-field is usually known as a 'wild-cat.' All wells drilled with the object of discovering a new structure, a new pay zone, or of extending the productive area of known pay zones are 'exploratory' wells. Those wells extending a known field are 'extension' or 'outstepping' wells. Wells drilled for deeper pay sands in the same field are 'vertical exploration' wells, while those drilled within the known boundaries of a proven field are known as 'exploitation'

FLOWING WELL: COMPONENT PARTS

or 'development' wells. In modern drilling the first structure of the drilling rig to be built is the derrick, this being,

in the case of permanent wells, a structural steel tower usually about 136 ft high. The 30-ft-square derrick floor, which is surfaced with boards and stands 8 to 14 ft off the ground, is the working platform for the crews. The hoisting winch or 'draw-works' by which the drill pipe, casing, and tubing are handled is driven by three or four engines installed behind it.

The hoisting equipment consists of the crown block (pulley) on top of the derrick and a travelling block which moves up and down the derrick by means of the hoist and a multiple cable arrangement. The drill proper consists of a steel drill-pipe with a cutting tool, known as a bit, at its lower end. The drill-pipe is rotated by a turntable mounted in the derrick floor. As the bit cuts deeper into the ground, new sections of drill-pipe are added to the drilling 'string.' The bit cuts a hole larger in diameter than the pipe, which is hollow. While drilling is in progress specially prepared mud is pumped down the pipe, through the bit, and up to the surface again in the space between the pipe and the sides of the borehole. This carries the rock cut by the bit to the surface (providing valuable specimens of the formations encountered by the drill), cools the bit, and forms a kind of plaster to prevent the walls of the borehole caving in. As the drill drives deeper the sides of the borehole are strengthened by successive 30-ft sections of steel casing, which is cemented into position. When a deposit is reached the oil, usually under great pressure, may be kept under control by maintaining a corresponding pressure of the circulating drilling mud. The drilling string is removed, and special tubing is run down the borehole to enable the oil to flow to the surface. The mud is then removed from the borehole, the flow at this stage being controlled by a system of valves and pipes at the wellhead known as a 'Christmas tree.' At first the oil rises to the surface under natural pressure, but later it may be necessary to lift it by mechanical pumping or by creating artificial pressures in the oil-bearing formation. In the last 100 years over a million O. W. have been drilled. Oil is produced from depths of over 17,000 ft, and exploratory boring has reached over 20,000 ft. The presence of oil deposits beneath the sea bed has led to the development of drilling from rigs on platforms or barges which form artificial is. See also PETROLEUM. See J. E. Brantly, *Rotary Drilling Handbook*, 1936; P. J. Jones, *Petroleum Production*, 1946-8; A. Beaby-Thompson, *Oilfield Exploration and Development* (2nd ed.), 1950; The Institute of Petroleum, *Modern Petroleum Technology* (2nd ed.), 1954; L. C. Uren, *Petroleum Production Engineering: Oil Field Development* (4th ed.), 1956.

Oilcake, richest and most concentrated of cattle foods, manuf. from oil-bearing seeds after they have been crushed to extract some of the oil. The cakes in most common use in Britain are those prepared from linseed, cotton seed, and soya-beans. Linseed cake contains from

9 to 11 per cent of oil, and if fed in moderate quantities is the best stock food of its kind. Decorticated cotton cake is made from cotton seed after the husk has been removed, and is valuable for fattening bullocks and dairy cows. Undecorticated cotton cake, made from the whole seed, is generally given to cattle fattening upon grass. Soya-bean cake, a recent introduction, is valuable for all classes of stock.

Oilcloth, see FLOORCLOTH and LINO-LEUM.

Oils, Essential, see ESSENTIAL OILS.

Oils and Fats are either glyceryl esters of the fatty acids (animal and vegetable oils) or hydrocarbons (mineral oils). In the former the relative proportion of solid and liquid glycerides determines whether the substance is a fat or an oil at ordinary temps. Oils may be colourless to yellow, are not miscible with water, have a sp. gr. of less than 1, and will be considered here as: (1) Mineral or hydrocarbon oils. This class includes a few essential oils mainly of vegetable origin, mineral oils like petroleum, oils obtained by distillation, coal-tar oils, shale oils, bone oils, etc. (2) Fatty oils, which may be saponifiable (i.e. hydrolysed by caustic alkalis or not). Saponifiable oils, etc., include glycerides and some essential oils, whilst non-saponifiable products include fusel oil, camphor oils, cholesterol, phenol, cresol, and many others. (1) *Hydrocarbon oils* are obtained either by the distillation of oil-bearing shales (Scotland) or from the petroleum of America, Russia, the Middle E., etc. The Scottish oils are mainly paraffins (q.v.), the Russian petroleum is composed chiefly of naphthenes, while the Amer. petroleum consists of paraffins, with aromatics and naphthenes. For commercial purposes crude petroleum is distilled and fractionated. Thus are obtained colourless oils used as solvents (petroleum ether), cleaning oils, and oils for varnishes, burning oils (kerosene), and lubricating oils (see PETROLEUM). These minerals are chemically more or less inert, and are unaffected by acids and alkalis at ordinary temps. (2) *Fatty oils* are obtained from animal fats and seeds of plants by pressure or extraction by volatile solvents. These fats and oils are chiefly composed of tri-stearin, tripalmitin, and triolein, and are easily decomposed to glycerol (q.v.) and the fatty acids (see FAT). They are soluble in ether, benzene, and chloroform, and are only slightly soluble in alcohol (except castor oil, which is soluble). The fatty oils are divisible into 3 groups: (i) *Drying oils*. These when exposed to the air absorb oxygen and harden. Such oils are valuable as painting oils, e.g. castor (dehydrated), linseed, poppy-seed, and flax-seed. (ii) *Non-drying oils* are used for lubricating purposes. Such are butter, lard, tallow, olive, palm, whale, seal, coconut oil, and castor (in natural state). (iii) *Semi-drying oils*, intermediate between (i) and (ii), e.g. rape (colza), castor, croton, and grape-seed oils. Boiled with caustic alkalis, fats and oils of this series undergo saponification, and are used in the manuf. of soaps (q.v.). Stearin is used in making candles, as also are palm oil and tallow.

Castor oil is used in certain types of lubrication, and in medicine, while some of these fats and oils are used as foods, viz. butter, lard, and coconut oil, and others as burning oils—colza and sperm oils.

The examination of oils and fats is a highly technical matter and involves such observations and determinations as taste and smell, colour, refractive index and dispersion, fluorescent effects, spectroscopic work and behaviour under polarised light, solubility in various solvents, heat of combustion, conductivity, melting point, sp. gr., viscosity, and complete chemical analysis, including the water content. In some cases *flash point* (q.v.) is a useful piece of information. Another important factor is the *iodine value*. Thus in Hübl's method an alcoholic solution of mercuric chloride and iodine in alcohol is made. Then a solution of the oil under test is made up in chloroform and the iodine solution added to it. Excess of the latter solution is used, and after adding potassium iodide solution the amount of the excess of iodine is found. From the results the amount of iodine absorbed by a known weight of the oil is then calculated. The Reichert value of a fat is obtained by heating 2.5 gm. of the fat with 5 ml. of pure alcohol and 6 ml. of strong KOH solution. After heating on the water-bath the soap produced is extracted with 70 ml. of boiling water and sulphuric acid of the proper strength to neutralise the alkali added. The liquid is distilled till 50 ml. have come over. The distillate is neutralised by decinormal alkali. The number of ml. used gives the Reichert value. The Maumené test depends on the heat produced when a fixed oil is mixed with sulphuric acid. Comparisons are made with standard cases.

Oilseeds, Processing of. The main processes through which O. pass for removal of the oil are cleaning, reducing, heating ('cooking'), and pressing or solvent extracting. In addition, it may be desirable to decorticate certain seeds (remove shells or hulls) and to delint cotton seed (remove short fibres or 'linters' remaining after ginning).

SEED CLEANING. O. received at a crushing mill usually contain varying amounts of extraneous matter—foreign seeds, sand, stones, metal, string, etc., which must first be removed to avoid adulteration of the final products and to protect processing machines against damage and unnecessary wear. The seeds are therefore passed either over a number of vibrating screens mounted in tiers and having the perforations diminishing in size from top to bottom, or through a declined rotating drum constructed from perforated plates with holes increasing in size towards the outlet. Sizes of holes are chosen to suit particular seeds and chutes are fitted to direct the seed and trash into separate conveyors and storage bins. Electromagnets are placed over conveyors and incorporated in chutes to remove tramp iron. Stones cannot, of course, be completely removed by screening, but can be separated from the seed by means of their greater density.

SEED REDUCING. This facilitates the extraction of oil but, as the structure and also the degree of fineness of the seed meal directly influence the oil yield obtained, the method of reduction used and size of particle produced must be selected to suit the physical character of the particular seed and the process by which the oil will be extracted. The seed is reduced by grinding or rolling to disintegrate a large proportion of the cellular membranes and so release the oil. Temp. rise during grinding or rolling should be kept to a minimum to avoid free flow of oil from the meal. Large seeds are first broken down either in a hammer type mill or by passing them through 'breaking' or 'cracking' rolls, but final reduction is usually by rolling. A set of breaking rolls consists of fluted steel rolls mounted in pairs, one of each pair being spring loaded, and may be up to 4 pairs high. The pitch of the flutes (V-shaped grooves), cut spirally along each roll, is the same for rolls which are paired, but is reduced on lower rolls so that, together with an adjustment of the clearance between the rolls, particles of the required size can be produced. Reduction of the seed is achieved by rotating the paired rolls at differential speeds, thereby producing a shearing or scissors effect between the cutting edges of the flutes. Lower rolls are rotated at higher speeds to prevent hold up of seed and blockage. The broken seed is then passed between heavy steel rolls mounted one above the other and with each roll supporting the weight of all the rolls above it, thereby subjecting the seed to increasing pressure as it passes back and forth between adjoining rolls from top to bottom of the assembly. There are five rolls about 16 in. in diameter by 4 ft long, per set (Anglo-Amor. Five-High Rolls), the top or second roll being fluted to ensure that the broken seed fed to it is 'nipped' and carried forward whereas the remaining rolls are usually smooth. A plate is fitted along the top of each roll on the feed side to guide the material between rolls. Seed passed through these rolls may be reduced to particles a few thousandths of an inch in thickness, but the size must be chosen to suit the oil extraction process. For solvent extraction of the oil, the particles are pressed into thin flakes by a single passage through a pair of large diameter smooth rolls, one of which is fitted with heavy springs at its bearing blocks to maintain pressure between rolls and is adjustable for minimum flake thickness. The size and thickness of flakes play a most important part in the solvent extraction process, and although the rate of oil diffusion is directly proportional to the surface area and inversely proportional to the thickness, flakes must have sufficient mechanical strength to withstand handling and filling into extractor vessels and also to allow flow of solvent through the flake mass.

COOKING OF OILSEEDS. Although a proportion of the oil in seed may have been liberated during rolling, a considerable number of the ultramicroscopic oil cells still remain intact and must be so

treated as to induce them to yield up their oil. Heat treatment ('cooking') is known to achieve this, but the complex changes which take place, both chemical and physiochemical in nature, have not so far been fully explained, and the conditions of temp., moisture, and degree of grinding most suitable for the seed being processed and the method of oil extraction are found chiefly by experience.

Subjecting the moistened seed particles to heat causes the oil and moisture to expand, thereby rupturing the cells, lowers the viscosity of the oil, reduces the surface tension of the oil interface and denatures and coagulates the proteins, so that some of the oil is released to the surface of the particle. The oil is further displaced by the moisture, because the latter has a lower surface tension at the boundary surface and is attracted by the hydrophilic gels of the seed, and is then in a suitable state to flow freely during pressing. Heat alone will not liberate the oil completely; in excess, in the absence of moisture, it will cause the oil to adhere more closely to the surface of the particles, due to reduced surface tension, destroying the granular nature of the meal and so forming a pasty mass which prevents oil flowing freely.

The process of cooking—heating, addition of moisture, and drying—is carried out generally in a 'kettle,' which consists of a series of closed, superimposed cylindrical pans, each of which is independently jacketed for steam heating and is equipped with a stirrer. An automatically controlled gate or flap is fitted to an outlet in the bottom of each pan, except the last, for discharging the meal to the pan below at a predetermined rate. The bottom-most outlet is manually operated to suit the machine being fed. There may be up to 5 pans in a series, the top one or two being provided with spray jets, for the addition of moisture to the meal, and the lower ones provided with exhaust ducting and fan for removal of moisture. It is thus possible to control the time of cooking, the moisture of the seed meal during each stage of cooking, and also the final moisture content. There are also pressure-type cookers in use, consisting of horizontal jacketed tubes with close-fitting stirrers, which agitate the meal and convey it through the tube. Nozzles are fitted for direct injection of steam at the beginning of the cooking process. In addition, the meal may be passed along steam-jacketed conveyors prior to entering the cooker, and through dryers after cooking to reduce the moisture content to suit the oil extraction process.

PRESSING. *Hydraulic press.* There are 2 main types, the 'open' Anglo-Amor, and the 'closed' or cage press. The 'open' press consists of 4 heavy vertical steel columns secured at the top and bottom to heavy blocks, the bottom one of which incorporates a hydraulic cylinder and ram. Suspended from the top, and closely filling the space enclosed by the columns, is a series of up to 24 corrugated horizontal plates. These are equally spaced at intervals of 2-4 in. and are suspended, one from the other, by linkages which permit

the assembly to be closed up. Pressure applied from below is evenly distributed over the plate area by a heavy bottom plate attached to the ram. The cooked meal to be pressed is moulded into cakes, by a machine located immediately below the kettle outlet, placed in strong woollen or nylon wrappers, and inserted between the metal plates. Pressure is applied in two or three stages by raising the ram, which closes up the plates, compresses the meal, and causes most of the oil to flow out. The 'closed' or cage press has vertical columns with top and bottom end blocks and hydraulic cylinder with ram similar to the open press, but the plates are replaced by a strong cage of round or square section made up from a number of closely spaced steel bars or slotted plates, ringed by heavy steel bands or supported in a steel frame. The length of the cage is such as to allow for filling at the top. During pressing, the space between cage and press head is occupied by a vertically hinged heavy block, which may close the cage solidly and restrict the applied pressure to the lower end of the charge as the ram passes up and into the cage, or the block may be of suitable cross-section for it to enter the cage during pressing, in which case the cage floats between the lower ram and opposing head and pressure is applied to both ends of the seed mass. There is a tendency for the oil to flow longitudinally rather than radially through the compressed cake, and the seed meal is therefore divided into layers by drainage plates or press cloths which are placed in the cage at intervals during filling. The oil is squeezed out through the narrow spaces between the cage bars and falls into drip-trays to be pumped to screens and filter-presses for removal of fine meal ('foots') before refining. Pressures in the region of 6000 lb. per sq. in. are possible with the cage press, whereas the maximum pressure on the cake in an open press is about 1700 lb. per sq. in. Although these presses have been almost completely replaced by continuous screw presses, the hydraulic cage press is still used for cold extraction of special oils, e.g. first pressing of castor beans to produce medicinal oil, the oil remaining in the residue being in this case extracted with solvent for technical purposes.

Continuous screw press is used throughout the world for the mechanical expression of oil from most varieties of O. It resembles a large elongated mincing-machine, and consists of a central worm shaft or screw rotating in a cage or 'barrel' made up from flat steel bars spaced a few thousandths of an inch apart. Pressure may be applied to a comparatively small extent by restricting the discharge of cake through the annular orifice at the end of the barrel, but high pressure is built up within the cage by combining this with a decrease in the pitch of the worm along the shaft, a gradual increase in diameter of the screw boss and reduction in diameter of the cage towards the discharge end. The size of orifice or choke may be adjustable, while the machine is working, so that the pressure may be regulated to suit a

particular seed. As a result of the high compression, oil is expelled from the meal through the spaces between the cage bars. Screw presses may be divided into 3 types: low pressure, high pressure, and a combination of low- and high-pressure sections. Low-pressure screw presses, with comparatively high capacities, are used for removal of a proportion of the oil from seeds with a high oil content, so that the residue may be more satisfactorily treated in a high-pressure screw press or solvent extraction plant. A combined machine may have the low-pressure section mounted vertically over the feed end of the high-pressure unit or, alternatively, it may have a horizontal multi-stage barrel with the shaft made up of 2 sections and driven by independent motors at different speeds. Depth and pitch of flights and shaft speeds are chosen to produce the pressures required. Screw press plants are automatic in most respects and are so arranged that flow of cleaned seed from storage bins and through all pre-treatment processes is automatically controlled by the feed to the expellers, which is regulated manually to suit variations in character of seed. Labour requirements are very small and generally of a supervisory nature only. Cake produced by high pressure and combined screw presses contains between 4 per cent and 7 per cent of oil, the amount varying according to the characteristics of the seed being crushed.

SOLVENT EXTRACTION. Solvent extraction plants involve either a batch or a continuous process. In a batch plant the hot flaked seed is delivered into a cylindrical pressure vessel, which may be mounted horizontally either on a shaft running in trunnion bearings or on rollers, by means of which it can be rotated on its longitudinal axis, or it may be installed in a fixed vertical position, in which case a shaft with stirrers is fitted. Grids and filters are fitted for drainage purposes and to prevent escape of fine meal during counter-current washing with solvent and during steaming. Hydrocarbon solvent is pumped into the sealed vessel at the bottom until full, when the flow is reversed to force out a mixture of solvent and oil ('miscella') from the bottom. Washing is continued until almost all the oil is leached out of the seed. The miscella of different concentrations is stored in separate tanks; the most concentrated miscella is passed to a distillation plant for removal of solvent, and the miscella of lower concentrations is pumped through following batches of seed to raise its concentration to a level suitable for distillation. Medium strength miscella is therefore pumped through a new charge of seed, followed by weak miscella and fresh solvent. In this way the solvent content of the final miscella and hence the size of distillation plant are kept to a minimum. After allowing time for draining, the meal is agitated while steam is passed through it to remove all traces of solvent. Batch extractor vessels of the vertical type are usually arranged in a line and operated as a semi-continuous process. The oil is leached out by counter-current washing

with solvent pumped through sev. of them in series, entering the line at a vessel containing nearly oil-free material and emerging as concentrated miscella from a vessel containing flakes of a high oil content. At regular intervals, one vessel, containing meal from which almost all the oil has been leached away, is disconnected from the head of the series and another freshly filled with flakes is added to the tail. In a continuous plant the process is taken a stage further, the flakes being moved by various means counter to the flow of solvent. In the Bollman (Hansa-Mühle) extractor, the seed flakes are fed automatically into metal baskets or buckets with perforated bottoms, pivoted between endless chains running over sprockets, within a gas-tight case, similar to a vertical bucket elevator. Fresh solvent is sprayed into the flakes containing the least oil, i.e. near the top of the 'up' side, and allowed to drain through to the bucket, and subsequent buckets, below. Miscella of increasing concentrations is collected at various points and pumped into baskets on the down side containing flakes of high oil content. As each bucket arrives at the top, containing meal from which almost all the oil has been leached and solvent drained, it is inverted, and the meal is transferred to a conveyor which passes through the extractor case to desolventisers. The miscella which has drained into tanks on the down side is pumped away to evaporators for removal of solvent. Fauth and De Smet extractors utilise a continuously moving belt of filter cloth to convey the flakes through a long, sealed chamber. Miscella and fresh solvent sprayed on to the moving layer of flakes at intervals percolate through the flakes and filter by gravity into tanks beneath to be recirculated or pumped to evaporators when sufficiently concentrated. A number of other designs incorporate vertical and/or inclined tubes through which the flakes are moved by various means counter to the flow of solvent. In the Bonotto extractor flakes fall at a controlled rate from equally spaced disks mounted on a central common shaft in a vertical tube while solvent passes up the tube. Rate of passage of flakes down the tube is controlled by rotating the plate assembly at a predetermined speed, and having stationary scraper arms sweep the meal through a slot in each plate to the surface of the plate below. As the spent flakes reach the bottom of the column they are discharged by a screw mechanism through a cone-type orifice adjusted to effect compression of the flakes and expression of most of the solvent. The extractor patented by Hildebrandt consists of 2 vertical tubes interconnected at the bottom by a third horizontal tube, each tube being provided with a screw conveyor with close-fitting perforated flights. Flakes are conveyed down one leg into the solvent (miscella) across to the second leg, and up above the level of solvent in the latter, where they drain before being discharged. Concentrated miscella is discharged near the top of the first tube

through a section provided with fine vertical slots which restrict passage of flake particles. Allis-Chalmers and Ford extractors are similar in principle to the Bonotto and Hildebrandt extractors respectively. Miscella from batch and continuous plants is first filtered to remove fine particles of meal and is then passed through a system of evaporators to remove all traces of solvent. Most of the solvent is removed in evaporators equipped with steam coils, but final stripping is carried out with live steam, sometimes under reduced pressure. The vapours are condensed in water-cooled condensers and separated by gravity, the water to be run to drain and the solvent returned to storage tanks for re-use. Finally, all air vented from the system to atmosphere is either washed by refrigerated brine or passed through adsorption towers containing activated carbon to remove the last trace of solvent. The crude oil is pumped into tanks to await dispatch to processors. Treatment of the meal consists of steaming and drying in the batch extractor vessel or in heated tubes fitted with worm conveyors, after which it is ground and cooled for storage or dispatch. It usually contains about 1 per cent of oil. *See also* COCONUT; COCONUT OIL; COTTON-SEED; GROUNDNUT OIL; LINSEED OIL; PALM OIL; PALM-KERNEL OIL; SAF-FLOWER OIL; SOYA BEAN; SOYA BEAN OIL; SUNFLOWER OIL; TUNG OIL.

Ointment, fatty substance of the consistence of butter, generally containing some medicinal agent, and intended to be applied to the skin for curative purposes. The fatty basis may be any substance sufficiently plastic, without any injurious action on the tissues and not liable to putrefaction; that most generally used is purified lard with an admixture of wax, the usual proportion being 80 parts of lard to 20 of wax. A harder O., used for conveying liquid antiseptics, is made up of 4 parts of solid paraffin, 1 of wool fat, and 5 of liquid paraffin. A soft O. base in general use consists of 11 parts of solid paraffin, 5 of lanolin, and 34 of liquid paraffin.

Oireachtas, name of the Parliament of the Rep. of Ireland. It consists of the President of the Rep., a Lower House, called *Dáil Éireann* (q.v.), and a Senate, called *Seanad Éireann*. *Dáil Éireann* comprises 147 members (T. D.s) elected by adult suffrage. *Seanad Éireann* has 60 members, of which 11 are nominated by the *Taoiseach* (Prime Minister), 6 are elected by the univs., and 43 are elected from panels of candidates representing the following 5 interests: (i) National language and culture, literature, art, education, etc.; (ii) Agriculture and fisheries; (iii) Labour; (iv) Industry and commerce; (v) Public administration and social services.

Oïrot, autonomous region of the R.S.F.S.R., *see* GORNO-ALTAY.

Oisante, *see* ANATASE.

Oise: 1. Dept in the N. of France, formed of parts of the anct provs. of Ile-de-France and Picardy. In general flat, it is well watered, mainly by the O. and

its tribs. It produces a great deal of agric. produce, and is known for its live-stock breeding. The prin. manufs. are textiles, sugar, and glass, and there are metallurgical industries. The chief tns are Beauvais (the cap.), Clermont, Compiègne, Senlis, and Reil (qq.v.). Area 2272 sq. m.; pop. 396,700. *See also* VEXIN.

2. Riv. of France, an affluent of the Seine, rises in the N. of the dept of Ardennes, and flows SW., joining the Seine at Conflans-Sainte-Honorine after a course of 150 m., for the last 75 of which it is navigable.

Oisin, *see* OSSIAN.

Oita, city and seaport of Oitaken, NE. Kynshu, Japan, 100 m. from Nagasaki. Silk yarn and textiles, cement, and metal wares are produced. Pop. 112,000.

Ojibwa, *see* CHIPPEWYANS.

Ojos del Salado, name of Andean peak on the Chilean-Argentine border. A new survey in 1955 claimed that it may be the highest in the whole of the W. hemisphere (*see* ACONCAGUA).

Oka, navigable riv. in central Russia, right trib. of the Volga. It rises in the central Russian upland and flows NE., joining the Volga at Gor'kiy. Length, 940 m.; main ports Gor'kiy, Ryazan', Dzerzhinsk, Kaluga.

Okapi, native name of the species of Giraffidae discovered by Sir Harry Johnston in 1901 in the Semliki forest, Belgian Congo; it is known technically as *Okapia johnstoni*. This giraffe-like animal differs from its allies in having a rather short tail, a short, thick neck, and no external horns, but vestiges of horns are to be found on the frontal bone. The coloration of the O. is curious: the limbs bear long, dark stripes, the back and sides are reddish-brown, while the limbs and part of the head are of a creamy colour. Very little is known of the habits of the O. beyond that they live in pairs in dense forests.

Okayama, city of Okayamaken, Japan, seat of the prefectural gov., 72 m. W. of Kobe. It has a fine castle and beautiful gardens. Silk and cottons are produced. Pop. 235,000.

O'Keefe, or **O'Keefe**, John (1747-1833), dramatist and actor, b. Dublin. His plays enjoyed considerable popularity in London. They include comedies, farces, and operas, such as *The Agreeable Surprise*, 1781, *The Poor Soldier*, 1783, *Wild Oats*, 1791, and *Modern Antiques*, 1791. The popular song 'I am a friar of orders grey' occurs in his opera *Merry Sherwood*. He was blind from about 1797. His *Recollections* appeared in 1826. *See* lives by R. W. Babcock, 1937, and Adelaide O'Keefe, 1937.

Okehampton, municipal bor. and mkt tn of Devon, England, 21 m. W. of Exeter, on the N. margin of Dartmoor, at the junction of the E. and W. Okement. There are picturesque ruins of a late Norman keep and of O. Castle. Pop. 3900.

O'Kelly, Sean Thomas (Seán Tomas O'Ceallaigh) (1882-), Irish journalist and political leader. He was educ. at O'Connell Schools, Dublin, and was returned as

Republican M.P. for N. Dublin in 1918. One of the original members of the Sinn Féin (q.v.) movement, he was Speaker of the first Dáil Éireann. He was Irish envoy to Paris and Rome, 1919-22, and to the U.S.A., 1924-6. From 1927 to 1945 he represented Dublin N. in the Dáil, and was successively vice-president of the executive council and minister for local gov. and public health, 1932-9, and minister for finance and for education. O.K. was proprietor and editor of the *Nation*, general secretary of the Gaelic League, and vice-president of the Fianna Fáil (q.v.) party. On 25 June 1945 he succeeded Dr Douglas Hyde (q.v.) as President of Ireland. He was re-elected president, without opposition, in May 1952.

Oken, Lorenz (1779-1851), Ger. naturalist, b. Bohlsbach, Swabia. His real name was Okenfuss. In 1802 he pub. a work entitled *Grundriss der Naturphilosophie, der Theorie der Sinne, und der darauf gegründeten Classification der Thiere*, first of a series of works of the same nature. In 1828 he was appointed prof. at Munich, and 4 years later at Zürich. See M. Pfannenstiel and It. Zaunick, *Lorenz Oken und J. W. Goethe*, 1941.

Okhotsk, Sea of, inlet of the N. Pacific in the E. of Siberia, divided from the ocean by Kamchatka Peninsula and Kuril Is. and from the Sea of Japan by Sakhalin and Hokkaido Is. Its main trib. is the R. Amur; chief ports: Magadan and Korsakov.

Okhrida, see OHRID.

Oki Islands, group of is. lying in the Japan Sea N. of Shimanekon, Japan. There are, in all, 4 is., Iodo being the largest; chief tn, Saigo. The group has a coastline of 182 m., and covers an area of 130 sq. m.

Okinawa, Pacific is. of the Ryukyu group, 325 m. from the Jap. mainland, the centre of a former Jap. prefecture, and an air base. It is long and narrow, with an irregular coastline and peninsulas projecting W. and E. Length from N. to S., 65 m.; maximum width, 10 m.; area, 485 sq. m. For the Amer. capture of O. in 1945, see PACIFIC CAMPAIGNS, or FAR EASTERN FRONT, in SECOND WORLD WAR.

Oklahoma (Choctaw Indian word meaning 'red people'), S.-central state of the U.S.A., called the Sooner State, bounded on the N. by Kansas and Colorado, E. by Missouri and Arkansas, W. and S. by Texas. One narrow strip touches New Mexico and Colorado on the W. Area 69,919 sq. m., including 643 sq. m. of water. The surface is principally an upland prairie, and large portions are very fertile, though others are bare and arid. O. rises in the W. to an elevation of 5000 ft and there are mts in the SW. It is well watered by the Red, Canadian, and Arkansas R.s. with their affluents. The chief mt ranges are the Wichita Mts in the S. part of the state; the Chautauqua Mts in the central portion; and the Ozark Mts, extending half way across the state. O. is noted for its diversity of crops: corn, cotton, wheat, oats, peanuts, maize,

potatoes, truck crops, and fruits are extensively cultivated. The first-named represents over two-thirds of the acreage and value. Yields in 1947: maize, 22 million bushels; wheat, 104 million; oats, 33 million; grain sorghums, 5 million. Soil erosion is serious. Between 1935 and 1940 the number of farms declined by 15.9 per cent (33,600), and between 1940 and 1945 by nearly 15,000, or another 8.3 per cent. Farm acreage totals 36 million, with 14 million under crops. The state also possesses an abundance of fine timber, and wool is produced. Petroleum, coal, rock asphalt, limestone, and gypsum are found, the value of the total mineral output for 1946 being \$326 million. O. ranks fourth nationally in petroleum production, with 187,789,000 barrels in 1953. Indians, wards of the nation, received (in 1930) over \$36 million in royalties on oil discovered in their lands. About 280 million gallons of natural gasoline and 345,000 million cub. ft of natural gas were produced in 1945. The state has a Senate of 44 members and a House of Representatives of 123 members elected for 4 and 2 years respectively. O. sends 2 senators and 6 representatives to Congress. The state was a part of the Louisiana Purchase. From 1866 onward the Indian country, as it was known, became gradually settled by the purchase of Indian lands by the gov. Organised as a ter. in 1890, and admitted as a state in 1907, it was originally known as Indian Ter. because on the great reservations were settled Cherokees, Creeks, Choctaws, Chickasaws, and Seminoles. Their descendants remain a large part of the present pop. of O. The chief cities are O. City (cap.), 243,504; Tulsa, 182,470; Muskogee, 37,289; Enid, 36,017; Lawton, 34,757; Shawnee, 22,498; Ponca City, 20,180; Bartlesville, 19,225; Okmulgee, 18,317; Ardmore, 17,890. Pop. of the state, 2,233,350. See Edna Ferber, *Cimarron*, 1936; Federal Writers' Project, *Oklahoma: a Guide to the Sooner State*, 1941; G. Foreman, *A History of Oklahoma*, 1942; A. Dobo, *Prairie City*, 1944; M. James, *The Cherokee Strip*, 1947.

Oklahoma City, cap. of Oklahoma, U.S.A., on the N. fork of the Canadian R. It is a new city settled in 1889, and has many handsome buildings and tree-lined streets. It is an important commercial, industrial, and distribution centre for a rich oil-producing and agric. area; there are petroleum refining and printing and publishing industries, and steel and iron products, wood products, clothing, pottery, bedding, and paints are manuf. O. C. Univ. was founded in 1911. Pop. 243,504.

Okmulgee, city, cap. of O. co., E. central Oklahoma, U.S.A. It is a trade and industrial centre for an oil-producing and agric. area. It has oil-refining, glass-making, cotton-ginning, and meat-packing. Near by is Lake O. Pop. 18,317.

Oktyabr'skiy, tn in Bashkiria (Russia), 90 m. W. of Ufa, rapidly growing centre of the Tartar-Bashkir oil-fields, and the starting-point of pipeline to Ufa. Founded

in 1940, it became a tn in 1946. Pop. (1956) 63,000, mostly Russian.

Okuni-Nushi, see OHONAMOCHI.

Olaf I (Olaf Tryggvason) (c. 960–1000), King of Norway. On being proclaimed king in 995 he began the conversion of the country to Christianity, built the first churches, and founded the see of Nidaros, or Trondheim. He fought with both Sweden and Denmark, and finally met his death off the is. of Svöld, near Rügen, where he was waylaid and defeated by the combined Swedish and Dan. fleets.

Olaf II, the Saint (995–1030), king and patron saint of Norway. He wrested the throne from Eric and Earl Sweyn (Svend Jarl) in 1015, and then tried to suppress paganism with such severity that some of his subjects sought protection in the ters. of Canute. O. was dethroned by Canute in 1028, but in 1030 he returned to Norway with an army. In a battle with Canute at Stiklestad O. was defeated and killed. He was canonised in 1164 and recognised as patron saint of Norway.

Olaf VI (Alexander Eduard Christian Frederik) (1903–), King of Norway. He succeeded his father, Haakon VII (q.v.), in 1957. His education included 2 years' study at Balliol College, Oxford. He married (1929) Princess Martha of Sweden (d. 1954), and their only son, Prince Harald (b. 1937), is heir presumptive to the Norwegian throne. O. became commander-in-chief of the Norwegian armed forces in 1944, and shared the war-time exile of the rest of the Norwegian royal family.

Olafsson, Eggert (1726–68), Icelandic naturalist, poet, and patriot who, in company with Bjarni Pálsson (q.v.), travelled throughout Iceland (1752–7) exploring the country. Of their travels they wrote a detailed account which was pub. in Dan. in 1772 and subsequently in various other languages (English 1805, abridged). See biography in English, 1925, by H. Hermannsson.

Olafsson, Jón (1850–1916), Icelandic poet, journalist, and politician, noted for his masterly trans., e.g. that of Mill's *On Liberty*. He said himself that his corner of the poetic field was a small one, but he hoped it was his own, and indeed it is.

Olafsson, Páll (1827–1905), Icelandic poet (brother of Jón O.), whose charming songs and humorous verses have for a cent. been on the lips of every Icelander. His poetry is characterised by a peculiar grace and melodiousness.

Olafsson, Stefán (1619–88), Icelandic poet and divine. He trans. the Younger Edda into Latin, and also the great philosophical poem, *Völuspá* (q.v.), of the Elder Edda. Mazarin offered him a post under the Fr. Gov. to translate and edit Old Icelandic classics. This tempting offer he was naturally inclined to accept, but was dissuaded from doing so by Bishop Brynjólfur Sveinsson (q.v.). Whatever the worthy bishop's motive may have been, its purity is suspected even to-day. With Hallgrímur Pétursson (q.v.), O. towers above his contemporary Icelandic poets. Many of his poems are so modern in spirit, form, and diction that they might

have been written in the present cent., and some of his love poems are among the best in the language.

Olafur Thórðarson (d. 1259), Icelandic poet and scholar, nephew of Snorri Sturluson and brother of Sturla Thórðarson (qq.v.). Some incomplete poems of his have been preserved, and an important grammatical treatise. See Finnur Jonsson's ed., 1927.

Öland, long and narrow Swedish is. in the Baltic, separated from Sweden by Kalmar Sound. It is 85 m. long and 10 m. at its broadest, and covers an area of 519 sq. m. It is well wooded in parts, and has good pasture ground for cattle. There are good fisheries all round the coast, also cement and alum works; grain and sandstone are largely exported. Borgholm, on the W. coast, is the cap. and only tn. Pop. 27,000, of whom 2423 are in Borgholm.

Olason, Páll Eggert (1883–1949), Icelandic scholar, author of numerous works on Icelandic hist. and biography. His *Islenskar æviskrár* (Icelandic Dictionary of National Biography), 5 vols., is occasionally referred to in this Encyclopedia.

Olauas Petri, see PETERI.

Olawa (Ger. Ohlau), tn of Poland, in Wrocław prov., 17 m. SE. of Wrocław (q.v.). It lies near the Oder (q.v.), on a canal linking that riv. to the O. It. There is a Gothic church, and there are metal industries. Pop. 8000.

Olax, typical genus of the family Olacaceae, consists of about 30 shrubs and trees inhabiting tropical regions of Asia, Africa, and Australia. The species are smooth evergreens, and have a disagreeable odour. *O. zeylanica* is the mallatree of Ceylon, the leaves of which form an ingredient of curry.

Olbers, Heinrich Wilhelm Matthäus (Matthias) (1758–1840), (Ger. physician and astronomer. b. Arbergen, near Bremen, studied medicine at Göttingen (1777–80). His new method of calculating the orbit of a comet won him fame. He discovered the asteroids Pallas (1802) and Vesta (1807), and the O. comet of 1815. See Barkhausen, *Biographische Skizzen verstorbener Bremischer Aerzte*, 1844.

Old Age Pensions, see NATIONAL INSURANCE ACT, 1946 and RETIREMENT PENSIONS.

Old Bailey, name of a street in the city of London, between Newgate St and Ludgate Hill, and commonly applied to the Central Criminal Court (q.v.). The Bailey, as it was originally called, was no doubt an outwork in front of the city wall. The first extant reference to the O. B. is dated 1444–5. The M.E. word *bailey*, appearing also in the forms *bail* and *bayle*, is from Medieval Lat. *ballium*, meaning the courts or wards of a castle formed by spaces between the circuits of defences surrounding the keep. The name *bailey* in this context is often retained after the disappearance of the castle and its defences. From very early times a gallows existed near the Horse Pool in Smithfield (sometimes called Smithfield Pond), only a short distance from the city gate (New Gate) at this point. It was

called the 'Elms' because of the quantity of such trees in the neighbourhood. With building development at Smithfield, the gallows were moved further W. Newgate (q.v.) early became the common jail for London and Middx. and the sessions at the O. B. have from time immemorial been held under the commission of Jail Delivery (q.v.) for Newgate and of Oyer and Terminer (q.v.) for the city. Up to 1906 the sittings of the Central Criminal Court were held in the old court house, but a new building designed by E. W. Mountford was opened in 1907, and now occupies almost the whole site of what was once Newgate Prison. The interior of the new court, which has sometimes and without regard to hist. been termed the New Bailey, is lofty and imposing, and over a great part of the vaulted ceilings are brilliantly coloured frescoes.

T. Fall

OLD ENGLISH SHEEP-DOG

Old English Sheep-dog ('Bohtail'), formerly much used, and developed to a high degree of intelligence, by shepherds and drovers in the S. cos. of England and Wales, but now a favourite show dog. The hard, shaggy coat should be free from curl, and have a dense waterproof undercoat. Its colour may be any shade of grey, grizzle, blue, or blue merle, with or without white markings. The head should be big and square with a long, strong jaw, black nose, and small eyes; the ears should be small and covered with wavy hairs. The forelegs are straight, and the feet small and round. The body should be square and short, and the hind-quarters high and heavy. The tail ought to be absent naturally, and puppies that are born with one should be docked when not more than 4 days old. Exercise for this breed is essential, and no dog suffers more from being kept chained up. Many

instances of the great intelligence of typical specimens of the breed are related, and they are valuable equally as stock or sport dogs or as companions and house dogs.

'Old Glory,' flag of the U.S.A., see FLAG.

Old Meldrum, burgh of Aberdeenshire, Scotland, $4\frac{1}{2}$ m. from Inverurie. On Barra Hill (634 ft.), 1 m. S., is a pre-historic fort. Pop. 1100.

Old Monkland, see MONKLAND.

Old Point Comfort, watering-place of Elizabeth City co., Virginia, U.S.A., at the N. side of the entrance to Hampton Roads (q.v.).

'Old Pretender,' see STUART, JAMES FRANCIS EDWARD.

Old Red Sandstone, name given to the succession of sandstones, shales, and thin bands of concretionary limestones which lie between the Silurian and Carboniferous rocks. These rocks were laid down on land or in isolated basins or lakes in the W. and N. of Europe. To the S. marine conditions prevailed, and marine sediments were deposited. The term Devonian is applied to these rocks, and to the period in which they and the rocks of continental origin (the O. R. S.) were deposited. The O. R. S. attains a thickness of about 20,000 ft in Scotland, and is subdivided into lower, middle, and upper groups. Enormous masses of contemporaneous felsitic, andesitic, and diabasic lavas and tufts are found in the O. R. S. of central Scotland, giving origin to the Cheviots, Pentland Hills, Sidlaws, and Ochils. The fauna of the period is remarkable for its fishes, such as *Palaeospondylus*, *Coccosteus*, *Dipterus*, and *Holoptychius*, giant arthropods and a few marsh plants (*Psilophyton*) are also found. In Norway, N. Russia, and Spitsbergen, O. R. S. rocks occur with typical fishes and plant remains, and the O. R. S. of N. America (New Brunswick) yields plant remains and occasional seams of coal.

Old Sarum, see SARUM.

Old Testament, see BIBLE.

Old Vic Theatre, opened in 1818 as the Royal Coburg; in 1833 the name was changed to the Royal Victoria Theatre in honour of the young princess. In 1879 Emma Cons, a social worker, was appointed manager of the theatre, and it was reopened as the Royal Victoria Coffee Music Hall, offering 'a purified entertainment and no intoxicating drinks.' In 1886 sufficient funds were gathered to buy the freehold of the theatre and vest it in a trust under the charity commissioners on behalf of the people of London. In 1898 Lillian Baylis, niece of Emma Cons, joined her as manager of the theatre. The first complete season of Shakespeare's plays was presented in 1914, and by 1923 the O. V. had become the first theatre in the world to present the complete cycle. In 1929 Ninette de Valois joined the theatre and laid the foundations of the Sadler's Wells Ballet; the new theatre at Sadler's Wells was opened in 1931.

Lillian Baylis d. in 1937. In 1940 the drama, opera, and ballet companies were based at the Victoria Theatre, Burnley, Lancs, and numerous tours were carried

out from there. The drama company returned to London in 1944 and was housed at the New Theatre (q.v.), as the O. V. had been damaged by enemy action. The necessary repairs were made in 1950 and the theatre was reopened in Nov. of that year. In the autumn of 1953 the management of the O. V. launched a plan to present in 5 consecutive seasons the whole of the 36 plays in the First Folio of Shakespeare. O. V. companies have visited America, Canada, Australia, New Zealand, S. Africa, Italy, Malta, Portugal, Egypt, Greece, France, Holland, Germany, the Scandinavian countries, and Finland. The O. V. is also responsible for the Theatre Royal at Bristol, where the Bristol O. V. Co. presents seasons of plays and where a school of acting is maintained. See Sybil and Russell Thorndike, *Lilian Baylis*, 1937; E. J. Dent, *A Theatre for Everybody*, 1945; Audrey Williamson, *Old Vic Drama*, 1948, 1953; Harcourt Williams, *Old Vic Saga*, 1949; R. Wood and M. Clarke, *Shakespeare at the Old Vic*, 1953-4, 1954, 1954-5, 1955, 1955-6, 1956, 1956-7, 1957.

Oldbury, tn of Wores, England, 5 m. WNW. of Birmingham, on the Birmingham canal. It has iron and steel industries, tube, chemical, aluminium, and brick and tile works. With Halesowen it forms a bor. constituency in Wores. Pop. 53,820.

Oldcastle, Sir John, also known as Lord Cobham (d. 1417), Lollard and rebel. He was a Herefordshire knight, helped to suppress Glendower's rising, and later fought for Henry IV in France. He is said to have been a friend of Prince Henry, later Henry V. In 1409 he married Joan, Lady Cobham, and was summoned to Parliament as Baron Cobham until 1413. In that year Arundel found him guilty of heresy, but O. escaped from the Tower, hiding first in London, then in the Midlands, and finally in Wales. He was declared outlawed (1414) and seems to have plotted various rebellions. He was later captured and executed. O. has been thought by some to be the original of Shakespeare's Falstaff.

Oldcastle, mrlkt tn and important archaeological centre (Slabh na Caillighe), of co. Meath, Rep. of Ireland, 26 m. NW. of An Uaimh. Pop. 650.

Oldenbarneveldt, Jan van (1547-1619), see BARNEVELDT.

Oldenburg: 1. Former grand duchy of N. Germany (after 1918 a rep.), comprising the prov. of O., around the tn of O. (see 2, below), the principality of Lübeck (N. of the state of that name), and the principality of Birkenfeld (qq.v.). The total area was 2482 sq. m., and the total pop. 582,000. O. was a constitutional ducal monarchy, hereditary in the male line. In 1180 the counts of O. and Delmenhorst (q.v.) succeeded in establishing the independence of their ters. after the downfall of Henry the Lion (q.v.). This family continued to rule O. until 1918, giving, moreover, new dynasties to Denmark, Russia, and Sweden.

2. Ger. tn in the Land of Lower Saxony, on the Hunte and the Hunte-Ems

Canal, 82 m. NW. of Hanover (q.v.). It was once the cap. of the duchy of O. It has anct walls and the former ducal palace (now a museum), and is the centre of a rich agric. region. Pop. 121,100.

Oldfield, Anne (1683-1730), commonly known as 'Nance,' actress, b. London. She made her début in 1700, and in 1704 played the part of Lady Betty Modish in Cibber's *Careless Husband*. She soon came to be recognised as one of the most brilliant actresses of the day. See E. Robins, *The Palmy Days of Nance Oldfield*, 1898.

Oldfield, Josiah (1863-1953), physician, lawyer, theologian, and fruitarian, b. Shrewsbury, educ. at Newport, Oxford, St Bartholomew's, and Lincoln's Inn. He was called to the Bar in 1892, but left legal practice to take up medicine. He qualified in 1897 and later founded the Humanitarian Hospital of St Francis, of which he was senior physician and chairman. In 1903 he took a similar post at the Lady Margaret Fruitarian Hospital. He pub. many books and pamphlets, including *Eat and Get Well*, *Eat and Keep Young*, *Healing and the Conquest of Pain*, *The Mystery of Birth*, and *The Mystery of Marriage*. He advocated the adoption of a fruitarian dietary for humane and aesthetic reasons. In 1901 O. founded the Society for the Abolition of Capital Punishment. During the First World War he raised and commanded a casualty clearing station and a field ambulance. In 1920 he was called to the Jamaican Bar.

Oldham, municipal, co., and parl. bor. of Lancs, England, 6 m. NE. of Manchester, incorporated as a bor. in 1849. The prin. buildings are the tn hall, the art gallery, museum, and public library, the new technical college for further education (opened 1954), and the art school. There are numerous parks and recreation grounds, and an excellent study centre. It is one of the chief centres of the cotton-spinning industry, and is noted for the manuf. of textile machinery; there are also a number of minor industries. O. is divided into 2 parl. constituencies (E. and W. O.), to each of which is added an adjoining urb. dist. Pop. 121,212.

Oldys, William (1696-1761), literary antiquary and miscellaneous writer, b. probably London. He became librarian to Lord Oxford, a post he retained for about 10 years, and in 1755 was appointed Norroy king of arms. Among his many works are *A Collection of Epigrams*, 1727, *Life of Sir Waller Raleigh*, 1736, and *The British Librarian*, 1737-8. He ed. the *Harleian Miscellany*, 1744-6, and compiled the *Catalogue of the Harley Library*, 1743-5. He also wrote sev. lives in the *Biographia Britannica* and *General Dictionary*. See memoir by J. Yeowell, 1862, reprinted from *Notes and Queries*.

Olea Europaea, see OLIVE.

Oleaceae, family of dicotyledonous trees and shrubs of which *Abelophyllum*, *Chionanthus*, *Forsythia*, *Fraxinus*, *Jasminum*, *Ligustrum*, *Olea*, *Osmanthus*, *Osmarea*, *Phillyria*, and *Syringa* are genera.

Olean, tn of Cattaraugus co., New York, U.S.A., on Allegheny R., 60 m. SSE. of Buffalo, rich in oil and natural gas. It manufs. chemicals, clothing, machinery, metal and wood products, dairy products, feed, tiles, glass, and cutlery; there are also printing works. Pop. 22,880.

Oleander (*Nerium oleander*), or **Rose Bay**, handsome evergreen shrub belonging to the family Apocynaceae, with fragrant flowers, rather like carnations, of various shades of pink, red, and white; one of the most easily grown greenhouse plants. Its large, willow-like leaves when bruised have a powerful and disagreeable odour, and are poisonous to human beings and animals. The physiological effects are similar to those of digitalis. The O. was known to the Greeks as *rhododendron*, *nerion*, or *rhododaphne*. See Pliny, xvi. 20.

Oleandra, family Polypodiaceae, genus of evergreen tropical ferns, with creeping shoots, jointed stems, and entire, lanceolate or strap-shaped fronds. They are grown in the stovehouse in hanging baskets or on pillars and walls in a layer of sphagnum or peaty soil held in place by a wire netting. They need abundance of water from Mar. to Sept., and a temp. of about 70°. The rest of the year a temp. of 60° and moderate watering are sufficient.

Olearia, genus of Australasian evergreen flowering shrubs, bearing in summer a profusion of daisy-like flowers as well as ornamental foliage. *O. haastii* is the New Zealand daisy bush, and is often grown on sunny borders and rockeries, especially near the sea. *O. erubescens*, *O. insignis*, *O. gunniana*, *O. moschata*, and *O. semidentata* are garden-worthy shrubs for mild dists.

Oleaster, see ELAEAGNUS.

Olefant Gas, see ETHYLENE.

Olefine, in chem., a hydrocarbon of the ethylene series, having the general formula C_nH_{2n} . The simplest O. is ethylene (q.v.) itself, C_2H_4 .

Oleic Acid (9-octadecenoic). $CH_3(CH_2)_7CH:CH(CH_2)_7COOH$, unsaturated fatty acid with one double bond, occurs in combination with glycerine as olein in virtually all fats and glyceride oils. It is a major component in most liquid vegetable oils and the prin. acid in palm oil, ground-nut oil, olive oil, sesame oil, and sunflower oil (q.v.). Chemically pure O. A. is a tasteless, odourless liquid at ordinary temps, and does not absorb oxygen when exposed to the air. Commercial O. A. contains varying amounts of other fatty acids and becomes rancid when exposed to air and light. It has a light straw to deep red or reddish brown colour, depending upon the degree of purity, and is sometimes described as 'Red Oil.' O. A. is prepared chiefly from split and distilled animal fatty acids by expression in hydraulic presses, or fractional crystallisation at low temp. from a solvent. Sometimes the polyunsaturated acids are polymerised, e.g. 'dimersed,' and only the unaffected oleic-rich monomer, removed by distillation, is fractionally crystallised to produce O. A. of high purity. Prin. manuf. products in

which O. A. and its derivatives are used are: liquid and dry cleaning soaps, textile soaps, synthetic detergents, shampoos, cosmetics, liquid waxes and polishes, synthetic rubber (latex), protective coatings, lubricants, insecticides, printing inks, and foods. See FATTY ACIDS.

Oleograph, name given to a picture done in oil colours by a chromo-lithographic process, the print being mounted on canvas and varnished to imitate an original oil painting.

Oleomargarine, see MARGARINE.

Oleosa, see MALLER.

Oléron, Île d', is. of the Atlantic Ocean, off the SW. coast of France, and part of the dept. of Charente-Maritime. Its maximum length is 18 m., breadth 7 m., and it covers an area of 66 sq. m. The surface is generally fertile, and it produces corn and wine. The prin. tns are St-Pierre and Le Château-d'Oléron. Pop. 14,000.

Oléron, Judgments of, code of maritime laws in use in W. Europe during the Middle Ages. It is said to have been originated by Eleanor of Guienne, wife of Henry II of England, towards the middle of the 12th cent., at O., part of the duchy of Aquitaine, which came into the possession of the Fr. Crown in 1370, and to have been introduced into England in the reign of Richard I, with some amendments and additions. See SEA LAWS.

Olfactory Nerve, see NERVOUS SYSTEM, *Cranial Nerves and Nose*.

Olga, St (c. 879-969), wife of Igor, Prince of Kiev. On his death in 945 she ruled as regent for her son Sviatoslav. In 958 she was baptised at Constantinople, and was after her death canonised in the Gk Orthodox Church, her commemoration day being 11 July. She made great but unsuccessful efforts to introduce Christianity into Russia, a task achieved by St Vladimir, her grandson.

Olhão, tn of Portugal, in Faro dist., on the Atlantic coast, 5 m. E. of Faro (q.v.). It has noted sardine fisheries and canneries, and salt works. Pop. 14,500.

Oliaros, see ANTIPAROS.

Olibanum (Gk *libanos*, frankincense), gum-resin yielded by various species of the genus *Boswellia*, found in Somaliland.

Oligarchy (Gk *oligarchia*), 'the government of the few,' the constitution amongst the anc. Greeks where a portion of the community were in possession of power, e.g. the govts. of Thebes, Megara, and Corinth. In anc. times, although it was acknowledged that an 'aristocracy' often developed into an O., the 2 were distinguished, 'O.' signifying the gov. of the wealthy, who were looked upon as directing their efforts towards their own aggrandisement and the maintenance of their own power and privileges, while 'aristocracy' meant the rule of the best people for the public good. See ARISTOCRACY.

Oligocene System, geological strata laid down in an epoch which elapsed between Eocene and Miocene time. In Britain the O. formations are only met with in the Hants basin, where they consist of thin-bedded sandstones, clays, marls, and

limestones, known collectively as a fluviomarine series. They are subdivided into the Headdon, Osborne, Bembridge, and Hamstead beds. The subdivs., lower, middle, and upper, of the O. in France, Belgium, Switzerland, and N. Italy, have been named after places of typical development, as Tongrian (from Tongres), Stampian (after Etampes), and Aquitanian (Aquitania) respectively. In the Paris basin the system is represented by lacustrine marls with the gypsum of Montmartre forming the lower O., followed by lacustrine and marine marls. The highest beds are the sandstones of Fontainebleau and the fresh-water limestones of Orleans (Beauce). The Ger. O. are remarkable for their deposits of lignite and brown coal. In N. America the Vicksburg beds (orbitolitic) occurring in Alabama and Florida, the White River beds of S. Dakota, and the Iled Bluff of the Mississippi dist., are of O. age.

Oliphant, Laurence (1829-88), Brit. journalist and travel writer, b. Cape Town. He studied law and was called to the Bar, but spent the first 38 years of his life in desultory study and travels which embraced America, China, and Japan. He was in the Crimean War and the Indian Mutiny, and served as private secretary to Lord Elgin when he was Governor-General of Canada. In 1865 he was elected M.P. for Stirling Burghs and in 1870 he was correspondent for *The Times* in the Franco-Ger. war. A voluminous and versatile writer, he pub. many books, including *Journey to Khatmandu*, 1852, *The Russian Shores of the Black Sea*, 1853, *Minnesota and the Far West*, 1855, *Patriots and Filibusters*, 1860, and *Piccadilly: a Fragment of a Contemporary Biography*, 1870. *Altiara Peto*, 1883, is a novel, *Episodes in a Life of Adventure*, 1887, is autobiographical, and *Scientific Religion*, 1888, embodies mystical views which he later adopted. His life was written by his cousin Margaret O. (q.v.). See also L. F. Loesching, *Personal Reminiscences of Laurence Oliphant*, 1891, and H. W. Schneider and G. Lawton, *A Prophet and a Pilgrim*, 1942.

Oliphant, Marcus Laurence Elwin (1901-), Australian physicist, b. Adelaide, educ. Adelaide Univ. and Trinity College, Cambridge. O. was appointed Messel research fellow of the Royal Society, 1931; fellow and lecturer, St John's College, Cambridge, 1934; assistant director of research, Cavendish Laboratory, Cambridge, 1935; prof. of physics, univ. of Birmingham, 1937-50; and since 1950 director of the research school of physical sciences at the Australian National Univ. His work in nuclear physics, and particularly his contribution to the development of atomic energy, is of outstanding importance in the hist. of science. O. has pub. papers on electricity in gases, surface properties, and nuclear physics.

Oliphant, Margaret, née Wilson (1828-1897), authoress, b. Wallyford, near Musselburgh. She produced her first novel, *Passages in the Life of Mrs Margaret Maikland*, in 1849, following this with *Caleb Field and Merikland* in 1851.

The last named met with such great success that on coming to London in 1852 she was invited to write for *Blackwood's Magazine*, contributing from that date until her death over 200 stories and articles. She wrote *Katie Stewart*, 1853, *Quiet Heart*, 1854, *Zaidee*, 1856, and *The Athelings*, 1857. Previous to this, she had, in 1852, married her cousin, Frank Wilson O., who was an artist in stained glass. She wrote in all about 100 books, the best known of which are the novels *Memoirs and Resolutions of Adam Graeme of Mossgray*, 1852, *Miss Marjoribanks*, 1866, *White Ladies*, 1875, *Effie Ogilvie*, 1886, and *The Marriage of Elinor*, 1892; also her biographies of R. B. Sheridan, 1883, Edward Irving, 1886, and Laurence O., 1891. See A. J. Coghill, *The Autobiography and Letters of Mrs Oliphant*, 1899, and Lady Anne Ritchie, *From the Porch*, 1913.

Olisipo, see LISBON.

Oliva, Sp. tn in the prov. of Valencia, near the Mediterranean coast. It has an auct. palace, and manufs. linen. Pop. 12,500.

Olivarez, Gaspar de Guzman, Count of (1587-1645), Sp. statesman, b. Rome. He became grand chamberlain to Philip IV, and from 1621 to 1642 was the real ruler of Spain. His foreign policy involved Spain in a series of disastrous wars, while at home his fiscal policy resulted in crushing taxation. O. was overthrown and exiled in 1642.

Olive (*Olea europaea*), slow-growing tree, with undivided leaves and axillary clusters of green flowers followed by pendulous, lustrous, blue-black oily fruits. While green and unripe, the fruits are bottled or pickled in brine. O. oil is extracted by pressure from ripe fruit. The tree has been cultivated since a remote period, especially on the borders of the Mediterranean Sea, and the cultivated forms exhibit great improvement in the size and oiliness of the fruits compared with the tree in its wild state. The wood is soft, but takes a high polish, and is used for making small, fancy articles.

Olive Branch Petition, final effort made by the Amer. colonists in 1775 to conciliate the Eng. Gov., after the outbreak of hostilities in the War of Amer. Independence. The petition was not allowed to be presented, and the only answer given to the appeal was a large increase of land and sea forces and a declaration in Parliament to take stern measures against the 'conspirators and insurgents' in America.

Olive Oil, fixed oil expressed from the fruit of the olive-tree, *Olea europaea*, of the natural order Oleaceae. The olive-tree has been cultivated from the earliest times in Greece, Italy, S. Spain, Asia Minor, and other Mediterranean countries, and has been introduced into Mexico, Chile, Peru, the S. states of America, Australia, China, S. Africa, etc., though the chief supply of the oil still comes from the Mediterranean coasts. The fruit is pressed to a pasty consistency, enclosed in woollen bags, and subjected to considerable pressure. This yields oil of the first quality; second and third grades are

yielded by subsequent pressings. O. O. is considered to be the finest of the edible oils and, in contrast to other vegetable oils, it is generally consumed as a food without refining or further processing. It is also used in the manuf. of cosmetics, pomades, 'castile' and other kinds of soaps, and in the combing process of the textile industry. Main fatty acids are—saturated: Palmitic (9–20 per cent); unsaturated: Oleic (64–85 per cent).

Oliveira Martins, Joaquim Pedro de (1845–94), Portuguese historian, b. Lisbon. Elected to Parliament in 1886, he held a succession of posts in the gov., including that of finance minister in the crisis of 1892, but resigned in the same year. His

his works are the portraits of James I and his family, Sir Philip Sidney, and the family of Sir Kenelm Digby.

Oliver, Peter (1594–1648), miniature painter, worked like his father Isaac O. (q.v.) in the style of Nicolas Hilliard. One of his celebrated miniatures is 'The Entombment,' begun by his father. He made copies in water-colour of old masters, some of which are at Windsor Castle. There are many fine portrait miniatures by him in private collections.

Olives, Mount of, called also **Mt Olivet**, is only once mentioned by this name in the O.T. (Zech. xlv. 4), though it is elsewhere spoken of under other titles. The Arabic name is *Jebel al-Tur*. It is situated to the

THE MOUNT OF OLIVES

many works include *Historia da Civilização Iberica* (trans. *A History of Iberian Civilisation*), 1879, *Historia de Portugal*, 1879, *O Brazil e as Colonias portuguezas*, 1880, *Historia de Republica Romana*, 1885, and *Os filhos de João I* (trans. *The Golden Age of Prince Henry the Navigator*), 1891.

Olivenite, olive-green coloured hydrous arsenate of copper with phosphorus. It occurs in orthorhombic prisms, but is also found fibrous and globular or earthy (h. = 3, sp. gr. = 4.4). Crystalline O. is found in Cornwall and Devon, and at Alston Moor in Cumberland. It has a vitreous lustre and breaks with a conchoidal fracture. The fibrous variety is also called wood-copper or wood-arsenate.

Oliver, see **ROLAND**.

Oliver, George, see **ONIONS**. **GEORGE O. Oliver, Isaac** (c. 1556–1617), miniature painter, probably b. in England, and, though of Fr. origin, regarded by his contemporaries as an Englishman. He painted many portraits, and was exceedingly expert in his miniatures. Among

E. of Jerusalem, from which it is separated by the valley of the Kidron or valley of Jehoshaphat. The name is frequently applied to the range of hills of which it is one. To its N. is the Scopus, the site of the encampment of the Romans under Titus. The 'Prophets' is a hill to the S. of Olivet proper, and the outlying spur of the range to the S. is known as the Mt of Offence. The M. of O. is connected intimately with the life of Jesus, for on the W. slope lay the Garden of Gethsemane. The M. of O. is 2680 ft above sea level, and on its summit are many churches and convents, the most ancient being the small octagonal church of the Ascension (5th cent.). Others are the Orthodox convent of Galilee; a modern Russian convent with a conspicuous view-tower; and the church of the Paternoster, this last being a Ger. Protestant hospice built by William II in 1910, and used as the gov. house by the Palestine administration up to 1927, when an earthquake rendered it uninhabitable. The Heb. Univ. was inaugurated here in 1925. Scopus is

controlled by Israel, but the univ. buildings have been disused since 1948. The rest of the range forms part of Jordan.

Olivier, Sir Laurence Kerr (1907-), actor, producer, and manager, *b.* Dorking, son of the Rev. G. K. O. He was educ. at St Edward's School, Oxford. First appeared on the public stage as Katherine in *The Taming of the Shrew* in a special boys' performance at the 1922 Stratford Shakespeare Festival. In the next 7 years he toured plays and sketches with Ruby Miller and Lena

Karsh, Ottawa

SIR LAURENCE OLIVIER

Ashwell, and spent 3 years in the Birmingham Repertory Co. His performance for the Stage Society as Stanhope in *Journey's End* heralded his long line of professional leading parts, the most celebrated of which have been Hamlet (Old Vic, 1937), Romeo (1939), Richard III (1948), and Macbeth and Titus (Stratford, 1955). Modern plays include *Venus Observed*, *The Sleeping Prince*, and *The Entertainer*. He has played in America, toured the Continent (1945), and Australia (1948). He has acted in many films (*Wuthering Heights*, *Pride and Prejudice*, etc.) and also produced and directed the film versions of *Henry V*, *Hamlet*, and *Richard III*, in which he played the leading parts. In 1930 he married Jill Esmond, who obtained a divorce in 1940; his second wife, Vivien Leigh (q.v.), played Juliet to his Romeo in his 1939

production. During the Second World War he was a lieutenant in the Fleet Air Arm, but was released in 1944 to co-direct the Old Vic Theatre Co. (q.v.). He was knighted in 1947.

Olivier of Ramsden, Sydney Haldane Olivier, 1st Baron (1859-1943), statesman, colonial administrator, and writer; educ. at Lausanne, Tonbridge school, and Corpus Christi College, Oxford. He entered the Colonial Office in 1882, and thereafter held a succession of important posts: secretary to the W. India Royal Commission, 1897; colonial secretary, Jamaica, 1899-1904; governor of Jamaica, 1907-13; permanent secretary of the Board of Agriculture, 1913-17. He was created baron in 1924. He took office as secretary of state for India, 1924, under the first Labour gov. O. was secretary of the Fabian Society from 1886 to 1890, and held what were then considered advanced views, especially on colonial policy. Among his publs. were *White Capital and Coloured Labour*, 1906, *The Anatomy of African Misery*, 1927, *The Myth of Governor Eyre*, 1933, and *Jamaica, the Blessed Isle*, 1936, a standard work. See *Sydney Olivier: Letters and Selected Writings*, with a memoir by Margaret O., 1948.

Olivine, see CHRYSLITE and IGNEOUS ROCKS.

Oliwa, vil. of Poland, in Gdańsk prov., 5 m. NW. of Gdańsk (q.v.). It has a cathedral of the Bishop of Gdańsk. At the Peace of O. in 1660 the rights of the kings of Poland in Sweden and Prussia were regulated.

Olla Podrida (literally 'putrid pot'), so called from its miscellaneous contents, is a stew made of meat, fish, poultry, vegetables, and other ingredients, very common in Spain. It is cooked in a closed pot, and is always very highly seasoned with pepper and garlic. Compare the Fr. *pot pourri* and the Scottish hotch-potch.

Ollenhauer, Erich (1901-). Ger. politician, educ. at elementary and commercial schools. He became an active Socialist at the age of 15, joining the Social Democrats (S.P.D.) in 1918. He went to Czechoslovakia and conducted anti-Nazi propaganda from there, being deprived of Ger. citizenship in 1935. He took refuge in France (1938-41) and Britain (1941-6). After the Second World War he returned to Germany, and succeeded Schumacher (q.v.) as chairman of the Social Democrats in 1952, carrying on Schumacher's anti-Ger. rearmament policy.

Olmütz, see OLOMOUC.

Olmütz, Convention of, Austro-Prussian agreement of 1850, by which, after the upheavals of 1848-9, the influence of Austria in Germany was revived, at the expense of Prussia. To the latter the convention was known as 'the humiliation of O.'

Olney, Richard (1835-1917), Amer. statesman and lawyer, *b.* Oxford, Massachusetts. In 1893 he was attorney-general of the U.S.A. In 1895 he became secretary of state in President Cleveland's Cabinet. He drafted the famous message

of 1895, insisting that Great Britain must submit to arbitration the long-standing boundary dispute between Venezuela and Brit. Guiana. O. retired in 1897.

Olney, tn of Bucks, England, on the Ouse, 59 m. from London. Wm Cowper, the poet, was a resident from 1767 to 1786, and the house he lived in, containing various relics, is still extant. A famous pancake race for women, begun in 1445, is held at O. annually on Shrove Tuesday. Pop. 2700.

Olomouc: 1. Region (*kraj*) in N. central Czechoslovakia, part of the former prov. of Moravia (q.v.) and including some dists. of Silesia (q.v.). It is watered by the Morava (q.v.), and contains part of the Sudetic Mts (q.v.). Area 2395 sq. m.; pop. 585,000.

2. (Ger. *Olmutz*) Czechoslovak tn. cap. of the region of O., on the Morava. Until 1640 it was the cap. of Moravia. It is a picturesque tn, is the seat of an archbishop, and has many fine buildings, including a Gothic cathedral and a 16th-cent. tn hall. It has a univ. (1576) with a notable library. There are iron, steel, engineering, and textile industries. Pop. 58,700.

Olonos, see *ERYMANTHUS*.

Oloron (-*Sainte-Marie*), Fr. tn. cap. of an arron., in the dept of Basses-Pyrénées, at the confluence of the Aspe and the Ossau. The former cathedral of Ste-Marie is partly 12th cent. There are textile and leather industries. Pop. 10,600.

Olsen, Björn M. (1850-1919), Icelandic scholar who wrote extensively on Old Icelandic literature. See P. E. Ólasen, *Íslenskar æfiskrár*, and H. Hermannsson's *Catalogues of the Fiske Icelandic Collection*.

Olztyń: 1. Prov. (*województwo*) of NE. Poland, bordering in the N. on the U.S.S.R., and in the NW. on the Baltic Sea. It is generally low-lying, is well wooded, and has numerous lakes, particularly in the E. (the Masurian Lakes). Until 1945 it was part of E. Prussia (q.v.). Livestock is raised, and cereals and potatoes are grown. The fishing and timber industries are important. Area 8105 sq. m.; pop. 500,000. See *MASURIA*.

2. (Ger. *Allenstein*). City of Poland, cap. of O. prov., on the Lyna, 105 m. N. by W. of Warsaw (q.v.). It was founded in 1348 by the Teutonic Knights (q.v.). It went to Poland in 1466, and to Prussia in 1772. It was retained by Germany after plebiscite in 1920. After the Second World War the Ger. pop. left. It is the seat of a bishop, is a health resort and mkt tn, and has a power station. Pop. 33,000.

Olsen, tn of Switzerland, in the canton of Solothurn, on the R. Aar. It is a railway junction, with workshops, and has manufs. of iron, wire, linen, cotton, and shoes. It is the centre of book-trade supply for the publishers of Switzerland. Pop. (1957) 18,600.

Oltenița, tn of Rumania, 35 m. SE. of Bucharest, on the l. b. of the Danube, at the confluence of the Argeș. It is a riv. port. Pop. (1930) 10,400.

Oltis, see *LOT*.

Oltis Missoo, see *BIWA LAKE*.

Oltul, see *ALUTA*.

Olympia: 1. Name given to a plain which contained the temple and sacred grove of Zeus Olympius, situated in the Peloponnesian dist. Pisatis, belonging to the Eleans, at the confluence of the Cladeus and the Alpheus. It was of great importance from very early times. Besides the temple of Zeus Olympius, there were sev. sacred edifices and other public buildings in the sacred grove and its immediate neighbourhood. The grove itself (called *Altis*), which is described by Pindar as being well wooded, was bounded on the W. by the Cladeus, on the S. by the Alpheus, and on the E. by the Stadium. In the centre was a grove of planes, and the whole Altis was surrounded by a wall (said to be the work of Heracles) in which were sev. gates; the most important being the Pompe Entrance in the middle of the W. side, through which all the processions passed. To the right of this entrance stood the Olympieum, or temple of Zeus Olympius, a magnificent building, designed by the architect Libon of Elis, and second only to the Parthenon. The temple contained the 'Callistephanus,' or wild olive tree, which furnished the garlands of the Olympic victors. In front of the Heraeum and Pelopium, and equidistant from both, was the Great Altar of Zeus (22 ft high), and between the altar and the temple of Zeus stood the Column of Oenomaus. Besides those already mentioned there were the stadium and the hippodrome. These two formed the place of exhibition for all the Olympic contests, and probably formed a continuous area from the circular end of the stadium to the further extremity of the hippodrome. The stadium, which was about 210 yds long, was used chiefly for foot races, and had 2 entrances, the Pompe and the Secret. the latter being only used by the Hellenodici or judges, while the hippodrome was used for chariot races and horse races. See E. N. Gardiner, *Olympia, its History and Remains*, 1925.

2. City, cap. of the state of Washington. U.S.A., on Budds Inlet about 50 m. from Seattle. It is a seaport and port of entry, and the seat of St Martin's College. It contains the capitol, a magnificent edifice built in native sandstone, in which is the state library. The chief industry is lumbering, but fishing and mining are also carried on, and the manuf. of metal products, farm machinery, and canning equipment. Water power is supplied from the Deschutes R. Pop. 15,819.

Olympia, glass-domed exhibition hall in the dist. of W. Kensington, bor. of Hammersmith, London. It was opened in 1886 and enlarged in 1923 and 1929. The exhibitions and trade shows regularly held here are the Christmas circus and fair, Cruft's Dog Show, the Ideal Home Exhibition, British Industries Fair, and the Dairy Show.

Olympiad, period of 4 years between each celebration of the Olympic Games. 776 BC was reputed to be the first year of the first O. O.s began to be reckoned

from the victory of Coroebus (776 BC), the first victor in the games after their suspension for 86 years; but Timaeus of Sicily, who fl. 264 BC, was the first writer who regularly arranged events according to the conquerors in each O. His practice was followed by Polybius, Diodorus Siculus, Dionysius of Halicarnassus, and others; but the last O. ended AD 394, for the Olympic Games were abolished in that year during the reign of Theodosius the Great. For converting O.s into years BC, multiply the number of O.s that have actually elapsed by 4, and deduct the number thus obtained from 780. For converting O.s into years AD, go through the same process as before, but subtract 780 from the number obtained by multiplication. But seeing that the Olympic Games (q.v.) were celebrated about midsummer, and that the Attic year began at about the same time, it is necessary to reduce the year BC by one if an event happened in the second half of the year. The method of calculation by O.s was, however, only used for literary purposes, and never adopted in everyday life.

Olympias (d. 316 BC), wife of Philip II of Macedonia, and the mother of Alexander the Great, was the daughter of Neoptolemus I, King of Epirus. Philip, on account of disagreements, separated from her and married Cleopatra. She left him to live with her brother Alexander, King of Epirus, whence she contrived the death of her husband. She returned to Macedonia on the accession of her son Alexander; but during his absence she caused great trouble to the regent Antipater, and on the death of her son in 323 BC was forced to retire again to Epirus. Here she remained until 317, when she became for a short time mistress of Macedonia; but she was forced to surrender eventually to Cassander, Antipater's son, and being condemned without a hearing, was put to death in 316 BC. See G. A. Macurdy, *Hellenistic Queens*, 1932.

Olympic Games. *The Ancient Greek Games.* The O. (or Olympian) G., the chief national festival of the Greeks, were held once every 4 years, and were celebrated in honour of Zeus. They occupied 5 days, and consisted of 2 parts: the presentation of offerings and the contests. At first the contest consisted of a simple running match held in the stadium, but about 724 BC the *diaulos*, or double course, was introduced, in which the runners had to make a circuit of the goal and return to the starting-point. Later came the *dolichos*, or long race, and in 708 BC the *pentathlon* was introduced, a five-fold contest, consisting of leaping, running, throwing the quoit, wrestling, and throwing the javelin. Wrestling and boxing, too, were combined in the *pankration* (648). In 680 chariot racing in the hippodrome was introduced, and though this was twice as long as the stadium, it had to be traversed about 10 times in both directions (at first with 4 horses, after 500 with mules, and after 408 with 2 horses). There were also races in armour, and those in which the horsemen had to

leap from their horses and run beside them with the bridles in their hands, besides competitions between heralds and trumpeters. The contests were open to all freemen of pure Hellenic descent who had not incurred any personal disgrace, but all barbarians and slaves were excluded. (The Romans, not being reckoned barbarians, were allowed to take part.) Women, too, were excluded, and were not even allowed to watch the games, there being but one exception, the priestess of Demeter. The supervision of the contests was in the hands of the Hellenodici, who were appointed by popular election from the Eleans themselves. At the end of the contests a sacrifice was made by the victors wearing their crowns, and a banquet was held in the Prytaneum of the Altis, during which a song of victory, composed by an eminent poet, was chanted by choral bands. Authors, poets, orators, and artists also used the opportunity afforded by the assembling of so vast a crowd to make themselves known by the recital and exhibition of their works.

The Modern Olympic Games. The revival of the O. G. was due to the energy and persistence of the Frenchman, the Baron Pierre de Coubertin, who, with the support of C. Herbert of the Eng. Amateur Athletic Association and W. M. Sloane of the Amer. Athletic Union, initiated an international congress at which France, Great Britain, U.S.A., Sweden, Italy, Spain, Greece, Russia, and Belgium were represented. The congress met at the Sorbonne in June 1894, and the International O. G. Committee was appointed with Baron de Coubertin as president. The first modern Olympiad was held at Athens in 1896, and it was decided to hold the games every 4 years in parts of the world to be chosen by the Olympic Committee, but, to satisfy Gk sentiment, an intermediate minor Olympic was held at Athens in 1906. The second Olympiad was celebrated at Paris in 1900, but the games did not yet create a world-wide interest. The third Olympiad (1904) at St Louis, U.S.A., was, like its predecessors, distinguished by Amer. successes, but several nations, including Great Britain, were unable to send teams. The first well-represented Olympiad was the fourth Olympiad, held at London in 1908. In this Olympiad weight-lifting, polo, lawn-tennis (omitted after 1924), and Association football (omitted after 1928) were introduced. Cycling, rowing, gymnastics, and wrestling, omitted since 1896, were revived. Rugby football was also included, but dropped in 1928. Swimming and hockey are two other popular events, nor must the literary, artistic, and musical competitions be forgotten. The fifth Olympiad was held at Stockholm in 1912, but the sixth Olympiad, to be held at Berlin, did not take place owing to the First World War. The seventh Olympiad was held at Antwerp and the eighth at Paris, where the Finn, Nurmi, distinguished himself. The ninth Olympiad at Amsterdam in 1928 saw the return of a Ger. team, excluded since the First World War, and also the introduction of athletic

events for women. Britain and the dominions had their most successful post-war team, while America again dominated in the field events. Nine Olympic records were made in 1928. The tenth was held at Los Angeles in 1932, and the eleventh at Berlin in 1936. This latter was used as a propaganda display for the National-Socialist regime, and there were expressions of racial prejudice when Negroes won some of the events. The twelfth and thirteenth Olympiads did not take place

10,000 metres, and marathon within 8 days. In Melbourne B. Morrow (U.S.A.), V. Kuts (U.S.S.R.), and Betty Cuthbert (Australia) all won 2 individual track titles. Following the example of previous O. G. there was a spate of new athletic records at Melbourne. In the men's events 18 out of 24 were improved upon, and all 9 were either equalled or beaten in the women's competitions. Australia proved the new leaders in swimming by winning 8 titles. Although the U.S.A.

Sport and General

THE OLYMPIC GAMES, MELBOURNE, 1956

The 5000 metres final, showing the winner, V. Kutz (Russia) leading from G. Pirie (G.B.), who was second, and A. Thomas (Australia), who came fifth.

owing to the Second World War and the next was staged in London in 1948. By this time the 17 sports were stabilised as: athletics, modern pentathlon, basketball, boxing, canoeing, cycling, fencing, gymnastics, field hockey, rowing, swimming, shooting, weight-lifting, wrestling, equestrianism, football, and yachting. Helsinki staged the fifteenth Olympiad in 1952, and the sixteenth, in 1956, was held in the S. hemisphere at Melbourne for the first time. Owing to Australian quarantine laws the equestrian events could not be held in Melbourne, and so were staged at Stockholm; the Winter O. G. were held in 1956 at Cortina.

At Helsinki the U.S.S.R. entered the O. G. for the first time in hist. The most distinguished competitor was E. Zatopek, Czechoslovakia, who won the 5000 metres,

lost ground in swimming, Americans dominated the men's athletics more than at any time in Olympic hist., winning 15 events. At Helsinki Britain's Olympic successes were confined to 1 gold medal in the equestrian events, but in 1956 Brit. competitors won 6 gold medals in the following sports: equestrian, athletics, swimming, fencing, and boxing (2).

The Olympic athletic records following the 1956 O. G. at Melbourne were as follows:

MEN: 100 metres, 10.3 sec., E. Tolian, 1932; J. C. Owens, 1936; H. W. Dillard, 1948; I. Murchinson, B. J. Morrow, 1956 (all U.S.A.). 200 metres, 20.6 sec., B. J. Morrow (U.S.A.), 1956. 400 metres, 45.9 sec., V. G. Rhoden (Jamaica), H. H. McKenley (Jamaica), 1952. 800 metres, 1 min. 47.7 sec., T. W. Courtney

(U.S.A.), 1956. 1500 metres, 3 min. 41.2 sec., R. Delany (Ireland), 1956. 5000 metres, 13 min. 39.6 sec., V. Kuts (U.S.S.R.), 1956. 10,000 metres, 28 min. 45.6 sec., V. Kuts (U.S.S.R.), 1956. Marathon, 2hrs 23 min. 03.2 sec., E. Zatopek (Czechoslovakia), 1952. 4 x 100 metres relay, 39.5 sec., U.S.A., 1956. 4 x 400 metres relay, 3 min. 3.9 sec., Jamaica, 1952. 20 kilometres walk, 1 hr 31 min. 27.4 sec., L. Spirin (U.S.S.R.), 1956. 50 kilometres walk, 4 hrs 28 min 07.8 sec., G. Dordoni (Italy), 1952. 110 metres hurdles, 13.5 sec., L. Q. Calhoun (U.S.A.), J. W. Davis (U.S.A.), 1956. 400 metres hurdles, 50.1 sec., G. A. Davis (U.S.A.), E. Southern (U.S.A.), 1956. 3000 metres steeplechase, 8 min 41.2 sec., C. Brasher (Great Britain), 1956. High jump, 6ft 11 in., C. W. Dumas (U.S.A.), 1956. Pole vault, 14 ft 11 in., R. E. Richards (U.S.A.), 1956. Long jump, 26 ft 5 in., J. C. Owens (U.S.A.), 1936. Hop, step and jump, 53 ft 7 in., A. F. da Silva (Brazil), 1956. Shot putt, 60 ft 11 in., W. P. O'Brien (U.S.A.), 1956. Discus, 184 ft 10 in., A. Oerter (U.S.A.), 1956. Hammer, 207 ft 3 in., H. Connolly (U.S.A.), 1956. Javelin, 281 ft 2 in., E. Danielsen (Norway), 1956. Decathlon, 7937 points, M. Campbell (U.S.A.), 1956.

WOMEN: 100 metres, 11 sec., B. Cuthbert (Australia), 1956. 200 metres, 23.4 sec., M. Jackson (Australia), 1952; B. Cuthbert (Australia), 1956. 4 x 100 metres relay, 44.5 sec. (Australia), 1956. 80 metres hurdles, 10.7 sec., S. B. Strickland de la Hunt (Australia), 1956. High jump, 5 ft 9 in., M. McDaniel (U.S.A.), 1956. Long jump, 20 ft 9 in., E. Krzesinska (Poland), 1956. Shot putt, 54 ft 5 in., T. A. Tishkevich (U.S.S.R.), 1956. Discus, 176 ft 1 in., O. Fikotova (Czechoslovakia), 1956. Javelin, 176 ft 8 in., I. Yaunzeme (U.S.S.R.), 1956.

The seventeenth Olympiad is due to take place at Rome in 1960.

The Games are controlled by the International Olympic Committee, on which more than 70 nations are represented. The equipping of each team is the work of the national committee, i.e. in Great Britain of the Brit. Olympic Association. See also **ATHLETICS**. See F. A. M. Webster, *The Evolution of Olympic Games*, 1914, and *Olympic Cavalcade*, 1948, and H. Abrahams, *The Olympic Games Book*, 1956.

Olympiodorus, name of 2 philosophers of the Neoplatonic school, natives of Alexandria. O. the elder (5th cent. AD) was teacher of Proclus. Of the writings of O. the younger (6th cent. AD) are extant a life of Plato, an attack on Strabo, and scholia on the *Phaedo*, *Alcibiades I*, *Philebus*, and *Gorgias*.

Olympus, anct name of sev. chains of mts. The most famous (now called Elymbo) was on the frontiers of Thessaly and Macedonia. Its highest peak is 9754 ft, and is snow-capped for 9 months of the year. O. was regarded by the Greeks as the abode of the gods, and as having the palace of Zeus at its summit.

Olynthus, anct tn of Chalcidice, and

the most important of the Gk cities on the coast of Macedonia. It was at the head of a confederacy of all the Gk tns in its neighbourhood, and maintained its independence, except for a short interval when it was subject to Sparta, till it was taken and destroyed by Philip (347 BC). The Olynthiac orations of Demosthenes urged the Athenians to send assistance to the city when it was attacked by Philip.

Omacatl, Aztec god of joy and festivity (the name signifies 'two reed'). He was worshipped only by those who came under his direct influence, i.e. the rich who could render homage to him in splendid banquets. The idea of communion which appears to have instigated the religious feasts of the Mexicans was apparently present in these banquets to the Mexican Bacchus. O. is one of the manifestations of the Gk deity Tezcatlipoca.

Omagh, mrkt tn and cap. of co. Tyrone, N. Ireland, on the Strule, situated among the foothills of the Sperrin Mts. Its castle (now in ruins) was besieged in 1509 and 1641. The chief buildings are the twin-spired Catholic church, the Church of Ireland, and the Courthouse. Industries include corn-milling, milk-processing, and shirt manuf. Pop. 6800.

Omaha, co. seat of Douglas co., and chief commercial city of the state of Nebraska, U.S.A., is on the r. b. of the Missouri R., 20 m. N. of the mouth of the Nebraska R. The city is well built on the sloping banks of the riv., and has many fine edifices. It is an important shipping, transportation, and industrial centre, served by railroads, transcontinental airlines, and bus lines. It is a port of entry. Industries include oil refining, lead smelting, and meat packing, and the manuf. of farm implements, mechanical appliances, paint, boxes, beverages, flour, and cereal and dairy products. The municipal airport and Offcut Air Force Base are here. Educational institutions include Creighton Univ., univ. of Nebraska College of Medicine, O. Municipal Univ., Duchesne College, College of St Mary, the Grace Bible Institute, and the state school for the deaf. Pop. 251,117.

Omaha Beach, ood name of the stretch of beach from the Vire R. to Port-en-Bessin, where the U.S. 5th Corps landed on D-Day 1944, in the Second World War.

Omahas, tribe of N. Amer. Indians, now living chiefly in E. Nebraska and numbering about 1800. They are of Sioux stock.

Oman, Carola Mary Anima (1897-), biographer and novelist, b. Oxford, daughter of Sir Charles O. (q.v.). During the First World War she was a nurse in France, and in 1922 she married Sir Gerald Lenanton. She is best known for her historical biographies, especially *Nelson*, 1947, which won the *Sunday Times* prize, and *Sir John Moore*, 1953, which won the Tait Black Memorial prize; others are *Prince Charles Edward*, 1935, and *Henricella Maria*, 1936, also *David Garrick*, a 2-vol. study, 1958. She has

written a number of historical novels, including *The Road Royal*, 1924, *Princess Amelia*, 1924, *Crouchback*, 1929, *The Empress*, 1932, *The Best of his Family*, 1933, and *Over the Water*, 1935; with these may be grouped her excellent children's books, *Alfred, King of the English*, 1939, and *Robin Hood*, 1949. Among her novels of modern times are *The Holiday*, 1928, *Fair Stood the Wind*, 1930, *Nothing to Report*, 1940, and *Somewhere in England*, 1943. *The Menin Road*, 1919, is a vol. of poems.

Oman, Sir Charles William Chadwick (1860-1946), historian, b. Muzaffarpur, India. In 1883 he was made a fellow of All Souls College, in 1905 a member of the Brit. Academy and Chichele prof. of modern hist. at Oxford, retiring from the latter post in 1946. Conservative M.P., Oxford Univ., 1919-35, he was made K.B.E. in 1920. A specialist in military hist., among his writings are *A History of the Art of War in the Middle Ages*, 1898, 1924, *A History of the Peninsular War, 1802-11*, a work of the greatest authority, *A History of England before the Norman Conquest*, 1910, *Napoleonic Studies*, 1929, *A History of the Art of War in the Sixteenth Century*, 1937, and *On the Writing of History*, 1939. His daughter Carola (q.v.) is also a historian, especially known for her life of Nelson, 1947.

Oman (and Muscat), sultanate in the extreme E. of Arabia between the Gulf of O. and the ocean on one side and the Rub' al-Khali desert on the other; the coastline stretches from near Cape Masandam at the head of the gulf to a point near meridian 54 E. on the S. coast, though the 300 m. or so between O. proper and the prov. of Dhofar are desert. Area 82,000 sq. m.; pop. 550,000. A range of mts runs the length of the country, 10,000 ft at the highest point, and in most places falling steeply to the sea. W. of the range is the quiksand Umm al-Samin, perhaps 95 m. by 40 m., a sump which collects any drainage there may be. The Batina plain N. of Muscat is very fertile, though the rest of the country is mt or desert with many oases. Dhofar is fertile but very small.

Hist. begins with the Muslim conquest. The caliphs found it hard to rule O. effectively; the name of Mohammad ibn Thaur, who led a punitive expedition in AD 894, is still execrated for the atrocities he committed. From 1009 O. was independent, and Persians devastated much of it in 1265. In 1508 the Portuguese seized the ports, but by 1614 only Muscat, Matrah, and the citadel of Sohar remained in their hands. In 1698 O. seized Mombasa and other places on the E. coast of Africa. From 1711 to 1742 there was anarchy, one party calling in the Persians who stayed from 1737 to 1741; one result was the rise of the present reigning family. In 1798 the first treaty with Britain was made and shortly after tribute was paid to the Wahhabis. In 1854 O. was driven out of Bunder Abbas and some other places on the Persian coast, and 2 years later Zanzibar broke away and became an independent state under a member of the reigning family. At the present time, a

man who calls himself the imam rules the interior, ignoring the sultan in Muscat. This summary gives only a faint idea of the ceaseless strife which makes up the hist. of O. The pop. is believed to consist of both S. and N. Arabs who are at daggers drawn; for cents. the parties have been called Hinawi and Ghafiri, and a vil. may contain both parties. In addition, the N. is orthodox Sunnite and the S. Ibadhi, i.e. heretical. The chief products are dates, sugar-cane, and fruit; the pearl fishery is not so important as it was. Trade is mostly in the hands of Indians, the chief imports being rice, sugar, and coffee; there are no industries of any importance. The chief tns are Muscat (q.v.) and Matrah. A new treaty of commerce and navigation was made with Britain in 1939. See also ARABIA. See Bertram Thomas, *Arabia Felix*, 1932, and J. Morris, *Sultan in Oman*, 1957.

Oman, Gulf of, extension of the Arabian Sea to the NW., between Makran (Persia) and O. It leads to the Persian Gulf through the strait of Ormuz, and has a width of 200 m. at its entrance.

Oman, Trucial, stretches the 325 m. between Cape Masandam and Qatar on the S. shore of the Persian Gulf. In 1853 an agreement was made between 5 small states and Britain to observe peace at sea; the previous name Pirate Coast gives the reason for the agreement. The original 5 are now 7, for one has split into 3; they are, from W. to E., Abu Dhabi, Dibai, Sharja, 'Ajman, Umm al-Qaiwain, Ras al-Khaima, and Fujaira, which is on the Gulf of O. The pop. is probably under 100,000 and Dibai is the biggest tn. So far no oil has been found in the dist., and as the pearl fishery has declined there is emigration to the oil-fields and elsewhere. The possibility of finding oil makes the desert valuable and, as there are no landmarks there, the fixing of boundaries is almost certain to lead to strife.

Omar (d. 644), Muslim caliph from 634 to 644. He subdued Egypt, Palestine, and Syria and defeated the Persians, and was the first to have the title of Commander of the Faithful. He introduced the new Arabian calendar.

Omar, Mosque of, name wrongly given to the Dome of the Rock. This was built by an Umayyad caliph who reigned from 685 to 705, and is not a mosque. It is built over the rock on which the altar of the Jewish temple is believed to have stood, and from it Mohammed ascended to heaven on his Night Journey.

Omar Khayyam (c. 1034-c. 1130), Persian poet, mathematician, and astronomer, b. Nishapur, the cap. of Khurasan. O. K. revised the calendar at the invitation of the Seljuq Sultan, Malikshah, and became famous throughout the E. as a mathematician; a work on algebra by him was known in Europe. His name is now inseparably connected with FitzGerald who trans. his *Rubaiyyat* (or quatrains) into English in 1859. The authenticity of many of the quatrains has been questioned. See F. Woepke, *L'Algèbre d'Omar Alkayyām*, 1851; Heron-Allen, *Facsimile of the Manuscript in the Bodleian Library*,

1898; eds. of the *Rubdydt* by Whinfield (who pub. a new Eng. version in 1882 and 'the first critical version of the text' in 1883) and John Payne, the poet, who produced another trans. in 1898; Bjerregaard, *Swift Interpretations of the Quatrains of Omar Khayyām*, 1902; life by J. K. M. Shirazi, 1905; O. Rothheld, *Omar Khayyām and his Age*, 1923; A. G. Potter, *Bibliography of the Rubdydt of Omar Khayyām* (eds. in foreign languages), 1929; essay by L. Housman and biography of FitzGerald by G. F. Maine in Collins's ed. of *The Rubdydt*, 1947; A. J. Arberry, *The Rubā'iyāt of Omar Khayyām*, 1949, and *Omar Khayyām*, 1952.

Ombre, or '**The Man**,' game of cards invented by the Spaniards. It is played by three persons with a pack of forty cards, the 8, 9, and 10 being dispensed with, and each player is dealt nine cards by threes. Each deal constitutes a game, and one hand plays against the other two, the solo player being called the 'O.' The game is described by Pope in his *Rape of the Lock*.

Omdurman, tn in the Sudan, on the l. b. of the Nile, facing Khartoum. It is a trading centre and a pilgrims' resting place, and was the chief tn during the regime of the Mahodi. On 2 Sept. 1898 Brit. forces under Kitchener, advancing up the Nile after the victory at Atbara, encountered the forces of the Khalifa. During the battle the 21st Lancers delivered the last full-scale cavalry charge of modern warfare. Winston Churchill took part in the cavalry charge, and describes the operations in *The River War*, 1899. Pop. 130,400.

O'Meara, Barry Edward (1786-1836). Irish surgeon to Napoleon in St Helena. He entered the army in 1804 as assistant-surgeon, served in Sicily and Calabria, and in 1807 went with Gen. Fraser to Egypt, but was dismissed from the army the same year for participating in a duel. After this he served as a naval surgeon, and in 1815 accompanied Napoleon to St Helena. Here he remained for 3 years, but being accused by Lowe of intriguing with Napoleon, was recalled. He pub. *Napoleon in Exile*, 1822, in which he attacked Lowe's treatment of Napoleon.

Omelet (the anglicised form of Fr. *omelette*) is a kind of thin pancake. It is made with eggs beaten up lightly, with the addition of milk or water, herbs, cheese, mushrooms, ham, bacon, fish, or game, and salt and pepper for seasoning, according to the requirements, and cooked in a buttered pan. For sweet O.s sugar is used instead of pepper, and fruit added.

Omen, name applied by the ancients to signs which were supposed to indicate good or bad fortune, e.g. the appearance of snakes, the flight of birds. See **AUGUR**; **DIVINATION**; **ORACLE**.

Omer, St (c. 595-c. 670), Fr. bishop, b. in the ter. of Constance, became a monk at Luxeuil. Later he became Bishop of Thérouanne, his see including the present Pas-de-Calais and Flanders, in Belgic Gaul. To propagate the faith St. O. enlisted many monks, and a great number of abbeys were built. The saint himself was the co-founder of Sithn, and round this

abbey grew up the tn now known as St. O. His feast is on 9 Sept.

Omer, St (France), see **ST-OMER**.

Omiš, tn in Croatia, Yugoslavia, on the Adriatic, situated at the mouth of the Cetina, and at the foot of steep mts. From the 10th to the 15th cent. it was the haunt of Dalmatian pirates, who on one occasion captured the daughter of the Doge of Venice. Pop. 12,900.

Ommamney, Sir **Erasmus** (1814-1904), admiral, b. London. He took part in the battle of Navarino (1827), for which he received a medal. He discovered the first traces of the fate of Sir John Franklin (q.v.) in 1850, and for his scientific researches he received the Arctic medal, 1851, was made F.R.S. in 1868, and knighted 1877, being advanced to admiral the same year.

Ommayyads, Arabian family of Mecca, the first Arabian caliph dynasty, founded by Muawiyah (c. 610-80) in 661. Under them the Arab realm extended to China and Spain. They were replaced by the Abbasids (q.v.) in 750, but estab. an independent caliphate at Cordova, in Spain, which lasted until 1031.

Ommiades, see **OMMAYYADS**.

Omnibus (Lat. 'for all'), name of a public conveyance which has undergone considerable modifications from its early form. The forerunner of the O. by Pascal

SHILLIBEER'S BUS OF 1829

was run unsuccessfully in Paris for a short period in 1662; it was revived in 1819 and introduced to London in 1829 by George Shillibeer. The characteristic that was sanctioned by an Act of 1832 was that it plied for hire throughout its route instead of being available, like the stage-coach, only to those who pre-booked at offices. The characteristic double-decked Brit. vehicle originated with the Great Exhibition of 1851; the 26-seat London garden seat horse-bus in 1881; motor buses were the subject of experiment from 1897 onwards and became estab. (G.W.R. service from Helston to the Lizard) in 1903. The first electric trolley-buses were operated in 1911; they often replaced trams and there is now a tendency for them to give place to the Diesel (or oil-engined) bus. See also **BUSES** AND **COACHES** AND **ELECTRIC TRACTION**.

O'Morgair, Malachy, see MALACHY, St. Omphale, the masculine but attractive queen of Lydia, to whom Hercules was slave for 3 years. He doted on her, and led an effeminate life spinning wool, while O. wore his lion's skin and was lady paramount.

Omphalea, genus of tropical climbing shrubs, family Euphorbiaceae, 15 species; of which *O. megararpa*, Hunter's Nut, yields large nutritious nuts and is cultivated in the W. Indies, and *O. triandra*, the Pop-nut or Cob-nut, yields a juice that is used in ink-making and a nut that is edible after removal of the poisonous embryo.

Omphalodes, genus of annuals and perennials (family Boraginaceae), bearing racemes of white or blue flowers. *O. linifolia* (Venus's navelwort) is a white-flowered annual, often grown in garden borders. *O. lucinae* (Rock navelwort) is a blue-flowered perennial of considerable value in the rock garden. The plants prefer a partly shaded position. *O. verna*, Blue-eyed Mary, is a creeping perennial, naturalised in Britain.

Omphalopsychol, 'those with their souls in their navels,' navel-contemplators, a term of abuse for the followers of St Gregory Palamas of Mt Athos (d. 1359) used by Barlaam, an It. Gk and eccles. adventurer who later became Bishop of Gerace in Calabria (1348) and taught Petrarch Greek. See HESYCHASTS.

Omsk: 1. Oblast in W. Siberia, lowland traversed by the R. Irtysh, with mixed forests in the N. and steppe in the S. It has dairy farming, sheep breeding, wheat growing, lumbering, engineering, woodworking, and food and light industries. The area was gradually annexed by Russia in the 16th-early 18th cents.; in the late 19th cent. it developed extensive dairy farming and butter production. Area 53,800 sq. m.; pop. (without O. city) 1,100,000, mostly Russians, also Ukrainians and some Tatars.

2. Cap., economic and cultural centre of the above, on the Irtysh and the Trans-Siberian Railway, directly subordinated to the Gov. of the Russian Federal Rep. It has engineering (agric. machinery), oil refining (pipeline from Tyumazy fields in Bashkiria), wood-processing, and varied light and food industries. O. was founded in 1716 as a Russian fortress in the S. defence line of W. Siberia; it became a tn in 1804, prov. cap. in 1822, and administrative centre of the Steppe ter. (now central and E. Kazakhstan) in 1882. After the Trans-Siberian Railway reached O. it became the commercial centre of W. Siberia and the biggest Siberian tn. The Bolsheviks were overthrown in O. in 1918, and for over a year it was the centre of anti-Bolshevik struggles in Siberia and the seat of Kolchak's gov. (see KOLCHAK). In 1919-22 O. was the seat of the Bolshevik Siberian Revolutionary Committee. There has been rapid industrial development since the Second World War. Pop. (1956) 505,000 (second in Siberia; c. 1914, 128,000; 1926, 162,000; 1939, 281,000).

On, see HELIOPOLIS.

Onager, or *Equus onager*, species of

mammal in the family Equidae, is the best-known wild ass of Asia (it is now included in the subgenus *Asinus*). It occurs in the steppes of W. and central Asia, and so closely resembles *E. hemippus* of Syria (which was considered specifically distinct by Geoffrey St Hilaire) that it is thought probable they belong to the same species. The O. is a swift-footed animal, sandy in colour, but with a dark stripe running down its back.

Onagraceae, dicotyledonous family of herbs and shrubs bearing red, white, yellow, blue, or purple axillary or terminal flowers, and opposite or alternate simple leaves. Genera include *Clarkia*, *Epilobium*, *Fuchsia*, *Godetia*, *Oenothera*, *Trapa*, *Zauschneria*.

Onamuchi, see ORONAMUCHI.

Onas, see FUEGIANS.

Onatas, of Aegina, Gk sculptor who fl. in the middle of the 5th cent. BC.

Oncidium, very large genus of epiphytic orchids, chiefly found in Peru, Ecuador, Mexico, and W. Indies, family Orchidaceae, over 500 species, varying considerably in form, colour, and size.

Ondarrabia, see FUENTERRABIA.

Ondes Musicales, or **Ondes Martenot**, electrophonic instrument invented by Maurice Martenot of Paris in 1929. It produces notes from the air graded according to the chromatic scale by a special device. It has a warbling note, which keeps in tune with the other orchestral instruments. Honegger used the O. M. in his *Jeanne d'Arc*.

Onega, lake in NW. Russia, second largest in Europe. Area 3800 sq. m. It is connected by the R. Svir' with Lake Ladoga and the Baltic, and by artificial waterways (see WHITE SEA-BALTIC CANAL; MARINSKIY WATERWAY) with the White Sea and the Volga.

Oneglia, see IMPERIA.

Onehunga, maritime bor. of N. Is., New Zealand, 6 m. from Auckland, of which it is a suburb. O. is of historic interest in that it was originally settled by military pensioners from England, and had the first lady mayor in the Brit. Empire (1894). Pop. 16,674.

Onesida: 1. City of Madison co., New York, U.S.A., situated at a height of 440 ft above the sea, on the O. Creek, 26 m. W. of Utica. The prin. manufs. are silverware, caskets, fertilisers, electrical supplies, plaster and paper products. The vil. of O. Castle, to the SE., forms the gathering-place of the O. Indians, whilst the H.Q. of the co-operative O. community (see NOYES, JOHN HUMPHREY) are also to the SE. Pop. 11,325.

2. Lake in New York, 6 m. to the NW. of O. city, between the cos. of Oswego, O., Onondaga, and Madison. It is 20 m. long by 5 m. wide, and is drained by the O. R. into Lake Ontario.

Onesida, N. Amer. Indian tribe, one of the Iroquois Confederacy (q.v.). To-day there are about 2500.

O'Neil, Bryan Hugh St John (1905-54), distinguished archaeologist who was a leading authority on prehistoric and Rom. periods in England and Wales and on late medieval fortifications. He was

chief inspector of ancient monuments from 1945 until his death; he himself undertook much excavation work in the Brit. Isles and gave great encouragement to the field-work of others. He wrote and ed. many of the guide-books pub. by the Ministry of Works, was Rhind lecturer in archaeology in 1946, a member of the Royal Commission on Historical Monuments, and a vice-president of the Society of Antiquaries, 1946-50.

O'Neill, Eugene Gladstone (1888-1953). Amer. dramatist. b. New York City. His father was James O'N., a well-known actor, who was celebrated in America for his star part in the old melodrama of *Monte Cristo*. O'N. studied at Princeton and Harvard, and then for a number of years led a most adventurous and varied existence. He went on a gold-hunting expedition to Honduras, spent sev. years in central and S. America, and worked as a sailor for 2 years. Returning to the U.S.A. he worked for a short time as a reporter, played a minor role in his father's company, and then spent months roaming the dock region of New York City. Stricken with tuberculosis, while in a sanatorium he wrote some one-act plays which were pub. at his father's expense. Upon restoration to health he went to Harvard Univ., and took a course in dramatic writing. *The Moon of the Caribbees* and *Six other Plays* was pub. in 1919. In the same year appeared *Beyond the Horizon*, his first full-length play. This won the Pulitzer prize in 1920, an honour later gained by 3 more of his plays. His early one-act dramas had been filled with realism, but *Emperor Jones*, 1921, was a clear break with this, being rather an experiment in expressionism. The central figure, after whom the play is named, is a Negro who has made himself by sheer brute strength monarch of the ex-slaves in a W. Indian is. There is a revolution against him. In 8 short episodes the audience is shown the change from the proud emperor to the timorous, superstitious black, lost in the jungle whither he has fled from those who seek his life. Out of O'N.'s knowledge of the docks and the sea grew *Anna Christie* 1922, another study in realism, which achieved great success both in New York and in London. *The Hairy Ape*, which appeared in the same year, is a second drama of expressionism. *Desire under the Elms*, 1924, reverts to realism, being a tragedy of passion played out on a New England farm.

The Great God Brown, 1925, has been acclaimed as one of the finest imaginative productions in Amer. literature. Here O'N. showed his growing distaste for mere naturalism and his increasing employment of symbolism. The same is true of his *Lazarus Laughed*, 1927; *Lazarus* d. and returned to life with the knowledge of what death is and its place in the larger purpose. *Strange Interlude*, 1928, is one of the strangest of all his dramas. Edouard Dujardin, the Frenchman, discovered the interior monologue for literature, and was followed by James Joyce in his *Ulysses*; O'N. adapts the interior mono-

logue to the stage. Running to 9 acts, and taking 5 hrs to play, it is a test of the patience and attention of the audience. Though its construction may appear fantastic and unreal, in actual presentation it is highly effective. O'N.'s concern is with human beings caught up in the currents of life, and struggling against the forces of evil. He deals largely with the depressed classes, and especially with the colour problem, though his *Mourning Becomes Electra*, produced in London in 1938, was a powerful and sombre modern psychological study of the Electra complex. His *Days without End*, 1934, is a modern miracle drama. In 1936 he was awarded the Nobel prize. Later works include *The Iceman Cometh*, 1946, and *A Moon for the Misbegotten*, 1947. He left an autobiographical drama, *Long Day's Journey into Night*, which was produced after his death and won the Pulitzer prize, making his fourth award, a record for a playwright, and the only time that a Pulitzer prize had been given posthumously. O'N. was married 3 times, and his daughter Oona married Charles Chaplin, the film comedian. See studies by S. K. Winther, 1934; R. D. Skinner, 1935; B. H. Clark, 1947; also J. W. Krutch, *The American Drama since 1918*, 1939.

O'Neill, Hugh, see TYRONE, EARL OF and IRELAND.

O'Neill, Owen Roe (c. 1590-1649), Irish soldier, nephew to Hugh O'N. (see TYRONE, EARL OF). He fought in the Sp. Army, and came to Ireland after the outbreak of the great rebellion of 1641. He was given command of the Ulster forces on the side of the Confederates, and fought with great success until his death in 1649.

O'Neill, Peggy, see EATON, MARGARET O'NEILL.

O'Neill, Shane, 2nd Earl of Tyrone (c. 1530-67). Irish chief and rebel, oldest legitimate son of Con O'N. (1484-1559) (who was made Earl of Tyrone by Henry VIII in 1542). After much civil strife he was recognised as chief by Elizabeth on her accession, but the recognition was revoked. During his life Ulster was the scene of constant war. He was again acknowledged chieftain of Tyrone in 1563, but with a reservation as to the rights of Hugh (who succeeded to the title in 1587); made a treaty with the English at Drumcece (1563); captured the chief of the MacDonnells (1565); invaded the Pale (1566); burned Armagh (1566); was defeated by the O'Donnells at Letterkenny in 1567, and murdered by the MacDonnells at Cushendun. See ISLAND SCOTS.

Oneonta, city of New York state, U.S.A., in Otsego co., on the l. b. of the Susquehanna, 73 m. SW. of Albany. It has railroad shops and flour-mills, and manufs. clothing, gloves, machinery, and wood products. It is the seat of Hartwick College and a state teachers' college, and there is a tuberculosis hospital. Pop. 13,560.

Onesimus, St, disciple of St Paul, under whose influence he came after robbing and running away from his master Philemon, a citizen of Colossae. See Paul's Epistle to Philemon.

Ongtong, see under LORD HOWE ISLAND.

Onion (*Allium cepa*), bulbous-rooted plant (family Liliaceae), probably a native of central or W. Asia, and cultivated from a remote period. By successive sowings and by careful storage, O.s may be had all the year round. Usually 2 main sowings are made: the chief, early in spring, to produce O.s for autumn and winter use, or for storing. The other sowings are made towards the end of the summer, for transplanting in the spring, a system by which larger and earlier bulbs are obtained which are seldom, if ever, attacked by the O. fly. In ordinary gardens the thinnings from the autumn sowings usually provide a sufficient supply of the green or spring O.s used in salads. Any except stagnant soils will grow O.s if well manured and if rotations of crops are followed, but only a deep, rich loam produces the heaviest crops. The growth of large O.s for competition at shows is very popular. Unlike much exhibition produce, their mild flavour makes them generally preferable in the kitchen to those less carefully grown. The best O.s for use in pickling are small, hard bulbs produced from April sowings on rather poor, dry, sunny land.

Onions, Charles Talbot (1873-), philologist, educ. at King Edward VI School and Mason College, Birmingham. He entered the teaching profession, and then in 1895 joined the staff of the *Oxford English Dictionary*, of which he became joint editor in 1914. He continued his association with the dictionary until 1933, and was also editor of 3 eds. of the *Shorter Oxford English Dictionary* in 1933, 1936, and 1944. He was lecturer in Eng. literature at Oxford Univ., becoming fellow of Magdalen College in 1923, and in 1927 was appointed reader in Eng. philology. He was awarded the C.B.E., 1934. His valuable *Shakespeare Glossary* was first pub. in 1911; a second edition appeared in 1919.

Onions, George Oliver (1873-), novelist, b. Bradford. He changed his name in later life to George Oliver, but wrote as Oliver O. He studied art in London and Paris, and worked for a time as illustrator and designer. His first book was *The Compleat Bachelor*, 1901, but his first real success was with the trilogy of novels *In Accordance with the Evidence*, 1912, *The Debit Account*, 1913, and *The Story of Louie*, 1913. Others are *Good Boy Seldom*, 1911, *Mushroom Town*, 1914, *The New Moon*, 1918, *A Case in Camera*, 1920, *The Open Secret*, 1930, *Cockcrow*, 1940, *Poor Man's Tapestry*, 1946, which was awarded the Taft Black Memorial Prize, *Arras of Youth*, 1949, and *Bells Ring Backwards*, 1953. He has written highly effective ghost stories, collected in *Widdershins*, 1911, *Ghosts in Daylight*, 1924, and *The Painted Face*, 1929. He married Berta Ruck (q.v.), the novelist.

Onitsha, tn. of S. Nigeria, on the E. bank of the Niger, at the beginning of the delta region. Its position renders it an entrepôt for the trade of the dist. Pop. 77,000.

Onnes, Heike Kamerlingh (1853-1926), Dutch physicist; b. Groningen, where he studied and gained his Ph.D. He was for some time director of the physical laboratory at Leyden, where he was the first to liquefy helium, at -269° C., in 1908. He discovered superconductivity—the complete loss of electrical resistance at a very low temp. in certain metals. He received the Nobel prize for physics in 1913, and was elected foreign member of the Royal Society in 1916.

Onobrychis, genus of leguminous herbs or shrubs with pinnate leaves and axillary spikes of racemes of purple, red, or white flowers. *O. radiata* is grown on the rockery; *O. viciifolia* is the fodder plant, Sainfoin (q.v.); its vars. *arenaria* and *montana* are sometimes grown in gardens.

Onomatopoeia (Gk *onoma*, word; *poiein*, to make) is a figure of speech in which the sound of words corresponds with the sense they convey. Many single words are onomatopoeic, such as 'bang,' 'clink,' 'splash.' So also are Tennyson's lines:

'The moan of doves in immemorial elms,
And murmuring of innumerable bees.'

See also FIGURE OF SPEECH.

Onomichi, city and port of Hiroshima-ken, Honshu, Japan, on Inland Sea. It manufs. fancy mats, and saké (q.v.) is produced. There are 48 Buddhist temples. Pop. 85,000.

Ononis, genus of ann., biennial, and perennial herbs, family Leguminosae, about 70 species; *O. repens*, *O. spinosa*, and *O. reclinata*, the Restharrowes, are found in Britain; *O. natriz* is the Goat-root of S. Europe, and *O. spectosa* of Spain is probably the most beautiful of the genus.

Onopordon (-um), genus of 12 ann., biennial, or perennial herbs, family Compositae, of which *O. acanthium*, the Common Cotton or Scotch Thistle, is found in Britain as a biennial.

Onslow Bay, on the SE. coast of N. Carolina, U.S.A., between Cape Lookout and Cape Fear, about 100 m. long and 25 m. wide. It receives the Newport, New, White Oak, and other rvs.

Ontake, sacred Jap. mt in the Jap. Alps, with a 14th-cent. Shinto shrine at the summit. Altitude 11,000 ft.

Ontario, SE. prov. of the dominion of Canada, separated from the U.S.A. by the St Lawrence R. and the Great Lakes of Superior, Erie, Huron, and O.

O. is that section of the dominion which is contained between the great international lakes and Hudson Bay, and between the W. boundary of Quebec and the E. limits of Manitoba. Its most S. point is lat. N. 41° 41' and its most N. lat. N. 56° 48'. Until 1912 its total area was 260,862 sq. m. In that year the prov. was extended by Act of Parliament to include the E. portion of Keewatin as far N. as Hudson Bay, and its area now amounts to 412,582 sq. m., of which its water area of 49,300 sq. m. forms the unusually large percentage of 11.9. The area is thus about equal in extent to the combined areas of the 6 New England states of the U.S.A. The pop. is upwards of 5,350,000, making it the most populous of the

Canadian provs. The pop. increased by 2,110,000 between 1871 and 1938. The W. portion of Keewatin is now included in the prov. of Manitoba. The Canadian portions of the Great Lakes cover an area of 40,354 sq. m. The NW. point of the prov. is close to Port Nelson on Hudson Bay, and its NE. boundary is formed by James Bay, an extension of Hudson Bay. The surface is of an undulatory character, in parts well suited to agriculture, with low ranges of hills extending westwards towards Lake Huron. The prov. is watered principally by the St Lawrence

carried on under unusually favourable conditions. The tobacco plant is extensively cultivated in the SW. area (the only tobacco grown in Canada), producing an ann. crop worth \$75,000,000.

O. is rich in minerals, the prin. being gold, nickel, silver, cobalt, blismuth, arsenical ore, zinc, and lead. Huge deposits of low-grade iron ore exist. The value of mineral production in O. in 1955 was \$578,000,000. Gold represented \$86,024,345 of the prov.'s production in 1955, and with other metals, of which nickel (\$176,000,000 in 1954), copper

Ontario Dept Travel and Publicity

AMBASSADOR BRIDGE, WINDSOR, ONTARIO

and Ottawa R.s, and their numerous tribes. The largest lakes exclusively in O. are Nipissing, Simcoe, and Nipigon. The climate of O. is healthy and bracing, but in most parts colder in winter and warmer in summer than that of Great Britain. At Toronto the temp. ranges from 89° to 13° 3', giving a mean temp. for the year of 44° 8'. The rainfall averages 35 in. annually. The soil of the arable areas is exceedingly fertile, and over 9,000,000 ac. are under crops, the chief being oats, wheat, barley, and maize; the minor crops include rye, peas, mixed grain, sugar beets, potatoes, and turnips. Agric. production in 1955 was valued at over \$1 billion. Dairy farming and cattle raising are engaged in. Fruit farming, especially in the Niagara dist., is carried on extensively, and splendid apples and peaches are grown. General farming, also a most important primary industry, is

(\$81,300,000 in 1954), silver, iron ore, and cobalt were the chief, made up over 70 per cent of the total for the prov. The nickel for the Sudbury dist. amounts to 90 per cent of the world's production. Mining is a thriving industry in the Sudbury, Cobalt, Kirkland Lake, and Porcupine dists. Coal has not yet been discovered in any appreciable quantity, though lignite is being raised in the James Bay region, and the means of obtaining it are rendered comparatively simple by the excellent system of canalisation and lake communication with the coal-bearing dists. outside the prov. Iron ore deposits are being tapped; 1954 production was \$20,341,203, of which half came from Steep Rock. Uranium mining has started with Blind R. field looming as the largest producer in N. America. The deposits of high-grade mica and other essential war minerals proved valuable for the Brit.

market when its feldspar supply from Scandinavia was cut off (1940). Development work for the production of asbestos was begun in 1941. The greater part of the Canadian production of common salt comes from wells in SW. O. Gypsum is mined in Paris, O. Lumbering is an important industry, and the productive forests, which cover 174,000 sq. m., yield spruce, pine, birch, poplar, and other valuable timber. Fur production is valued at over \$3,000,000 annually. The petroleum wells in the SW. of the prov. produce a steady supply of oil. The

young country like Canada, in parts of its wealthiest prov., O., soil erosion, deforestation, and loss of water resources should have become extensive. The Ganaraska R., selected as a considerable area for post-war development, drains about 75,000 ac., and the water reaches have been seriously deforested, with wind and water erosion continuing after the destruction, so that a considerable portion of the upper part of the Ganaraska watershed is now unfit for successful agriculture. Its reforestation and other conservation methods will, however, be supplemented

National Film Board, Canada
QUEENSTON POWER PLANT, NIAGARA FALLS, ONTARIO

fisheries yield cod, salmon, bass, herring, lobsters, and mackerel. O., of all the Canadian provs., is the centre of the country's manufacturing life, owing to its abundant water-power resources and its proximity to the coal-fields of Pennsylvania. Hydro-electric power systems, using Niagara and other falls, were producing upwards of 5,000,000 h.p. at the end of 1955. The manufs. are numerous and varied, agric. implements, railway rolling stock, and textiles being the most important; but during the Second World War there was a rapid increase in the output of many kinds of munitions and other special manufs. essential to the Allies' war effort, such as aero engines and aeroplane construction generally. The output equals that of the rest of Canada. There is great activity in the canning and pork-packing industries.

In respect to post-war planning schemes it is an important commentary that in a

by dams for flood control. Spring flooding on the W. of S. O. is a very serious ann. danger, causing substantial loss to municipalities along their shores.

O. is well equipped with a variety of educational institutions, and has univ. and colleges of importance. In recent years there has been in Canada a tendency to lengthen the period of compulsory attendance, and this tendency has been most marked in O., where in 1919 an Act was passed providing that children from 8 to 14 years of age must attend full time, and that young persons from 14 to 16 who were below univ. matriculation standard must also attend full time; those exempted owing to their occupations must attend part-time classes. The operation of this Act has greatly increased the attendance in O. secondary schools. The average number of pupils attending educational institutions is over 1,000,000. The O. agric. college and experimental

farm at Guelph were estab. in 1874 to train young farmers in the science and practice of agriculture and to conduct experiments for the benefit of the prov. The Kemptville agric. school and farm had grown rapidly in importance before the Second World War. The horticultural experiment station at Vineland in the centre of the Niagara fruit belt is the most important station in Canada for work on the special problems of the fruit and vegetable grower. Other similar institutions are the Ridgeway experimental

(Ontario Dept of Lands and Forests)

A FIRE-DETECTION TOWER IN ONTARIO

farm in the SW. peninsula and the New Liskard demonstration farm in N. O. The leading denominations in O. are United Church of Canada, Rom. Catholics, Church of England, and Baptists, in the order named.

The ordinary revenue and expenditure in the years immediately preceding the Second World War balanced at about \$90,000,000. In 1955-6 the gross interim figures were revenue, \$411.3 million; expenditure, \$410.6 million. The estimated wealth of O. represents about one-third of that of the whole dominion.

The prov. has a separate Parliament and administration, with a lieutenant-governor at its head, assisted by 90 members (elected for 5 years), forming a Legislative Assembly which has power to control its own affairs, but must not

conflict with the policy of the central administration of the dominion, to which are sent 82 members and 24 senators. The Executive Council consists of 13 members, 9 holding portfolios. Besides the regular depts, certain commissions have been created for specific purposes; these include the Niagara Falls Park Commission, Railway and Municipal Board, Hydro-Electric Power Commission, and Timiskaming and N. O. Railway Commission. The cap. is Toronto. Other important cities are Ottawa (seat of national gov.), Hamilton, Windsor, London, Brantford, and Kingston (qq.v.). There is railway communication to all parts of the prov. Before the War of Independence the country was sparsely inhabited by roving tribes of Indians; but on the close of the war of 1783 thousands of Brit. loyalists crossed over into Canada, and this portion was called Upper Canada, a name it continued to bear until 1867, when it was renamed O. It is the premier prov., and is considered the most flourishing in the dominion. See also CANADA. See A. H. D. Ross, *Ottawa, Past and Present*, 1927; E. C. Guillet, *Early Life in Upper Canada*, 1933; F. Landon, *Western Ontario and the American Frontier*, 1941, and *Western Ontario*, 1943; R. L. Jones, *History of Agriculture in Ontario, 1613-1880*, 1946; and O. Bureau of Statistics and Research, *A Conspectus of the Province of Ontario*, 1947.

Ontario, Lake, lake of N. America, forming part of the S. boundary of the above prov., situated between lat. 43° and 44° N. and long. 76° and 80° W. Its length is 185 m., and its mean breadth is about 50 m.; its depth ranges from 15 to 120 fathoms. The St Lawrence R. forms its outlet on the NE., while in the SE. it receives the waters of Lake Erie, by means of the Niagara R. and the Welland Canal. Its area is over 7000 sq. m., and it contains sev. ls. at its E. end. The lake abounds in fish, and it is noted for its Oswego bass. The chief Canadian ports on its shores are Toronto, Hamilton, Kingston, Port Hope, and Coburg, while Oswego, Sackett's Harbor, and Charlotte are the chief Amer. Storms are prevalent on the lake, whose coasts are studded with lighthouses.

Onteniente, Sp. tn in the prov. of Valencia, on the Clariano. Pop. 14,000.

Ontology (adapted from a Late Lat. word, *ontologia*, from the Gk *ôn*, *ontos* the present participle of the verb *einai*, to be, and *logos*, word or science), the name given to that branch of philosophy (see METAPHYSICS) which deals with the immaterial concepts of essence, existence, etc., as distinct from psychology and natural theology. The name given to the science by Plato was 'dialectic,' whilst Aristotle's 'first philosophy' was akin to it. A great part of metaphysics has been bound up with these matters, although, of course, in the dawn of philosophy the possibility of objective reality was not questioned. Wolff was the first philosopher to use O. as a technical term. He divided theoretical philosophy into that which deals with being in general (subjective or objective)

and that which deals with particular entities. The former he called O., whilst the latter was divided into psychology, cosmology, and natural theology, according as the entities were the soul, the world, or God. The theory that the nature of knowledge itself is the first study of philosophy, and that not until a conclusion has been come to on this does the nature of being admit of study, has of late years superseded Wolff's theory. Thus with the evolution of metaphysics O. has been relegated to a secondary place. See articles on METAPHYSICS; PHILOSOPHY; PSYCHOLOGY; etc., and on the various religious systems, all of which have some ontological basis. See J. MacTaggart, *Nature of Existence*, 1927; G. Santayana, *Realm of Essence*, 1928; C. G. Stone, *The Social Contract of the Universe*, 1930; E. Meyerson, *Identity and Reality*, 1930; F. Coffey, *Ontology*, 1938; W. Ehrlich, *Ontologie des Bewusstseins*, 1940; L. De Raeymacker, *Philosophie de l'être*, 1946; P. J. Glenn, *Ontology*, 1955.

Onus Probandi, see PROOF, BURDEN OF. **Onyhiium**, family Polypodiaceae, genus of evergreen ferns with finely divided, graceful fronds. *O. siliculosum* needs stovehouse culture; *O. japonicum* is more hardy, but must be kept somewhat dry in winter. It is easily increased by div. of its numerous crowns.

Onychophora (Gk *onus*, claw; *pherein*, to bear), class of the phylum Arthropoda (i.e. insects, crustaceans, and other invertebrates with jointed legs), includes sev. genera, but the term *Peripatus*, estab. by Gudding (1826), is still commonly used as the generic name for all. He included it in the Mollusca, but Moseley (1874) proved conclusively its arthropod structure. The characteristics of the class are the presence of air tubes, tracheae; a dermomuscular body wall; paired excretory ducts, the nephridia; and a body composed of many similar segments bearing 'feet.' The head bears single pairs of antennae, jaws, and

has been regarded as providing the 'missing link' between the 2 groups.

Onyx, chalcedony composed of alternating white and black or dark brown layers. These colours are often modified by artificial staining in order to enhance the value of the stone for ornamental purposes. It was highly valued by the ancients and used for cameos. The term 'O. marble' was at one time applied to alabaster. A variety of O. is sardonix, which contains alternating bands of dark red carnelian (sard, q.v.). The best varieties of O. are obtained in India.

Oodnadatta, tn of S. Australia, NW. of Lake Eyre, on the railway from Port Augusta to Alice Springs. Pop. 100.

O'okiep, mining tn of Namaqualand (q.v.), Cape Prov., S. Africa, 92 m. ESE. of Port Nolloth. Its fortunes fluctuated with the world price of copper, which is mined in the dist. Sparsely populated and very dry. Pop.: Whites, 654; Coloureds, 644; Bantu, 565.

Oolite, or **Roestone**, limestone which is composed of small rounded grains, which show in thin section under the microscope a concentric shell arrangement. Each grain shows also a radial structure, and under polarised light should give a black cross if a true sphere. The concentric layers of the grain are gathered round a nucleus, which may be a quartz granule, a piece of shell, or other organic body. Some modern O.s (as at Karlovy Vary) may be due to algae (*Girvanella*) which secrete lime from the surrounding waters and build up these radiate and fibrous grains. The O.s are well developed in the Jurassic system, the coarser varieties being called **pea-stone** or **pisolite**.

Oology, science relating to birds' eggs, their identification, classification, etc. The general characteristics of birds' eggs are a shell composed chiefly of carbonate of lime with smaller quantities of phosphate of lime and magnesia, a membrane enclosing the food material, the white or albuminous food material, the yolk or yellow portion, and the minute germ from which the living organism develops. Some shells have an outer glazed layer like porcelain glaze, as in the ostrich egg; others have a chalky outer layer, as in the eggs of cuckoos, cormorants, and grebes; yet others have a translucent outer layer as in the kingfisher's egg. Eggs are also identified by their shape; those of the plover are pear-shaped, those of the sandgrouse cylindrical, those of owls are spherical, while the majority have the familiar shape of the hen's egg. Colour, or pigmentation, occurs in wide variety, both in individuals and in different species. The uniform tints or ground colouring may be brownish, blue, yellow, brick-red, or green; superposed on this may be lines or spots or both of different colour or different intensity, while the eggs of rails and plovers often exhibit double spots; that is, strongly marked spots superposed on a wider area of fainter hue. It may be mentioned that a special licence is necessary for the collection of wild birds' eggs, as they are now almost everywhere protected by law.

PERIPATUS

oral papillae; the openings of the tracheae are scattered over the body. The jaw muscles are striated. Malpighian tubules are absent. *Peripatus*, of which there are many species, is found in the S. continents, Malay, New Zealand, and E. and W. Indies. It looks somewhat like a caterpillar of medium size, and lives in damp places under the bark of trees. In its heart and lacunar circulation, small coelom and haemocoel, salivary glands, the presence of tracheae, the modification of its anterior appendages as mouth parts, and its regular ecdysis, *Peripatus* resembles the Arthropoda. It differs from them in the absence of exo-skeleton and external segmentation; the soft cuticle and muscular body wall; the segmentally arranged nephridia with ciliated tracts. In these and other characters it resembles the Annelida (segmented worms), and

Oorial, *see* URIAL.

Oort, Adam van, *see* NOORT.

Oosterbeek, vil. in the Netherlands (prov. of Gelderland), 3 m. W. of Arnhem, was the 1st Airborne Div. H.Q. in the Arnhem battle. A memorial was unveiled in 1946 to the Brit. troops, most of the dead being buried in a nearby cemetery.

Oosterhout, tn in the prov. of N. Brabant, Netherlands, 5 m. N.E. of Breda. There is trade in agric. produce, manufs. of pottery and tiles, tanning, leather, and sugar-refining. Pop. 22,100.

Oostkamp, tn in the prov. of W. Flanders, Belgium, 4 m. S. of Bruges; mainly engaged in agriculture, cattle breeding, and manufs. of linen. Pop. 8000.

Ootacamund, tn of Madras state, India, situated in the Nilgiri Hills at a height of 7500 ft. O. was formerly the hot weather H.Q. of the Madras Gov., and is a favourite summer resort.

Ooze, *see* OCEAN AND OCEANOGRAPHY.

Opacity, that property of a body which prevents light passing through it. Newton explained this property by the unequal densities of the particles of the body, the light being so irregularly reflected and refracted that ultimately it becomes absorbed. On the wave theory of light it is explained as being due to the fact that the particles of the body absorb the light, converting the energy into heat.

Opah, *see* CENTRARCHIDAE.

Opal, hardened colloidal condition of silica, usually containing a small percentage of water. Water content varies from 1 to 21 per cent; in precious O. it is generally 6-10 per cent. It is found disseminated in veins and nests through rocks, and is also formed from the siliceous waters of some hot springs (geyserite). In colour O. is white, grey, yellow, red, etc., the colours varying according to the position in which the stone is held. Precious O., which exhibits a delicate play of colours (opalescence), is found in Hungary, Mexico, Queensland, New S. Wales, and S. Australia, and for jewellery is cut with a convex surface. Large stones are difficult to procure for jewellery, owing to the multiplicity of flaws with which they are intersected. Fine O. found in Mexico gives fire-like reflections. Hydrophane is an opaque white or yellow variety, which becomes translucent and opalescent on immersion in water. Wood O. is wood replaced by silica, the grain of the wood being preserved. It has a variety of colours, and is used for ornamental purposes. Hyalite, a transparent glossy variety of O., occurs in stalactitic forms. Menilite or Liver O. occurs in concretionary forms in shaly deposits. Float-stone is a tuberculous or porous siliceous mass which floats on water. Tripoli infusorial earth is related to O. The O. was once thought to bring misfortune to its owner, but the superstition has lost ground in recent years.

Opava (Ger. *Troppau*), Czechoslovak tn in the region of Ostrava (q.v.), on the Oppa. It was once cap. of Austrian Silesia (*see* SILESIA). Textiles and paper are manuf. Pop. 30,200

Open Field System. O. F. S. of farming was in vogue during the time of William I. The arable land of the manor farms consisted of 3 large open fields: one for wheat or rye (the bread crop); another for barley, for barley cakes and beer (the drink crop); and the third ploughed to rest the soil (fallow). The fallow field in the next year would be sown for wheat, while the barley field would become fallow, so that every 3 years each field would in turn be rested. The fields were divided into strips of 1 ac. or $\frac{1}{2}$ ac., and were separated by low ridges of unploughed turf, instead of by hedges, thus being open, as opposed to the enclosed field of to-day. Laxton in Notts is farmed in some degree on similar lines to-day, and at Eton certain meadows are thrown open during Aug., Sept., and Oct. to the cattle of the villagers, under the care of a 'hayward.' *See also* map on p. 424. *See* OPEN SPACES AND COMMONS.

Open Hearth (Siemens) Steel Process, *see* IRON AND STEEL.

Open Spaces and Commons. Parks and recreation grounds in tns are very erratically distributed and often quite inadequate. Some cities and bors. in Great Britain (notably spa tns and holiday resorts) have well over 10 ac. or more per 1000 inhab., others hardly any. The National Playing Fields Association recommends that at least 6 ac. of playing-field space a 1000 pop. are required, all permanently reserved for the purpose, and preferably in public ownership. For parks and public gardens the association considers that at least a further 1 ac. a 1000 pop. should be provided. These standards were endorsed in 1956 by the Ministry of Housing and Local Gov. as a guide for the reservation of O. S. in development plans; in those for tns it considered the provision made had frequently been too low; the trend of demand was likely to rise with the growing interest in athletics and an increase in leisure time. The Ministry of Housing and Local Gov. mentioned also that a target of 4 ac. of allotments a 1000 pop. was recommended by the Allotments Advisory Committee of the Ministry of Agriculture (1950); many tns are far short of this quota.

London Co. had in 1951 only 2.47 ac. a 1000 of all kinds of O. S. with public access; while the bors. of Woolwich and Westminster had 7 ac. a 1000, Islington and Shoreditch had only a quarter-ac. a 1000. The Co. of London Development Plan, 1951, aims at an ultimate 2½ ac. a 1000 in 20 years, and this is regarded as very difficult to attain. In other countries similar shortages exist: thus New York City in 1938 had 1 ac. of O. S. a 1000 inhab.; its planners considered 3.33 ac. a desirable minimum, perhaps unattainable.

All co councils and local authorities in Great Britain have powers under the Open Spaces Act, 1906, to acquire land for O. S. and to maintain and regulate it. Many recreation grounds and parks have been provided under this and earlier Acts. Grants may be made by co. councils and the Exchequer under the Physical Recreation Act, 1937. The National Playing

Fields Association also makes grants for playing fields from the King George VI Memorial Fund. Under the Town and Country Planning (q.v.) Acts land in development plans may be zoned as O. S., and such land may be acquired by agreement or compulsorily by a local authority for playing fields, parks, or allotments (see also GREEN BELTS). The London Co. Council and some other local authorities also have powers under local Acts to provide or contribute to the provision of sports and pleasure grounds, public walks, etc.

Open Spaces, and Footpaths Preservation Society.

Opencast Mining, see MINING.

Openshaw, see MANCHESTER.

Opera, drama of any description in which the text is wholly or partly sung and accompanied by an orchestra. The modern art-form arose in Italy about 1600, but its origins go back much farther, through the medieval mystery plays to the Attic drama, in which music played an important part. Perhaps the first essay in the direction of O. was the song-play of the 13th cent., *Robin et Marion*

OPEN FIELD SYSTEM

From an old map of Laxton in Nottinghamshire.

Commons and common fields are in a somewhat different category. Usually they are wastes and pastures which have never been individually appropriated, but are used in common for grazing or other purposes by the inhab. of a par. or dist. Many ant. commons and common fields passed into private ownership by the Enclosure Acts in the 18th and early 19th cents.; those that remain, which cover extensive areas, are protected from enclosure by the Commons Preservation Act, 1876, and defended by the watchfulness of the Commons, Open Spaces, and Footpaths Preservation Society (see FOOTPATHS). Others contend, however, that much common land could be usefully cultivated, and in 1955 a Royal Commission was appointed to consider its future status, control, and use. See E. C. Gonner, *Common Lands and Inclosure*, 1912; H. Bradley, *Enclosures in England, 1400-1900*, 1918; and pub. of Commons,

by the eminent trouvère Adam de La Halle. Late in the 16th cent. an aristocratic Florentine circle of musicians and literary men known as the *Camerata*, reacting against the current polyphonic musical style and attempting to revive the principles of Gk drama, began to write dramatic works in a new declamatory style—recitative. The leaders were the composers Peri and Caccini and the poet Rinuccini. The first known It. opera is *Dafne*, 1597, by Peri and Rinuccini; the first of which the music survives complete is *Euridice*, 1600, by the same collaborators; this libretto was set by Caccini 2 years later. A different approach was through the madrigal. Vecchi's *Amfiparnaso*, 1597, is a series of madrigals not intended for the stage, yet approaches dramatic form. The first great master of O. was Monteverdi, whose *Orfeo* was produced at Mantua in 1607. His madrigals had already gone a long way in dramatic

expression; he now enriched a dramatic text by greatly strengthening the orchestral and harmonic elements, and foreshadowed the later aria in his attempts at sustained melody. The distinction between recitative and aria became clearer in his successors, Cavalli and Cesti, but the balance of music and drama, always precarious throughout the hist. of O., became stilted; the lt. love of vocal and scenic display usurped the functions of dramatic characterisation. The subjects were still generally classical or historical, but comic episodes were introduced as a diversion.

In 1637 the first O. house was opened at Venice. O. soon spread to other lt. tns, then to Paris (c. 1645), later to Vienna and Germany, where it remained Italian at the courts but was to become partly German at Hamburg about 1680. The Fr. O. was founded in 1669 by the poet Perrin, and the first important Fr. O., *Pomone*, by Perrin and Cambert, was produced there in 1671. But it was the Italian Lully who, incorporating the native ballet, estab. the tradition of Fr. Grand O., continued in the next cent. by Rameau. Lully worked under the patronage of the court, which his O.s were designed to glorify. In England the foundations of a native O., based on the masque, were laid by the composers who contributed to *The Siege of Rhodes* in 1656, and consolidated by Purcell, whose early death, however, left *Dido and Aeneas*, 1689, as a solitary pointer to the Eng. O. that might have been, as important and as free of convention as Monteverdi before and Gluck after it. Elsewhere O. remained Italian in form, style, and language. By the end of the cent. the leading influence was the Neapolitan school under Alessandro Scarlatti, followed later by Porpora, Pergolesi, Cimarosa, and others. With the aid of the poets Zeno and Metastasio the form became rigidly standardised; Scarlatti was responsible for the *da capo* aria, the 2 kinds of recitative, *secco* (accompanied only by the harpsichord) for the rapid transaction of dialogue, and *stromentato* (accompanied by the orchestra) for more dramatic moments, the rejection of the chorus, and the separation of the monumental *opera seria* from the more racy *opera buffa*. Scarlatti himself with his great melodic and expressive powers was able to animate this style, but with lesser composers it soon deteriorated into empty vocal display. The lyrical and dramatic genius of Handel made the most of it, but could not preserve it because it was alien to his sphere of activity, and his most important dramatic experiments were made in his Eng. oratorios, which are really O.s in disguise with the great asset of a chorus. The important reforms of Gluck were in essence a return to the principles of Monteverdi. He opposed the tyranny of the singer, especially of the *castrato*, who always sang the chief male parts in lt. *opera seria*, and concentrated on dramatic expression and characterisation. His new style was first prominent in *Orfeo*, 1762, and fully developed in the O.s he wrote for Paris from 1774, in which

he adopted the Fr. emphasis on ballet and chorus. But Gluck had long cultivated the Metastasian type, together with Italians like Traetta and Jommelli, and the Ger. Hasse, as well as Fr. comic opera, which began to flourish in Paris by the middle of the cent. in the hands of Philidor, Monsigny, Grétry, and others. Meanwhile a popular O. of contemporary life with spoken dialogue had also appeared in various local forms: ballad O. in England (*The Beggar's Opera*, 1728), and *Singspiel* in Germany. At first a reaction from the classical-dynastic *opera seria* of the court, this led directly to the romantic and national O. of the next cent. The cosmopolitan Mozart wrote masterpieces in all the current forms: *opera seria* (*Idomeneo*); *opera buffa* (*Le Nozze di Figaro* and *Così fan tutte*); an intermediate type of Shakespearian scope (*Don Giovanni*); and *Singspiel* (*Die Entführung, Die Zauberflöte*); and made great advances in characterisation and orchestral detail. The Ger. romantic O. of Weber stems partly from Mozart and the *Singspiel*, partly from the ethical Fr. grand O. of the revolutionary period under Cherubini and Spontini (the Paris stage, continually dominated by foreigners, has always kept its tradition). Beethoven's *Fidelio* springs from the same stock. The distinctions between aristocratic and popular O. now began to disappear, and Paris became an important centre where Meyerbeer in grandiose political O.s and Auber in *opéra-comique* led from about the 1830's, presently joined by Offenbach in operetta. In Italy the singer still reigned supreme, but the brilliant wit and vivacity of Rossini and the melodic charm of Donizetti and Bellini give their O.s distinction. Ger. dramatic music is dominated by Wagner after the production of his *Rienzi*, 1842, and *Der fliegende Holländer*, 1843. Influenced by Weber, whose remarkable *Euryanthe*, 1823, is the source of sev. innovations generally attributed to Wagner, and also by the romantic Marschner and the ostentatious Spontini and Meyerbeer, he evolved a new form which he called music-drama. This has little in common with traditional O., and finds its closest parallel in the symphonic poems of Liszt—with the stage action and the musical thought closely interrelated. Wagner's genius, instrumental and symphonic as well as vocal and dramatic, thus found its perfect expression; but the conviction expressed in his many writings that he was revolutionising O. by returning to the principles of Gluck and Attic drama misled his successors. A misunderstanding of Wagner lies at the heart of the best later Ger. O.s such as Humperdinck's *Hänsel und Gretel*, Wolf's *Der Corregidor*, and the early operas of Richard Strauss. Meanwhile traditional O. progressed rapidly in Italy and France. Verdi, often crude but always vital at first, developed into a figure comparable with Mozart and Wagner, though quite different from either, until, in his last O.s *Otello*, 1887, and *Falstaff*, 1893, he reached a musico-dramatic balance on the highest level, such as it.

O. had not known since Monteverdi. The succeeding exponents of the *verismo* school, Mascagni and Leoncavallo, sacrificed musical values to dramatic sensationalism; and Puccini sometimes marred an individual musical and dramatic talent by crudely assailing the emotions of his audience. In France the striking if imperfect dramatic genius of Berlioz has always been neglected. Gounod attempted, only with partial success, to bridge the gap between the outworn conventions of Fr. grand O. and *opéra-comique*. His work is too often sugary and sentimental. Bizet's original genius rarely fell into these faults and achieved much that was striking in detail before he produced a masterpiece unique of its kind in *Carmen*, 1875. The many operas of Massenet and Saint-Saëns are more notable for craftsmanship than creative power. Debussy's single O., *Pelléas et Mélisande*, 1902, is a work of impressionistic suggestion that has found no true

Troilus and Cressida, 1954, has also been hailed in the U.S.A. and on the Continent of Europe as being in the main the line followed by such masters as Verdi and R. Strauss. Vaughan Williams, Bliss, Berkeley, Tippett, Bush, and others have also made O. part of their endeavour. See R. A. Streatfeild, *The Opera* (5th ed., revised by E. J. Dent), 1925; F. Howes and P. Hope-Wallace, *A Key to Opera*, 1939; E. J. Dent, *Opera*, 1940; D. J. Grout, *A Short History of Opera*, 1947; G. Kobbé, *Complete Opera Book*, 3rd revised ed., 1954; E. Newman, *Opera Nights* (new ed.), 1956.

Opera Glass, or **Galileo's Telescope**, instrument used for obtaining a magnified image of some distant object. It consists essentially of 2 lenses, a converging lens as objective, and a diverging lens as the eye lens. The objective lens L would form a real inverted image B of the distant object A. But before this image is formed the rays fall on the diverging lens M,

RAY PATH OF A GALILEAN TELESCOPE

successor. Russian O., largely founded on a rich folk-song tradition, began with Glinka and Dargomizhsky and reached its height in Mussorgsky's *Boris Godunov*, 1874. Borodin's *Prince Igor*, 1890, has an epic grandeur; Rimsky-Korsakov's O.s are remarkable for fantasy, melody, and orchestral colour, rather than characterisation. Tchaikovsky combined the native Russian with the Fr. and It. tradition. Czech O. was formed by Smetana out of folk-song and the Liszt-Wagner symphonic style; he was followed by Dvořák, whose gifts were more lyrical than dramatic, and Janáček, one of the most original opera composers with strong dramatic gifts, who aimed at a naturalistic utterance. Falla and Granados in Spain and Bartók in Hungary have made interesting experiments in O. Most remarkable of the modern continental O.s is Alban Berg's *Wozzeck*, 1925, in which late romantic naturalism is combined with the atonality of the Schönberg school. In England the operettas of Sullivan were distinguished by wit, melody, and delicate scoring. In the early 20th cent. the strongest influences have been Wagner (Delius, Boughton) and folk-song (Holst, Vaughan Williams), and in the middle of the cent. Eng. O. suddenly blossomed out most remarkably. The strong dramatic gifts and musical virtuosity of Britten have made his already numerous O.s welcome all over the world, and Walton's

which renders them divergent so that they appear to come from the image C which is erect. C is the image which is seen by the observer. The fact that the image seen is erect, and that the telescope is comparatively small in size, makes it extremely useful as an O. G.

Operation Overlord, see **OVERLORD**.

Operation Sealion, the Ger. plan for the invasion of Britain, 1940. Ger. plans for invading Britain, begun in Nov. 1939, were intensified in July 1940, when Hitler was faced with the first major check to his strategy. Seeing that Britain showed no signs of coming to terms, he decided to undertake a landing operation, and the Ger. staff were given until mid Aug. to prepare it. The Ger. leaders, who were apprehensive of the proposed operation through fear of the R.N., thought it essential that the Ger. Air Force should accept the double role of both destroying the R.A.F. and preventing the Brit. Navy from attacking a landing force, and Goering (q.v.) was confident that the Ger. Air Force would be equal to these tasks. But later orders showed that Hitler was most reluctant to take a final decision, though on 3 Sept. directives were issued to prepare for embarkation at Rotterdam, Antwerp, and Le Havre, and D-Day was fixed for 21 Sept. Hitler, however, postponed the operation, and on 12 Oct. the invasion was called off until the spring, the fact being that the battle of

Britain had resulted in the failure of the Luftwaffe to carry out the first of its tasks, the destruction of the R.A.F. In July 1941 Hitler again postponed the operation until the spring of 1942 on the assumption that by that time the Russian campaign would be completed. The project does not seem to have been seriously considered again, and was finally cancelled in Jan. 1942.

It was widely believed in Britain that a Ger. invasion attempt was actually launched in 1940, but this is officially stated to be a fallacy. The official Brit. statement on Ger. plans, made in the House of Commons on 18 Nov. 1946, was based on captured Ger. documents and interrogation of Ger. prisoners of war (see *Itansard*, 18 Nov. 1946). It would appear that there was little enthusiasm amongst the Ger. naval chiefs for 'Sealion', and no real understanding by the army of the difficulties inherent in cross-Channel invasion. See A. Martienssen, *Hitler and his Admirals*, 1948, and P. Fleming, *Invasion 1940*, 1957.

Operational Calculus. In mathematics 'operations,' such as addition, subtraction, integration, differentiation, etc., are represented by symbols. During the 19th cent. it was realised that the symbols or 'operators' were themselves susceptible to manipulation, irrespective of their operands. An example of such a calculus is the electric circuit theory developed by O. Heaviside. Heaviside's methods were at first looked on with suspicion by the purists, as being not rigorous enough, but his work was of great practical application, especially in electrical engineering, and the O. C. has now been reconciled with other theories such as the calculus of finite differences and been shown to derive logically from the earlier Laplace transformations. See N. McLachlan, *Theory of Complex Variables*, 1939, and *Modern Operational Calculus*, 1948.

Opercularia, genus of Australian herbs or sub-shrubs (family Rubiaceae) with small globular heads of white flowers. *O. aspera* and *O. hispida* are sometimes grown in greenhouses, requiring a soil composed of equal parts of sandy loam, fibrous peat, and leaf soil.

Operculum (Lat., 'a lid'), in botany, the term which is used in speaking of the lid of the capsule of mosses. It forms a cover for the peristome, and falls off when the spores are ripe. In fishes (q.v.) it is the cover over the gills.

Opere operato, ex, in theology, term introduced by the schoolmen to express the manner in which the sacraments are efficacious. Certain general dispositions may be necessary in the receiver, but it is not these dispositions which render the sacrament effective. Bellarmine says: 'When we say the sacrament confers grace *ex opere operato*, our meaning is that grace is conferred by virtue of the sacramental act, instituted by God to this end, and not by the merit of the minister or of the recipient.'

Ophelia, **Ophelia Acid**, see CHIRATA.

Ophieleide (Gk *ophis*, a serpent; *kleta*, a key), obsolete brass wind instru-

ment of the bassoon type, but more closely related to the serpent, with a much coarser tone. It was patented by the Paris instrument maker Halary in 1821. It is unlike the bass horn and the Russian bassoon in being descended from the cornett family. It resembled the bassoon in shape, but was thicker and more uncouth, had 11 keys, a mouthpiece like that of the trombone, and a compass of about 3 octaves. Mendelssohn wrote for the O. in *Elijah* and *Midsummer Night's Dream*, but it is now obsolete and replaced by the tuba. Also a 16-ft reed organ pedal stop of powerful tone.

Ophidia, see SNAKES.

Ophiolatri, see SNAKE WORSHIP.

Ophiopogon, or **Snakeshead**, genus of perennials (family Liliaceae) with long narrow variegated leaves, and racemes of white or lilac flowers. *O. Jaburan*, Japan, and *O. intermedius*, China, are nearly hardy.

Ophir, region celebrated in anct times for its fine gold and frequently mentioned in the O.T. From O. gold and precious stones were brought to Solomon. Its position has been the subject of much dispute. Suggested localities are Zimbabwé, in Mashonaland; Abhira, at the mouth of the Indus; Suhara, in Goa; Mt O., in Johore; and S. Arabia.

Ophites (Gk *ophis*, a serpent), or **Nasenes** (Heb. *nachash*, a serpent), early Gnostic sect which, in addition to the usual doctrines held in common with the other such groups, taught that special veneration should be paid to the serpent, the introduction of knowledge into the world being due to the serpent that tempted Eve. They are referred to by Hippolytus, Irenaeus, Origen, and other early Church writers. See Gnosticism.

Ophiuroides, see BRITTLE-STARS and ECHINODERMATA.

Ophrys, genus of hardy terrestrial orchids with beautiful flowers, many of which bear a remarkable resemblance to insects. *O. apifera*, the bee orchid, is about a foot tall, and has 3 to 6 bee-like flowers in a loose spike. Other Brit. species are the fly orchid (*O. insectifera*) and 2 rare spider orchids.

Ophrysia, see PHEASANT.

Ophthalmia, inflammation of the eye. This term is not now in general use, the inflammation being related to the affected part or parts of the eye.

Ophthalmology (Gk *ophthalmos*, eye; *logos*, discourse), the science of the eye, its anatomy, physiology, visual functions, and diseases. See BLINDNESS; CATARACT; CONJUNCTIVA; EYE; GLAUCOMA; IRITIS; REFRACTION. ERRORS OF; TRACHOMA. See also J. H. Parsons and W. S. Duke-Elder, *Diseases of the Eye* (12 ed.), 1954; A. Sorsby (ed.), *Modern Trends in Ophthalmology* (third series), 1955; H. Neame and F. A. Williamson-Noble, *Handbook of Ophthalmology* (8th ed.), 1956.

Ophthalmoscope, optical instrument designed for examining the surface of the retina of the human eye, invented by Helmholtz (1851). Since his time many types of O.s have been designed (using

Helmholtz's basic principles), and with the modern instruments the structure and health of the cornea, aqueous, crystalline lens, vitreous, and retina may be investigated. An estimate of the refractive error of the eye may also be made with the O. There are 2 methods of viewing the retina, direct ophthalmoscopy and indirect ophthalmoscopy.

Direct Method (Fig. 1). The instrument will include in the handle the source of light, C, and behind the mirror D a battery or lenses will enable the observer A to focus the structures of the eye described above. In modern instruments it is usual to include a convex lens system between the source C and the mirror D, and the mirror D may then be a plane mirror.

Indirect Method (Fig. 2). In this method the source C is behind the eye B, and the mirror D will consist of a concave retinoscope and the light is focused by the convex lens E. By this method the

his subjects being Johnson, Burke, and Fox. He was also an historical painter. He became an associate of the Royal Academy in 1787, and in the following year a member. His tomb in St Paul's is near that of Sir Joshua Reynolds. His work, while not aiming at ideal beauty or refined poetical conception, is characterised by energy of style and vivid realism. His portrait of Mary Wollstonecraft Godwin in the National Gallery, London, well represents his style. See A. Earland, *John Opie and his Circle*, 1911.

Opinicus (heraldry), fabulous animal having the head and wings of a griffin or eagle, a short tail like that of a camel, and the body of a lion. It is sometimes represented without wings. It forms the crest of the Barber Surgeons of London.

Opitz, Martin (1597-1639). Ger. poet, b. Bunzlau, Silesia. In 1625 he was crowned poet laureate at Vienna by the Emperor Ferdinand II. A patent of nobility was

FIG 1. DIRECT METHOD: SELF-ILLUMINATED

FIG 2. INDIRECT METHOD

observer A may only view a small magnified area of the retinal surface. Other parts of the eye may not be examined by this method.

Ophthalmoscopy enables the practitioner to observe the only part of the vascular system functioning which can be made visible, hence its extreme importance in diagnosis of the health of the eyes and the whole body. An adaptation of this instrument enables one observer to use both eyes with a binocular O.; another permits a number of observers to receive demonstration of a specific eye; incorporation with a camera enables photographs of the retinal fundus to be taken.

Opie, Amelia, née Alderson (1769-1853), novelist, b. Norwich. Her husband was John O. (q.v.), the painter. She pub. *Simple Tales* in 1806, and many novels, including *The Dangers of Coquetry*, 1790, *Adeline Mowbray*, 1804, and *Valentine's Eve*, 1816. See C. L. Brightwell, *Memoir of Amelia Opie*, 1855, and J. Menzies-Wilson and H. Lloyd, *Amelia: the Tale of a Plain Friend*, 1937.

Opie, John (1761-1807), painter, b. Harmony Cot, near St Agnes, Cornwall, son of a carpenter, whose real name was Oppy. He evinced such skill in taking portraits that Dr Wolcott (better known as Peter Pindar), the Truro physician, took him into his house and afterwards (1780) to London. He soon became famous, and in 1783 received a commission from the king, and advanced rapidly as a fashionable portrait painter, among

conferred on him in 1629, in the title of von Boberfeld. He became historiographer to Ladislaus IV of Poland in 1638. His poems (*Teutsche Poemata*, *Welliche Poemata*, *Geistliche Poemata*) tend to be didactic, cold, and formal. In his *Büchlein von der Poeterei*, 1624, he stresses the importance of clarity and adherence to rules. See studies by F. Gundolf, 1923, and H. Marx, 1931.

Opium is obtained by drying the juice of the unripe capsules of the poppy (*Papaver somniferum*). The plant is extensively cultivated in India, Asia Minor, Egypt, Persia, and China. Sown in Nov. in rich loose soil, the poppy-heads are ready to be operated upon by the end of Feb. O. has a bitter nauseous taste, and a heavy narcotic odour. Its properties as a drug are due to the alkaloids which it contains, viz. morphine, narcotine, thebaine, papaverine, codeine, etc. These alkaloids are either free or combined with such acids as meconic, lactic, or phosphoric. O. also contains gum, saccharic matter, fat, and water. The habit of eating O. is very prevalent, especially in the Far E. Its use is usually begun to relieve pain or sleeplessness, and after a month's use the individual becomes a confirmed O.-eater. If taken in excess O. poisoning is set up, and the victim suffers from dyspepsia and nervous attacks. After a large dose of O. the person lies in a state of coma. Respiration is slow and noisy, the pulse is often slow but full, and the eye pupils contract. The skin also becomes pale and livid, and covered with a cold perspiration.

For O. poisoning an emetic or coffee is given, and the patient is kept moving if possible. For smoking O. a pipe of peculiar construction is required, and the effects are much the same as in the case of O. eating. As a medicine, O. may be given for pain or sleeplessness. It is also used in cases of diarrhoea and sometimes to alleviate coughing. It is usually given in the form of laudanum, a tincture prepared by dissolving O. in dilute alcohol.

The O. traffic was formerly an important source of revenue to India, but stringent regulations have been introduced to stop it. O. is produced in India under licence from the gov., and production is now confined to the states of Uttar Pradesh, Madhya Bharat, and Rajasthan. Previously the cultivation of poppies under licence was also permitted in Himachal Pradesh, and a small quantity was grown in Bilaspur. The O. is bought from the cultivators by the gov. at fixed rates, and gov. responsibility is confined to (a) the control of cultivation through the licensing system and of production of O. at the gov. factories at Ghazipur and Neemuch; (b) the sale of a comparatively small amount to the state govts. after processing or purifying for medical or quasi-medical needs; and (c) the export of the balance to foreign countries for medical and scientific purposes. Cultivation and manuf. are regulated by the Indian Opium Acts of 1857 and 1878, and the Dangerous Drugs Act, 1930, under the general control of the Union Ministry of Finance. In 1953-4 the area engaged for poppy cultivation totalled 52,887 ac.; the total value delivered by cultivators in Uttar Pradesh, Madhya Bharat, and Rajasthan to the gov. in 1953-4 was £1,147,272 (Rs. 15,297,631). Exports were principally to the U.K. and the U.S.A., also to France, Argentina, Italy, and Belgium. Formerly most of the exported O. went to China, but in 1906 the Chinese Gov. prohibited the use of O. in schools and the army, and ordered all *habitues* to be registered and their allowances gradually decreased. In 1907 the Indian Gov., in furtherance of the efforts of the Chinese Gov. to suppress the cultivation and use of O. in China, decided gradually to reduce the amount exported to China, and as from 1917 its export was entirely prohibited. In 1928 the gov. of India announced its intention to restrict the export of O. otherwise than for medicinal purposes. Exports of provision O. to foreign countries ceased at the end of 1935.

In 1948 the Permanent Central O. Board in Geneva expressed grave concern at 'the presence of Iranian opium in the illicit traffic in many parts of the world.' In 1949 the World Health Organisation convened a conference of E. Mediterranean countries on the subject. O. is an important crop in Turkey, in the Ayvon Karahisar and Konya dists. In its report for 1955, made to the Economic and Social Council of the U.N., the Permanent Central O. Board said that O. was still the main element in the illicit consumption of narcotics. There were millions of addicts,

morphine and heroin used by addicts.

Opium War, name given to hostilities between Great Britain and China in 1840, following the destruction of Brit. ships taking opium to China. The war resulted in the cession of Hong Kong and the treaty ports.

Opole: 1. Prov. (*województwo*) of SE. Poland, bordering in the S. on Czechoslovakia. It is crossed SE.-NW. by the fertile valley of the Oder (q.v.), and in the S. has foothills of the Sudetic Mts (q.v.). The Silesian Neisse (q.v.) waters the W. of the prov. Until 1945 its ter. was in Ger. Upper Silesia (q.v.); the Ger. pop. was then expelled. Livestock is raised; cereals, potatoes, flax, and sugar beet are grown, and iron and other minerals are found. There are textile, leather, sugar, and engineering industries. Area 3635 sq. m.; pop. 850,000.

2. (Ger. *Oppeln*) City of Poland, cap. of O. prov., on the Oder, 170 m. SE. of Warsaw (q.v.). It was the cap. of a duchy, 1163-1532, and then passed into the hands of the Hapsburg (q.v.) family. In 1742 it went to Prussia. It is the seat of a bishop. There are textile, flour, machinery, and cement industries. Porphyry is found in the dist. Pop. 30,000.

Opon, tn of Mactan Is., Cebu, Philippine Is., opposite Cebu city. It is noted as the place where Magellan d. in 1521. Pop. 37,280.

Oporto (Portuguese *Pôrto*; anct *Portus Cale*), city of Portugal, cap. of Douro Litoral prov. and *Pôrto* dist. (qq.v.), on the Douro (q.v.), 3 m. from its mouth on the Atlantic, 175 m. NNE. of Lisbon. It is the second city of the country, and has been an important tn since the time of the Moorish supremacy. An outer harbour to take large vessels was constructed at Leixões, on the Atlantic 5 m. NW., in 1890. O. is built in terraces on the steep N. slopes of the rocky Douro gorge. It is connected to the S. suburb of Vila Nova de Gaia (known for its wine storehouses and its 16th-cent. monastery of Serro do Pilar) by the 2-storeyed bridge of Dom Luis I., which crosses the riv. in a single span of 560 ft at a height of 120 ft; this bridge and another bridge higher up the gorge are the work of Eiffel (q.v.). The streets of the old tn are narrow and tortuous, with tall, painted and balconied, granite houses. There are sev. good modern boulevards, notably the Rua dos Clérigos, the streets of Santo Antonio and Santa Catarina, and the Rua das Flores. The city has many public squares, of which the prin. is the Praça da Liberdade, containing a bronze statue of Dom Pedro IV. The 13th-cent. Gothic cathedral (called *Sé*) has been badly modernised, but has a fine interior and contains a solid silver altar and retable. The church of São Francisco, near the Bolsa (Exchange), is a mass of beautiful carvings of the 15th and 16th cents. Other buildings of note are the 12th-cent. church of São Martinho, the modern law courts, and the city's most conspicuous landmark, the

Torre dos Olérigos (18th cent.), which is 246 ft high. There is a univ. (1911) and there are colleges of music and art. O. is famous for the wine which it exports (see PORT WINE). The wine trade, begun by Eng. merchants in the 17th cent., was encouraged by the Methuen Treaty (q.v.). In addition to wine the port has a trade in fruit, olive oil, and salt. There are foundries, and there are textile, sugar, pottery, glass, tobacco, paper, and food-stuff industries. Pop. 284,850.

Opossum, word derived from the Amer. Indians, and applied to the various members of the marsupial family Didelphyidae. Fossil forms have been found in different parts of the world. The O. is the only native N. Amer. marsupial. In habit all are arboreal, except *Chironectes minimus*, an aquatic species, and nocturnal; in diet they are carnivorous or insectivorous. The number of digits is invariably 5, and there are 50 teeth; the tail is usually long and prehensile, and the pouch is frequently absent. The chief genus is *Didelphys*, and consists of 23 species, varying in size from that of a cat to a rat. The commonest of these is *D. virginiana*, which occurs in the U.S.A. It has coarse, yellowish hair tipped with brown or black, a scaly tail, hairy at the tip, short legs, and a pig-like snout. The young are carried by the mother in her pouch. The young of *D. dorsigera* have the interesting habit of curling their tails round their mother's, and being borne about in this fashion. *Chironectes*, the water O., or yapock, has completely webbed feet, and lives upon fish.

Oppeln, see OPOLE.

Oppenheim, Edward Phillips (1866-1946), novelist, b. London. He was educ. at Wygoston Grammar School, Leicester. His departure from school for the family leather business is amusingly told in his autobiography, *The Pool of Memory*, 1941. Altogether O. wrote some 150 books and, besides being one of the world's most prolific authors, he was among the best writers of 'thrillers.' Trans. into most European languages, he was especially popular with Ger. readers until he exploited Ger. hostility to Britain. Books which were particularly favoured by his large public were *Mysterious Mr Sabin*, 1898, *The Double Life of Mr Alfred Burton*, 1914, *Mr Grex of Monte Carlo*, 1917, *The Double Traitor*, 1918, *The Great Prince Shan*, 1922, *Prodigals of Monte Carlo*, 1926, *The Channing Syndicate*, 1927, *The Glenlitten Murder*, 1929, *The Million Pound Deposit*, 1930, *Gallows of Chance*, 1934, *The Strange Boarders of Palace Crescent*, 1934, *Bird of Paradise*, 1936, *Dumb Gods Speak*, 1937, *A Pulpit in the Grill-Room*, 1938, and *Advice Limited*, 1939. He also collaborated in 2 plays: *The King's Cup*, produced at the Adelphi in 1909, and *The Eclipse*, at the Garrick in 1919. After the First World War he settled in S. France.

Oppenheimer, Sir Ernest (1880-1957), chairman of De Beers Consolidated Mines Ltd., and many other S. African and Rhodesian mining companies, and one

of the world's leading industrialists. He began his career at the age of 17 in the London office of A. Dunkelsbuhler and Co., where he gained his early experience of the diamond world. In 1902 he was sent to S. Africa in connection with the firm's interests in Kimberley. In 1908 he was elected a member of the city council and became mayor in 1912, which office he held till 1915. He was largely responsible for the raising of the 2nd Kimberley Regiment at the outbreak of the First World War, and during the Second World War devoted himself to the service of the Red Cross and other welfare organisations. In recognition of the services rendered to S. Africa over a number of years he was knighted in 1921, and from 1924 to 1938 he sat as S. African party member for Kimberley in the Union Parliament.

Oppenheimer, John Robert (1904—), Amer. physicist, son of a Ger.-Jewish immigrant and successful textile exporter, b. New York. He graduated from New York's Ethical Culture School, where he had an intensive course in chem. At Harvard he studied under the physicist P. W. Bridgman and the philosopher A. N. Whitehead (q.v.). At 21 he went to England to study under Lord Rutherford and Sir J. J. Thomson at Cambridge Univ., and also went to Göttingen where he earned his Ph.D. at 23 with a brilliant paper on quantum mechanics, and concluded with still further study at Leyden and Zürich. From 1928 he taught science at the California Institute of Technology and the univ. of California, winning a great reputation, and developing at that univ. an outstanding school of theoretical physics. In Mar. 1943 he was chosen by the U.S. Army to head a new scientific laboratory from which emerged the first atomic bomb. O. became chief executive of a \$60,000,000 company with 4500 workers, including such eminent physicists as Enrico Fermi and Niels Bohr, though he had never even been chairman of a physics faculty. It was recognised, however, that apart from his knowledge of physics, he had the capacity to make people pull together and work at fever pitch. Subsequently he was appointed to a small board of 7 members to suggest U.S. policy on the future of atomic energy, and was responsible for much of the writing and many of the ideas in a resulting report which called for an international atomic development authority. He is president of the Amer. Physical Society, and director of the Institute of Advanced Study, near Princeton. In 1953 he was suspended by the U.S. Gov. from secret atomic research on the grounds of security.

Oppert, Julius (1825-1905), Ger. Assyriologist, b. Hamburg of Jewish parents. He made a special study of auct Persian, and in 1847 pub. *Lausystem des Altpersischen*. In 1857 he became prof. of Sanskrit at the School of Languages at the National Library in Paris, and in 1874 was appointed to the chair of Assyrian philology in the Collège de France. He was also employed on various philological

missions by the Fr. Gov. His main publs. include *Histoire des empires de Chaldée et d'Assyrie*, 1865 (with J. Ménant), *Documents juridiques de l'Assyrie et de la Chaldée*, 1877, *Le Peuple et la langue des Mèdes*, 1879, and *Trois mille ans de science chaldéenne*, 1896.

Oppian, author of 2 didactic poems in Gk hexameters. Modern criticism favours the view that the poems are by 2 writers of the same name. *Halieutica*, a poem of about 3500 lines, on fishing, dedicated to Aurelius and his son Commodus, was probably written by a native of Anazarba or Corycus in Cilicia, who flourished in the reign of Marcus Aurelius (161-80). *Cynegetica* (2150 lines), on hunting, is dedicated to Caracalla, which places its date after AD 211, and its author was probably a native of Apamea or Pella in Syria. Both works are ed. with trans. by A. W. Mair, 1928.

Oppland, inland co. of Norway, including the prosperous Gudbrandsdal valley, which runs to Lake Mjøsa, and the famous Jotunheimen mt range. The land is high to the N. and low to the S. Forestry and agriculture are of great importance; O. is also one of Norway's most popular holiday areas. Lillehammer is the cap. Area 9608 sq. m.; pop. 160,400.

Ops, Rom. nature goddess, wife of Saturn, and mother of Jupiter, symbolical of plenty and fertility, and protectress of agriculture. She shared her temples and festivals with Saturn, and on the Capitol she shared the honours with her son Jupiter. See also CYBELE.

Opsonins (Gk *opsōnēin*, to obtain food). The capacity of the white blood corpuscles to absorb and digest invading bacteria (phagocytosis, q.v.) was shown by Douglas and Sir Almroth Wright in 1903 to depend on the presence of O. in the blood serum: white corpuscles washed free from serum are unable to carry out phagocytosis. In addition to normal opsonin, which has a generalised action on all bacteria, special O. or bacteriotropins are formed against specific bacteria as a result of immunisation. The opsonic index of a patient is the ratio of the number of bacteria ingested by a white corpuscle in the patient's serum to the corresponding number for normal serum; it varies between about .5 and 2, being high in patients who have been immunised or are convalescing from a disease. See BACTERIA, Immunity.

Optic Nerve, see EYE.

Optical Glass, see GLASS.

Optical Illusion, see ILLUSION and MIRAGE.

Optician. An 'ophthalmic O.', according to the National Health Service Act of 1946, is a person having the prescribed qualifications in optics (q.v.), including the measurement of errors of refraction, in orthoptics, and in the fitting and supply of optical appliances. A 'dispensing O.' is a person having the prescribed qualifications for the fitting and supply of spectacles.

Optics, science that deals with the phenomena of light and vision. O. is usually divided into 3 branches: (1) physical O., for which see LIGHT; (2)

physiological O., see VISION; and (3) geometrical O., with which the present article is concerned. It is a matter of everyday experience that we cannot see round corners, a fact that suggests that light must in some sense travel in straight lines. The belief is strengthened by taking a number of opaque screens punctured by a small pin-hole and arranging them so that a straight line can be drawn from a source of light through the pin-holes to the eye. The source of light can then be seen, but if one of the screens is shifted slightly, no light enters the eye, showing that, to a very close approximation at least, light travels in straight lines. Refined apparatus shows that this is only an approximation, however (see DIFFRACTION), but for many practical purposes it is assumed that light does travel in straight lines, and the straight lines of light are called rays of light. When light strikes the surface separating 2 media, one or both of two things may happen: viz. (1) the light may be reflected at the surface; (2) the light may be refracted into the second medium (in each case some absorption of light takes place). The 2 laws governing the first of these events are known as the *Laws of Reflection*: (a) the incident ray, the reflected ray, and the normal to the reflecting surface at the point of incidence lie in the same plane; (b) the angle of incidence is equal to the angle of reflection where the angles of incidence and reflection are the angles that the directions of the rays make with the normal at the point of incidence. The *Laws of Refraction* are: (a) the incident ray, the refracted ray, and the normal to the surface separating the 2 media at the point of incidence lie in the same plane; (b) the ratio of the sine of the angle of incidence to the sine of the angle of refraction is a constant for 2 given media and is known as the refractive index of the second medium relative to the first. The ratio is actually the ratio of the velocity of light in the first medium to its velocity in the second (the ratio varies for different coloured lights).

The function of geometrical O. is to reduce the behaviour of all types of mirrors, plane, spherical, paraboloidal, etc., and of all types of refracting bodies, plane, spherical and cylindrical surfaces, lenses, prisms, and systems of lenses, to simple, general terms derived from the application of the laws of reflection and refraction to the case under discussion, making use of the propositions of Euclidean geometry. Some of the results are summarised below.

Plane mirror. The image of a point is as far behind the mirror as the object is in front of it, and the line joining the object and image is normal to the mirror.

Spherical mirror. If the radius of the sphere of which the mirror is a small portion is r , then the position of the image of a point object on the axis of the mirror

is given by the equation $\frac{1}{v} + \frac{1}{u} = \frac{2}{r}$, where u is the distance of the object from the mirror, measured along the axis, and v is

the distance of the image from the mirror, measured along the axis. All these distances are reckoned positive if measured in the direction opposite to the incident light, negative if measured in the same direction as the incident light. (Convention of signs.)

Spherical lens. The position of the image of a point on the axis of a lens is given by the equation

$$\frac{1}{v} - \frac{1}{u} = (\mu - 1) \left(\frac{1}{r_1} - \frac{1}{r_2} \right)$$

where v and u are respectively the distances of the image and object measured from the centre of the lens, μ is the refractive index of the material of the lens relative to the surrounding medium, r_1 and r_2 are the radii of curvature of the front and back surfaces of the lens respectively. All the distances are measured in accordance with the convention of signs given above. See also REFLECTION, REFRACTION, and other articles on various branches of light. See E. Holmvard and F. Barraclough, *Heat, Light and Sound for Beginners*, 1931; R. A. Hous-toun, *Treatise on Light*, 1938; W. J. Humphreys, *Physics of the Air* (3rd ed.), 1940; B. K. Johnson, *Practical Optics*, 1947; W. E. Williams, *Applications of Interferometry*, 1950; R. A. Sawyer, *Experimental Spectroscopy*, 1951; C. Candler, *Modern Interferometers*, 1951; C. Curry, *Geometrical Optics*, 1953; L. C. Martin, *Geometrical Optics*, 1955.

Optimism (Lat. *optimus*, best), word having both a strictly philosophical and a popular sense. The well-known doctrine of Leibnitz, in his *Essais de Theodicée*, 1710, that 'everything is for the best in this best of all possible worlds,' may be taken as the extreme of the optimistic philosophical doctrines. Leibnitz did not mean that everything in the world was perfect; but while admitting the existence of evil he maintained that the monads, of which he believed the universe to consist, strive after ultimate perfection. Therefore of all the infinite number of possible worlds which presented themselves to the mind of the Creator, the existing one was the best possible. The evil which Leibnitz admitted to be in the world he divides into 3 kinds: metaphysical, physical, and moral. The explanation of the 2 first named, that one is unavoidable in a created being, while the other is a punitive and admonitory agent, is much more satisfactory than that of the last; it is that problem which Leibnitz's system, like many others, fails to solve. The milder form of O., which believes that on the whole the universe is advancing towards a better state of things, is more properly called mellorism or evolutionism. Generally speaking, a teleological view of the universe connotes some form of O., which is found in conjunction with idealistic rather than materialistic theories. In the popular sense of the word O. means the belief that 'there is a soul of goodness in things evil,' and that whatever exists is right in some inscrutable fashion, or can be

made the means of good. Alternatively O. may simply mean the habit of 'looking on the bright side of things,' which naturally springs from a belief in the ultimate triumph of good. The opposite of O. is pessimism (q.v.).

Optina Pustyn', former famous monastery in the Kaluga oblast of central Russia, founded in the 15th cent. In the 19th cent. it was a much visited centre of the activities of the Staretsy (see STARETS), who exercised strong influence on Russian spiritual and intellectual life.

Optional Clause, otherwise Article 36, paragraph 2, of the Statutes of the Court of International Justice (see also INTERNATIONAL COURT OF JUSTICE). The statutes, in the original draft, gave the court compulsory jurisdiction in certain classes of disputes as between all members of the League of Nations, the chief of which concerned the interpretation of treaties, any question of international law, and the nature or extent of reparation for the breach of an international obligation. But in the final draft there was substituted a clause which members could adopt by declaring that they would recognise as compulsory *ipso facto* and without special agreement, in relation to any other member accepting the same obligation, the jurisdiction of the court in the above noted classes of disputes. This is the O. C. In 1940 there were 38 states adherent to the O. C. (Germany did not renew her signature, and Japan withdrew from the court in the same year), including Great Britain, the dominions, and other leading countries. In 1940 Britain renewed for a further 5 years its acceptance of the jurisdiction of the permanent court, under the same reservations as previously, and with the further reservation that it was not prepared to accept the court's jurisdiction in disputes 'arising out of events occurring at a time when His Majesty's Government are involved in hostilities.'

Opuntia, Prickly Pear, family Cactaceae, a genus of over 200 species found in the Americas; often large shrubs or trees, spiny stems, and short tubed, yellow or red flowers. Some species, transplanted to S. Africa and Australia as fencing subjects, became obnoxious weeds, now controlled biologically by a small parasitic insect; de-spined and processed, O.s may be used for cattle fodder. A few species are grown as ornamental plants indoors.

Opus (Lat. 'work'). Its abbreviation Op. is used as a prefix to enumerations of a composer's works. Its It. equivalent, *opera*, at first had the same meaning, but is now used almost exclusively in its later specific sense.

Opus Signinum, common form of Rom. floor or pavement made of cement with which is incorporated crushed brick or tile.

Opwijk, tn in the prov. of Brabant, Belgium, 11 m. NW. of Brussels; mainly engaged in agriculture. Hops and flax are largely cultivated. Pop. 8800.

Orach, see ATRIPLEX.

Oracle (Lat. *oraculum*, from *orare*, to speak), place at which a deity answers the questions of his votaries through the mouth of his inspired minister, or the

response given. Recourse to O.s is found among most of the nations of the ancient world, but the practice is specially studied with reference to the Gk examples. Such methods of divination include: (1) that which depends on an examination of certain phenomena interpreted according to rule; (2) that in which the O. is delivered in trance or frenzy by an inspired priest or priestess; (3) direct revelation in dreams, or by intercourse with spirits. To the first class belong all methods of divination by animals and the examination of their entrails when sacrificed. The second class was also common in Greece, though few of the oracular shrines were really famous. The best known, then as now, was the O. of Apollo, at Delphi, which appears to have been a sacred place at least from the 2nd millennium bc. Questions were put to the Pythia (priestess) by a male prophet who also recorded the answer, usually in hexameter verses. The Pythia herself delivered these answers in a state of frenzy induced by some unknown means, and not, as was once supposed, by vapours rising from the earth. O.s are frequently used in primitive societies. For a detailed account of one such, see E. E. Evans-Pritchard, *Witchcraft, Oracles, and Magic among the Azande*, 1937; H. W. Parke and D. E. W. Wormell, *The Delphic Oracle*, 2 vols., 1956. See also DIVINATION.

Oradea, formerly *Grosswardein*, tn of Rumania, cap. of prov. of Oradea, near the Hungarian border; until 1918 part of Hungary. O. lies on the Cris, 80 m. WNW. of Cluj. It was ceded in 1940 to Hungary, and returned to Rumania after the war. Reputedly founded in 1080 by St Ladislaus, it contains an old fortress and many public buildings, including bishops' palaces, since it was the seat of Orthodox, Rom. Catholic, and Uniate bishops. Pottery making and distilling are carried on. Pop. (1948, mainly Magyar) 82,282.

Oradour-sur-Glane, Fr. vil. in the dept of Haute-Vienne, 12 m. NW. of Limoges (q.v.). It was the scene of an atrocity during the Second World War when 643 of its inhab. were massacred by Ger. troops. Alleging, without foundation, that an arms dump had been found there, the Germans, on 10 June 1944, shot all the men of the tn in a barn in batches of 20. The women and children were driven into the church, the doors of which were locked after a large case of explosives had been deposited inside. This case exploded soon afterwards and, when the building was in flames, Ger. soldiers heaped chairs and benches on the imprisoned victims, on whom the roof then collapsed. Meanwhile Ger. soldiers drenched all the houses and barns with some incendiary substance and set the whole place ablaze. The Bishop of Limoges condemned the atrocity and summoned the people of Limoges to a memorial service in Limoges Cathedral on 16 June. When the service, attended by thousands of people, was held, time bombs were discovered in the crypt of the cathedral. These had been put there by members of the Vichy militia. It is said

that the Germans had intended to burn not O.-sur-G., but Oradour-sur-Vayres, which is in a dist. where there was serious fighting between the men of the *maquis* (Fr. resistance forces) and the Germans.

Orasla Jökull (the frozen mount of solitude), volcano, and the highest mt in Iceland, situated in the SE. of the country, and adjoining Vatna Jökull on the S. It reaches a height of 6952 ft. Eruptions occurred in 1341, 1362, 1598, and 1727. It was first ascended in 1891 by an Englishman, F. W. W. Howell. See his *Icelandic Pictures*, 1893.

Orage, Alfred Richard (1873-1934), Brit. journalist, b. Dacre, Yorks. Educ. privately, he was a teacher in Leeds till 1905, and came to London as a journalist in 1906. With Holbrook Jackson he took over the editorship of the *New Age*, which under his direction soon became a forum for the views of the best-known journalists, as well as for O.'s incisive weekly commentary. O. wrote 2 books on Nietzsche (*Friedrich Nietzsche: the Dionysian Spirit of the Age*, and *Nietzsche in Outline and Aphorism*), whose principles he applied to sociology in his propaganda for national guilds. After the First World War he became a protagonist of the Douglas Social Credit plan until he gave up the editorship of the *New Age* in 1922. For 2 years he lectured in America on literature and psychology, and on his return to England in 1932 founded the *New English Weekly*, in which he advocated financial reform on Douglas credit principles. An *Alphabet of Economics* appeared in 1917. See memoir by P. Mairret, 1936.

Orakzais, Pathan tribe of NW. Pakistan, inhabiting the mts of Tirah, on the Kohat border. Their origin is obscure. Risings among them were put down by the British in 1855, 1868, 1869, 1891, and by the Tirah expedition under Sir Wm Lockhart in 1897-8.

Oran: 1. Most westerly dept of Algeria, divided into the 4 arrons. of O., Mostaganem, Sidibel-Abbes, and Tlemcen. The dist. is fertile and rich in minerals. Area 23,450 sq. m.; pop. 2,173,700.

2. Cap. of above dept, a fortified seaport standing at the mouth of a small stream, at the foot of the Sainte Croix, 70 m. NE. of Tlemcen. It is a Fr. naval station and has a moderately good harbour, and there is an excellent one at Mers-el-Kebir, 3 m. distant. Most of the tn is modern and well built after the Fr. style. It is a centre of the wine industry, and has a large export trade in grain, wine and spirits, livestock, hides and wool, and esparto grass. The climate is healthy though hot. It was in the hands of Spain during 1509-1708 and 1732-92, when it was abandoned after being largely destroyed by earthquakes. It was occupied by France in 1831.

In July 1940, after the Hitler-Pétain armistice, the Brit. Gov. gave a 6-hr ultimatum to Fr. ships at O. They were offered, but rejected, conditions which were intended to prevent Germany and Italy from seizing them. A Brit. battle squadron under Adm. Somerville (q.v.)

attacked them, assisted by aircraft. One Fr. battleship was sunk and another damaged, one battle cruiser was damaged, and two destroyers and a seaplane carrier were set on fire and sunk. There were only slight Brit. casualties (3 July). The Pétain Gov. broke off diplomatic relations with Britain as the result of this action. On 6 July It. ships were bombed at O. U.S. troops landed near O. on 8 Nov. 1942. Pop. 299,018.

Orang-outan, or **Orang-utan** (*Pongo pygmaeus*, or *Simia satyrus*), member of the family Simiidae, which is found solely in Borneo and Sumatra. In colour it is

Mirrorpic

ORANG-OUTAN

tawny, and in height averages about 4 ft. The brachycephalic condition of the head is very marked, the fore-limbs touch the ankles when the animal is erect, both hallux and pollex are short, and the former is usually devoid of a nail; the dorsolumbar vertebrae are 16 in number. The O. is arboreal, and when on the ground it walks on the outside of its feet. During the night-time it sleeps in a nest which it builds in the trees. In habit it is solitary except during the pairing season, and in diet it is mainly frugivorous. See Winifred Felce, *Apes*, 1949.

Orange, House of, ruling family of a once independent principality now included in the dept of Vaucluse, France, and to-day occupying the throne of the Netherlands (q.v.). The male line of Gerald Adhemar (d. 1086) ended in 1174 when the heiress married Bertrand de Baux. Nine princes of his line followed one another until another heiress, Marie de Baux, married Jean de Châlons in 1393. His descendant, Philibert (1602-30), was an able soldier and

for his part in the campaign of Charles V was rewarded by the emperor with extensive possessions in the Netherlands. Philibert was succeeded by his nephew, René of Nassau-Châlons, whose father, Henry, Count of Nassau, had also enjoyed the emperor's confidence. René on his death in 1544 devised his titles and estates to his first cousin, William of O.-Nassau, famous in hist. as William the Silent. The princes of this line rendered service to the causes of Dutch independence and of Protestantism. William the Silent was assassinated in 1584. His great-grandson became William III of England; but on his death in 1702 the succession was disputed by the King of Prussia and John of Nassau-Dietz. The peace of Utrecht (1713) effected a compromise. The Prussian claim was abandoned, the ter. of O. was incorporated in France, and John was given the title Prince of O. In 1815 his descendant, William VI, became King of the Netherlands as William I. See M. E. Grew, *The House of Orange*, 1947.

Orange: 1. City of Essex co., New Jersey, U.S.A., 12 m. W. of New York. It is a favourite residential centre, and manufs. clothing, chemicals, brushes, auto accessories, cement and concrete products, electrical supplies, etc. Pop. 38,030.

2. Co. seat of O. co., Texas, U.S.A., on Sabine R., 90 m. NE. of Galveston. Pop. 21,000.

3. Fr. tn in the dept of Vaucluse, near the Rhône and the Aygues, 13 m. N. of Avignon. A synod held here in 529 was of importance in the Pelagian (see PELAGIUS) controversy. It was the cap. of the co., later the principality, of O. from the 11th to the 16th cents.; in 1544 it passed to William the Silent (q.v.), and hence gives its name to the ruling family of Holland (see HOUSE OF ORANGE). It was taken in 1672 by Louis XIV, and was confirmed in Fr. possession by the treaties of Ryswick in 1697 and Utrecht in 1713 (qq.v.). There are notable Rom. remains, including a theatre, a triumphal arch, and an amphitheatre. Foodstuffs, textiles, brooms, and jewellery are manuf. Pop. 14,000.

4. Tn of New S. Wales, Australia, on the E. slopes of Mt Canobolas, 170 m. WNW. of Sydney. Farming is carried on, it is one of the best fruit-growing (cherries, apples, pears, plums, grapes, peaches, figs, etc.) dists. of Australia, and sheep are raised. Pop. 18,570.

Orange. *Citrus aurantium* is the Seville or Bitter O., its petals yielding the perfume, Oil of Neroli, and its fruit being used for marmalade; *C. bergamia*, the Bergamot O., the peel of which yields an essential oil for Eau de Cologne; *C. sinensis*, the Sweet O., *C. nobilis*, the King O., and its variety *deliciosa*, the Mandarin or Tangerine O., esteemed for their edible fruits. Having their origins in tropical Asia, O.s and hybrid fruits are now grown in many warm countries commercially, notably California and Florida of U.S.A., Brazil, S. Africa, W. Indies, and Spain. Being evergreen, they yield more or less continuously in suitable climates. In Britain they are chiefly grown for

ornamental purposes and the fragrance of their flowers in cool greenhouses, but will fruit if given sufficient heat.

Orange Free State, formerly a S. African Boer rep., now a prov. of the Union of S. Africa, bounded on the W. and S. by Cape Prov. (the Orange R. forms the S. boundary); on the N. by the Vaal R.; and on the E. by Basutoland and Natal. The high veld of the O. F. S., with the Transvaal, lies across the westward-sloping surface of the plateau of S. Africa, the Vaal and Orange R. system carrying the waters of the E. through the Kalahari desert to the Atlantic Ocean. Its surface mainly consists of undulating, grassy plains and plateaus, sloping towards the N. from the Drakensberg Mts in the SE.; to the E., on the Basutoland border, it is hilly. Generally speaking, the country lies at an altitude of 4000 to 5000 ft above the sea. It is watered by the Vaal and Orange R.s, with their tribs. the Modder, Caledon, etc. The climate is temperate and healthy, with moderate rainfall. Stock farming, to which the country is admirably suited, forms the main industry, sheep, cattle, horses, and pigs being largely bred. An increasing amount of land, especially in the E., is being devoted to agriculture, which receives every encouragement from the gov. There are over 250,000 ac. under wheat. Maize, potatoes, oats, fruit, and tobacco are also grown. There is considerable mineral wealth. Diamonds are found near Jagersfontein and Koffyfontein, and the produce averages over £1,000,000 in value annually. (In Jan. 1919 the find of a stone of 388 carats was reported.) Coal is mined just S. of the Vaal, and to a lesser extent in Vierfontein. Iron ores, gold (*see* ODENDAALSRUST), and salt are also found. Trade is mainly carried on with the U.K. Cottons, wool, leather and hides, diamonds, etc., are exported. During the Second World War diamonds, and particularly industrial diamonds, showed a decided boom, and the diamond mine at Jagersfontein is expected to reopen as soon as machinery is available. The cap. is Bloemfontein. Other important tns are Harrismith, Smithfield, Ladybrand, and Jacobsdal.

The prov. has an administrator aided by a prov. council of 25 members (elected for 5 years). There is an executive committee of 4 members. It sends 8 members to the Senate and 13 to the House of Assembly of the Union Gov. The O. F. S., like the Transvaal, has never extended the franchise to any but the white pop. Justice is administered under the Rom.-Dutch law. The prin. religious body is the Dutch Reformed Church. Education is free up to matriculation standard and compulsory up to the age of 16, but exemption may be granted in special cases or when a child has passed standard vi and is in regular employment. Unless parents object, the 2 official languages, English and Afrikaans, are taught to all pupils, the home language of the pupil being the chief medium of instruction and the second language being introduced gradually during the primary school course.

Higher and technical education are under the control of the minister of education for the Union, while primary (including elementary) and secondary education are controlled by the administrator of the prov. There are about 451 European public schools and about 11 aided private schools, with a total enrolment of 40,600 pupils; and about 548 non-European public and aided schools, with total enrolment of 61,300, and 4 training institutions for native teachers. Area 49,647 sq. m. The census of 1951 gave a pop. of 1,018,207 (European, estimated 1953, 238,000; non-European, 775,702; others, 7918).

History. The earliest Boer settlement on the N. of the Orange R. was made about the year 1828, after which came the Great Trek of 1835-6, when 10,000 people, following the refusal of the Brit. Gov. to agree to the extension of the colonial boundary to the Kei R. as a move against predatory Bantu, and also in consequence of the abolition of slavery, crossed the Orange R. to escape altogether from Brit. rule. These settlers, however, soon quarrelled with the Griquas, who were under the protection of the Brit. Gov., with the result that Sir Harry Smith, in 1848, annexed the whole country S. of the Vaal, an event which led to the Boers taking up arms under their old leader, Pretorius, who was defeated at Boomplaat in 1848, and then retired with some of his adherents to the N. of the Vaal. The ter. was then known as the Orange R. Sovereignty. The Brit. Gov., however, in view of increasing difficulties with the Basutos, abandoned the country in 1854, and its independence as the O. F. S. was confirmed at Bloemfontein in that year, much against the will of many of the inhab., who preferred Brit. rule. In the main the subsequent hist. of the O. F. S. was peaceable, but there was some fighting with the Basutos, and, eventually, the ter. of the Basutos was conquered and incorporated in 1869 by the treaty of Aliwal North into the O. F. S. The discovery of diamonds at Kimberley at this time and the consequent influx of diggers led to a dispute with the Brit. Gov. over the boundary of the O. F. S., which was settled in 1876 by a convention signed in London providing for a payment by Great Britain of £20,000 in commutation of the claim of the O. F. S. This convention was signed by Brand, whose moderation and statesmanlike qualities as president had won general recognition. In 1889, not long after his death, the O. F. S. entered into an alliance with the S. African Rep., which was renewed in 1897, and this alliance was appealed to as binding the O. F. S. to assist the S. African Rep. in her quarrel with Great Britain in 1899. The rep. took a prominent part in the S. African war of 1899-1902, and was made a Brit. crown colony (Orange R. Colony) in 1900. In 1907 responsible gov. was granted, and in 1910 the colony was merged in the Union of S. Africa as the prov. of the O. F. S.

Native administration. In the O. F. S. the native pop. in the reserves was never large and, despite immigration, it is still

far lower in proportion to Europeans than in any other prov. of the Union. Formerly there was a Dept of Native Affairs, but it was abolished in 1908, when native administration was entrusted to the colonial secretary's dept. From the outset it gave no general recognition to native law, though, by a special enactment, it acknowledged the legality of native marriages in the Thaba Nchu reserve and, by later enactments, a limited system of intestate succession derived from Rom.-Dutch law was introduced. Three chiefs have civil judicial powers, and 2 of these have criminal powers as well, in the native courts. The Native Administration Act, 1927, which gave these powers, also gave statutory recognition to native law in all provs. of the Union. This, though it obviated embarrassment arising from the previous limited recognition, was really in harmony with the political objective of segregation, and was directed less to the maintenance of native law for its own sake than to differentiating its field. There are 4 Native Reserve Boards, whose nominated members sit under the chairmanship of a magistrate, and derive their resources from the local tax imposed by the Natives Taxation and Development Act. There are to-day only 3 small reserves, one comprising lands assigned to Mopeli, a Basuto chief who submitted during the Basuto war of 1865-6; the others consisting of the remainder of the lands which the Basuto assigned in 1829 to a section of the Barolong which had been driven out of Bechuanaland: the latter were left in possession by the Voortrekkers in consideration of help rendered by them against the Basuto. As in other provs. of the Union there is a complicated system of pass laws. The regulations under the Native Administration Act, 1927, require the native to take out a pass to enter or travel within any 'pass area,' i.e. anywhere within the O. F. S. and Transvaal except native areas scheduled under the Native Land Act of 1913. The rigidity of the system is, however, mitigated by the issue of travelling passes by officials and owners of farms, and by the grant of exemptions. There are also in Bloemfontein and other large towns 'locations' for natives. Over 50,000 natives live in the Bloemfontein location and are said to live under as good conditions as any in the Union. The natives here have cinema shows, concerts, and meetings, a Y.M.C.A., a native dispensary, and an undenominational high school. There are also sev. well-laid-out sports grounds. It has been found that by establishing an advisory board, elected by the natives and to which all matters concerning the location are first referred, the natives have been brought to take a pride in the progress and orderliness of their native tn. See A. H. Keane, *The Boer States*, 1900; J. H. Malan, *Die Opkoms van in Republiek of die Geskiedenis van die Orange Vrystaat tot die Jaar 1863*, 1929; H. J. Wikar, *Journals*, 1935; E. A. Walker, *History of South Africa*, 1935.

Orange River, riv. of S. Africa, rising

in the Mont-aux-Sources, Drakensberg, Basutoland, and flowing generally W. to enter the Atlantic in lat. 28° 38' S. It forms the N. boundary of Cape of Good Hope, separating it from the Orange Free State, Griqualand W., Brit. Bechuanaland, and Great Namaqualand. The chief tribes are the Vaal and Caledon on the r. b., and the Hartbeest and the Zeekoe on the l. b. Its banks are well wooded, but much of the country through which it flows is desert. It is of little use for irrigation owing to the depth of its channel, and sand-bars, shallows, rapids, and falls make navigation impossible. Diamonds are found near the mouth of the O. R. and at various places along its 1100 m. course.

Orange Society, name of an Irish political society with the professed objects of the defence of the Protestant faith and succession. From the time of the Elizabethan settlements in Ireland there was bitter enmity between Catholics and Protestants, and this was intensified by the events connected with the rebellion of 1641 and the Williamite revolution of 1688-90 (see IRELAND, *History*). During the whole of the 18th cent. Ulster in particular was kept in a continuous state of ferment by this semi-religious, semi-political feud. In 1795, when the Protestant party was in the ascendant, the O. S. was formed (taking its name from William of Orange), and it worked to secure Protestant dominance wherever possible. It was organised as a secret society, arranged in lodges. During the 19th cent. it spread widely, having lodges not only in Ireland but also in Great Britain and the dominions, especially Canada. Its activities have sev. times caused Parliament to take action to restrain it. It was entirely suspended in Ireland from 1813 to 1828. The society keeps as high festivals the anniversaries of the battle of the Boyne (1 July) and the battle of Aughrim (12 July). See *Orangemen Exposed* (anonymous, New York, 1824; parl. report on the Orange Association, 1835; Lillburn, *Orangemen*, 1866).

Orangeburg, city of S. Carolina, and co. seat of O. co., 38 m. SSE. of Columbia. It is situated in a rich agric. region. The industries include oil and lumber milling, cotton, grain processing, meat-packing, and foundry and machine shop products. It is the seat of Claflin College and the S. Carolina Agric. and Mechanical College, both for Negroes. Pop. 15,322.

Orangemen, see ORANGE SOCIETY.

Orangery, building having large windows on its S. side, used for growing oranges. There are examples at the palaces of Hampton Court, Kensington, and Versailles (all built between c. 1680 and c. 1710).

Oraşul Stalin, see STALIN (tn).

Oratorio, dramatic form of religious music for concert performance, consisting of solos and choruses, with instrumental accompaniment. The term, however, has been variously defined at different periods in different countries, and, in its beginnings, in the early 17th cent., it had

action, scenery, and costumes, while, sometimes, works not religious in character have been called O.s, evidently because they consisted of the solo, choral, and orchestral features of O. proper while yet not being operas, in that they were not intended for stage performance.

The origin of both the name and the form is usually traced to the oratory of St Philip Neri. About the middle of the 16th cent. this saint commenced a series of biblical lectures at the oratory. In order to make these more interesting, Animuccia, the master of the papal chapel, wrote settings for hymns, *Laudi spirituali*, to be interspersed throughout the lectures. It is probable, however, that the origin of the O., in Germany at least, is connected with the hymns and songs of the old miracle and mystery plays, and also with the usual method of singing the Passion gospel during Holy Week. Emilio de' Cavalieri's *Rappresentazione de anima e di corpo*, 1600, shows the very close affinity between the O. and the opera. Both were founded on the monodic system of harmony, and to this system the It. school adhered more closely than the German. The name of Carlissimi (d. 1674) is particularly important as a developer and exponent of the It. O., set to Lat. words. One of his O.s, *Jephtha*, is founded partly on the scriptural story of Jephtha's sacrifice of his daughter, but it has also lyrical rhymed passages for solo and chorus, and a narrator in the manner of a Bach Passion. In Germany the O. was from the beginning written round the Passion. Heinrich Schütz's (1585-1672) settings of the Passion prefigured Bach but they have a high value of their own. The Ger. school worked on the whole more closely in the polyphonic style of composition than the earlier It. had done. The form was raised to a great height by Bach (1685-1750), whose greatest composition of this kind appeared in 1729, the *Passion according to St Matthew*. The most important composer of O. during the 18th cent. was Handel, whose works in that form belong to the Eng. school, the most famous being *Messiah*, 1741. Other well-known O.s are Bach's *St John Passion*, 1720; Haydn's *Creation*, 1798; Beethoven's *Mount of Olives*, 1814; Mendelssohn's *St Paul*, 1836, and *Elijah*, 1846; Berlioz's *Childhood of Christ*, 1854; Liszt's *St Elizabeth*, 1865; Franck's *Beatitudes*, 1879; Dvořák's *St. Ludmila*, 1886; Parry's *Judith*, 1888; Stanford's *Eden*, 1891; Elgar's *Dream of Gerontius*, 1900, *The Apostles*, 1903, and *The Kingdom*, 1906; Honegger's *King David*, 1921; and Walton's *Belshazzar's Feast*, 1931.

Oratory, art of rousing the emotions and convincing the understanding of others by public speech according to the rules of rhetoric. It may be classified as political, forensic, and religious. The ancients experienced no strong religious passion, so that their O. was confined to the courts and the legislative assembly. Before Demosthenes the prin. orators of Athens were Lysias and Isocrates. The speeches alleged to have been delivered by Pericles and recorded by Thucydides are probably

the composition of the historian; yet some of them remain among the most moving utterances of hist. Demosthenes stands apart from and above all others. An eclectic in style, he achieved a synthesis which makes him still the leader of human eloquence to whom alone of the Athenians Aeschines yields the palm of O. At Rome the rugged eloquence of Cato, the Scipios, and the Gracchi gave way before the Attic influence. It has been said that a certain oriental strain marred the speeches of Hortensius; but the great forensic orations of his rival Cicero rank with, and, in the opinion of some, even surpass, the achievement of Demosthenes. As at Athens, so at Rome, the end of freedom marks the decay of eloquence. After the extinction of imperial despotism 2 causes hindered the rebirth of O. There was a lack of political and legal institutions, which have always been the nursery of eloquence, and language itself was undergoing a long and difficult transformation.

The Eng. language, together with the parl. tradition and the hallowed dignity of the Eng. courts, has fostered a high standard of O. The names of Lord Chatham, Pitt the younger, Charles Fox, Lord Brougham, Disraeli, and Gladstone adorn the 18th and 19th cents.; and the splendour of their debates was enhanced by the speeches of their Irish colleagues Edmund Burke, Henry Grattan, Richard Sheridan, and Daniel O'Connell. In France the voices of Mirabeau, Desmoulins, and Danton heralded and sustained the revolution. Later, in America, the outstanding representative of eloquence was Abraham Lincoln, whose Gettysburg speech is ranked by some critics with the greatest oratorical triumphs of the old world. The 20th cent. has experienced a decay of culture; and this decay has been marked by a lack of orators to interpret and control the portentous happenings of these 50 years. Two notable exceptions have been the impassioned demagogues of Adolf Hitler and, more important, the parl. and broadcast speeches of Winston Churchill during the Second World War. These swayed the destiny not of a single nation but of the world. Eng. forensic O. has enjoyed an equal splendour and suffers a similar eclipse. The eloquence of Henry Hawkins, Edward Carson, Rufus Isaacs, and F. E. Smith remains the glory of the Eng. Bar and Bench. Religious O. reached its perfect flower in France. St Bernard of Clairvaux and Jean Gerson dominated the pulpit in the Middle Ages. The semi-political wranglings of the reformers were not fertile ground for the selfless passion which inspires the great pulpit orator; but from the 17th cent. onwards there arose a succession of preachers who, independently of the religious content of their discourses, rank with the finest speakers of the world. Bossuet, Bourdaloue, Fénelon, Massillon, and Lacordaire have no equals as exponents of the Christian faith and the duties of the Christian life. See also RHETORIC.

Oratory of St Philip Neri, Congregation of the, was founded in 1556 at the hospital

of San Girolamo della Carità, Rome, by the saint whose name it bears (see NERI, PHILIP, Sr). The society had at first no definite rules; but after the death of St Philip a constitution conformable to his spirit and intention was drawn up by the historian Baronius, one of his earliest companions. The Oratorians are priests living in community under simple vows terminable at any hour. The Oratory was introduced into England by Newman in 1847, the first house being at Maryvale, near Birmingham, later transferred to Birmingham itself. The Brompton Oratory is an independent offshoot of this.

A Fr. oratory was founded in 1611 by Cardinal de Bérulle, and called the Congregation of the Oratory of Our Lord Jesus Christ. The general intention was to strengthen eccles. discipline, and the rule was also adopted by the Oratory of the Immaculate Conception, founded in 1852 in Paris.

Orbetello, see ARGENTARIO.

Orbigny, Alcide Dessalines d' (1802-57), Fr. naturalist, b. Couëron, Loire-Inférieure. He was appointed travelling naturalist to the Museum of Natural Hist., Paris; and in 1826-34 went on a scientific mission to S. America, embodying the results of his researches in zoology, palaeontology, and ethnology in *Voyage dans l'Amérique méridionale*, 1839-42. Among his other works were *Galerie ornithologique des oiseaux d'Europe*, 1836-8, the unfinished *Paléontologie française*, 1840-54, and *Prodrome de paléontologie stratigraphique*, 1850-2.

Orbilius, Pupillus, see PUPILLUS.

Orbis Sensualium, see COMENIUS.

Orbit, path traversed under the influence of gravitation by a heavenly body round its primary. In the solar system ellipses are traced by satellites round their planets, and by planets round the sun, the primary occupying one of the foci. The elements provided when an O. has been computed are the long. of perihelion, the long. of the ascending node, the inclination of the O., the eccentricity, the semi-axis major or mean distance, and the time of perihelion passage. The planetary O.s vary in eccentricity from 0.007 to 0.25, those of satellites from 0 to 0.76. Periodic comets move in elliptical O.s from about 0.11 to 0.9999 eccentricity; most comets move to nearly parabolic paths, while sev. trace a hyperbola. But all of these latter formerly moved in elliptic O.s, and were thrown into hyperbolic O.s by the perturbations of the major planets.

Orades, Lat. for Orkney Is. (q.v.).

Oragna, or L'Aragno († 1308-c. 1368), nickname (the archangel) of Andrea di Cione, Florentine painter, sculptor, and architect. His work is rich in colouring and ornamental in effect, though rather hard and conventional in execution. Among his masterpieces are the wall paintings in fresco and an altar-piece in the Strozzi Chapel, Santa Maria Novella, Florence; the frescoes in the Campo Santo at Pisa; the altar-pieces in tempera, 'The Coronation of the Virgin' (National Gallery, London); and in architecture,

the church and tabernacle of Or San Michele, Florence. He left sev. unfinished works, completed by his brothers Nardo and Jacopo.

Orchard, large or small plantation of fruit trees. Modern O.s consist of 'straight' plantings of apples, pears, plums, and cherries. Best soils for fruit are of a loam character, with certain types of sands or clays for second choice; no fruits do well in soils subject to water-logging or drying out. For apples, deep, sandy, gravelly, or clayey loams, with good draining subsoils, are best. For pears, medium to heavy loams. Plums do best on heavy to medium loams, and are more tolerant of wet soils than other fruits. Cherries like medium to light loams, and deep, well-drained soils. Soft fruits are less exacting and thrive on most soils, given adequate organic matter content. Land sloping to the S., W., or N. is preferable to that sloping to the E. Protection by windbreaks, natural or made, is needed on land fully exposed to the SW. Maximum sunlight in summer is essential. Elevation is important. High land is generally preferable to low, but the crucial factor is the movement of air currents. An O. should be sited and planted so that the heavy cold air can move through it easily to lower levels beyond. Frost pockets and narrow valleys should be avoided. A minimum rainfall of 20-25 in. per annum is needed for fruit crops. It is not good practice to plant O.s with 'filler' trees to be taken out some years later, and undercropping of tree fruits with bush fruits needs careful planning. A modern O. is planted for permanency from the start. Where circumstances dictate mixed plantings, gooseberries may be planted with apples, black currants with plums, cherries with plums, but not apples with plums or cherries, since soil and manurial requirements must be similar. Plums or damsons may be planted on the windward side of O.s. Raspberries, strawberries, and brambles are planted separately. Five systems of planting prevail: square, rectangular, diagonal, quincunial, and hexagonal. Spacing depends on type and habit of tree chosen. Gooseberries and currants may be planted at 6 ft apart (1210 trees per ac.); bush apples and pears at 12 ft apart (302 trees per ac.); half-standard apples, pears, and plums at 24 ft apart (75 trees per ac.); and full standard tree fruits at 30 ft apart (48 trees per ac.). Land for fruit should be deeply ploughed, and the subsoil broken up if hard and panned. No manure is necessary for tree-fruit planting, except potash on light or deficient soils. Soft fruits should have dung or compost ploughed or dug in before planting. If drainage is needed drains should be laid after the orchard has been laid out, but before trees are planted. Drains should run between the rows of trees into the main drain. Actual planting is done in dry open weather from about mid Oct. onwards, but is best completed before Dec. Planting holes should be 9-12 in. deep, and 24-36 in. in diameter for tree fruits. Subsoil is broken up with

a fork, then a little top soil put back so that the tree is planted in good top soil entirely. Firm planting is vital, but ramming of the soil, particularly clays, is undesirable. All trees need staking; bush trees can be staked with stakes driven slantwise, pointing into the prevailing wind, standards and half-standards are best given 2 stakes about 18-24 in. apart on each side of the tree, with a cross-piece fastened to the tree, 12 in. below the branching head. The O. floor should be cultivated and kept free from weeds and grass until tree growth is well developed.

Grass orchards are less popular. Although stock such as poultry and sheep can be run under half-standard or standard trees, manurial treatment tends to become unbalanced. Grass has a starving effect on tree growth, and O.s should not be planted direct in grass. When trees are well developed it is permissible to allow grass to grow over the roots, but it should be kept short by cutting or grazing with stock, and careful attention given to manuring and fertilising of trees. Sheep suit fruit best, as their excrement has a high potash content; geese are excellent, then poultry; pigs and cows are less suitable, since their excrement is less evenly distributed. Overstocking should be avoided, and the land rested from stock and limed periodically. Temporary cover-cropping of O.s with leguminous seed mixtures is helpful in building up organic content of soil. Intercropping of fruit with vegetables interferes with spraying programmes. Good regular yields of fruit depend largely on manuring. Broadly, desert apples, red currants, and gooseberries need potassium mainly, supplemented by nitrogen and phosphorus; cooking apples, pears, cane fruits, and strawberries require potassium, but heavier supplements of nitrogen; while stone fruits, black currants, and nuts need plentiful nitrogen and moderate amounts of potassium and phosphorus. In practice, manuring must be related to pruning, cultivating, soil, drainage, and type and variety of fruit and tree.

Orchard house. A lean-to or span-roof glasshouse for the culture of fruit trees in pots should preferably be not less than 20 ft wide, 12 ft high at the ridge, and 6 ft at the side. All sides should be made to open panel-wise for free ventilation. Sufficient heating to nullify spring frosts in Mar.-April is desirable. Pot trees can provide a greater variety of fruit from a given space than outdoor trees. Fruit ripens 1 to 2 weeks earlier. Success depends upon management and attention to watering, syringing, top dressing, and feeding to maintain health and fertility. Apricots, figs, nectarines, and peaches can be kept constantly in the house. Apples, pears, and plums can be placed out of doors in a favourable situation from early June to early Feb. Currants, gooseberries, and cherries are best cropped under glass, and then put outside until early Feb. Trees should have been grown in pots from the time they were grafted or budded, and should be 3 to 4 years old, well furnished with fruit buds. Size of

pots are 12-16 in. Trees are grown in a compost of 1 part by bulk each of coarse sand, leaf mould, rotted manure, mortar rubble, and 5 parts medium loam, plus 12 oz. bone meal and 6 oz. of a balanced fruit fertiliser to every barrowful of compost. Repotting is done in mid Oct., but is not necessary every year. Healthy trees need only a little old soil removed from the surface and sides, and replaced with fresh compost. Trees are wintered out of doors after watering well, and plunging to the rims of the pots in ashes. Pots are then covered with organic litter to keep frost out. In Feb. trees can be moved into the house. Indoor trees usually need pollinating by hand, using a rabbit's scut or camel-hair brush when flowers are open. Fruits should be well thinned, and all fruit trees in pots need careful pruning. Apples, pears, cherries, currants, and gooseberries are summer-pruned. In the case of nectarines, peaches, and plums, main shoots are cut back by one-half and laterals to 2 to 3 buds of their base.

Orchardson, Sir William Quiller (1835-1910), artist, b. Edinburgh. He first exhibited at the Scottish Academy in 1848. In 1862 he settled in London, where for some time he worked in close association with John Pettie (q.v.). He was elected A.R.A. in 1868, and in 1877 made R.A. In 1870 he visited Venice. He was knighted in 1907. His work is somewhat marred by too much emphasis on story-telling, but O. had genuine ability as a painter. Among his best-known pictures are 'Challenged,' 1865, 'Ophelia,' 1874, 'A Venetian Fruit-seller,' 1874, 'Flotsam and Jetsam,' 1876, 'The Queen of the Swords,' 1877, 'Hard Hit,' 1879, 'Napoleon on board the *Bellerophon*,' 1880, 'The Young Duke,' 1889, and 'Her Mother's Voice,' 1888. He was also a popular and successful portrait painter.

Orchestra, body of instrumental players performing in a theatre or concert hall. The term originally meant the semicircular space in front of the stage in the ant. Gk theatre where the chorus danced and sang; it has been transferred from the place to its occupants. The modern O. did not begin to evolve till about 1600. At that period the same music was often performed indiscriminately by voices and/or instruments; many books of madrigals are described as fit for viols or voices. The small instrumental groups were generally confined to the same family, e.g. the consort of viols or recorders, and they played what we should call chamber music. Wind bands existed, and trumpets and drums for military and ceremonial use. There were no public concerts before the 18th cent.; the O. developed in the theatre, the church, and the court (Louis XIV of France kept a band of 24 violins, imitated by Charles II of England). Of these the theatre was the most important because it encouraged experiment. In his opera *Orfeo* (1607) Monteverdi used an O. of strings, woodwind, brass, harp, 2 harpsichords, and 3 organs, with other optional instruments, e.g. lutes, and put orchestral colour

deliberately at the service of dramatic effect. About the same time Giovanni Gabrieli at Venice extended the antiphonal principle from vocal to instrumental music, and wrote works for 2 groups of instruments (or O.s), contrasting the sonorities of strings and brass. But progress was not consistent. During the 16th cent. the violin family replaced the viols, and the centre of the O. became the strings. They were always supported by a keyboard instrument (generally harpsichord or organ), which played the bass line and added any harmonic filling required, more often than not prescribed by the composer in a figured bass. The

woodwind, and brass, supported by percussion. The first violinist was now the true leader of the O. In addition to pairs of flutes, oboes, clarinets, and bassoons, 2 (occasionally 4) horns had been introduced; and in Beethoven's fifth Symphony the 3 trombones completed their transition from the church to the concert hall via the theatre. Big drum, cymbals, and triangle were used for special effects (known as Turkish music); so was the piccolo, and a little later the cor anglais, while the harp returned from long exile. The wind bass was supplied by the ophicleide and double bassoon, and from about 1860 by the tuba, which ousted the ophicleide. By 1815

PLAN OF A SYMPHONY ORCHESTRA, SHOWING THE ARRANGEMENT OF INSTRUMENTS AND PLAYERS

keyboard player, who was often the composer, directed the performance (there was no conductor in the modern sense); next in importance were the leaders of the first violins and the basses, who took their position beside the keyboard. Oboes, bassoons, and flutes (more strictly recorders) won a place in the O. of Lully (1632-87) and Purcell (1659-95), and trumpets and drums were introduced for special effects; but the wind instruments often had little to do except reinforce the O., and flutes and oboes were generally played alternately by the same players. The period of Bach and Handel saw the rise of the concerto, and the use of one or more solo instruments, either in contrast to the main orchestral body or to supply an *obbligato* in a vocal work. The opera and oratorios of Handel not only introduced sev. additional instruments, but explored fresh ground in orchestral sonorities. The modern O. did not emerge till about 1800. The keyboard player had dropped out of the later O.s of Haydn and Mozart, and the instruments became standardised in their 3 groups of strings,

the application of the valve to horns and trumpets greatly extended their range, by giving them a full chromatic scale, and thus the power of the whole O. During the romantic period O.s increased rapidly in size, and composers turned more and more to exploit the mounting possibilities of instrumental colour. This process reached its height in the works of Berlioz and Wagner, who himself added new instruments, and was carried to excessive lengths by Strauss, Mahler, and early Stravinsky. In France special prominence was given to the cornet (taken from the military band) and the instruments of the saxophone family. A later movement, led in part by Stravinsky himself, favoured smaller O.s, and the economic conditions of two world wars were partly responsible for the frequent use of chamber O.s. Experiments have been made in the introduction of electric instruments, such as the Ondes Martenot (see ONDES MUSICALES).

To the growing complexity of the O. is due the rise of the modern conductor, a 19th-cent. phenomenon developing out of

the violinist leader. Weber in 1826 used a roll of paper, and others a violin bow, but soon the baton came into use. The interpreter-conductor was largely the creation of Wagner. In earlier times a heavy baton had sometimes been used simply to beat time (Lully *d.* as a result of injuring his foot with one). Early in the 19th cent. control of orchestral music began to pass from the court to the middle classes, and public concert societies were founded. The Leipzig Gewandhaus already existed; the London Philharmonic Society was founded in 1813, the Paris Société des Concerts du Conservatoire and the Munich Odeon-Concerts in 1828. Many others followed. The number of permanent O.s increased rapidly after the middle of the cent., especially on the continent and in the U.S.A. Until this cent. Britain was backward in this respect, but is now well supplied by the London Symphony, London Philharmonic, Royal Philharmonic, Philharmonia, and the various O.s associated with the B.B.C., besides a number of prov. O.s, of which the Hallé in Manchester is the most distinguished. See C. Forsyth, *The Orchestra in the Eighteenth Century*, 1940, and *The Orchestra from Beethoven to Berlioz*, 1949; F. Howes, *Full Orchestra*, 1942; A. Carse, *The Orchestra*; R. Nettel, *Orchestra in England*, 1956.

Orchids (Orchidaceae), family of over 15,000 monocotyledonous perennial herbs, of world-wide distribution, most abundant in the tropics. Those of tropical regions are mostly epiphytes, those of temperate regions mostly terrestrial and apparently depend on association with mycorrhiza for successful growth. A few species, lacking chlorophyll, are saprophytic, and get their nourishment from the humus forming matter in which they grow. In Britain some 22 terrestrial genera are found, among which are *Neottia* (Bird's-nest Orchis); *Listera* (Twayblade); *Spiranthes* (Lady's Tresses); *Epipactis* (Helleborine); *Aceras* (Man Orchis); *Ophrys* (Insect Orchis); *Hermidium* (Musk Orchis); *Platanthera* (Butterfly Orchis); *Cypripedium* (Lady's Slipper); and 12 species of *Orchis*; all small, pretty, and interesting to grow along with other temperate species in rock gardens, borders, or shady greenhouses or frames. Many beautiful O. can be grown easily in small greenhouses, and culture need not be expensive. O. are grown commercially for their flowers: *Vanilla fragrans* is a source of the vanilla pods of commerce, and the tubers of some *Orchis* were once exploited as a source of salep, a nutritious drink. There are over 600 genera, some of which are described under their names. See C. Darwin, *The Fertilisation of Orchids*, 1862; W. Watson and H. J. Chapman, *Orchids, their Culture and Management*, 1903; C. H. Curtis, *Orchids*, 1950; R. T. Northern, *Home Orchid Growing*, 1950; B. S. Williams, *Orchid Growers' Manual*, 1952; D. Sanders and E. Cooper, *Orchids and their Cultivation*, 1954.

Orchil, or **Orchella**, see **ARCHIL**.

Orchomenus, 2 cities of ancient Greece: (1) In Boeotia, on R. Cephissus. (2) In

Arcadia, lying N. of Mantinea, W. of Stymphalus. Both were important till the 5th cent. BC.

Oreus, Lat. name of the nether world and its god, corresponding to Hades and Pluto respectively.

Orozy, **Emmuská**, **Baroness** (1865–1947), Brit. novelist, b. Tarnaörs, Hungary, daughter of Baron Felix O. She studied painting in London, and exhibited at the Royal Academy. In 1895 she pub. her novel, *The Scarlet Pimpernel*, first written as a play in collaboration with her husband, Montague Harstow, son of a Yorks clergyman, and followed this with more than 40 novels of a similarly romantic character, chiefly of the period of the Fr. Revolution, including many 'Pimpernel' sequels, such as *The Elusive Pimpernel*, 1908, most of which had a great vogue. Her writings included essays, historical novels, and detective stories. *Links in the Chain of Life*, 1947, is an autobiography.

Ordnainers, Lords. In 1310 a committee of barons set up a body of 21 peers, the Lords Ordainers, in an effort to control Edward II. After 18 months' deliberation they put forward proposals for future gov., known as the 'ordinances' of 1311. See also **EDWARD II**.

Ordeal (O.E. *ordāl*, *ordael*, judgment; cf. Ger. *Urteil*), or **Judicium Dei**, very common medieval method of deciding doubtful questions. It is not an isolated phenomenon, for in all parts of the world such appeals to magic are common, and many close analogies to the medieval methods may be found. It will be possible here to deal with the medieval forms. Trials were generally made by boiling water, by red-hot iron, by cold water, by fire, or by blessed bread (the *corsmaed*). In the trial by boiling water the accused person was made to plunge his hand, and sometimes his arm, into boiling water, and perhaps take something from the bottom of the vessel. The hand was then sealed up, and his guilt or innocence was judged by its condition at the end of 3 days. The O. by red-hot iron was performed either by carrying a red-hot iron a certain number of paces or by walking barefoot over or between red-hot ploughshares. Well-known examples of this type of O. are those which vindicated Queen Emma (mother of Edward the Confessor) and St Kunigunde. In the trial by fire the accused had to justify himself by walking between two fires of wood placed close together. Here, again, a certain number of days was allowed for recovery. In the O. by water the accused was bound and thrown into cold water. If he sank he was innocent, but if the water refused to receive him he was guilty. This long remained a favourite test of witchcraft. The O. by blessed bread depended upon the belief that a perjurer could not swallow such food. Henry III abolished legal O.s in England, except trial by battle, which theoretically remained in force until 1818, when it was brought to an end on the occasion of its claim by a man indicted for murder.

Ordeal Tree, see **CERBERA**.

Order, in classification (of plants and animals) refers to a related group below class and higher than family. It is therefore composed of a number of families, e.g. the *O. Carnivora* belongs to the class *Mammalia* and includes such families as *Canidae* (dogs) and *Felidae* (tigers and cats). See **CLASSIFICATION**, **PLANTS**; **SPECIES**; **ZOOLOGY**. *O.* is also a term in architecture (q.v.).

Order in Council, one of the means by which most of the business of the Privy Council (q.v.) is expressed, authenticated by the signature of the clerk of the council. Proclamations, usually reserved for the more important subjects dealt with by the Privy Council, are signed by the sovereign and pass under the Great Seal. *O.s* in *C.* are sometimes issued to deal with points left outstanding after legislation passed by Parliament has actually come into force; such *O.s* in *C.* are made under many different Acts and may operate throughout almost the whole field of statute law. Committees of the Privy Council, whether standing committees or those convened for a special purpose, when reporting to the sovereign in council must have their recommendations approved by *O. in C.*; in less important cases, however, decisions rest with the committees and are effected without this formality. *O.s* in *C.* are usually complete in themselves and do not generally require further executive acts to bring about their objects.

Ordericus Vitalis (1075–c. 1142), Anglo-Norman monk and historian, b. Atcham, Shropshire. St Evroul, a Norman monastery, was his home for most of his life. His *Historia Ecclesiastica* (1123–41), dealing with England and Normandy, contains some important contemporary hist. It was ed. by L. Duchesne in 1619, and by A. le Prévost for the Société Historique de France in 1838–55, and trans. into English by T. Forester in 1853–6.

Orders, Army. The queen's regulations and *O.* for the Brit. Army, which were formerly notified in army circulars, have, since 1888, been promulgated together with General *O.* under the title of A. *O.* The Crown has always issued regulations and *O.* for the government and general economy of the military forces, in execution of statutory provisions relative thereto; but such *O.* would not be enforced by the law if in any way *ultra vires*, e.g. if they purported to affect persons not subject to military law (see as to this under **MARTIAL LAW**). A. *O.* are issued to the Army Council nominally by the command of the sovereign as expressed under the sign manual. Details relating to appointments and promotions, pay, uniforms, etc., or other special matters, are dealt with by royal warrants issued through the War Office.

Orders, Holy (see also **ORDINATION**), the name for the ministry of the Rom. Catholic Church, and for the sacrament by which it is handed on and perpetuated. There are 4 major orders (bishops, priests, deacons, and sub-deacons), and 4 minor (acolytes, exorcists, readers, and doorkeepers). Of the major orders, the first

3 are the H. *O. par excellence*. H. *O.* are conferred sacramentally by the laying-on of hands by a bishop. The bishop conferring them must himself have been validly consecrated by another bishop in the Apostolic succession (q.v.). The Church of England abandoned the minor orders and sub-diaconate (but see **LAY-READER**) at the Reformation, but retained the 3 prin. major orders (which most of the protestant bodies rejected, setting up ministries of their own on what they considered to be the N.T. model). Whether the Anglican Church holds the Rom. Catholic view of H. *O.* as the only valid and lawful ministry of Christ's Church, *jure divino*, and so of the *esse* of the Church, may be disputed. She prefers to leave it an open question. Some Anglicans think that H. *O.* are only of the *bene esse* of the Church. Anglican orders were condemned as invalid by the Rom. Catholic Church in 1896 (*Apostolicae Curiae*), on the ground of defect of right intention. Anglicans vigorously and ably rebut this charge. The Presbyterian Church accepted only one order of the ministry, that of presbyters (priests), rejecting the need of a bishop for ordination. See H. B. Swete, *Early History of the Church and the Ministry*, 1918; C. Jenkins and K. Mackenzie, *Episcopacy, ancient and modern*, 1939; K. E. Kirk, *The Apostolic Ministry: Essays on the History and Doctrine of Episcopacy*, 1946.

Orders, Monastic, see **MONASTICISM**.

Orders of Architecture, see **COLUMN**.

Orders of Knighthood. Origin and hist. of knighthood generally has been treated in the article **KNIGHTHOOD**. This article relates principally to the different *O. of K.* of the various nations of Europe.

GREAT BRITAIN AND IRELAND: (1) *The Most Noble Order of the Garter*. Selden, corroborated by Froissart, fixed the date of the foundation of this anc. order as 1348; but, in the absence of all authentic records, both the date and the cause of foundation rest upon mere tradition. The register known by the name of the Black Book, which is usually referred to as treating of the order from its very foundation, was only drawn up in its present form towards the middle of the 15th cent. According to Froissart Edward III resolved to re-erect Windsor Castle, the scene of dramas of King Arthur and the Round Table, and to make an order of knights of himself and his children, to be called the Knights of the Blue Garter, and that an ann. feast of the order should be solemnised at Windsor on the day of St. George. Popular tradition has the different version, derived from the romantic episode narrated by Polydore Vergil, of the Countess of Salisbury's garter dropped at a court festival and picked up by the king himself, who, observing the general significant smile of the onlookers, tied it round his own knee and uttered the celebrated words: 'Honi soit qui mal y pense.' A third theory is that of Camden, the antiquary, who says that the order originated at the battle of Crécy, when Edward ordered his garter to be displayed as a signal for the onset. In any

case, there is no more ancient or illustrious order in Europe. Its officers consist of the Prelate (bishop of Winchester), the Chancellor (bishop of Oxford), the Registrar (dean of Windsor), Garter King of Arms, and the Usher of the Black Rod. It had undergone many changes before the Act of 1805, when its constitution was fixed as comprising the sovereign and 25 knights companions, together with such lineal descendants of George III as might be elected. Its statutes have at different times provided for the admission of sovereigns and extra knights, the latter of whom have always become part of the 25 companions on the occurrence of

THE STAR OF THE GARTER

vacancies. Since 1947 membership of the order is again at the sole discretion of the sovereign without reference to the Prime Minister. The habit and uniform are the garter of dark blue ribbon, edged with gold, bearing in golden letters the motto above-mentioned, with chased gold pendant and buckle; blue velvet mantle lined with white taffeta; star of the cross of St George; crimson velvet hood and surcoat, black velvet hat with plume of white ostrich feathers and a tuft of black heron's feathers fastened with a band of diamonds; gold collar with 26 pieces, each in the form of a garter, and the figure of St George slaying the dragon attached to it. Each knight has his stall in St George's chapel, Windsor, and his garter-plate (displaying his arms) remains there permanently. Knights of the Garter write K.G. after their names. See also MILITARY KNIGHTS OF WINDSOR.

(2) *The Most Ancient Order of the Thistle.* Founded in 1687, it fell into desuetude after the abdication of James II, but was revived in 1703 by Queen Anne. The insignia are the star worn on the left side of the coat, consisting of a St Andrew's cross of silver embroidery, in the centre of which is a thistle of green in a field of gold, surrounded by a circle of green bearing the motto 'Nemo me impune lacessit' ('No one provokes me with impunity,' the motto of all the Scottish regiments, and generally rendered in

the vernacular, 'Wha daur meddle wi' me!'); the collar of thistles intermingled with sprays of rue; and the badge worn pendant-wise and tied under the arm, consisting of a figure of St Andrew, in gold enamel, with green gown, bearing before him the cross, enamelled white, the whole environed with rays of gold in the form of a glory. By a statute of 1827 the order is to consist of the sovereign and 16 knights.

(3) *The Most Illustrious Order of St Patrick.* The national order of Ireland, founded by George III in 1783. It was formed on the model of the Garter, and named after the Irish patron saint. The motto is 'Quis separabit?' ('Who shall separate?'). The insignia are the star of the cross of St Patrick on a field argent, charged with 3 imperial crowns within a circle of azure, with motto above. The order now consists only of the sovereign and about a dozen knights, including princes of the royal blood.

(4) *The Most Honourable Order of the Bath.* Founded traditionally in 1399 by Henry IV, revived by George I in 1725. It differed from the *Knighthood of the Bath*, that more ancient order, admission to which was characterised by various ceremonies, the chief being that of bathing, and which form seems to have died out at the coronation of Charles II, but to have been revived and combined with the newer order into a regular military order. There were to be originally, in addition to the sovereign and a prince of the royal blood, only 35 knights; but eventually, to commemorate the termination of the Napoleonic wars, the numbers were increased and divided into 3 classes; and again, in 1847, it was further extended by the addition of civil knights commanders and companions. The first class is comprised of knights grand cross (57 military, 29 civil, excluding distinguished foreigners); and the second, knights commanders (161 military, 112 civil, exclusive of foreigners); the third, companions of the order (702 military and 368 civil). The insignia of the military classes are a gold Maltese cross with the inscription 'Ich dien,' gold collar of 9 imperial crowns and 8 roses, thistles, and shamrocks issuing from a sceptre; of the civil classes, a silver star of 8 rays, charged with 3 imperial crowns, surrounded by a red circle in which is the same motto; a badge of gold with the same emblematic rose, thistle, and shamrock.

(5) *The Most Distinguished Order of St Michael and St George.* Founded 1818, after the cession of Malta to Britain and the submission of the Ionian Is. to Brit. protection, for the purpose of honouring the most meritorious of the Maltese and Ionians, and also such Brit. subjects as had distinguished themselves in the Ionian Is. or Mediterranean. William IV. ordained that it should consist of knights grand cross, knights commanders, and cavalieri or companions, to the number of 15, 20, and 25 respectively. The members of the order enjoy rank and precedence immediately after the corresponding classes of the Order of the Bath. The

insignia of the knights grand cross are a 7-rayed silver star, in the centre of which is a representation of the Archangel St Michael encountering Satan, and the motto 'Auspicium melioris aevi' ('Augury of a better era'); a collar of lions and Maltese crosses, a gold cross badge surmounted by the imperial crown, a Saxon-blue satin mantle lined with scarlet silk, and a blue satin chapeau; of the knights commanders and companions, a 4-rayed star and smaller cross.

(6) *The Most Exalted Order of the Star of India*, instituted in 1861, now comprises knights grand commanders, knights commanders, and companions. The collar of the star consists of links of lotus flowers, red and white roses, and palm branches. The motto is 'Heaven's Light our Guide.'

(7) *The Most Eminent Order of the Indian Empire*, under the grandmastership of the Indian viceroy, was estab. in 1877 to commemorate Queen Victoria's assumption of the title Empress of India. The collar is composed of elephants, peacocks, and Indian roses. The motto is 'Imperatrix auspiciis' ('Under the auspices of the Empress').

(8) *The Royal Victorian Order* was founded by Queen Victoria in 1896 'as a reward for personal services to the queen and her successors.' Motto: 'Victoria.'

(9) *The Most Excellent Order of the British Empire*, instituted in 1917, having both civil and military divs., awarded to both men and women for services rendered to the Brit. Empire. It has 5 classes: Knights or Dames Grand Cross (G.B.E.); Knights or Dames Commanders (K.B.E. or D.B.E.); Commanders (C.B.E.); Officers (O.B.E.); Members (M.B.E.). Motto: 'For God and the Empire.'

(10) *The Knights Bachelor* do not constitute a royal order, but comprise the surviving representation of the anc. State O. of K. The Register of Knights Bachelor, instituted by James I in the 17th cent., lapsed, and in 1908 a voluntary association, now known as 'The Imperial Society of Knights Bachelor' by royal command, was formed with the primary objects of continuing the various registers dating from 1257, and obtaining the uniform registration of every created knight. In 1926 a design for a badge to be worn by Knights Bachelor was approved and adopted.

AUSTRIA. The following orders of imperial Austria have been officially discontinued, although the orders are still worn. (1) *The Order of the Golden Fleece*, founded by Philip le Bon (Duke of Burgundy and the Netherlands) in 1429, on the occasion of his marriage to Isabella of Portugal. Its archives were taken by Charles VI to Vienna, and there received with vast splendour, but the grandmastership of the order was for a long time a bone of contention between Spain and Austria, and was tacitly settled by the estab. of a Sp. and an Austrian branch. The motto is 'Je l'ay empris' ('I have accepted it') (the order). The characteristic emblem of the order is the golden fleece, hanging on a golden blue-enamelled

flint stone, emitting flames of fire, and the motto 'Pretium laborum non vile.' (2) The purely military *Order of Maria Theresa*, founded by that queen in 1757. (3) *The Order of Leopold* (founded as a set-off to the apostolic *Order of St Stephen*, which was confined to the nobility), estab. in 1808 by Francis I for the purpose of honouring all meritorious subjects, civil or military, regardless of rank. (4) *The Order of Elizabeth Theresa*, founded in 1750; the second military order of Austria. (5) *The Order of the Iron Crown*, founded in 1809 by Napoleon Bonaparte in commemoration of his coronation as the first hereditary king of Italy, the reigning kings of the various It. states to be grand masters of the order. After the fall of Napoleon the order was forgotten until Francis I of Austria, in 1816, during his visits to the new It. provs., reintroduced it in a modified form, when it received the name of the *Austrian Order of the Iron Crown*. The name is derived from the anc. Lombard crown (which was used to crown Napoleon) of gold and precious stones, behind which is attached an iron ring forged, according to tradition, from the nails of Christ's cross. Other orders of Austria were the *Order of the Star Cross* and the *Teutonic Order* (which originated like the Hospitallers of St John in the time of the crusades), and the *Civil Cross of Merit*, founded in 1850.

BELGIUM: (1) *Order of Leopold* (civil and military), founded in 1832. Motto: 'Union is strength.' The administration of the order is vested in the foreign minister. The characteristic emblem is the crossed swords and crowned lion. (2) *Iron Cross and Medal*, founded 1835. Like the Order of Leopold, conferred upon the revolutionary defenders of the fatherland; hence the inscription 'Indépendance de la Belgique.'

BULGARIA: *The Order of St Alexander* was instituted in 1881, and the senior *Order of SS. Cyril and Methodius* in 1909; both were abolished by decree in 1948. In the same year the following orders were created or maintained: *People's Republic of Bulgaria*; *People's Liberty 1941-1944*; *9th September 1944*; *For Bravery* (military); *People's Order of Labour*; *For People's Service*; and *For Science and Arts*.

DENMARK: (1) *The Order of the Elephant*. Officially dated as of the first half of the 15th cent., is rarely bestowed and commands high respect. Originally of a religious character, and formerly requiring papal consent on grant, since 1893 it has entirely lost its religious element. Distinctive emblem, a white elephant and mahout. Motto: 'Maznanimi Pretium.' (2) *Order of the Dannebrog*. Second of the Dan. O. of K., founded by Waldemar II, 1219, in honour of the banner of Denmark, which was supposed to have fallen from heaven to inspire the army at the siege of Reval. In 1500 the order was suppressed, but revived by Christian V in 1671. In 1808 Frederick VI made it an order of merit for all the Dan. people, whether for military or civil services. It has 4 degrees, and in addition a class of Dannebrogsmænd, who are not strictly members

of the order. In 1842 a special class (grand commanders) was created for persons of royal blood. The decoration is a white enamelled gold cross, suspended by a white ribbon with a red border. The inscription reads 'God and the King,' and it carries the figures 1219, 1671, and 1808.

FRANCE: *The Legion of Honour* (the only existing order in France). After the coronation of Napoleon (1804) this order, which was estab. in 1802, as early as the year 1814 counted about 37,000 members. Its organisation has been modified at various times, and the order is now divided into 5 ranks, viz. knights of the grand cross, grand officers, commanders, officers, and knights. There is no more numerous order of knighthood at present in existence anywhere. The highest grades, however, rank with the most exalted European orders, and the celebrated cross is a much coveted distinction. The president of the Fr. Rep. is the grand master of the order, but the administration is vested in a grand chancellor. Military and naval members receive salaries when on the active list. Women are eligible, e.g. Rosa Bonheur and Madame Curie were both members. There is a considerable number of foreign members, whilst the number of Fr. members of the 4 higher classes is limited. The decoration consists of a white enamelled star with double rays under a royal crown, in the centre of which is the effigy of Henry IV, and on the reverse the motto 'Honneur et Patrie.' The star for the knights is silver, and for the other classes gold.

GERMANY: The following are the orders which were in existence under the old Ger. Empire: *The Order of Albert the Bear* (Anhalt); the orders of *Fidelity*, of *Charles Frederick*, of the *Zähringen Lion*, and of *Berthold I* (Baden); *The Order of St Hubert* and the military *Order of Maximilian Joseph* (Bavaria); *The Order of Henry the Lion* (Brunswick); the orders of *Louis*, of the *Golden Lion*, and of *Philip the Magnanimous* (Hesse); the orders of the *Wendish Crown*, and of the *Griffin* (Mecklenburg-Schwerin); *The Order of Duke Peter Frederick Louis* (Oldenburg); orders of *The Black Eagle*, of *The Red Eagle*, *Order for Merit*, orders of *The Crown*, of *William*, of *The House of Hohenzollern*, and for ladies of *Service* (Prussia); *Order of the Rauten Krone*, or *Crown of Rue*, the military *Order of St Henry*, and *The Order of Albert* (Saxony); *The Order of Ernest* (duchies of Saxe-Coburg-Gotha and Saxe-Meiningen); *Order of Vigilance* (Saxe-Weimar); orders of *The Crown of Württemberg*, of *Frederick*, and of *Olga* (Württemberg); *Iron Cross*, originally instituted in 1813 by Frederick William III for service in the war of Liberation, and granted to civil as well as military personnel. The decoration consists of a Maltese cross of iron edged with silver, and, formerly the initial of the sovereign granting the award was in the centre; above, on the upper arm, is a crown, and below, on the lower arm, the date of the campaign. The Grand Cross of double the size is presented to the victor of a

decisive battle. The cross is worn round the neck. The two remaining classes, called first and second, granted for bravery in action, are worn on the left breast. The order was revived by William I on 19 July 1870, just before the outbreak of the Franco-Prussian war, and again in the First and Second World Wars, when large numbers were awarded.

The Prussian orders of *The Black Eagle* and *For Merit* were among the most distinguished in the world. The former was founded by the elector of Brandenburg on the day of his accession to the throne of Prussia in 1701. The emblem was a blue enamelled octagon, consisting of a cross with 'F.R.' (Fredericus Rex) in the middle of the obverse, and a black eagle with expanded wings in each of the 4 spaces between the arms of the cross. Candidates must already have been knights of the Red Eagle. *The Order for Merit*, called *Pour le Mérite* in Germany, was divided into 2 classes: military, and science and art. It was originally founded as the 'Ordre de la Générosité' by Prince Charles Emil in 1665, but in 1740 converted by Frederick II to its later appellation and restricted to military persons. A century later it was extended to persons of civil merit, when, among others, the following celebrated Germans were honoured in the new div.: Savigny, Lessing, Mendelssohn, Schelling, Schlegel, Tieck, Meyerbeer, Grimm, Humboldt, and Schwanthaler; and the following foreigners: Count Borghese, Chateaubriand, Faraday, Herschel, Daguerre, F. Liszt, and Rossini. Later recipients include Carlyle and von Moltke.

GREECE: *The Order of the Redeemer*, founded in 1833 by King Otho to commemorate the deliverance of Greece after the war of Independence. Badge: white enamelled cross, the wings of which are connected with oaken and laurel leaves. *The Order of George I* was instituted in 1912.

HOLLAND: (1) *The Military Order of William*, founded in 1815. Emblem: a cross with the motto 'For valour, devotion, loyalty.' (2) *The Order of Orange Nassau*, founded by Queen Wilhelmina in 1892. (3) *The Order of the Netherlands Lion*, founded (1818) for civil merit.

ITALY: Titles of nobility are no longer recognised, but the following orders existed before 1946: (1) *The Order of the Annunziata*, founded in 1362 by Amadeus VI, Count of Savoy, under the style of *The Order of the Collar*. It was the highest order in Italy, and its members took precedence over all other state officials. Emblem: a collar consisting of love-knots and roses, with a pendant and medallion representing the Annunciation. (2) The order of *SS. Maurizio e Lazzaro* (St Maurice and St Lazarus), being a combination of the ant. *Military Order of St Maurice*, founded in 1434, and the religious *Order of St Lazarus*, founded in 1572. Its great merit lay in the fact that not only was it pre-eminently conferred on persons notable for their charitable works, but that its income was devoted to charitable purposes. (3) *The Order of the Crown of*

Italy, founded in 1868 to commemorate the estab. of the kingdom of Italy.

LUXEMBOURG: *The Order of Adolphus of Nassau* (1858); *The Order of the Oak Crown* (1858, revived); and *The Order of the Golden Lion* (1890), which is the hereditary order of the grand duke.

MONACO: *The Order of St Charles* (1853, revived).

NORWAY: (1) *The Order of St Olaf*, founded in honour of the introducer of Christianity into Norway. (2) *The Order of the Norwegian Lion*, founded by Oscar II in 1904.

POLAND: *The Order of the White Eagle* and *The Order of Pelonia Restituta*.

PORTUGAL: The orders of *Christ*, *St James*, and *Aviz*, all 3 being originally spiritual orders, but secularised in 1789. The first-named was a revival of the Templars after their abolition in France by Philip le Bel, King Diniz of Portugal giving an asylum to that famous order in consideration of their support against the Sp. Moors in Algarve. The distinctive emblem is a white cross within a red.

RUMANIA: *The Order of the Star of Rumania* (1877) and *The Order of the Crown of Rumania* (1881). The latter has both civil and military divs. Both were abolished in 1947.

RUSSIA: Under the Soviet Gov. there are no titles. In former imperial Russia the tsar used to be Grand Master of all the Russian orders, with the exception of that of *St Catherine*, which was an order for ladies. The grand dukes became, at baptism, knights of the order of *St Andrew*, founded in 1698 by Peter the Great to initiate his court into the refinement of the civilised courts of Europe and to encourage his nobility in the pending war with Turkey; *Alexander Nevsky*, founded in 1725 by Catherine I; *The White Eagle*, founded in 1713 by Augustus II of Poland, and after the revolution of 1831 united, together with other Polish orders, with those of Russia; and *St Anne*, founded in 1735 by Duke Charles Frederick in memory of the Empress Anne and in honour of the Duchess Anna Petrovna. The prin. emblems of the above orders were: for that of *St Andrew*, a blue enamelled figure of St Andrew on the cross, resting on the eagle of the empire with 3 crowns; of *Alexander Nevsky*, an octagonal red enamelled cross with the imperial eagle in its corners, and in the middle the figure of St Alexander on horseback; of *The White Eagle*, a cross containing on its face the white eagle with expanded wings, and gold flames in the corners; of *St Anne*, a Maltese cross with the initials of St Anne and the inscription 'Amant: just: piet: fidem.' The decoration of the order of *St Catherine* was, for Class I, a grand cross adorned with diamonds, the figure of St Catherine, and the inscription 'For love and fatherland'; for Class II, a similar star, smaller in size and with fewer diamonds. *The Military Order of St George* was founded in 1769 for military service on land or sea, and the decoration was a white cross with gold borders, containing in its central medallion the figure of St George slaying

the dragon. But while there are no longer titles or O. of K. as such, there are many related to war services or labour. The highest Soviet distinctions are those of *Hero of the Soviet Union* and *Hero of Socialist Labour* and both include the *Order of Lenin* (instituted in 1930), the *Hammer and Sickle Gold Medal*, and a certificate of honour. Other orders, instituted between 1918 and 1935, are those of the *Red Banner* (1918), the *Red Banner of Labour* (1920), the *Red Star* (1930), and the *Badge of Honour* (1935). Six more orders, issued during the Second World War, are of the *Patriotic War*, *Suvorov*, *Kutuzov*, *Alexander Nevsky*, *Bogdan Khmelnitisky*, and *Victory and Glory*.

SPAIN: All orders were abolished after the declaration of a rep. The chief orders which existed under the monarchy were those of (1) *St James of Compostella* (patron saint of Spain after the victory of Clavijo), founded by certain nobles in the 12th cent. by analogy to the Templars in pursuance of their united intention to protect Christian pilgrims against the Moors. It degenerated into a mere decoration of military merit. The badge is a representation of the cross of red cloth shaped like a sword, with red carved lilies on the hilt, which used to be worn by the old knights. (2) *St James of Calatrava*, founded with a view to protect Castile against the Moors. The representative cross of this order was a red cross cut out in the form of lilies. (3) *St James of Alcantara*, formed to protect Spain against the Moorish inroads when the above orders had been compelled to migrate by Ferdinand, King of León and Galicia. The cross in this case, which was substituted for the previous black collar and scapulary, is green. *The Order of the Golden Fleece* has been dealt with under Austrian orders, there having been both a Sp. and an Austrian branch of that order.

SWEDEN: *The Order of the Seraphim*, or *The Blue Ribbon*, founded according to general opinion in 1280 by Magnus I, is the most ancient and illustrious existing Swedish order. Its objects, which were very exalted, consisted in carrying out the candidate's promise made to God and the king to defend the laws of the order, to shed his blood for the evangelical religion and his country, and to sustain the ancient glory of the Swedish name. The badge is a star with the initials J. h. s. (Jesus hominum salvator). Other orders are those of the *Pole Star*, *Charles XIII* (granted to freemasons of high degree), *Vasa* or *Green Ribbon*, and the *Sword* or *Yellow Ribbon*.

TURKEY: *The Order of Glory* (1831) and *The Order of Privilege* (1879). Also 2 other orders with civil and military awards, the *Medjidie* (1852) and the *Osmanieh* (1862). Titles were abolished in 1934.

YUGOSLAVIA: The following are the old Serbian and other orders, the traditions of which were continued under the kingdom of Yugoslavia: *The Order of the White Eagle* (1882); *The Order of St Sava* (1883); *The Order of Milosh the Great* (1898); *The Order of the Star of Karageorgević* (1904).

The Order of St Lazarus belongs only to the king. They were abolished after the declaration of a rep.

Other and non-European countries also have or had O. of K. Japan's prin. order is that of the *Chrysanthemum*, founded in 1877, and practically conferred only on members of the royal house or foreign princes. The only Chinese order was that of the imperial *Double Dragon*, which was conferred only on foreigners, the Chinese native analogy to a knight being the *man darin* (q.v.). Siam has *The Order of the White Elephant* (1861), also the *Sacred Order* for royalty; Persia, *The Order of the Sun and Lion* (1808). Egypt had sev orders of recent creation: *Order of Mohammed Ali* (1915); *Order of the Nile* (1915); *Order of Al Kamal* for ladies (1915) the *Military Star of King Fuad* (1919) and the *Order of Ismail* (1922). See also HOSPITALIERS, KNIGHTS, and NOBILITY.

See J. B. Burke, *The Book of Orders of Knighthood and Decorations of Honour*, 1858, and the *Almanach de Gotha* (to 1944).

Ordinaries, see HERALDRY.

Ordinary, in canon law, an ecclesiastic of superior standing, who exercises his jurisdiction according to the normal discipline of the Church. In the Anglican Church it usually means the bishop or his chancellor.

Ordinate, see GEOMETRY, *Analytical Geometry*.

Ordination, sacrament by which holy orders are conferred in the Christian Church (cf. Acts i). Early forms are to be found in the Prayer-book of Serapion, Justin Martyr, the *Didache*, and the *Canons of Hippolytus*. In the Rom. Catholic, Orthodox, and Anglican Churches O. can be conferred only by a bishop. Among Presbyterians, O. is performed by the body of presbyters, acting by one of their number previously appointed. Here also the imposition of hands is used. The act by which a bishop is made is called Consecration.

Ordinance, heavy weapons of warfare, see ARTILLERY.

Ordinance, Board of. From Coke's reports we learn that the B. of O. took its name from an ordinance or law (not extant) made to regulate the bore and size of artillery, and was the state dept charged with the care of crown fortresses and their armaments, garrisons, and stores. The board dates back to the Middle Ages, but it was not till 1683 that it was reorganised as a civil dept of the state for the custody and supply of both naval and ordnance stores, and the master-general of the board placed under the orders of both the Lord Treasurer and the Lord High Admiral. The navy was formerly more associated with the ordnance than the army, but the development of the standing army has resulted in the army subsequently acquiring possession of the Ordnance Dept. and, through the secretary for war, providing all armaments and warlike stores, munitions, and equipment for both services. After the revolution of 1688 the B. of O. was divided into 2 branches: the 'military,' under the master-general, and the

'civil,' which had to do with making contracts with manufacturers or contractors to supply warlike munitions and equipment, and acted as custodian of the store dept. The master-general, who was independent of the secretary for war, was president of the B. of O., and the chief adviser to the Crown in military matters. This position he held throughout the 18th cent., and down to 1828 he was generally a member of the Cabinet. The board presented its own estimates to Parliament, and was therefore separately responsible to Parliament for the expenditure of the money voted to its use. Down to its abolition it appears to have done an immense amount of work, though there seems not unnaturally to have been an inveterate antagonism between the Ordnance Dept and the secretary for war, especially as, in spite of the distinction into a civil and a military branch, the former had soon become more or less merged in the latter. The duties of the board were in the highest degree comprehensive, comprising as they did the construction and upkeep of forts, the acquisition of land for that purpose, the purchasing, warehousing, and forwarding of stores, the manuf. of munitions and equipment for army and navy, the organisation and administration of the Royal Artillery and the Royal Engineers and associated corps, and the execution of the ordnance survey and geological survey (qq.v.). It seems clear that all these duties, being essentially ancillary to those of the War Dept, could hardly be economically and efficiently carried out except by that dept, and it is not surprising that they were, in 1855, transferred to the War Dept by the Ordnance Board Transfer Act, from which year the B. of O. ceased to exist.

Ordnance Factory, Royal, Brit. Gov. organisation for the production of war materials. They come under the control of the Ministry of Supply. There was great expansion of the O. F.s during the war years, some being both built and worked by the gov., others built by the gov. and worked by private firms under contract. See I. Hay, *P.O.F.s: the Story of the Royal Ordnance Factories*, 1949.

Ordnance Survey. The O. S. was estab. in 1791 to carry out a trigonometrical survey of England and Wales and also to make a map of Great Britain at the scale of 1 in. to 1 m., chiefly for defence purposes. The task being a military one, it was entrusted to the Board of Ordnance (q.v.), whence the title O. S.

By 1840 only Scotland and the 6 N. Eng. cos. remained unmapped at the 1-in. scale, and in that year the Treasury, after survey experience in Ireland, decided that these areas should be surveyed at the 6 in. to 1 m. scale. A long controversy ensued as to the most suitable scale. A departmental committee in 1853 recommended the survey of all cultivated areas at a scale of 1 : 2500, a scheme approved by the Treasury, but limited to areas where the 6-in. survey was being carried out. An adverse vote by the House of Commons in 1857 aroused such criticism

that a royal commission on the subject was estab., which in 1858 approved the 1:2500 scale. Four years later the House of Commons ordered the extension of a survey at this scale to the S. cos., still mapped only at the 1-in. scale. To meet an agitation for the cheapening of the system of land transfer the estab. of the O. S. was doubled in 1880, and from 1890 a complete series of the large-scale plans was available.

The civil work of the O. S. had long preponderated over the military, so that in 1870 control passed from the War Office to the Ministry of Works, passing to the Board of Agriculture later and remaining under the control of the equivalent ministry.

The First World War interrupted severely the periodical revision of the large-scale survey, and afterwards financial retrenchment put heavy limitations on the dept's work. Thus the inter-war development of new housing estates and roads outstripped the recording of them by the O. S. Administrative efficiency became so impaired that, in 1935, a departmental committee, under Viscount Davidson, was estab. to report on the matter. The Second World War almost immediately interrupted the implementation of the committee's recommendations, and not until 1947 was real progress possible. Since then the new Primary Triangulation of Great Britain has been completed, in 1952, and the re-survey of the main urban areas at 1:2500 scale, and the revision and re-casting into National Grid sheet lines of the 1:2500 plans, are well in hand. See also MAPS.

Ordovician System, geological name of the second system of Palaeozoic rocks (q.v.); the Ordovician follows the Cambrian, and is followed in turn by the Silurian. The Ordovician in Wales, where it was first recognised and named after the anct tribe of Ordovicii, consists of greywackes, grits, and shales, with black mudstones, conglomerates, and limestones, and is arranged into 4 chronological groups: Arenig, Llanvirn, Llandovery, and Bala. The last is the youngest. Three different types or facies of Ordovician deposits can be seen in Britain. The first consists of sandy or limey beds often with an abundant fossil fauna in which brachiopods and trilobites are conspicuous. Such beds were laid down in shallow seas. A second type consists of thin bands of graptolite-bearing shales alternating with cherts containing trilobites. Graptolites were floating animals living far out to sea whose remains are found in deep water sediments. This type of deposit is accordingly regarded as a deep sea deposit. The third type of O.S. known in Britain consists of volcanic rocks. Both the Arenig and Bala subdiv. record periods of volcanic activity. Volcanic rocks of Bala age build up the ranges of Snowdon and Penmaenmawr.

In the Lake Dist. the Borrowdale volcanic Series is underlain by the Skiddaw Slates with Arenig graptolites and overlain by the Conistone Limestone which contains Bala brachiopods. The Ordo-

vician of Scotland, exposed in the S. Uplands (Girvan, Moffat), indicates deep-water conditions at Moffat, where graptolites occur in a thin succession of shales, which contrast with the thick succession, seen between Girvan and Ballantrae, famous for radiolarian cherts, pillow lavas, and serpentines. Ordovician rocks are known from many other parts of the world, and can be subdivided and correlated by their faunas, the graptolites being especially useful in the shaly facies. Trilobites, cephalopods, brachiopods, and radiolaria were abundant and very early fishes have been found in the Rockies in W. America.

Ordu, il of Turkey on the N. coast of Asiatic Turkey, between Samsun and Kerasund. Pop. 409,891.

Ordzhonikidze, Grigoriy Konstantinovich (1886-1937). Georgian Communist. He joined the Bolsheviks in 1903; in 1912 he became a member of their Central Committee. O. spent sev. years in prison and banishment. After the Oct. revolution (q.v.) in 1917 he was Extraordinary Commissar of the Soviet Gov. in S. Russia. In 1920 he became the head of the party in the Caucasus, in 1921 in Transcaucasia, and in 1926 chairman of the Central Control Commission of the party, whose task was to suppress oppositionists (see COMMUNIST PARTY OF THE SOVIET UNION), and deputy head of the gov. He became chairman of the Supreme Council of National Economy, and a Politburo (q.v.) member, in 1930, and in 1932 commissar for heavy industry. O. was one of Stalin's chief lieutenants, but during the Great Purge (q.v.) he d. in mysterious circumstances, according to Khrushchëv, having been driven to suicide by Stalin.

Ordzhonikidze: 1. (until 1939 **Vladikavkaz**: 1944-54 **Dzardzhikau**). Tn in N. Caucasus, on the Terek cap. and economic centre of the Ossetian Autonomous Rep. (q.v.). It has lead and zinc works and food industries, and is the main cultural centre of the N. Caucasus. It was founded in 1783 as a Russian fortress, and in 1863 became cap. of Terek oblast. In 1921-4 it was cap. of the Mt People's Autonomous Rep. (q.v.). Pop. (1956) 159,000 (1859, 2500; 1897, 44,000; 1939, 127,000), mainly Russian.

2. See YENAKIYEVO.

Ordzhonikidzegrad, see BEZHITSKA.

Ore and Ore Dressing. An ore generally consists of metal-bearing minerals, together with earthy material or 'gangue.' Before the metals can be extracted from the minerals as much as possible of the earthy material must be removed from the ore, the process being known as ore dressing. In general only the precious metals such as gold, platinum, etc., are found 'native,' that is in the elemental state. Baser metals, owing to their higher chemical reactivity, are more often found in chemical combination with non-metallic material such as oxides, sulphides, sulphates, carbonates, phosphates, silicates, etc. It is common to find the minerals of 2 or more metals deposited together, e.g. the nickeliferous magnetite pyrites of Canada, which consist of nickel,

copper, and iron sulphides associated together. Other minerals may consist of the double compound of 2 metals, e.g. dolomite, a calcium-magnesium carbonate. It is only when the cost of extraction, considered in conjunction with marketing costs (e.g. transport over long distances when the metal is found in remote regions), is economic relative to the selling price (a factor governed by supply and demand) that the deposit is reckoned as an ore. It is commercially practicable to mine and treat material containing very small percentages of the precious metals, e.g. gold ores may contain as little as 0.2 oz. per ton, while on the other hand it does not pay in most countries to deal with iron deposits containing less than about 30 per cent of iron. In ore dressing rock ores are first broken down in jaw-, gyratory-, or roll-crushers, or in stamp mills, then in some cases finely ground in ball mills. Classification, or sizing of particles, is carried out during fine grinding. Most classifiers operate on the principle of Stokes's law, in which a rising column of water in a tank containing the ore carries away the fine material while leaving the coarse in the tank. 'Concentration' follows: magnetic material can be separated from non-magnetic in the magnetic separator. Jigs and concentrating tables and the old gold-miner's pan all depend upon separation of the less dense 'tailings' and denser 'concentrates' into 2 layers, a process known as stratification, when the ore is treated with a stream of water. 'Froth flotation' is able to concentrate extremely fine material and is particularly applicable to sulphide ores. In this method frothing and collecting agents are added to the fine material in a tank and air bubbled through it from the bottom. The mineral adheres to the bubbles and is carried to the surface, where it is scraped off into separate containers. After concentration the mineral must be filtered and dried ready for the extraction processes. See METALLURGY.

Örebro, or Oerebro: 1. Prov. of central Sweden. Area 3560 sq. m.; pop. 257,136.

2. Cap. of above prov., near the W. end of Lake Hjelmar, 53 m. SW. of Vesterås. It was long a place of assembly of the diet, which, in 1520, here decreed the estab. of Lutheranism. It was largely rebuilt after a fire in 1854, and is now a centre of the iron trade; copper and silver are also mined near by. Manufs. include machinery, chemicals, footwear, and matches, and the chief state railway workshop is here. O. is an inland port and a railway junction. There is a state technical college. Pop. 70,412.

Oregon, the 'Beaver State,' one of the United States of America, bounded on the N. by Washington, E. by Idaho (from which states it is separated by the Columbia R. and the Snake R. respectively), S. by California and Nevada, and W. by the Pacific Ocean. Total area 96,980 sq. m., including 630 sq. m. of water. The prin. rvs. are the Columbia and its branches, i.e. the Willamette, Fall R., Snake R., and the Owyhee.

The Columbia, which is 14 m. wide at its mouth, carries abundant steamship traffic 400 m. from the Pacific to the Idaho state line. The Dalles and Cello Canal, completed in 1915, opens the Columbia and Snake R.s. to navigation to a distance of nearly 600 m. from the ocean. Large ocean-going vessels can reach Portland, 108 m. inland. The Cascade Mts., which have extinct volcanic peaks of 4000 to 14,000 ft high, run N. and S., dividing the state into 2 unequal regions. The W. third of the state, bordering the Pacific, has a mild, equable, and moist climate, with valleys of great fertility, where pines grow from 250 to 300 ft high, and firs from 4 to 10 ft in diameter. Agriculture is the main occupation, and O. has 20,000,000 ac. of farm land. Almost every variety of temperate-zone crop is produced. The prin. industries are lumbering, flour and grist milling, fish canning, paper and pulp making, printing and publishing. There are planing mills, meat-packing factories, foundries, copper-smelting works, and refineries. Minerals include gold, copper, lead, and mercury. Value of mineral products in 1950 was over \$21,000,000. The timber of O. is the most extensive in the U.S.A., with about 29,755,000 ac. of forest land; the ann. cut of timber is the greatest in the country. The fruit industry is an enormous one, O. apples being sold all over the world. Salmon fisheries, especially at the mouth of the Columbia R., are among the world's finest. Halibut, sturgeon, pilchard, tuna, and oyster fisheries are also abundant. Bonneville Dam and defence needs led to the development of ship-building, electrochemical, and metallurgical industries.

O. sends to Congress 2 senators and 4 representatives. The Legislative Assembly has a Senate of 30 members, elected for 4 years, and a House of 60 representatives, elected for 2 years. School attendance is compulsory from 8 to 16 years of age; those between 16 and 18 must attend part-time or evening schools if deficient in basic education. Centres for higher education include the Univ. of O., O. State College, Univ. of Portland, Willamette Univ. Prin. tns: Portland (373,628); Salem, the state cap. (43,140); Eugene (35,880); Klamath Falls (15,875); Medford (17,300); and Astoria, (12,330). O. was the name formerly given to the whole ter. W. of the Rocky Mts, claimed by the U.S.A. as far as lat. 54° 40' N. This claim was resisted by the Brit. Gov., which asserted a right to the entire ter. The boundary dispute was, however, settled on the 49th parallel. The N. portion is now Washington. The territorial gov. was organised in 1848, and in 1859 O. was admitted as a state. Pop. 1,521,341. O. instituted the national movement for direct primaries, initiative, referendum, and recall. It voted for prohibition before the U.S.A. It has a celebrated agric. college at Corvallis with 8000 students. See lists of the state by N. H. Bancroft, 1886-8; H. S. Lyman, 1903; C. H. Carey, 1922; H. W. Scott, 1924; also J. H. Horner, *Oregon: Her*

with a full or heavy registration. Two years later Elliot and Illl introduced the radiating pedal-board into the York Minster O.; this idea was later combined with Willis's concave and radiating pedal-board.

The ordinary modern O. embodies these principles. It consists of bellows, wind-trunk, and chests and keys and pedals; the keys and pedals are in contact by means of a system of trackers or of electric cables with the pipes and reeds, which are grouped at discretion by means of stops, composition-pedals, and couplers. The electric-contact ideas were first brought forward by Dr Gauntlett at the 1851 Crystal Palace Exhibition. At the Paris Exhibition in 1887 the tubular pneumatic system was advanced. All modern touch systems are variants in these 2 methods. The keys are arranged in 3, 4, or 5 rows, or manuals, the chief manuals being 'great,' 'swell,' and 'choir' as the normal basis, with perhaps 'solo' and 'echo' added. In a 3-manual O. the 'solo' is occasionally found instead of the 'choir.' The principle of the swell was invented by Jordan in 1712; the pipes are ranged in a box, of which the front resembles a Venetian blind, which opens or closes as the swell-pedal is manipulated. The Hope-Jones electro-pneumatic O.s have a double touch, i.e. 2 levels of depression for the same key, the lower being more emphatic and suitable for picking out a theme, the higher being adapted to accompaniment. Similar effects are obtainable by means of ingenious inventions by Casson and others. The compass of keys on a modern O. is 5 octaves (61 notes), and of pedals, 32 notes; and many improvements and new ideas in the matter of swell- and composition-pedals and combination couplers continue to be presented. With the advance in the mechanical perfection of the instrument has come a corresponding advance in ease of control which has made possible the construction of gigantic instruments of which the most notable example is that in the Convention Hall, Atlantic City, U.S.A. This instrument possesses 7 manuals, 1249 stop keys, and over 33,000 pipes, whilst its blowing apparatus necessitates engines of over 400 h.p. Its tonal range is remarkable and is spread over 4 gallery O.s in addition to its main divs. While nothing approaching the size of this monster is found in Britain, there are many magnificent examples of the O.-builder's art in cathedrals, churches, and concert halls. Notable examples are those at Liverpool Cathedral, St Paul's, and Canterbury Cathedral. Size alone is not a criterion, many notable O.s with a smaller tonal range depending chiefly on the refinement and balance of their tone colours rather than on great power. The cinema O. has contributed something new both in tonal values and constructional technique. Making free use of the extension principle whereby various tones are 'borrowed' at varying pitches, its main tone is based on the tibia, a large-scale flute, instead of the diapason. String, brass, and wood-wind stops give an

orchestral effect and ingenious mechanical devices make possible a variety of percussion effects. A tremulant is generally used over the whole tonal range to overcome the dead acoustics of the average cinema. Instruments vary in size from small instruments with only 5 main ranks to large concert O.s of 3 or 4 manuals capable of reproducing the full range of orchestral tone colour.

In 1935 a new type of instrument made its appearance—the electrophonic O. Instead of pipes, this new development made use of the thermionic valve. The depression of a key caused a valve to oscillate at a fixed frequency corresponding to the note. The electrical wave so produced was fed into an amplifying unit similar to that of a radio set and thence into loudspeakers whence it emerged as sound. Various modulations of tone colour were brought about by the addition of the necessary harmonics to the fundamental tone. Since that date there have been many developments both in the system whereby the initial tone is produced and in tonal variety. The chief advantage of the electrophonic O. is that it does not require tuning, having no pipes; it takes up a minimum space and is considerably cheaper than the pipe O. Nevertheless it is still only in the development stage.

Burn's *Dictionary of Organs and Organists*, 1921, lists over 700 books in the bibliography of the instrument, many of which are now only to be found in technical reference libraries. The standard work on the subject is E. J. Hopkins *The Organ: its History and Construction*, 1877. See also C. Clutton and C. Dixon, *The Organ: its Tonal Structure and Registration*, 1950; W. L. Sumner, *The Organ: its Evolution, Principles of Construction, and Use*, 1952; *The Organ* (quarterly magazine).

Organ, Organic, Organism, see BIOLOGY and MORPHOLOGY.

Organic Chemistry, term formerly applied to the study of compounds obtained directly or indirectly from living organisms or their products or remains, but now used to denote the chem. of the compounds of carbon. The name was first definitely employed in the modern sense of Gmelin in 1848. Organic compounds are extraordinarily numerous, and include such important and diverse substances as hydrocyanic acid, strychnine, brucine, and oxalic acid among poisons; aspirin, antifebrin, salvarsan, chloral, Bayer 205, morphia, penicillin, mepacrin, and diamamine among drugs; chloroform, ether, cocaine and novocaine among anaesthetics; lyddite, trinitrotoluene (T.N.T.), dynamite, nitroglycerine, cordite, and gun-cotton among explosives; camphor, vanillin, musk, geraniol, citral, ionone, and benzaldehyde among perfumes; coal, petrol, paraffin, coal-gas, and most other fuels; starch, sugar, fats, vegetable and animal oils, proteins, and vitamins among foodstuffs; phenol, cresol, iodoform, and formalin among antiseptics; and cotton, silver, alcohol, vinegar, turpentine, soap, dyes, paper,

calcium carbide, and photographic developers among common commodities. Protoplasm itself, the actual living matter of animals and plants is a congeries of carbon compounds.

Historical. Although many organic compounds, such as starch and sugar, have been known from very early times, little progress was made in the elucidation of their properties and composition until the late 18th cent., when the Swedish-Pomeranian chemist, C. W. Scheele (1742-86), first prepared, and examined the properties of, chemically pure specimens of many important carbon compounds, e.g. glycerine, uric acid, milk-sugar, and hydrocyanic acid. A. L.

numbers of the same atoms, followed by the further discovery (F. Wöhler, 1828) of the same peculiar relationship between urea and ammonium cyanate, led to the recognition of the phenomenon of isomerism (q.v.). To define the constitution of an organic compound it is, in fact, insufficient to state merely the numbers of the atoms of the various elements in its molecule, since many different compounds of the same molecular formula (isomers) may exist. Thus the formula C_2H_6O applies to 2 compounds, viz. alcohol and dimethyl ether, while the formula $C_{10}H_{16}O$ applies to at least 120 different compounds. The frequency with which isomerism occurs emphasised the need to

I.C.I.

A GENERAL VIEW OF A MODERN ORGANIC RESEARCH LABORATORY

Lavoisier (1743-94) began the systematic analysis of organic compounds and showed that, in addition to carbon, the elements most frequently present in them are hydrogen and oxygen, and, less often, nitrogen, chlorine, sulphur, phosphorus, and other elements. Further advances in methods of analysis were made by J. von Liebig (1803-73), and with the simultaneous progress in general chemical theory it became at length possible to arrive at definite conclusions as to the structure of numerous carbon compounds.

In the early days of the science it was believed that organic compounds could be originally formed only under the influence of an occult *vis vitalis* or vital force, but this belief was gradually abandoned when such typical products of living organisms as alcohol, urea, and oxalic acid were prepared artificially in the laboratory. A striking discovery, made by Liebig in 1823, that the molecules of silver cyanate and silver fulminate consist of the same

investigate the constitution of carbon compounds much more closely, with the aim of discovering the way in which the atoms are arranged within the molecule. The results of such investigation are expressed in structural formulae, whereby the difference between isomers is clearly indicated. Thus dimethyl ether exhibits properties best indicated by the formula $CH_3 \cdot O \cdot CH_3$, whereas the properties of alcohol are represented by the formula $CH_3 \cdot CH_2 \cdot OH$. Both formulae, it will be observed, contain the same number of the same atoms viz. 2 of carbon, 6 of hydrogen, and 1 of oxygen, but the structure of 1 molecule is entirely different from that of the other.

Prominent in this research into the molecular architecture of organic compounds were Liebig and Wöhler, who showed that certain groups of atoms, radicals, could maintain their identity throughout a series of chemical changes, and were present in numerous related

compounds. Thus the radical benzoyl, $C_6H_5\cdot CO\cdot$, whilst incapable of independent existence for a long time, is contained in the following (and many other) substances: benzoic acid, $C_6H_5\cdot CO\cdot OH$; benzoyl chloride, $C_6H_5\cdot CO\cdot Cl$; benzoyl iodide, $C_6H_5\cdot CO\cdot I$; benzoyl cyanide, $C_6H_5\cdot CO\cdot CN$; benzamide, $C_6H_5\cdot CO\cdot NH_2$; and benzaldehyde, $C_6H_5\cdot CHO$. While the number of radicals is theoretically infinite, it is found in practice that only a comparatively small number occurs with any marked frequency, and by a study of the properties that these common radicals (e.g. methyl, $CH_3\cdot$; ethyl, $C_2H_5\cdot$; carboxyl, $\cdot COOH$; carbonyl, $\cdot CO$; aldehyde, $\cdot CHO$; phenyl, $C_6H_5\cdot$) confer on compounds containing them, it is possible to deduce their presence or absence in newly discovered compounds, and to predict with some confidence the properties of a compound from its structural formula alone. Further progress was made by J. B. A. Dumas (1800-84), who showed that many properties of organic compounds were conditioned by the general structure of the molecule as a whole, and that, as long as this structure was broadly maintained, an electropositive element such as hydrogen might be partly or wholly replaced by such a typically electronegative element as chlorine without alteration of the fundamental nature of the compound so treated. While at first this theory of types appeared to be diametrically opposed to the radical theory, A. Laurent (1807-53) and C. F. Gerhardt (1816-56) showed that the 2 might easily be reconciled, since substitution of chlorine for hydrogen, and other such replacements, might well leave the general shape and position of the radicals unchanged, the 'derived' radicals being roughly similar in chemical character to the originals.

In 1852 Sir Edward Frankland (1825-1899) introduced the idea of valency (q.v.), or definite combining power of atoms, observing, for example, that 1 atom of phosphorus showed a tendency to combine with either 3 or 5 atoms of other elements, but no other number; the valency of phosphorus was therefore said to be 3 or 5. Hydrogen, on the other hand, has only 1 combining bond per atom, while oxygen has 2, so that to satisfy the combining power of 1 oxygen atom 2 hydrogen atoms are needed. The theory of valency, as applied to organic compounds, was greatly improved and extended by F. A. Kekulé (1829-96), who in 1858-68 showed that carbon uniformly has a valency of 4, and that carbon atoms have the remarkable and almost unique power of linking up together to form chains, rings, etc., which constitute the framework of the compound molecules. Thus butane, $CH_3\cdot CH_2\cdot CH_2\cdot CH_3$, has a straight chain of 4 carbon atoms: $C-C-C-C$; isobutane, $(CH_3)_2CH\cdot CH_3$, a branched chain:

$\begin{array}{c} O \\ \diagup \\ C-C \\ \diagdown \end{array}$; and benzene C_6H_6 , a closed chain or ring of 6 carbon atoms:

$\begin{array}{c} C-C \\ \diagup \quad \diagdown \\ C-C \\ \diagdown \quad \diagup \\ C-C \end{array}$. In 1865 Crum Brown (d. 1922) introduced the system of denoting each valency bond, or unit of combining power, by a line, a neat device that at once rendered possible the clear and precise formulation of the supposed arrangement of atoms within a molecule. For example, the graphic formulae of (i) alcohol, and (ii) dimethyl ether are written as follows:

Similarly, the more complicated molecule of ethyl acetate is graphically represented as:

While such formulae undoubtedly indicate to some extent the actual spatial arrangements of the atoms in a molecule, they are more rightly to be regarded as an epitome of the chemical properties of the substances they represent, and their value is consequently in no wise diminished by modern theories and discoveries relating to the structure of the atom.

Remarkable evidence on this point is to be found in the facts of stereoisomerism (q.v.), a branch of O. C. founded by L. Pasteur (1822-95), J. H. van't Hoff (1852-1911), and J. A. Le Bel (1847-1930). They showed that the ordinary plane formulae were insufficient to account for certain cases of isomerism, e.g. that of the lactic acids, where 3 distinct compounds exist, all of which must be represented by the single plane formula, $CH_3\cdot CH(OH)\cdot CO_2H$, and van't Hoff and Le Bel independently and almost simultaneously in 1874 suggested that in such cases it is necessary to take into account the 3-dimensional structure of the molecules. It has, indeed, been found that wherever the molecules of a compound are asymmetric, the observed isomerism can be explained only by space formulae, and conversely, it has been possible to predict previously undiscovered isomers by a recognition of asymmetry in the molecules of a substance. Such isomerism (stereoisomerism) is not always accompanied by asymmetry, but when asymmetry is present the stereoisomers are distinguished by their optical effects on polarised light.

The rapid growth of O. C. in the last hundred years has been extraordinarily fruitful on the practical side, since the structure of many valuable natural products has been ascertained, and their manuf. by artificial methods from cheap sources rendered possible. Thus indigo, acetic acid, alizarin, and methyl alcohol, to name only a few, can now be prepared synthetically at a much lower cost than formerly; while the range of dyes, drugs,

explosives, etc., has been extended enormously by applications of the knowledge won by organic chemists. In the sphere of biochemistry (q.v.) O. C. is throwing light on the physiological basis of life, whilst in medicine it is now possible deliberately to build up new remedial and preventive substances of practically any desired character. In agriculture, horticulture, paper-making, brewing, tanning, and numerous other industries the organic chemist is playing an ever-increasing part, while the former art of perfumery is rapidly becoming a more specialised branch of the science of O. C.

General. Organic compounds are classed in sev. divs., of which the 2 principal are the fatty or aliphatic (q.v.) and the aromatic (q.v.). Aliphatic compounds, so called on account of the fact that the fats are among the most typical members of this div. (Gk *aleiphar*, fat), may theoretically be regarded as ultimately derived from methane or marsh gas, CH_4 , while benzene and its derivatives are classed as aromatic. The main distinction in structure between the 2 groups is that the aromatic substances contain a closed chain nucleus of carbon

atoms, e.g. benzene, $\text{HC} \begin{array}{c} \text{H} \\ \diagup \quad \diagdown \\ \text{C} = \text{C} \\ \diagdown \quad \diagup \\ \text{H} \end{array} \text{CH}$, and

naphthalene, $\text{HC} \begin{array}{c} \text{H} \quad \text{H} \\ \diagup \quad \diagdown \quad \diagup \quad \diagdown \\ \text{C} = \text{C} \quad \text{C} = \text{C} \\ \diagdown \quad \diagup \quad \diagdown \quad \diagup \\ \text{H} \quad \text{H} \end{array} \text{CH}$ while

the aliphatic compounds have open chains of carbon atoms, e.g. pentane, $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_3$. Heterocyclic compounds contain a closed ring consisting partly of carbon atoms and partly of other multivalent atoms, e.g. pyridine,

$\text{N} \begin{array}{c} \text{H} \quad \text{H} \\ \diagup \quad \diagdown \\ \text{C} = \text{C} \\ \diagdown \quad \diagup \\ \text{H} \end{array} \text{CH}$. Within each large div.

the compounds fall into well-defined homologous series. Any particular homologous series can be represented by an algebraic formula, e.g. $\text{C}_n\text{H}_{2n+2}$ for the paraffin series, and any 2 consecutive members of a series differ in molecular constitution by 1 carbon atom and 2 hydrogen atoms. Thus methane, CH_4 , ethane, C_2H_6 , and propane, C_3H_8 , are the first 3 members of the paraffins. All the members of a given series can be prepared by similar methods and show a general similarity of properties, 2 facts that do much to lighten the labour of the student of O. C. Some of the prin. classes of organic compounds are given below, with general formulae:

Aliphatic.

1. Paraffins, $\text{C}_n\text{H}_{2n+2}$.
2. Olefines, C_nH_{2n} .
3. Acetylenes, $\text{C}_n\text{H}_{2n-2}$.

4. Alcohols, e.g. $\text{C}_n\text{H}_{2n+1}\text{OH}$.
5. Aldehydes, e.g. $\text{C}_n\text{H}_{2n+1}\text{CHO}$.
6. Fatty Acids, $\text{C}_n\text{H}_{2n+1}\text{CO}_2\text{H}$.
7. Ketones, e.g. $\text{C}_n\text{H}_{2n+1}\text{CO}\cdot\text{C}_m\text{H}_{2m+1}$.
8. Ethers, $\text{C}_n\text{H}_{2n+1}\text{O}\cdot\text{C}_m\text{H}_{2m+1}$.
9. Amines, e.g. $\text{C}_n\text{H}_{2n+1}\text{NH}_2$.
10. Amides, e.g. $\text{C}_n\text{H}_{2n+1}\text{CO}\cdot\text{NH}_2$.
11. Carbohydrates, e.g. $\text{C}_6\text{H}_{12}\text{O}_6$, glucose, $\text{C}_{12}\text{H}_{22}\text{O}_{11}$, cane-sugar, and $(\text{C}_6\text{H}_{10}\text{O}_5)_n$, starch.

Aromatic (benzene derivatives)

1. Benzene hydrocarbons, $\text{C}_n\text{H}_{2n-6}$.
2. Nitro-compounds, e.g. $\text{C}_n\text{H}_{2n-7}\text{NO}_2$.
3. Amino-compounds, e.g. $\text{C}_n\text{H}_{2n-7}\text{NH}_2$.
4. Phenols, e.g. $\text{C}_n\text{H}_{2n-7}\text{OH}$.
5. Sulphonic acids, e.g. $\text{C}_n\text{H}_{2n-7}\text{SO}_3\text{H}$.
6. Diazo-compounds, e.g. $\text{C}_n\text{H}_{2n-7}\text{N}_2\text{Cl}$ (and aromatic alcohols, aldehydes, acids, ketones, ethers, amides, amines, etc.).

Heterocyclic.

1. Pyridine, $\text{C}_5\text{H}_5\text{N}$.
2. Pyrone.

3. Pyrrole, $\begin{array}{c} \text{CH} = \text{CH} \\ \diagdown \quad \diagup \\ \text{N} \text{H} \end{array}$.
4. Furan, $\begin{array}{c} \text{CH} = \text{CH} \\ \diagdown \quad \diagup \\ \text{O} \end{array}$.

6. Quinoline,

7. Isoquinoline,

See H. Gilman, *Organic Chemistry*, vols. 1 and 2 (2nd ed.), 1943; vols. 3 and 4, 1953; and L. F. Fieser, *Organic Chemistry* 3rd ed.), 1956.

Organic Husbandry, practice of agriculture and horticulture in all their phases based upon the use of organic materials and natural methods, to the exclusion of chemical fertilisers, dusts, and sprays, and

artificial forcing of stock for their produce. The keynote is the law of return, whereby it is held that the residues of organic life, plant remains, animal and human excreta, etc., must be returned to the earth, and in decomposition stimulate the natural processes that restore and build soil fertility. A naturally fertile soil means healthy plants; healthy plant food means healthy animals and humans. The cycle is thereby complete, and high disease resistance means no need for insecticides, fungicides, or medicine. O. H. also embraces mixed, not specialised, farming, mixed crops rather than monoculture, and the use of soil-building plants and trees to prevent erosion. Theoretically it is held that chemical fertilisers disrupt the natural processes of nutrition, destroy an essential link between certain soil fungi (mycorrhiza) and plants, and so adversely affect plant and animal nutrition and health. In practice, O. H. is founded on the conservation of all plant and organic debris on farms and gardens, and their conversion into humus and plant foods via the compost heap. Composting methods vary in detail, but in principle consist of the stacking of mixed organic materials in layers, sandwich fashion. The thickest layers are of plant debris topped by thinner layers of animal matter (manure, etc.), which serve to accelerate decomposition. A dusting of lime may be added as an alkalinising base, and a sprinkle of soil. The sequence is repeated to form moist, aerated, flat-topped heaps with tapering sides, not less than 5 ft square and 4½ ft high. Heaps may be turned one or more times to restimulate rotting. Compost heaps can be made smaller than the dimensions stated above if given protection in a compost bin. In scarcity of animal manure, organic fertilisers (bone meal, hoof, and horn, dried blood, etc.) may be used. Finished compost is applied at any season. High handling and labour costs are the chief disadvantages. Sheet composting is practised on farms and consists of dressing green manure crops or spent pastures with farmyard manure and ploughing in by Aug.-Sept. Consistent stocking of the soil with organic matter improves it biologically and chemically, and the accretion of humus and plant nutrients gives sound fertility. See Sir A. Howard, *An Agricultural Testament*, 1940; F. H. Billington, *Compost*, 1942; Lady Eve Balfour, *The Living Soil*, 1943, 1947; Frank Sykes, *Humus and the Farmer*, 1946; E. Pfeiffer, *Soil Fertility, Renewal, and Preservation*, 1947; D. P. Hopkins, *Chemicals, Humus, and the Soil*, 1949.

Organisation for European Economic Co-operation, formed after the Foreign Aid Act authorising the Marshall Plan for European Recovery was signed by President Truman on 3 April 1948; the 16 European nations which had accepted the Marshall offer met in Paris to set up a joint organisation (i.e. the O.E.E.C.) which was intended to outlive the European Recovery Programme. The understanding was that European countries should come to an agreement upon the

economic assistance required from the U.S.A., and upon measures of self-help. A preliminary conference between Britain, France, and Russia, in 1947, broke down when the Soviet Union expressed its dislike of a European economic programme on the grounds that current arrangements would be disturbed and national sovereignty impaired. The other 2 countries, however, issued invitations to all European states save Spain to take part in measures of economic co-operation, the Soviet bloc refusing participation. A conference of the 16 participants was held in Paris, and ultimately outlined a plan for the restoration of European economy by the end of 1951. This was held to require 4 measures: the solving of the problem of Europe's trade deficit with America, estimated at \$22,440,000,000 for 1948-51; maximum mutual co-operation by the 16 nations; the estab. of internal financial stability; and maximum production by each participant. A convention in 1948 set out the constitution of the permanent O.E.E.C., namely, a council, an executive committee of 7, a secretariat, and sev. *ad hoc* committees.

After Marshall Aid ended, O.E.E.C. as originally envisaged continued to function, concentrating on the dollar problem which was common to most of its members, but also studying increasingly the questions of liberating inter-European trade and returning to currency convertibility. The European Payments Union, at present (1958) one of O.E.E.C.'s main functions, will cease to exist when convertibility is restored. Britain is an active member of O.E.E.C., which has admitted new members since its inception (e.g. the Federal Ger. Rep. was admitted Oct. 1949), the present (1958) chairman being D. Heathcoat Amory, Brit. chancellor of the exchequer.

Organists, *see* ROYAL. **Organo-Metallic Compounds**. Compounds of metals with alkyl (e.g. C_2H_5) or aryl (e.g. C_6H_5) groups. They are colourless liquids with low boiling points. Many of them are decomposed by water with liberation of much heat, and burn in air often with explosive violence. Some compounds, e.g. $Mg < \overset{Br}{C_2H_5}$, contain halogen as well. These are known as Grignard's reagents. Thus to make magnesium ethyl bromide, *dry* magnesium (1 atom) is covered in a flask with *dry* ether and 1 molecule of ethyl bromide is added. A vigorous action sets in, and finally a solution of the Grignard reagent in ether is obtained. These reagents are very valuable aids in organic chemistry. Thus with water and alcohol they yield hydrocarbons; with oxygen they give alcohols; they react with halides of metals (and some non-metals); they absorb carbon dioxide and can be made to yield acids (carboxylic) by treating the product with a dilute mineral acid. Aldehydes can be converted into secondary alcohols, and so on.

O.-M. C. of the type $Mg(C_2H_5)_2$ can be made either by the action of an alkyl

halide with the metal, or by the action of zinc alkyl and the metallic chloride in question. Thus $\text{Sn}(\text{C}_2\text{H}_5)_4$ can be made from stannic chloride and zinc ethyl. $\text{Zn}(\text{C}_2\text{H}_5)_2$. Zinc ethyl itself is a liquid which boils at 118°C . Aluminium methyl, $\text{Al}(\text{CH}_3)_3$, boils at 130°C . and reacts violently with water. Mercury, tin, lead, etc., yield compounds like $\text{Hg}(\text{C}_2\text{H}_5)_2$, whilst lead tetraethyl (q.v.) has found commercial application as an anti-knock reagent. Mercuric ethyl is obtained from zinc ethyl and mercuric chloride, and also by the action of ethyl iodide on sodium amalgam. It boils at 159°C ., is very poisonous, but does not oxidise easily in air.

Organon (Gk *organōn*, an instrument), name applied to the works of Aristotle (q.v.) on logic (q.v.). These were so called because logic is neither a speculative science nor, properly speaking, a practical art, but an instrument for use in all scientific thought. Francis Bacon entitled one of his treatises *Nomum Organum*, professing to expound therein a new system of inductive logic.

Oriani, Alfredo (1852-1909), It. novelist and essayist, scarcely known outside Italy, is celebrated in his own land as the precursor of Fascism, and the Fascists undertook a national ed. of his works. He was born in Faenza, and here in his villa he passed most of his life. During his life he was practically ignored, but was later honoured not only by the Fascists, but also by the critic Benedetto Croce, and by the literary group of the jour. *Voce*. He was primarily a thinker, influenced especially by the philosophy of Hegel. He preached that Italy needed real unity; and that there was too much regionalism. To the tendency prevailing in his time he opposed the martial spirit. These ideas were especially set forth in *La lotta politica in Italia*, 1892, and *La rivolta ideale*, 1907. Also for a time he tried his hand at novels, which were marked by a pitiless realism, the fruit of his observation of the villagers around him. Among these were *Gelosia*, 1894, *La disfatta*, 1896, and *Olocasta*, 1902.

Oribasius (c. AD 325-403), Gk physician, native of Sardis or Pergamus, friend and physician of the Emperor Julian, accompanying him to Gaul (355) and to Persia (363). He became quaestor of Constantinople (361). O. was banished temporarily by Valentinian and Valens, but recalled in 370. O. was the greatest of the Byzantine physicians. Half of his *Medicinalia Collecta* (*Συναγῆγαι Ιατρικαί*) is extant. It is compiled largely from Galen and others (see ed. of 1851-76), and is of importance as preserving the works of many medical writers of antiquity which would otherwise have been lost.

Orid, see **ORRID**.

Oriel College, Oxford, founded in 1326 by Edward II, prompted thereto by Adam de Brome, clerk in chancery. The name comes from a message in Oxford called *La Oriole*, which was demised to the college at its foundation, but the origin of this name is unknown. Famous members

of the college include Sir Walter Raleigh, Gilbert White, Thomas Hughes, and Cecil Rhodes. See G. C. Richards and H. E. Salter, *The Dean's Register of Oriel, 1446-1661*, 1926, and C. S. Emden, *Oriel Papers*, 1948.

Oriel Window, window projecting from an upper storey, and supported by a bracket or corbelling. O. Ws were commonly used in late Gothic civil architecture, especially in France and England.

Orient Line, now a subsidiary of the Peninsula and Oriental Steam Navigation Co. (q.v.), steamship line sailing between London and Australia which succeeded the old O. L. of sailing ships which used to ply between London and Adelaide. Its steamship service to Australia was started in 1878. At that time it sailed some of the Pacific Steam Navigation Co.'s ships, but this arrangement ended in 1901 and later the O. L. built a new fleet of 12,000-ton steamers to replace them. O. L. steamers call at Gibraltar, Marseilles, Naples, Port Said, Aden, and Colombo on their way to Australia. The *Oracles* (28,000 tons gross), launched in Oct. 1947, was named after a new ship lost during the Second World War, and has a speed of $22\frac{1}{2}$ knots; she can make the passage between England and Melbourne in 28 days. *Oronsay* (28,000 tons) sailed on her maiden voyage in 1951, and *Orsova* (29,000 tons) in 1954. At the beginning of 1954 the O. L. started a service across the Pacific from Australia calling at Auckland, Fiji, Honolulu, San Francisco, and Vancouver, whilst once a year eastbound and westbound O. liners sail round the world.

Oriental and African Studies, School of, a school of London Univ. (q.v.), founded in 1916 and opened 1917. In the amending charter of 1938 (which added the words 'and African' to the title and restated the purposes of the school), it is declared that its objects are to 'further research in and to extend the study and knowledge of the languages of Eastern and African peoples, ancient and modern, and the literature, history, religion, law, customs, and art of those peoples. The courses are designed for the needs of persons about to proceed to the E. or to Africa for study and research, for the public service or commerce, or for the pursuit of a profession or calling.' The scope of the teaching covers culture and history, including oriental art and archaeology, the literatures, religions, philosophies, and customs of oriental and African countries, social anthropology, phonetics, linguistics, law, courses for colonial service probationers, and commercial courses. The school is housed in modern buildings on the Bloomsbury site, and has a student body of about 600.

Oriental Club, see **CLUB**.

Oriental Languages, see **LINGUISTIC FAMILIES**.

Oriental Plague, see **PLAGUE**.

Orientation, determination of the points of the compass with special regard to the E.; in eccles. architecture the arrangement of a sacred building so that its main arc may point towards the E. In Gk temples the main door was at the E. end, and some

such custom was followed in the early Church. The altar was near the W. end, and the officiant faced the people standing still further W. Later the custom became estab. of placing the altar at or near the E. end, the priest officiating usually with his back to the congregation. (For orientation of Muslim mosques see MOSQUE.)

Oriente: 1. The most easterly and largest of the Cuban provs. (formerly Santiago de Cuba), covering an area of 14,132 sq. m. The prov. is mountainous in parts, but is drained by numerous streams and has some fertile valleys and plains. The highest mt peak is Turquino (8560 ft.). The chief products are iron, copper, chromium, manganese, mercury, slate, marble, sugar, tobacco, fruit, cereals, coffee, honey, wax, petroleum, etc. Cap. Santiago. Pop. 1,798,185.

2. Region of Ecuador, on the E. side of the Andes. It is divided (since 1925) into the provs. of Napo-Pastaza and Santiago-Zamora. The main townships are Tena and Macas respectively. It comprises a large tract of country in the Amazon valley, and is crossed by many rivers. An area rich in timber, rubber, and probably gold, its possession has been disputed by Ecuador, Peru, and Colombia. Area 219,095 sq. m., of which only 110,000 are inhabited. Pop. 50,354.

Oriflammé (Med. Lat. *auriflamma*), red flag of the abbey of St Denis, which the kings of France received from the abbot at their coronation. It was at first used only against infidels, but later was in general use, appearing for the last time at Agincourt. In the 15th cent. the O. was superseded by the blue standard powdered with fleurs-de-lis, and the last mention of the original O. is in the inventory of the abbey of St Denis dated 1531.

Organum, genus of aromatic herbs and sub-shrubs (family Labiatae). *O. marjorana* is the sweet marjoram of gardens. *O. vulgare*, the common marjoram with purple or white flowers, is also aromatic. *O. dictamnus*, dittany of Crete, is a handsome pink-flowered plant often grown in hanging baskets. *O. onites* is the Pot Marjoram.

Origen (186-c. 254), the most famous and influential Christian writer of his age, b. Alexandria. His father, Leonidas, was martyred under Septimius Severus, 202, and O.'s mother had to restrain her son from following his father to death. He made such progress under Pantaenus and Clement that Demetrius, Bishop of Alexandria, allowed him to catechise when only 18. He was learned in Scripture and Gk philosophy alike, and so zealous in his asceticism that he took the counsel of Matt. xix. 12 literally and castrated himself. The persecution of Caracalla, 216, especially attacked the learned, and O. had to flee. He gave public lectures on the Bible in Palestine at the invitation of the bishops of Jerusalem and Caesarea, but Demetrius objected that he was not a priest and he returned to Alexandria. He revisited Palestine, c. 231, on his way to Greece, and the 2 bishops ordained him. Deme-

trius again objected that a eunuch could not be a priest, and an Alexandrian synod unfrocked O. and forbade him to teach. Palestine and other dioceses refused to accept this, and O. settled at Caesarea, which his fame soon made a rival to Alexandria for scholarship. O. was imprisoned and tortured in the Decian persecution, dying as a result of his sufferings. He was never reckoned a martyr or confessor, for his speculations were so bold that even in his lifetime he was sometimes suspected of heresy. Some of his ideas were later condemned, e.g. the pre-existence of souls; that the resurrection body would be solid and spherical (the perfect shape); and that all, even the devil himself, would ultimately be saved. His exegesis of the O.T. was critical, and he readily preferred the allegorical to the literal interpretation. His great work was the adaptation of Gk philosophy (especially the *Logos* doctrine) to Christian thought. Representing all that was the best in Christian scholarship of the first 3 cents., he was broad in his conceptions and tolerant in controversy. Among his works that survive in Greek or Latin, at least partially, are his commentaries on Matthew, John, and Romans, his *Fundamentals* (*Peri Archon*), his great apologetic *Against Celsus*, and over 300 homilies. The Berlin Academy began a definitive ed. of his works in 1899. See also the ed. of Lommatzsch (25 vols.), 1831-48; the Ante-Nicene Christian Library (Eng. trans.), *De Principiis*, 1869, and *Contra Celsum*, 1872; C. Bigg, *Christian Platonists of Alexandria*, 1886; E. Leigh-Bennett, *Handbook of the Early Fathers*, 1920; H. Chadwick, *Contra Celsum*, 1953; J. Danielou, *Origen*, 1955.

Original Sin, sinfulness inherent in human nature since the Fall (q.v.). That man is morally crippled and subject to sin is a fact of common experience, amply proved by hist. It is also a revealed truth of the Christian religion, which teaches that this debility is inherited from our first parents, and is the consequence and punishment of their failure under probation to obey the will of God. The doctrine is based in scripture on the story of Adam and Eve (Gen. ii and iii) as elaborated by St Paul, especially in Rom. v. It is also involved in the whole Christian belief in salvation and redemption through Jesus Christ. The doctrine is unanimously taught by the early Fathers (c.f. Irenaeus, *Adversus Haereses*, iii. 22, 14; Tertullian, *De testimonio animae*, iii); Origen, *Homilia in Jeremiam*, viii. 1). In the 4th cent. Pelagius (q.v.) denied it. Since the Reformation (q.v.) there has been controversy about the exact nature of O. S., and the spiritual consequences of the sin of Adam upon his human nature and that of his posterity. Rom. Catholic theology defines O. S. as 'the guilt and stain of sin which we inherit from Adam.' What this means is further specified as being the necessity of physical death, loss of supernatural grace, and a depraving of the intellect and will. See also BAPTISM.

Orihuela, Sp. tn in the prov. of Alicante,

on the Segura, in a fertile, irrigated garden region. It has a 14th-cent. cathedral, much restored, sev. other fine anct churches, and a 17th-cent. college. There is a large trade in oranges, wine, and oil, and textiles are manuf. Pop. 45,350.

Orillia, summer resort of Ontario, Canada, on Lake Couchiching in Simcoe co., 60 m. N. of Toronto. There are iron foundries and saw- and grist-mills, and factories for making motor-cars and agric. implements. Pop. 12,796.

Orinoco, third largest riv. of S. America, being next in importance to the Amazon and Plata. The new airport of Puerto Ordaz, and even more the new river port of San Félix (pop. 8000), are beginning to enhance its economic importance, providing as they do an outlet for the newly developed iron ore of the Cerro Bolívar. Its source is in the Sierra Parima, Venezuela, at an altitude of nearly 5000 ft, below Ferdinand de Lesseps Peak, 3° 40' N. lat. and 64° 30' W. long. Up to its junction with the Guaviare, which joins it on the l. b., W. of 68° W. long., it holds a generally WNW. course for 360 m. During this course, 20 m. past Esmeraldas it bifurcates on the l. b., at 3° 10' N. lat. and 66° 17' W. long., into the Casiquiare (q.v.) which links up at its S. extremity with the Rio Negro, a trib. of the Amazon, and on the r. b., it is joined by the Ventuari. From its confluence with the Guaviare it flows almost due E. across the llanos or joined on the l. b. by the Vichada and Meta, both in Colombia, and the Apure and its many tribs. in Venezuela, and descending from the highlands by the cataracts of Maipures (which are nearly 2 m. wide and some 660 yds long) and Atures (5 m. wide and 6 m. long). Between the mouths of the Guaviare and Meta it separates Venezuela from Colombia, but otherwise its entire course runs through Venezuelan ter. From the junction with the Apure the main stream flows almost due E., across the llanos or grassy plains to the Atlantic at 8° 20' to 10° 0' N. lat. In this part of its course the prin. tribs. are the Caura, Caroni, and Paragua, all in Venezuela, and all flowing from the S. The delta begins at 62° 30' W. long., 130 m. from its mouth, by throwing off a branch which flows N. into the Atlantic, and covers an area of 8500 sq. m. The Boca de Navios, between Brit. Guiana and Naima Isle, is the mouth mostly used, but 6 others are also navigable. The Boca de Navios is divided by a line of is. into 2 channels, each 2 m. in width. The water of the riv. is of a milky-white colour, and may be easily distinguished at a great distance.

The O., from its source in SE. Venezuela on the Brazilian border, thus describes a great semicircle, the estuary being no more than 500 m. from its source in the Sierra Parima, whilst its entire course is 1960 m., of which 900 m. below the Atures cataracts and 600 m. above the Maipures cataracts are navigable.

The head of uninterrupted navigation is at the confluence of the O. with the Apure, 777 m. from the mouth of the riv. During its upper course the O. flows between the

mts and dense forests of Venezuelan Guiana on the E., and the wide llanos of Colombia on the W.; but after it reaches the lowlands, below its junction with the Apure, it has mts on its l. b. or N. side and the plains on its r. b. At a distance of 150 m. from its source the riv. is only 90 yds wide; above its junction with the Casiquiare, at an altitude of 1000 ft, it is 650 yds wide; below its junction with the Apure, at an altitude of 200 ft, it is from 4 to 5 m. wide. In the flood season (April-Sept.), following the rains, the lower course becomes an immense lake, covering the llanos for some miles to the E. of the Apure. The area of the basin is about 370,000 sq. m.

Orioles are passeriform birds found only in the old world, and constitute the family Oriolidae; the Amer. O., or Baltimore birds (q.v.), belong to a separate family, the Icteridae. The birds are insectivorous and frugivorous, and hence are to be seen usually on forest trees. The plumage is generally very brilliant, and the male bird utters a flute-like note. *Oriolus oriolus*, the golden oriole, which is occasionally seen in Britain, is orange-yellow in colour with black markings; *O. kundoo* is the Indian mango-bird.

Orion, son of Hyrieus of Boeotia, a hunter, of great beauty, who loved Merope, the daughter of Oenopion of Chios, and for offering violence to her was blinded by Dionysus. He opened his eyes to the rising sun, and his sight was restored. He afterwards lived in Crete, and hunted with Artemis. According to one legend, he was slain by the bite of a scorpion.

Orion, most brilliant and interesting of the constellations, contains 3 splendid stars: Rigel (magnitude 0.3), Betelgeuse (0.9), Bellatrix (1.9), and 44 stars between magnitudes 4 and 5.2. The Great Nebula in O., which is just visible to the naked eye, is one of sev. nebulae in the constellation. It surrounds θ Orionis, the middle star of the giant's sword (see NEBULAE). Betelgeuse (q.v.) is one of the largest stars visible. The stars in O. are not all at the same distance from the earth, Rigel being about 3 times as far away as Betelgeuse.

Orion's Dog, see CANIS MAJOR.

O'Riordan, Conal Holmes O'Connell (1874-1948), novelist and playwright, b. Dublin. In his earlier works he used the pseudonym F. Norreys Connell. His first book was *In the Green Park*, 1894, but his first real success was *The Fool and his Heart*, 1896, which was followed by *The Nigger Knights*, 1900, *Adam of Dublin*, 1920, with its sequels *Adam and Caroline*, 1921, and *Married Life*, 1924, *Rovena Barnes*, 1923, *Soldier Born*, 1927, *Soldier of Waterloo*, 1928, *Soldier's End*, 1938, and *Judith Quinn*, 1939. He succeeded J. M. Synge as director of the Abbey Theatre from 1909 to 1915, but his plays are not in the usual Abbey tradition. They include *Rope Enough*, 1913, *His Majesty's Pleasure*, 1925, and *The King's Winding*, 1929.

Orissa, state of India, formerly administered with Bihar (q.v.), lying along

the E. seaboard, with W. Bengal and Bihar to its N., Madhya Pradesh to the W., and Andhra Pradesh to the S. Its most important features are the great delta of the Mahanadi and the hilly tracts to the W. through which the Mahanadi gorge has provided the setting for the spectacular Hirakud Dam and reservoir. The hills are largely unproductive and forested; the delta is by contrast thickly populated, alluvial, and, near the sea, swampy lowland.

History. The Oriyas trace their hist. back to the anct kingdom of Utkal.

1957, is the world's longest; its reservoir (288 sq. m.) the greatest in the world. It is ultimately to irrigate 2 million ac. and provide 200,000 kw. of power. A second dam, the Machkund, will benefit O. and Andhra Pradesh on a smaller scale. Thus considerable development can be foreseen.

Culture. The state is a linguistic and cultural unit—Oriya is the language of the vast majority of the pop. It has many historic sites, and Puri, with the temple of Jagannath ('Juggernaut'), and Bhuvaneshwar, city of 500 temples and new cap. of O., are notable. The

Indian National Railways

PURI: JAGANNATH (JUGGERNAUT) TEMPLE

Their country was broken up in the period of Muslim domination. An Oriya awakening developed in the Brit. period. The isolated prov. was badly hit by a famine in 1866, which took 1,000,000 lives, after which the provision of better irrigation and rail communications was taken in hand. The Oriya demand for a separate prov. was conceded in 1936; after independence the rulers of 48 small princely states were persuaded to merge their kingdoms into O.

Development. Rice is grown on 9.5 million ac. out of 14 million ac. of cultivated land. Other grains, jute, cotton, and fruit are also produced. Much of India's iron ore is mined in O., and at Rourkela a steel plant is projected to yield 1 million tons a year (capital outlay Rs. 1,000,000,000). Some manganese, chrome, coal, and graphite are also mined. The Hirakud Dam, inaugurated in Jan.

new Utkal Univ. has 17 colleges affiliated to it.

Government. The governor acts through ministers responsible to an elected assembly of 140. O. is represented in India's Parliament by 10 members in the Upper and 20 in the Lower House. Other tns of note besides Bhuvaneshwar are Cuttack (pop. 103,000) and Puri (pop. 49,000). Area 60,140 sq. m.; pop. 14,600,000. *See also* BHUVANESHWAR and JAGANNATH.

Oristano, tn in Sardinia (q.v.), 55 m. NW. of Cagliari (q.v.). It has a cathedral and a 13th-cent. tower, is an important agric. centre, and has potteries. Pop. 17,300.

Oriya Language, *see* INDO-EUROPEAN LANGUAGES.

Orizaba, city of Mexico, in the state of Vera Cruz, 228 m. ESE. of Mexico city, altitude 4000 ft. It is reached from the

cap. via Puebla by the Mexican S. branch of the National Railway. There is considerable trade in sugar and tobacco, textiles are made, and there are railway workshops. The weaving of table linen is a new and thriving industry, and the tn is also noted for its wool sarapes. There are many silver- and gold-mines in the neighbourhood. Cattle-raising and agriculture are also carried on. The chief crop is coffee. The Mitla (q.v.) ruins are 25 m. SW. of the tn. In the vicinity is the slumbering volcano of O. or Citlaltépetl. Its last serious eruption was in 1566. Pop. 48,000.

Orizonte (Jan Frans van Bloemen) (1662-c. 1740), painter, b. Antwerp. He left his native tn for Italy early in life, and passed the remainder of his life in that country. His finest pictures are in the pontifical palace at Monte Cavallo. He was a follower of Poussin and particularly noted for his landscape paintings, being nicknamed 'Orizonte' by reason of the beauty and delicacy shown in his portrayal of distances. He had 2 brothers, also painters, viz. *Pieter van Bloemen*, called 'Standaart' (1657-1719), and *Norbert van Bloemen*, called 'Cephalus' (1670-1746).

Orjonikidze, see ORDZHONIKIDZE.

Orjonikidzegrad, see BEZHITS.

Orkhon Inscriptions (also known as Siberian, Early Turki, Pre-Islamic Turki or Kök Turki Runes) are the earliest epigraphical monuments written in Turki; and the earliest alphabetic inscriptions discovered in N. central Asia. They belong to the 7th and 8th cents. AD. Some of them are long funerary inscriptions, describing the war glories of the Tu-küe, the earliest known Turki people, who ruled over Mongolia from the mid 6th cent. AD to the mid 8th cent. These inscriptions were found on the Upper Ob, the Upper Yenisei, and particularly on the R. Orkhon, to the S. of Lake Balkal. The inscriptions are written either in horizontal lines running, like the Semitic alphabets, from right to left, or vertically (perhaps under Chinese influence) in columns following each other from right to left. This script was deciphered in 1893 by the Dan. scholar W. Thomsen. The language of the inscriptions is early Turki, the oldest form known of the Turkish tongue, which differs very widely from Osmanli Turkish. The script, which must have already been in use in the 6th cent. AD, consists of 38 letters, of which 4 are vowels (a, y, u, ö or ü); curiously enough, many consonants vary in form according to the following vowel-sound, e.g. *k* has as many as 5 forms (for writing (1) *ka*, (2) *ky*, (3) *ko* or *ku*, (4) *kü*, *ke*, *ki*, and (5) *kö* or *kü*). The origin of this script is uncertain; it may have derived from a local Pahlavik script (see PAHLAVI) or from the Sogdian alphabet (see ALPHABET).

There are 2 forms of the Orkhon script, the monumental, of which a few varieties are known, and which externally resembles the Teutonic runes, and the cursive form, the script of various fragments at Turfan (E. or Chinese Turkestan).

Orkney and Shetland, Duke of, see BOTHWELL, EARL OF.

Orkney Islands, separated from Caithness by the Pentland Firth (q.v.), lie between 58° 41' 24" and 59° 23' 2" N. lat. and between 2° 22' 2" and 3° 25' 10" W. long.; and are 73 in number at low water, of which 28, besides Mainland, or Pomona, are inhabited.

Many brochs, chambered cairns, and burial mounds remain as evidence of prehistoric and Norse settlements. The Neolithic dwellings of Skara Brae are important examples. The Orkneys, under the name Orkades, are mentioned by the anc. geographers, Pliny, Ptolemy, and others. In 876 Harald Haarfager conquered both them and the Hebrides. During the greater part of the 10th cent. they were ruled by independent Scandinavian Jarls (earls), but in 1093 they became formally subject to the Norwegian crown. Thus they remained Scandinavian till 1468, when they were given to James III of Scotland as a security for the dowry of his wife, Margaret of Denmark. The is. were never redeemed from this pledge; and in 1590, on the marriage of James VI with the Dan. Princess Anne, Denmark formally resigned all pretensions to the sovereignty of the Orkneys. During their long connection, however, with Norway and Denmark, all traces of the primitive Celtic pop. disappeared, and the present inhab. are of the pure Scandinavian stock.

The surface is very irregular, and the land is indented by numerous arms of the sea. Next to Mainland, the most important of the is. are N. and S. Ronaldshay, Hoy, Rousay, Stronsay, Flotta, Shapinsay, Eday, and Sanday. The highest peak is Ward Hill in Hoy, which has an elevation of 1560 ft. The temp. of the O. I. is comparatively mild, considering their N. lat. This is due chiefly to the proximity of the Gulf Stream. There is little difference in temp. between day and night; and frost and snow are rare. The rainfall averages 36½ in. At the season of the 'longest day' there is no darkness for about 6 weeks and during the summer solstice snapshots can be taken at midnight. The exports are chiefly agric. produce, and cattle. The chief tns are Kirkwall, the cap., and Stromness. The Orkney and Shetland (q.v.) is. return one member to Parliament. The area of the O. I. is 376 sq. m.; pop. 21,258.

See J. Gunn (ed.), *The Orkney Book*, 1909; A. W. Brögger, *Ancient Emigrants, Norse Settlements*, 1929; V. G. Childe, *Skara Brae*, 1931; J. S. Clouston, *A History of the Orkneys*, 1932; H. Marwick, *Orkney*, 1951.

Orlando, Vittorio Emanuele (1860-1952), It. jurist and statesman, b. Sicily, became a prof. of constitutional law at Palermo. He became minister of the interior in Boselli's Cabinet (1916). He succeeded Boselli as premier in 1917, and proved a tower of strength at the time of Cadorna's (q.v.) disastrous defeat at Caporetto (q.v.) by stiffening the national resistance. In the Inter-Allied Peace Conference in Paris, 1919, he was one of the

'Big Four' (see PEACE CONFERENCE). He seceded from the council in May 1919 on the Fiume question. Retiring from politics after Mussolini came to power, he returned to the Constituent Assembly to fight against the peace treaty after the Second World War, but, on the Chamber's approval of the treaty, he resigned his seat.

Orlando, tn in Florida, U.S.A., co. seat of Orange co., 125 m. S. of Jacksonville, and the state's largest inland city. It is a citrus-fruit packing and shipping centre; there are canneries and nurseries, and the manufs. include sheet-metal and concrete products, machinery, fertilisers, mirrors, and boxes. Pop. 52,367.

Orléanais, anct. prov. of France, the Pagus Aurelianensis of the Romans. It corresponded to the present depts of Loiret, Loir-et-Cher, and Eure-et-Loir, and parts of Seine-et-Oise, and Nièvre. The cap. was Orléans.

Orléans, Dukes of. The title of Duke of O. was created by Philip VI, and conferred on his son Philip. When the 3rd duke ascended the throne of France as Louis XII in 1498, the duchy lapsed. Louis XIII in 1626 bestowed the title of Duke of O. on Jean Baptiste Gaston, a son of Henry IV, but the title was not revived after his death until, in 1680, Louis XIV revived it in favour of his brother Philip. Descendants of this line are living at the present time; a brief account of the prin. persons who have held the title follows:

Louis (1372-1407), younger son of Charles V, was previously Count of Valois and of Beaumont-sur-Oise and Duke of Touraine, being created Duke of O. in 1392. He married Valentina, daughter of the Duke of Milan. His quarrel with Philip II, Duke of Burgundy, on the question of his wife's claims to Milan culminated after the death of Philip in his being murdered by one of the partisans of John, Philip's successor.

Charles (1391-1465), commonly called Charles d'Orléans, was the eldest son of the above duke. He married Isabella, the widow of Richard II of England, in 1406; in 1415 he was captured at Agincourt, and kept a prisoner in England until Nov. 1440. He spent most of the rest of his life at Blois, where he held a literary court. He is one of the finest of the late medieval Fr. poets, his rondeaux being outstanding for their poignancy and grace.

Jean Baptiste Gaston (1608-80), was the third son of Henri IV and Marie de Medici. Until 1638 he was heir to the throne. He intrigued continually and unsuccessfully against the Crown, and was eventually exiled from Paris.

Philippe I (1640-1701), the son of Louis XIII of France, was created Duke of O. in 1661, and married Henrietta, sister of Charles II of England, the same year. After her death (supposed to have been by poison at the duke's instigation) he married Charlotte Elizabeth, daughter of Charles Louis, elector-palatine of the Rhine. He had a distinguished military career.

Philippe II (1674-1723), regent of France, the son of the above. On the death of Louis XIV, he became sole regent and on Louis XV attaining his majority in 1723 Philippe continued in power as his Prime Minister. It was during his regency that the schemes of John Law (q.v.), the Scottish financier, which Philippe encouraged, brought the country to the verge of bankruptcy. A notorious libertine, Philippe was also a patron of the arts and philosophy.

Louis Philippe Joseph (Egalité) (1747-1793), b. St Cloud, was principally notable for his democratic views during the revolution, when he took the name of Philippe Egalité, and voted for the death of Louis XVI, his cousin. He was, however, subsequently guillotined. His son later became king as Louis Philippe (q.v.).

Henri (Prince of Orleans) (1867-1901), b. Ham, near Richmond. He was chiefly noted as a traveller and explorer, discovering the source of the Inraddi, for which he received the medal of the Geographical Society of Paris.

Louis Philippe Robert (1869-1926), b. Twickenham and educ. in France till 1886; he returned there in 1890 and expressed a wish to serve as a conscript, but was imprisoned for a short period. He later served with the Brit. Army in India. On his death, without issue, Jean, Duke of Guise, became pretender to the Fr. crown, being succeeded in 1940 by his son Henri, Comte de Paris. See M. Coryn, *House of Orleans*, 1936.

Orléans, Maid of, see JOAN OF ARC.
Orléans, Fr. tn, cap. of the dept of Loiret, on the r. b. of the Loire. Caesar called O. *Cenabum*; in later imperial times it was known as *Civitas Aureliani*, and was the anct. cap. of the prov. of Orléanais (q.v.). In 1429 Joan of Arc (q.v.), the Maid of O., began her mission to free France from the English, by forcing the Eng. troops under the Duke of Bedford to raise the siege of the tn. It suffered severely in the Huguenot troubles, in the Franco-Ger. war (q.v.), and in the Second World War. It is the seat of a bishopric. Its fine cathedral is a rebuilding since the 17th cent. of a previous structure destroyed in the religious wars. There are many anct. buildings and monuments, including churches, mansions, and an impressive museum, formerly the tn hall. Dolet (q.v.) was b. here. It is a road, rail, and canal junction. There is an extensive trade in agric. produce and wine, and machinery, confectionery, and textiles are manuf. Pop. 78,450.

Orléans, Isle of, is. of Quebec, just below Quebec City, on the R. St Lawrence. It is a fertile spot 21 m. long, with an area of 69 sq. m., and is noted as a summer resort.

Orley, Bernaert van (c. 1490-c. 1542), Flem. painter, b. Brussels. He studied Raphael at Rome, and later was appointed painter to Margaret of Austria. He made a number of designs for tapestry, the most celebrated being 'The Life of Abraham' at Hampton Court, and 'Maximilian's Hunts' in the Louvre.

Orloff Diamond, see DIAMOND.

Orms, or Ormin, see ORMULUM.

Ormazd (a corruption of the Pahlavi for *Ahura Mazda*, 'Lord Wisdom'), the god of goodness and light, creator of all that is good, and in perpetual conflict with *Ahriman* (q.v.), the god of evil, over whom he will certainly, with man's help, prevail, according to Zoroastrianism and the *Parsees* (q.v.).

Orme, Robert (1728-1801), historian of India, b. Anjengo on the Malabar coast, went to Calcutta in 1742, and entered the E. India Co.'s Service. In 1752 he pub. *A General Idea of the Government and People of Indostan*. He was appointed a member of the council at Madras 2 years later. Returning to England in 1760, he began his *History of the Military Transactions of the British Nation in Indostan from the year 1745, 1763-78*. His work is valuable as an early record of Brit. Indian events.

Orme's Head. The Great O. H. is a conspicuous limestone promontory W. of Llandudno (q.v.), rising to 679 ft above the Irish Sea. The lighthouse is visible at a distance of 24 m. The Little O. H., 463 ft, lies to the E.

Ormesby, par. and vil. of N. Riding, Yorks, England, 3 m. SE. of Middlesbrough. Pop. 2621.

Ormoe, or **MacArthur**, city of Leyte, Philippine Is., on the W. coast, 32 m. SW. of Tacloban. Sugar milling is carried on, and rice and sugar are exported. It was used by the Japanese as a supply port during the Second World War (up to 1944). In 1950 its name was changed to MacArthur. Pop. 72,730.

Ormolu (Fr. or *moulu*, ground gold), brass containing copper with about 40 per cent. of zinc, and of a golden-yellow colour. The prin. use of O. is for the mountings of furniture. Small articles are made from O., and it is also a basis for cloisonné work, produced in China for a long period.

Ormond, old name for Tipperary (q.v.).

Ormonde, James Butler, 1st Duke of (1610-88), succeeded as twelfth Earl of O. in 1633, and in 1661 was created duke in the Irish, and in 1682 duke in the English, peerage. He acted for Charles I against the Irish rebels in 1643, and in the following year was appointed lord-lieutenant of Ireland. In 1648 he was royalist commander in Ireland, where, after the execution of the king, he proclaimed Charles II. He was defeated by Cromwell in 1649, and fled abroad to join the king. On the restoration he was made lord steward of the household, and was again lord-lieutenant of Ireland in 1661-9, and 1677-82, and once more in 1684. After James II came to the throne he retired into private life, but in 1687-8 he opposed sev. of the more arbitrary acts of the king, and especially those directed against Protestantism.

Ormonde, James Butler, 2nd Duke of (1665-1745), eldest surviving son of Thomas, Earl of Ossory, succeeded to the dukedom in 1688. He was a supporter of William and Mary and at their coronation acted as lord high constable. He commanded the Life Guards at the battle of the Boyne, and was present at the battle

of Steinkerk. He was taken prisoner at the battle of Landen, but was exchanged for the Duke of Berwick. Under Anne he held the offices of lord-lieutenant of Ireland and captain-general of the forces. From the latter office he was removed on the accession of George I., and in 1715, as a leader of the King Jacobites, was impeached, but escaped to France. He now threw in his lot with the Pretender (see STUART, JAMES) and took part in the rising of 1715, and 4 years later accepted the command of the abortive expedition of the Sp. fleet to England. See JACOBITES.

Ormskirk, urb. dist. of Lancs, England, 12 m. NE. of Liverpool, and famous for its anct. street market held under royal charter for over 700 years. The par. church with both tower and spire has tombs of the Stanley earls of Derby. The grammar school is 17th cent. At Lathom are the ruins of Burscough Priory, and also of Lathom House, the old seat of the Lathams and Stanleys. O. has brass foundries, an ordnance depot, and cake and biscuit factories. It is celebrated for gingerbread. Pop. 21,500.

Ormulum, M.E. metrical trans. of the gospel hist., consisting of a series of Eng. homilies in iambic verse written by Orm or Ormin, canon of St Augustine in the vicinity of Lincoln, about 1200. It comprises some 10,000 lines which have neither rhyme nor alliteration; the author uses a partly phonetic spelling, which provides valuable data for the philologist. See also under ENGLISH LANGUAGE. See ed. of R. M. White, 1862 (revised by R. Holt, 1878) and P. Lambertz, *Die Sprache des Ormulum nach der lätlichen Seile untersucht*, 1904.

Ormuz, see **HORMUZ**.

Ornaments, Musical, notes which are not a part of the melody or harmony, but merely embellishments thereof. Some are now regarded as superfluous, either because the fashion of highly ornamented playing and singing is dead or because great elaboration is not suited to modern instruments. Some of the embellishments that were indispensable to the harpsichord, for example, because of its inability to give prominence to certain notes by accentuation, sound to modern ears merely fussy on the pianoforte. But the revival of old instruments, and of interest in the performance on them of the music originally written for them, has made a careful and scholarly study of old O. imperative nowadays. O. may be divided into main families, each of which has numerous subsidiary members: Appoggiatura, Shake, Mordent, Turn, Acciacatura, etc.

Orne: 1. Dept of NW. France, formed from part of anct. Normandy, and divided into the arrons. of Alençon, Argentan, and Mortagne; cap. Alençon. It comprises 2 distinct physical regions, viz. the W., consisting of rugged hills and extensive forests, with patches of pastureland occasionally interspersed, and the E. with fertile valleys and rich pasture lands. Iron, copper, lead, and granite are the

prin. minerals. Cereals are cultivated to a certain extent, but more care and attention are given to the apple and pear orchards, for the raising of cider and perry. The dept is famous for its horses, and cattle are reared and dairy produce exported. Iron wares, linens, cotton, lace, glass, and leather goods are the prin. manufs. The dept was the scene of heavy fighting in 1944. Area 2371 sq. m.; pop. 273,200.

2. Riv. of France rising in the O. dept, and flowing generally NW. for half its course and NE. for the remainder, reaches the English Channel in the Bay of the Seine. Length 80 m. Argentan, Thury-Harcourt and Caen are on its banks; between the last 2 tns the valley of the O. is very picturesque and is called the 'Norman Switzerland.'

Ornithocephalus, small genus of epiphyt. orchids, natives of tropical America. *O. grandiflorus* bears racemes of white and green flowers, and the suggestion of the bird's beak, which gives the genus its name, is found in the long slender rostellum to which the pollen masses are attached. The plant is usually grown in peat and sphagnum in a small pan suspended near the roof of a greenhouse.

Ornithogalum, or **Star of Bethlehem**, genus of bulbous plants (family Liliaceae), bearing racemes of white, greenish-white, or yellow flowers. The only true Brit. species is *O. pyrenaicum*, Bath Asparagus or the spiked star of Bethlehem. *O. nudans* and *O. umbellatum* are naturalised in Britain, and others are grown in warm borders or as pot plants.

Ornithoglossum, genus of bulbous plants (family Liliaceae), occasionally grown in the greenhouse. *O. glaucum*, with greenish-brown flowers, and *O. undulatum*, with purple-green flowers, both natives of S. Africa, are the prin. species.

Ornithology, branch of zoology which teaches the hist. of birds. See BIRD.

Ornithopter, a flapping-wing flying-machine derived from the action of birds, a type conceived by Leonardo da Vinci about 1500, and by others since. No full-size O. has flown, but numerous models have been successful. See AEROPLANE.

Oro, or **El Oro**, Pacific prov. of SW. Ecuador. Cacao is the prin. product, and gold is found in Zaruma. The cap. is Machala. Area 3134 sq. m.; pop. 108,820.

Orobanchaceae, family of leafless, scaly, succulent plants, which are parasitical on the roots of other plants or which live upon decaying organic matter. Among the genera are *Orobanche* and *Lathraea*, both of which are represented by Brit. species.

Orobanche, or **Broomrape**, family Orobanchaceae, genus of parasitic plants with close spikes of flowers, brown, purple to yellowish-white. Species native to Britain include *O. purpurea*, Purple Broomrape, parasitic on Milfoil; *O. rapum-genistae*, Greater Broomrape, parasitic on Gorse and Brooms; *O. alba*, Red Broomrape, parasitic on Thyme; *O. minor*, Lesser Broomrape, parasitic on Clovers; *O. hederae*, Ivy Broomrape, found only on Ivy, and others.

Orobis, or **Bitter Vetch**, see LATHYRUS. **Orogeny**, see MOUNTAIN BUILDING PERIOD.

Oromocto, vil. in New Brunswick, Canada, about 10 m. SE. of Fredericton. Its selection as H.Q. area for Camp Gagetown, the largest army training area in Canada, has given it considerable importance. Camp Gagetown has an area of nearly 600 sq. m. and will have complete training facilities for an army division. It is expected that within a few years the area around O. will have a pop. of at least 10,000.

Oronsay, see COLONSAY and ORONSAY. **Orontes**, or **Nahr-el-Asi** (The Rebellious), riv. of N. Syria and Turkey, which rises in the Lebanon, and flows first N., through Homs, to Antioch, and then turns WSW., and enters the Mediterranean Sea, 40 m. N. of Latakia. Length 250 m.

Orooniah, see REZA'IEH.

Oropesa Float, mine-sweeping device comprising a pear-shaped float on the end of a wire and moving at an angle to the ship. The wire is held to a set depth by a kite, and cuts the mooring cable of mines by being serrated. See MINES, MILITARY AND NAVAL.

Oropus, anct tn and seaport of Greece in Attica, 23 m. N. of Athens. Its possession was the source of continual strife between the Athenians and Boeotians from the 6th cent. BC to 338 BC, when it came into undisputed possession of the Athenians.

Oroya, cap. of Yauli prov., Peru, 137 m. from Callao, at the junction of the Central Railway and the Cerro de Pasco Railway. The tn, which stands at an altitude of 12,180 ft., is situated at the confluence of the Mantaro and Yauli Rs. The chief activity is the smelting of copper ore and various other metals. Pop. 15,000.

Orpen, Sir William Newenham Montague (1878-1931), painter, son of Arthur Herbert O. of Stillorgan, co. Dublin. At the age of 11 he went to the Metropolitan School of Art, Dublin, and, later, to the Slade School. O. was one of the artists chosen by the gov. to paint pictures of the First World War, being given the rank of major. He was knighted in 1918, and in 1921 he became president of the International Society of Painters and Gravers. His war pictures, many of which he presented to the nation, show scenes, tragic, comic, and grotesque, according as the subject struck his fancy; they are forceful and to the point, but artistically remain accidental dramatisations of his emotions rather than generalisations. Among the best known of these are 'Changing Billets' and 'Bombing at Night.' His best pictures are genre subjects and interiors with figures such as 'The Fracture,' 'Homage to Manet,' 'A Bloomsbury Family' (that of Mr Wm Nicholson). He painted many portraits, including 'The Hon. Percy Wyndham,' 1907, a notable early example of his powers. 'Dame Madge Kendal,' and 'Sir Ray Lankester,' all of a rather mechanical brilliance. A portrait of himself holding a 'Dead Ptarmigan,' and another of 'Alfred W. Rich, Esq.,' are

examples of excellent sketching. Among his pictures of Irish life, 'The Irish Wedding' and 'Sowing the Seed in the West' are greatly admired. Undoubtedly a great draughtsman, as a painter he was rather the brilliant executant than the great craftsman. See memoir by P. G. Konody and S. Dark, 1932.

Orpheus, legendary son of Oeagrus by the muse Calliope, and the most illustrious poet of the pre-Homeric period. He lived in Thrace, and became an Argonaut. O. was presented by Apollo with a lyre, on which he played so exquisitely that not only every living thing but rivers and rocks were moved by his music, and obeyed his will. He married the nymph Eurydice, who died from a serpent's sting. Resolved to recover her, O. dared to descend

myth developed a school of mystic theology which flourished at Athens during the 6th cent. BC. O. resembled the Thracian worship of Dionysus (q.v.).

Orpiment, native trisulphide of arsenic which occurs in lemon-coloured crystals in Czechoslovakia, Rumania, the U.S.A., Kurdistan, and elsewhere. Formerly it was used as a dye.

Orpington, urb. dist. of Kent, England, 5 m. SE. of Bromley, mainly residential and agric. There was a printing press here in 1873 for printing Ruskin's own works, superintended by George Allen, who was also his publisher. Charles Darwin lived (1842-82) at Downe, where he did all his greatest work. The parl. constituency of O. includes part of the Dartford rural dist. Pop. (estimated) 64,480.

Orr, John Boyd, see BOYD ORR.
Orrell, tn. of Lancs, England, 4 m. WSW. of Wigan. There is a cotton-mill, sand and gravel quarry, and farming in the neighbourhood. Pop. 9400.

Orrery, Earls of, see BOYLE.

Orrery, instrument deriving its name from the one constructed for Charles Boyle, Earl of Orrery, by Rowley, 1715. It was an improved form of 16th-cent. planetarium (a machine for exhibiting the relative motions of the planets and their positions in respect to the sun and one another) invented, or at least constructed, by George Graham (1672-1750), and showed the motions of the members of the solar system, with relative sizes and distances, but circular orbits, by means of arms and uprights moved by geared wheels. A good example is to be seen in the Kelvingrove Museum, Glasgow, and Thomas Tompion, the famous London clockmaker, also constructed an O.

Orris Root, rhizome of *Iris florentina*, a violet-scented plant occurring in S. Europe. A starch or flour is prepared from the rhizome for use in the manuf. of toilet powders, especially dentifrices. The plant is cultivated for the purpose in the N. of Italy, and is sometimes grown in Brit. gardens.

Orrs, Eugenio d' (1882-), art critic, was b. Catalonia. He became director of public instruction in Barcelona. Under the nom. de plume of Xenius he was regarded as the champion of catalanism. About 1920, however, he began to separate himself from his Catalan friends, and to write in Castilian. As art critic he has been one of those who battled for fuller recognition of what Portugal contributed to art. One of his finest books is his life of Goya.

Orsay, see D'ORSAY.

Orsborn, Albert William Thomas (b. 1886), see SALVATION ARMY.

Orsett, see THURROCK.

Orsini, Giovanni Gaetano, see NICHOLAS (popes), *Nicholas III.*

Orsk, tn in Ozenburg oblast of S. Urals, on R. Ural, 140 m. SE. of Ozenburg. It is the centre of the rapidly developing Orsk-Khallovo industrial area (iron and steel, non-ferrous metallurgy). O. itself has heavy engineering, oil-cracking (pipeline from Gur'yev in the Emba oilfields),

THE DEATH OF ORPHEUS
A vase in the British Museum.

into Hades. For this sad story see EURYDICE. In his grief O. retired to the mt caves and scorned the advances of the Thracian women, who, in revenge, tore him limb from limb in frenzy and threw his head into the Hebrus. The Muses collected his remains and buried them at the foot of Olympus, while Zeus placed his lyre among the stars. See W. K. C. Guthrie, *Orpheus and Greek Religion* (2nd revised ed.), 1952.

Orphica, number of early Gk poems on mystic subjects. They were once ascribed to Orpheus, but many of them were written during the 4th cent. AD. The chief poems of the Orphic cycle are the *Argonautica*, an epic poem on the voyage of the Argonauts; *Lithica*, a poem on the properties of stones; *Physica*; and *Minyas*. See A. Dietrich, *De Hymnis Orphicis*, 1891; eds. of the *Orphica* by Hermann, 1896, and Abel, 1885; Eng. trans. of the *Hymns* by T. Taylor, new ed., 1896.
Orphism. Around the Orpheus (q.v.)

and meat-packing plants. It was founded in 1735 as a Russian fortress; before the 1930's it had a cattle trade. Pop. (1956) 157,000 (1926, 14,000; 1939, 66,000).

Orşova, tn of Rumania, on opposite banks of the Cerna at its confluence with the Danube, at the Iron Gates. Old O., on the W. bank of the R. Cerna, is a trading and shipping centre. New O., on the opposite bank, was repeatedly taken and retaken in the wars of the 18th cent. Pop. (1948) 5107.

Ortega y Gasset, José (1883-1955), Sp. writer and philosopher, b. Madrid. He studied at Madrid and in Germany, and became prof. of metaphysics at Madrid. His first book of importance is *España invertebrada*, 1921, showing a marked pro-Ger. attitude. *El tema de nuestro tiempo*, 1923, estab. his philosophical position of 'vitalism.' In his famous *La rebelión de las masas*, 1930, he prophesied the doom of Europe. He was essentially a journalist, and many of his books appeared first as articles in the *Revista de Occidente*, which he had founded. His wide range of ideas, his preoccupation with the present, and his lively style, make him a stimulating rather than a profound writer. His *Obras completas* were pub. in 6 vols., 1946-7, and have been trans. into many European languages. See J. Sánchez Villaseñor, *Ortega y Gasset, pensamiento y trayectoria*, 1945.

Ortegal, Cape, promontory, the most N.-westerly point of Spain, on the Bay of Biscay, 35 m. NE. of La Coruña (q.v.). In a naval battle off the cape in 1805, Sir Richard Strachan defeated a small Fr. fleet, survivors of Trafalgar, all the ships of which were captured or sunk.

Ortelius, Wortels (Ortel, or Ortell) Abraham (1527-98), Flemish geographer and mathematician, b. Antwerp, of Ger. parents. His *Theatrum orbis Terrarum*, 1570, was the first modern atlas, and he also wrote *Synonymia Geographica*, 1578. In 1575 he was appointed geographer to Philip II of Spain, and 2 years later he came to England and helped to induce Camden to produce his *Britannia*.

Orthez, Fr. tn in the dept of Basses-Pyrénées, on the Pau. In the 13th cent. it was cap. of Béarn (q.v.), and it was, later, a Huguenot (q.v.) centre. Wellington defeated Soult here in 1814 during the Peninsular War (q.v.). The tn has a 14th-cent. bridge and an anct keep. There are metallurgical and textile industries. Pop. 6500.

Ortho-acids, name applied to substances containing one or more —C(OH), groups. They are known in the form of their derivatives, the free acids being unstable, rapidly losing water with the formation of ordinary acids containing the —CO·OH group:

Orthochromatic, see PHOTOGRAPHY.
Orthodox Church, see EASTERN ORTHODOX CHURCH.

Orthography (Gk *orthos*, correct; *graphein*, to write), art of setting down words correctly as regards their component letters according to accepted usage; in

other words, the art of accurate spelling; indeed, the term 'correct spelling' may be regarded as synonymous with O. Accurate spelling should properly be a reliable guide to the pronunciation of the word spelt, but since the number of symbols used for the representation of speech seems always to have been less than the number of sounds used, it is probable that O. has never perfectly served its purpose. Italian and Spanish are still mainly phonetic, German is less so, while in English and French the spelling is almost an arbitrary symbolism. Before the Conquest English was more or less phonetic. During the period from the Conquest to the introduction of printing, roughly, that is to say, during the M.E. period (see ENGLISH LANGUAGE), the same state continued. Even at this time, however, the need of reform was felt, as is shown by Orm or Ormin's attempt at phonetic spelling, the O. of the *Ormulum* (q.v.) being the most valuable extant source of information on the development of sound in M.E. During the M.E. period pronunciation and dialect varied in the sev. parts of the country. The spelling often differed. There were conventional representations of the various sounds, but there were not conventional representations of whole words. Even the introduction of printing did not finally fix O., and the attempt was still made to make the spelling of the word represent the pronunciation. The control of spelling passed from the writers themselves (or rather their scribes) to the printers, who did what they pleased with an author's spelling. The 16th and 17th cents. show a considerable degree of variation in spelling; a phonetic basis for O. had been largely abandoned, but a uniformity based on prevailing usage had not yet been estab. Pronunciation, moreover, went on changing, and now the spelling has not only ceased to be a guide to pronunciation, but in many cases it has become a positive hindrance. Only in the 18th cent. (with Dr Samuel Johnson's *Dictionary*), and particularly in the 19th cent., did Eng. spelling become quite firmly fixed. It seems hardly necessary to cite examples to prove the inadequacy of our present symbols. Whereas we have but 23 symbols (c, x, and q are supernumerary), there are from 38 to 44 sounds to be represented. Even in the use of our few symbols there is much inconsistency. Especially is this true with regard to the vowels. Taking an example at random, we see, for instance, the short e sound represented not only by e as in *set, fed, nettle*, but by a as in *many*; by ea as in *feather, leather*; by ai as in *said* and *against*; by ei as in *heifer*; by eo as in *jeopardy* and *leopard*; by ay as in *says*. In the present cent., however, a movement has arisen for a reform in this direction, although with little headway even in America. See also SIMPLIFIED SPELLING.

Orthopaedic Surgery (Gk *orthos*, straight; *pais*, child), branch of surgery concerned with bones, joints, muscles, nerves, and any tissues so injured or diseased that deformity or impairment of function may

result; its applications are by no means confined to children. The main types of affections treated in O. S. are: (1) Affections of joints. These affections may be due to bacterial infection or to injuries such as fractures, bad sprains, or repeated minor injuries. (2) Affections of bone may similarly be due to infection or to injury such as fracture (q.v.). The growth of bone may also be affected by certain disturbances of the endocrine secretions, by deficiency of antirachitic vitamins (see RICKETS), and by tumours. (3) Diseases or contraction of the soft tissues such as skin, muscle, and tendons near joints may cause deformity. Gradual stretching will correct some forms of contraction. Infected or injured bursae, the lubricating sacs over the joints, are other frequent causes of deformities such as bunions and housemaid's knee. (4) Affections of the nervous system include obstetric injury to this system, degeneration of nerve tracts, cerebral lesions, and infantile paralysis (q.v.). (5) Most deformities are 'static,' and mainly due to bad postures. Flatfoot (q.v.), round shoulder, and hollow back are some of the commonest static deformities. (6) Congenital affections result from abnormal embryological development, and their causes are not fully known. Congenital clubfoot, flatfoot, dislocation of hip, affections of the vertebral column, are amongst other congenital faults treated by O. S. Physiotherapy (q.v.) is one of the main aids to O. S. See J. Cyriax, *Textbook of Orthopaedic Medicine*, 1954.

Orthophosphoric Acid, see PHOSPHORUS. **Orthoptera** (Gk *orthos*, straight; *pteron*, wing), large order of insects containing over 12,000 species among which are such well-known creatures as grasshoppers, crickets, cockroaches, leaf- and stick-insects. They are characterised by their conspicuous and biting mouth-parts, stiff tegmina, and membranous metathoracic wings, which close like a fan when in repose; the wings are frequently either reduced or absent, and there is no abrupt metamorphosis.

Orthoptics, see REFRACTION, ERRORS OF, *Sight-testing and under SQUINTING*.

Ortho-Sulphobenzimide, see SACCHARIN. **Ortler Group**, N. Italy, group of the E. Alps (q.v.), forming the watershed of the Adige, Adda (qq.v.), and Oglio R. basins. The Ortler, or Ortler Spitze, 12,802 ft, the highest summit in the group, is near Bormio (q.v.). It was once regarded as inaccessible, but in 1804 it was ascended by Josef Pichler, an Austrian chamols hunter, with 2 Tyrolean mountaineers. The discovery of easier routes in 1865 caused the ascent to become popular.

Ortolan (*Emberiza hortulana*), member of the bunting family, common in Europe and W. Asia, but a rare visitant to Britain. It spends the winter in Africa, and is netted in great numbers while migrating. It rapidly fattens after being fed for a short time on oats, millet, and other grain, and is then killed for the table, being highly valued by epicures. The O. somewhat resembles another bunting, the yellow-hammer, but its head is grey. The

upper surface is reddish-brown with black streaks, the throat yellow, and the under parts greenish-olive. The nest is made on the ground or on banks, and in it are laid about 5 eggs.

Orton, Arthur, see TICHBORNE CASE. **Ortona a Mare**, It. tn in Abruzzi e Molise (q.v.), 12 m. E. of Chieti (q.v.), on a cape on the Adriatic coast. Together with Lanciano (q.v.) it forms an archbishopric, and has many old buildings. The cathedral, castle, and Farnese (q.v.) palace were badly damaged during the Second World War. The small harbour is used for fishing and a coasting trade. Pop. 21,700.

Ortygia, see SYRACUSE. **Oruro**, city of Bolivia, cap. of the dept of the same name. The dept has an area of 20,386 sq. m. and an estimated pop. of 210,260 (1950). The tn is the seat of a bishopric and the H.Q. of a military dist. It is the hub of the Bolivian railway system and the centre of a great tin-mining area. Silver, copper, and wolfram are also worked in the dist. The city stands at an altitude of 12,100 ft and the nights are very cold. There is a large power station. The pop. is 62,975, largely Indians, and their carnival masquerade ('Diabladas') is exciting and colourful and famous throughout the country.

Orvieto, It. city in Umbria (q.v.), 22 m. NW. of Terni (q.v.). It is situated on the r. b. of the Paglia, on an isolated, high plateau of tufa. It has Etruscan (see ETRURIA) antiquities, and is thought to be the site of the Etruscan tn *Volturni*, destroyed by the Romans c. 265 bc. It has been the seat of a bishop since AD 509. The beautiful It. Gothic cathedral (13th-16th cents.), partly constructed of grey and white marbles, has a magnificent façade with mosaics, bas-reliefs, and bronze sculptures. There is a palace (13th-14th cents.) formerly used by the popes, a splendid 13th-cent. *Palazzo del Popolo*, and many other remarkable buildings. The white wine of the dist. is famous, and O. has also a trade in corn and silk. Pop. (tn) 24,400; (com.) 28,350. See BOLSENA.

Orwell, George, pseudonym of Eric Blair (1903-50), Brit. novelist and essayist, b. Motihari, Bengal. Educ. at Eton, from 1922 to 1927 he served with the Indian Imperial Police in Burma, and later he used this experience in *Burmese Days*, 1934. A period of poverty, during which he was successively tutor, teacher, and bookshop assistant, is described in *Down and Out in Paris and London*, 1933. In 1936 he fought in the Spanish Civil War, was wounded, and wrote about it in *Homage to Catalonia*, 1938. During the Second World War he worked for the B.B.C., and immediately after it pub. his finest book, *Animal Farm*, 1945, a satire on dictatorship. His pessimistic *Nineteen Eighty Four*, 1949, pictures the horrors of totalitarianism pursued to the limit. Earlier novels were *Keep the Aspidochelone Flying*, 1936, *The Road to Wigan Pier*, 1937, and *Coming Up for Air*, 1939. He also pub. some vols. of essays, including

Inside the Whale, 1940, and *Shooting an Elephant*, 1950. See study by J. Atkins, 1955.

Orwell, first known as the Gipping, riv. of England, in Suffolk. It has its source a few miles W. of Stowmarket, through which it passes, flowing also through Needham Market. Below Ipswich it forms the estuary known as the Stour. The riv. is navigable to Ipswich.

British Railways

THE STOUR ESTUARY AT PARKESTON QUAY, HARWICH

Oryol, see ORYL.

Oryx, important genus of antelopes, of the subfamily Hippotraginae, containing 6 species, natives of Africa, Arabia, and Syria. Both sexes have long, annulated horns, and the female has 4 mammae. *O. leucoryx* (the leucoryx), *O. beatrix* (the Beatrix antelope), *O. gazella* (the gemsbok), and *O. beisa* (the beisa) are the 4 best-known species.

Oryza, genus of tall, marsh grasses, family Gramineae, of which *O. sativa*, rice (q.v.), is the most important species.

Orzesko, Elise, née Pawłowska (1842-1910), Polish writer, b. near Grodno, Lithuania. She deals mainly with 2 themes, the misery of the peasants and the desolation of the Jews in their ghettos. In *Meir Ezofowicz*, 1878, her best novel, she symbolises the 2 currents that exist in all these ghettos, assimilation and complete religious, cultural, and social separation. Other books: *Eli Makower*, 1875, on the relations between the Polish nobility and the Jews; *On the Niemen*, 1888, on the Polish aristocracy (of which she was a member); *On Lost Souls*, 1886, on country life in White Russia; and *Gloria Victis*, 1910.

Osage, N. Amer. Indian tribe, the most important of the Siouan linguistic stock.

They were among the fiercest of the plains tribes. To-day they are citizens of Oklahoma, numbering about 3500.

Osage, riv. of U.S.A., formed S.E. of Rich Hill, W. Missouri, by junction of Marais des Cygnes and Little O. Rivs. It flows ENE., and bearing NE. enters the Missouri R., joining it on the r. b. 10 m. from Jefferson City. Length 494 m.

Osage Orange (*Machura pomifera*), hardy deciduous tree, native of N. America. It is usually spiny, and bears entire or serrated shiny leaves and small yellow or green flowers, which are followed by large golden fruits, filled with a foetid slime.

Osaka, second largest city of Japan, 15 m. from its seaport of Kobe, is situated on a large riv. on the S.E. coast of the is. of Honshu, in the most central and populous part of the empire. Before the Second World War it was the great emporium of trade and luxury. It had over 7000 factories and yards producing textiles, glass, metal goods, leather goods, ships, etc., and exported, chiefly to Korea and China, large quantities of sugar, straw goods, and textiles. There is a fine castle. It suffered from a disastrous earthquake in 1891 and from fire in 1909. O. was much damaged by Amer. bombers in June-July 1945. Following a raid by super-fortresses, 1 June, some 400 super-fortresses bombed O. again on 7 June; again bombed 8, 14, and 19 June, the raid of 14 June being especially severe. Industrial targets S. of O. were hit on 3 July, and an oil refinery N. of it on 9 July. Then on 24 July some 700 super-fortresses bombed the tn, together with others (see further under PACIFIC CAMPAIGNS IN SECOND WORLD WAR). O. is again the commercial and industrial centre of the Kansai dist. Steel and other metals, machine tools, electric equipment, glass, textiles, and chemicals are important products. Pop. 2,547,000.

Osbeckia, genus of deciduous or evergreen herbs or shrubs (family Melastomaceae), bearing racemes of red, purple, violet, or yellow flowers, sometimes grown in warm greenhouses in Britain.

Osborn, Henry Fairfield (1857-1935), Amer. palaeontologist; b. Fairfield, Connecticut. In 1880 he became Da Costa prof. of zoology, Columbia Univ., and dean of faculty of pure science there, 1892-5. Curator of vertebrate palaeontology in Amer. Museum of Natural Hist., 1891-1910, he was later research prof. of zoology, Columbia Univ.; palaeontologist to the Canadian Geological Survey, 1900-1904, and to the U.S.A. Geological Survey after 1900. Celebrated for reconstruction of prehistoric mammals, his works include *From the Greeks to Darwin*, 1894, *Evolution of Mammalian Molar Teeth*, 1907, *The Age of Mammals*, 1910, *Men of the Old Stone Age*, 1915, *Origin and Evolution of Life*, 1917, *Impressions of Great Naturalists*, 1924, *Evolution and Religion in Education*, 1926, and *Man Rises to Parnassus*, 1927.

Osborne, Dorothy (1827-95), letter-writer, b. Chicksands, Beds, daughter of Sir Peter O., who held Castle Cornet in

Guernsey for the king during the Civil war. In 1655 she married Sir Wm Temple (q.v.), diplomat and essayist. Her letters to him during their long separation before marriage have a very great charm. The *Letters from Dorothy Osborne to Sir William Temple* were ed. by E. A. Parry in 1888 and by G. C. Moore-Smith in 1928. See Macaulay's essay on Temple, and Lord David Cecil, *Two Quiet Lives*, 1947.

Osborne, John (1929-), actor and dramatist, b. London. Left school at the age of 17 and started work as a journalist, but gave this up after a few months in order to become an actor. Since then he has played in repertory theatres and touring companies throughout the country. His first play, *Epitaph for George Dillon*, was written in collaboration with Anthony Creighton. He wrote *Look Back in Anger* during one of sev. periods of unemployment; it was produced with great success by the English Stage Co. in 1956, after it had been rejected by most of the leading managements and agents. This was followed in 1957 by *The Entertainer*, in which Sir Laurence Olivier (q.v.) played the leading part.

Osborne House, formerly one of the favourite residences of Queen Victoria, in the Isle of Wight, 1 m. SE. of Cowes. Queen Victoria d. there in 1901, and the estate was willed to the Prince of Wales, who, on his coronation as Edward VII in 1902, made a gift of the building and grounds to the nation, to be used as a convalescent home for officers of the army and navy. It is now open to the public during certain months of the year.

Osborne Judgment, trade union action brought in the king's bench div., taken to the court of appeal and, finally, to the House of Lords (1909). The decision declared null and void a trade union rule which provided for an enforced levy on members towards the payment of the salaries of M.P.s, and thereby checked the growing political power of the unions. The judgment was largely nullified in the Trades Union Act of 1913.

Osbourne, Lloyd (1868-1947), Amer. novelist and collaborator with R. L. Stevenson, b. San Francisco, son of Samuel O. and Fanny van de Grift, his wife, whom Stevenson married in 1880. O. was educ. at private schools in Paris and elsewhere, and at Edinburgh Univ., where he studied engineering. Thereafter he was nearly always with the Stevensons. O. collaborated with his stepfather in writing *The Wrong Boz*, 1889, *The Wrecker*, 1892, and *The Ebb-Tide*, 1894. Collaboration with so famous an author has tended to obscure O.'s individual merits and indeed O. was only 26 when Stevenson died. O. alone invented and wrote *The Wrong Boz*, which Stevenson only touched up after its completion. The earlier part of *The Wrecker* was entirely O.'s work, but Stevenson invented the character James Pinkerton and wrote the last 4 chapters, besides more than 4 others (including the Paris scene), or about one-third of the book. *The Ebb-Tide* was jointly planned

and written throughout in intimate collaboration, but Stevenson completed the story, and rewrote most of it. O., however, was himself a first-rate storyteller, and he knew well the S. Seas which are the background of much of his work. With his sister, Mrs Strong, he wrote *Memories of Vailima*, 1903, on life in Samoa; in collaboration with his nephew, Austin Strong, he wrote 2 plays entitled *The Little Father of the Wilderness*, 1905, and *The Exile*, which was produced by Sir John Martin-Harvey. In 1887 he was U.S. vice-consul for Samoa, where he resided with Stevenson till the latter's death in 1894. He left Samoa in 1897, with his mother, and eventually made his home in the U.S.A. His separate publs. include *Love the Fiddler*, 1903, *The Motormaniacs*, 1906, *Three Speeds Forward*, 1907, *The Adventurer*, 1907, *Harm's Way*, 1909, *The Kingdoms of the World*, 1911, *Wild Justice*, 1922, *An Intimate Portrait of R. L. S.*, 1924, *The Grierson Mystery*, 1928, *Peril*, 1929, and contributions to many magazines.

Oscas, see HUESCA.

Oscans (*Oscas lingua* was the Lat. term for their speech), or *Osci*, in Gk *Oskoi*, or *Opikoi*, from *Opici* or *Opici* (terms connected with the indigenous word *opos* or *opsaom*, in Latin *opus*, meaning work, to work), were Italic tribes who inhabited S. Italy in the first millennium BC. About 200 Oscan inscriptions are extant; 150 of them have been found in Campania. They belong mainly to the 3rd and 2nd cents. BC, but some inscriptions may be assigned to the 5th cent. BC, others to the Christian era. The most carefully engraved of them is the *Cippus Abellanus*, of the first half of the 2nd cent. BC, containing a treaty for the joint use of a temple by the inhab. of Nola and Abella. The longest is the *Tabula Bantina*, of the second half of the 2nd cent. BC, containing the local laws. The most important is the *Tabula Agnonensis*, of the mid 3rd cent. BC, containing a list of local divinities. There is an inscription from Messina (in Sicily), and a variety of short inscriptions come from Pompeii. Oscan coins have been found dating from the 5th to the 1st cent. BC. The Oscan script was an offshoot of the Etruscan alphabet. The careful spelling and engraving of the inscriptions, the precise differentiation of sounds, the invention of the letter-sign *u* for *o*, which did not exist in Etruscan, and of *i* for an open *i*, indicate the development of script and language.

The O., till their ruin in the Hannibalic war, had a higher civilisation than the contemporary Romans, and very probably possessed a literature. Their language was one of the most important of the Italic dialects, belonging to the same linguistic branch as Latin. This branch can be subdivided into 2 groups, Italic proper (Oscan, Umbrian, Siculan, and some minor dialects, such as Paelignian, Volscian, Marrucinian, Sabine) and Latinian (Latin and Faliscan) (see INDO-EUROPEAN LANGUAGES). These 2 groups can be distinguished as P-group (Italic

proper) and Q-group (Latinian); one of the most remarkable characteristics of their divergency being the fact that in the former group the Indo-European guttural-velar sounds q^u and g^u are represented by p and b , while in Latinian they are represented by qu and u (or gu , following n); e.g. Lat. *quis* = Oscan *pis*; *uenerit* = *henuit*. See further LATIN LANGUAGE AND LITERATURE.

Oscar I (1799-1859), King of Sweden and Norway, *b.* Paris, son of Jean-Baptiste Bernadotte, later Charles XIV (q.v.). Although proposals to reform the constitution proved abortive in his reign, much was done to promote the national welfare, especially in freedom for industry and trade, efficiency of communications, and reform of the criminal law. In 1857, owing to O.'s ill health, his son (afterwards Charles XV) became regent.

Oscar II (1829-1907), King of Sweden and Norway (of the latter until 1905), son of Oscar I, *b.* in Stockholm. In 1872 he succeeded his brother, Charles XV, as King of Norway and Sweden. When Norway separated from Sweden (1905) it is attributed to O.'s broad mindedness and insight that there were no serious popular uprisings (see HAAKON VII; NORWAY; SWEDEN). During his reign great strides were made in national development, scientific research, geographical discovery, and industrial enterprise. He wrote *Memorials of the Swedish Fleet* (poems); *Military History of Sweden, 1711-13*, 1861-7; a trans. of Herder's *Cid*; a poetical version of Goethe's *Torquato Tasso*, 1861; and *Memoirs of Charles XII* (Eng. trans., 1879).

Oseola (Seminole, *As-se-ho-lar*) (c. 1800-38), chief of the tribe of Seminole Indians in Florida. In 1835 the Indians rose in rebellion against being transferred to reservations W. of the Mississippi R. Amer. troops were sent against them. In Dec. Maj. Dade and 100 soldiers were massacred in a Florida swamp, and on the same day O. killed and scalped Wiley Thompson, an Indian agent. For a long time O. and his men held out, and hundreds of Amer. soldiers perished of fever in the swamp. He was taken prisoner at last while holding a conference under a flag of truce, an act of inexcusable treachery, though represented as one of retaliation, and confined in Fort Moultrie until his death. Gen. Jessup, who captured O., was severely censured for his act, but he contended that it was the only way to stop the career of the treacherous chief. However, the war went on for about 7 years, costing the U.S.A. \$20,000,000 and the lives of 1500 men.

Oschersleben, Ger. tn in the dist. of Magdeburg, on the Rode, 19 m. WSW. of Magdeburg (q.v.). It has engineering, chemical, and foodstuff industries. Pop. 20,000.

Osci, see OSCANS.

Oscillation. A body is said to oscillate when it moves backwards and forwards like a pendulum. The verb to oscillate means to swing to and fro or to vibrate. The motion of a pendulum is the typical oscillatory motion. Suppose the bob is

displaced from D to B, and then released. It swings along the arc BC and then back along CB, and so on. It oscillates along BC about the equilibrium position D. BD is the amplitude of O. Suppose the bob is moving through D in the direction of BC. The time taken before the bob moves again through D in this same direction is called the period of O. For any given pendulum of constant length this period is always the same if the pendulum is not restrained and the arc of O. is small. This period is termed the

OSCILLATION

natural period of O., and is defined as the period of a body which is set oscillating and left to itself. But a body may execute forced O. If it is acted on by an alternating force of definite period, it ultimately oscillates in a period coincident with that of the force and not with its own natural period. The centre of O. is the point of an oscillating body such that if the whole mass of the body were concentrated there, the time of O. would be unchanged. It coincides with the centre of percussion of the body. See also CENTRE OF OSCILLATION; HARMONIC MOTION; RESONANCE.

Oscillators, oscillation generators, devices producing sustained oscillations, usually combinations of a naturally oscillating unit with a device supplying energy to make good what is lost in friction or otherwise, as an electromagnet excited with a.c. of the correct frequency maintains the vibrations of a tuning-fork. Electric O. in radio engineering consist usually of an oscillatory circuit (q.v.) with an amplifier valve supplying its own input. The valve converts the d.c. power supplied to the anode into a.c. power, part of which is fed back to the grid. The grid-cathode voltage is opposite in phase to the anode-cathode voltage. A grid-leak bias *GL* (fig. 1) improves the stability and makes the oscillator self-starting. Figs. 1 and 2 show two conventional O. The frequency is approximately the resonance frequency of the oscillatory circuit, $\frac{1}{2\pi\sqrt{LC}}$, but depends somewhat on the electrode voltages and

the coupling of the load. Variations in frequency occur owing to changes in L and C with varying temp. and to temp. effects in the valve, as well as to variations in load impedance. The latter can be eliminated by use of a buffer amplifier. A high Q -factor (q.v.) of the LC circuit makes the frequency independent of valve voltage and load. A high degree of stability can be obtained by using a

tude of the oscillations increases to a maximum at a frequency just below the resonance frequency of the LC circuit. At ultra-high frequencies the LC circuit is replaced by parallel-wire or coaxial transmission lines (see RESONANCE). Such lines have distributed capacitance and inductance—they are miniature models of power transmission lines. A line 7.5 cm. long corresponds to a quarter-

FIG. 1. HARTLEY OSCILLATOR

FIG. 2. COLPITTS OSCILLATOR

mechanically vibrating quartz crystal as control. A quartz plate with the flat sides perpendicular to an electric or X -axis—an ' X -cut'—is placed between two electrodes across which an a.c. voltage is applied. This excites mechanical vibrations of the quartz plate with a very sharp maximum at the resonance frequency. (Conversely a forced mechanical vibration produces an a.c. voltage across the faces—examples of the piezo-electric effect.) As the quartz plate acts like an oscillatory circuit, the resonance frequency can be adjusted by shunting with a capacitor. The crystal oscillator is used on fre-

wavelength at 1000 Mc/s. For frequencies of 3000 to 30,000 Mc/s the ordinary valve is not suitable, especially at power sizes, as various parasitic oscillations arise owing to inductance of leads, stray capacitances, etc. In the reflex klystron and the klystron, the velocities of the electrons emitted from the cathode are modulated, and in the magnetron the trajectories of the electrons are affected by the simultaneous actions of a magnetic and an electric field. In both cases the result is that electrons are collected together ('bunched') in a mass or a cloud and supply energy at the proper fre-

FIG. 3. QUARTZ-CRYSTAL OSCILLATOR

quencies from 4 kc/s to 10 Mc/s. Stability of 1 part in 10,000 can be maintained indefinitely, and the crystal oscillator is the standard device for maintaining the frequency of transmitting stations.

The LC circuit is tuned to a frequency slightly less than the resonance frequency of the crystal; the oscillations are generated at a frequency independent of the valve. If C is now increased, the ampli-

quency to cavity resonators (q.v.). Magnetrons are the only devices suitable for high power output (1-100 kW) at wavelengths of the order of cms. See F. E. Terman, *Radio Engineering*, 1947.

Oscillatory Circuit, electric circuit with capacitance and inductance, in which energy surges between the electrostatic and the electromagnetic form, as the energy of a swinging pendulum surges

between potential at the top of the swing and kinetic at the bottom. The energy stored in a capacitor of capacitance C charged to e volts is $\frac{1}{2}Ce^2$, and when the capacitor discharges through an inductance L , the current i builds up electro-magnetic energy $\frac{1}{2}Li^2$. As in the swinging pendulum, the energy flows back, charging the capacitor again, and the process continues with decreasing amplitude until the energy is dissipated as heat in the resistance R —always present in electric circuits. The frequency of the

oscillations is $f = \frac{1}{2\pi} \sqrt{\frac{1}{LC} - \frac{R^2}{4L^2}}$. This is the 'natural frequency' of the circuit. If $R > 2\sqrt{L/C}$, f becomes imaginary: the capacitor discharges without oscillations, the energy is very quickly lost in the resistance. If R is negligible compared with $\sqrt{L/C}$, and E and I are the maximum values of e and i , $\frac{1}{2}CE^2 = \frac{1}{2}LI^2$ and $E/I = \sqrt{L/C}$. This is the 'surge impedance' of the circuit. When R , L , and C are connected in series across an a.c. supply at constant voltage with adjustable frequency, at low frequencies the capacitive reactance, $1/2\pi fC$, is greater than the inductive reactance, $2\pi fL$, and the current is leading. As the frequency increases, the phase angle decreases and

becomes 0 at $f = \frac{1}{2\pi\sqrt{LC}}$ when the reactance vanishes and the current becomes a maximum, limited by R only. This is the 'resonance' (q.v.) frequency of the circuit. At higher frequencies the current becomes lagging. If an inductive (R_1, L_1) and a capacitive circuit (R_2, C_2) are connected in parallel across the a.c. supply, the main current—the vector sum of the 2 branch currents—is lagging at low frequencies, the phase angle becomes 0 at resonance, when the current is a minimum, and at higher frequencies the current becomes leading. See CIRCUIT, ELECTRIC and RESONANCE, ELECTRIC.

Oscillograph, instrument used for the study of wave-form of electric current and voltage (or any phenomenon that can be translated into such) and for recording transient electric phenomena (q.v.). The electromagnetic O., invented by Duddell, is in principle a moving-coil galvanometer. Two phosphor bronze strips are stretched taut in the gap of a powerful electromagnet and carry a small mirror. The coil is immersed in castor oil which gives suitable damping, and has a period of free oscillation of 0.0001—0.0003 sec. A beam of light is focused on the mirror and reflected on to a second mirror, vibrating or rotating at right angles to the coil vibrations, which furnishes the time scale. For recording, a photographic film on a drum takes the place of the time scale. The deviation of the coil is about 3 cm. when supplied with a.c. of 0.2–0.5 A. For power frequencies, the Duddell O. is more accurate than the cathode-ray O. A hot-wire type is also in use. For use as O. the cathode-ray tube (q.v.) is provided with a time base. The

quantity whose variation is to be examined is 'translated' into a voltage which is applied to the horizontal plates so as to give vertical deflections of the spot. An a.c. voltage will then show a straight vertical line. To spread out this line into a wave and repeat the process so as to give a steady (locked) picture, the spot is given a horizontal motion to the right, with constant velocity, with a quick fly-back at the end of one complete cycle (or more). This is achieved by impressing on the plates a voltage of 'saw-tooth' wave-form (see FIG. 1). The time base is provided with controls, calibrated in frequencies, which enable the cycle to be varied from a few c/s up to sev. kc/s.

Amplifiers are usually built into the time-base apparatus. These amplifiers must possess a flat and uniform response up to the frequencies of a few Mc/s if they are to handle all types of wave-form without distortion. Provision is made in the O. to enable the wave-form under examination itself to 'trigger' the time base independent of the frequency controls of the latter.

The O. is one of the most useful tools of the engineer. Complicated wave-forms can be examined in detail, which is essential in radar (q.v.) and television (q.v.). It is applied to the measurement of vibrations in engines and other structures, to pressure variations, and to switchgear and other transients.

Osh: 1. Oblast (prov.) of the Kirgiz S.S.R. of the Soviet Union. Cotton is extensively cultivated in the Fergana valley and there are important coal-mines. Pop. 410,000.

2. Cap. of the O. oblast, has silk-spinning and textile mills. It is the starting point of the Pamirs motor-road to Khorog. Pop. 45,000.

O'Shaughnessy, Arthur William Edgar (1844–81), poet, b. London. He was for a time, from 1863, assistant in the natural hist. dept. of the Brit. Museum. In 1870 he pub. *An Epic of Women, and Other Poems*. This vol. met with great applause, but he was not so successful in his next venture, *Lays of France*, 1872, nor in his third, *Music and Moonlight*, 1874. His *Songs of a Worker*, ed. by A. W. N. Deacon, were pub. posthumously in 1881. See life by Louise C. Moulton, 1894.

Oshawa, industrial city of Ontario, Canada, on Lake Ontario, 30 m. E. of Toronto. It has a good harbour, and is on the main lines of both the Canadian National and Canadian Pacific Railways from Toronto to Montreal. It is the centre of a good agric. dist. The city has a fine collegiate-vocational institute, a

modern hospital, a good public library, 31 churches, and 4 parks. Its hydro-electric power is provincially owned and municipally operated. The most important industry is motor-car and truck manufacturing; other industries include motor accessories, castings, brass and copper fittings, plastics, pharmaceuticals, builders' supplies, sheet-metal materials, woodlens, pottery, and glass bottles. Pop. 46,051.

Oshima, group of 3 small is. belonging to Japan, lying S. of Kyushu, in 30° 50' N. lat. and 130° E. long. Their names are Kuroshima, Iwojima, and Takashima.

Oshkosh, city, co. seat of Winnebago co., Wisconsin, U.S.A., in resort area on the W. shore of Lake Winnebago where it receives the Fox R., 75 m. NNW. of Milwaukee. O. manufs. woodwork, machinery, and automobile parts, and has a W. state college. Pop. 41,100.

Oslander, Andreas (1498-1552), Ger. Protestant divine, b. Gunzenhausen, son of a blacksmith named Hoseman. He took an active part in the Reformation, and attended conferences at Marburg, Augsburg, and Schmalkald. While pastor in Nuremberg he pub. his *Harmony of the Gospels*, 1537. In 1548 he was appointed lecturer at the new univ. of Königsberg, but his religious opinions were unpopular, and he was attacked by Melancthon and other Lutherans. He founded a famous family: his son Lukas (1534-1604) was a court preacher; Andreas (1562-1617), son of Lukas, was chancellor at Tübingen; Johann Adam (1626-97) was preacher, prof., and chancellor at Tübingen; and his sons, O. and John, physician and philologist respectively. See life by W. Möller, 1870.

Osters, trees or shrubs of the willow genus (*Salix*), cultivated for conversion into baskets and other wicker-work articles. They are grown in plantations known as holts, and the produce is commercially called rods. O. are usually grown on deep rich alluvial soil, which is subject to flooding. Sets of 2 years' growth, about 18 in. long, are planted in Feb. or Mar. at the rate of about 20,000 per ac. The land needs careful cleaning for the first 2 years, and the holts mature after 3 years, lasting, if properly managed, 15 years. *Salix viminalis* is the common osier, with 40 varieties or hybrids. This is the species chiefly used in basket-making. Brit. osier-beds also contain *Salix triandra*, the Fr. willow, much hybridised; *Salix purpurea*—which does not attain the tree form, its slender twigs being grown as O. by pollarding the trunk; and the golden osier, a variety of white willow. See also BASKET.

Osijek (Ger. Esseg; Hungarian Eszék; anct. Mursa), tn in Croatia, Yugoslavia, on the Drava. Its site has been occupied since Neolithic times. It is the cultural and economic centre of Slavonia (q.v.), manufs. textiles and furniture, and is an agric. market of great importance. Pop. 57,300.

Osimo (anct. Auximum), It. tn, in the Marches (q.v.), 9 m. S. of Ancona (q.v.). It was a Rom. colony after 157 BC. There

are remains of anct. walls, and a cathedral, and the tn has a trade in agric. produce and silk. Pop. (com.) 23,000.

Osipenko (until 1939 Berdyansk), port on the Sea of Azov, in the Zaporozh'ye oblast of the Ukraine; it has an engineering industry (agric. machinery, aircraft), and is a mud and beach health resort. Pop. (1938) 59,000 (c. 1914, 38,000; 1926, 26,000). O. was founded in 1827, and became a tn in 1835.

Osiris, an Egyptian god estab. in the Delta about the 5th dynasty, always represented as a dead king with the Atef crown (q.v.), shrouded and holding crook and flail. His cult may be Syrian, a form of the god of vegetation who dies annually and comes to life again. The myth woven round him in Egypt—known chiefly from Ptutarch—mainly concerns his death and resurrection as ruler of the dead. His sister Nephthys was the counterpart of her brother-husband Set, who killed O. but was defeated by O.'s son Horus the younger (q.v.). Two versions of O.'s death are both connected with the Nile, chief source of vegetation in Egypt. In one he was entrapped by Set in a chest which was thrown into the Nile and carried to the Delta swamps. Isis (q.v.), his wife, eventually found it, mourned over it, and went to urge Horus to avenge his father. Meanwhile Set came and cut the body into 14 pieces, dispersing them over Egypt; Isis eventually found all but one, building a shrine over each part where she found it.

By the Middle Kingdom, the identification of the dead king with O. had been extended to commoners, so that every dead man was known as O. So-and-so. This O. cult spread rapidly. When it reached Upper Egypt the centre of the cult became Abydos, where the tomb of Zer, third king of the 1st dynasty, was identified as the tomb of O. In the Late Period, O. became the chief god, even superseding Amun-Ra as ruler of the world. (See also SERAPIS and DRAD, BOOK OF THE.)

Osler, Sir William (1849-1919), Canadian physician and humanist scholar, b. Bond Head, Ontario. He graduated M.D. at McGill Univ., 1872, and was prof. of the institutes of medicine there, 1874-1884; he then became prof. of clinical medicine at the univ. of Pennsylvania, 1884-9 and at the age of 40 he accepted the chair of medicine at Johns Hopkins Univ. in Baltimore, 1889-1904. Given the opportunity to establish a new medical school there, he created an institution that revolutionised medical teaching in N. America by his combination of bedside teaching and co-ordination of wards and laboratories. At the age of 56 he became regius prof. of medicine at Oxford. A versatile man, O. left the impress of an original mind on pathology, clinical and scientific medicine, and epidemiology. His famous *Principles and Practice of Medicine*, 1892 (16th ed., 1947), was the most popular text-book in the Eng. language with sev. generations of medical students and practitioners. Among O.'s most original and lasting

contributions to scientific medicine must be included his investigations of the blood-platelets, his researches on the malarial parasite, his studies in malignant endocarditis, and his writings on angina pectoris and allied disorders. Tuberculosis was also one of his special subjects. He was one of the first seriously to question the estab. use of alcohol in medical practice, and to point out that its regular use increased the danger of tuberculosis. O. was more than a great physician and scientist; he was a humanist and classical scholar, being the first member of his profession to be elected president of the Classical Association, and he was also president of the Bibliographical Society in 1913. He was an enthusiastic collector, especially of classical medical texts and of the writings of Sir Thomas Browne. He bequeathed his magnificent library of over 7500 items to McGill Univ., where, with its catalogue, the *Bibliotheca Osleriana*, 1929, it stands as a monument to one of the greatest and best-loved of all physicians. O. was an apostle of international medicine, and personified the truth of the saying that the art of healing knows no frontiers. Elected F.R.S. in 1898, he was created a baronet in 1911. Among his works are *Cerebral Palsies of Children*, 1889, *Chorea and Choreiform Affections*, 1894, *Lectures on Abdominal Tumours*, 1895, *On Angina Pectoris and Allied States*, 1897, *Monograph on Cancer of the Stomach*, 1900, *Science and Immortality*, 1904, *Aequanimitas and other Addresses*, 1904, *Counsels and Ideals*, 1905, *An Alabama Student and other Biographical Essays*, 1908, *The Principles and Practice of Medicine* (8th ed.), 1912, and *The Evolution of Modern Medicine*, 1913. He also ed. *A System of Medicine*, in 7 vols., 1905-1910. See H. Cushing, *Life of Sir W. Osler*, 2 vols., 1926, 1940; E. G. Reid, *The Great Physician*, 1931; W. R. Belt, *Osler*, 1952.

Oslo (formerly *Christiania*), cap., city, and co. of Norway, situated in the S.E., at the head of the O. Fjord.

O. was founded in the 11th cent. by King Harald Haardraade. In 1624 it was completely burnt down and replanned by Christian IV (hence the name *Christiania*). He was a Dan. monarch, and following Norway's separation from Denmark, 1814, and from Sweden, 1905, the city reverted in 1925 to its original Norwegian name, O. O. fell to the Germans in the Second World War on 9 April 1940, the city having been taken by surprise by sea and air forces. The Germans surrendered to the patriots in May 1945, and O. was liberated.

Since the incorporation of the neighbouring dist. of Aker on 1 Jan. 1948, O. has become one of the largest cities in the world territorially, with an area of 453.3 sq. km., mostly rural. Urb. O. is rapidly expanding, however, with many new housing estates growing up around it. The city, with the fjord stretching out to the S., is very beautifully situated among pine woods and hills that rise like an amphitheatre. The sheltered harbour is excellent, and has ample facilities to

accommodate the largest ships. During severe winters the fjord may be frozen, but is kept open by breakers. There are 2 main railway stations with a good train service to all parts of Norway, into Sweden and the Continent via Denmark. Electric trains connect the city and the suburbs; the roads are good and the easy travelling has made O. centre of extensive tourist traffic. The civil airport is Fornebu, 20 min. by road from the city centre. Many of the prin. buildings are conveniently concentrated in or near the main street, Karl Johan, which is overlooked at one end by the Royal Palace (completed 1848). In Karl Johan are the National Theatre (closely associated with Ibsen), the older part of O. Univ. (completed 1854), and the Storting (Parliament). Close by and overlooking the fjord is the impressive tn hall (opened 1951 at the time of O.'s 900th anniversary celebrations). Architecturally the city is mostly a mixture of 19th- and 20th-cent. buildings. Of the latter, Broadcasting House is one of the finest examples. Of old buildings, the most outstanding is Akershus Castle, a fort and palace of medieval origins, overlooking the harbour and fjord. O. Cathedral in the main market square is a fine example of 17th-cent. church architecture.

O. is noted for its lavish municipal patronage of the arts. All the public rooms in the tn hall are richly decorated with large murals, executed by Norway's leading contemporary artists, and there is also much sculpture, including a series of colourful wooden reliefs from old Norse mythology. In Frogner Park (10 min. by tram from the city centre) is the unique collection of statues, comprising 150 groups by the Norwegian Adolf Gustaf Vigeland (q.v.), depicting the moods of man and woman in their journey from birth to death. The handsome Vigeland studio and museum (he d. in 1943) is close to the park. The collection of paintings by the expressionist Edvard Munch in the city's National Gallery is also important. O. is rich in museums, particularly in the dist. of Bygdøy (reached by ferry or bus in 10 min.). The Viking Museum there contains 3 original Viking ships and many other Viking relics. The buildings containing the Kon Tiki raft and the famous polar ship *Fram* are near by, and also the Technical Museum and Maritime Museum. Particularly popular is the Open-Air Folk Museum with its collection of 150 old wooden buildings assembled from many regions of Norway, and with original furnishings.

O. offers many opportunities for sport and open-air activity, especially skiing. Large tracts of forest land in the surrounding hills are accessible in 20 min. by electric train from the underground station in the city centre, and tens of thousands of O.'s inhab. spend winter Sundays skiing there. Holmenkollen is the site of the famous ski jump used only once annually, in Mar., for the international ski jumping competition which attracts up to 100,000 spectators. Facilities for bathing are good in the O. Fjord.

and one of Europe's finest swimming pools was opened in Frogner Park in 1956. Bislet Stadium is the centre for athletics and speed skating, and the new Jordal Amfi is used for ice hockey. O. is well provided with theatres and cinemas, whilst the hotels are good but insufficient for the large and growing number of visitors.

Formerly timber was the city's prin. industry. Now, however, the economy is much more varied, with a very considerable manuf. of both consumer and capital goods. O. is Norway's biggest

a small tribe of Ogüzian Turks. O. succeeded his father as chieftain in 1288, and on the destruction of the sultanate of Iconium in 1299 by the Mongols succeeded in obtaining part of Bithynia. He had previously subjugated many of the neighbouring Ogüzian chiefs, and this new accession of ter. rendered him powerful enough to attack the Byzantines with success. In 1301 he defeated the Emperor Andronicus II at Baphaeon, and he continued his career of conquest until his death. O. had assumed the title of sultan on the extinction of the Iconium

Royal Norwegian Embassy

OSLO: CITY HALL

port both in volume of trade and also as port of registration for merchant shipping. Pop. 450,000.

Oslo Convention of Dec. 1930 was for a greater measure of free trade between the signatories, namely, the Netherlands, Belgium, Sweden, Norway, Denmark, and Luxembourg. Finland adhered in Feb. 1933.

Osman, or **Othmān ibn 'Affān** (c. 574–656), 3rd caliph of the Muslims. One of the early converts to Islam, he was one of its most zealous supporters, and linked himself still more strongly to Mohammad by becoming his son-in-law and private secretary. He was elected to succeed Omar in the caliphate in 644, but proved quite incapable. He was murdered by Mohammed, a son of Abu-Bekr.

Osman I, or **Othman**, **Othoman** (1259–1326), surnamed **Al-ghazi** (the conqueror), b. Bithynia, the son of Orthogrul, chief of

sultanate in 1299, and was the founder of the Ottoman dynasty.

Osman II (1605–22), Sultan of Turkey, son of Ahmed I. He succeeded to the throne in 1618 on his brother, Mustapha I, being declared insane, but he reigned for only 4 years, being dethroned by the janizaries and put to death.

Osmanthus, genus of evergreen shrubs and trees (family Oleaceae). The flowers of *O. fragrans*, sometimes grown in green-houses, are used in China to scent tea. *O. ilicifolius* and *O. delavayi* are very handsome hedge plants.

Osmiridium, or **Iridosmine**, alloy of osmium and iridium. It commonly occurs associated with platinum, palladium, copper, gold, and iron in the so-called platinum ores, found usually in outcrops of detritus deposits. The chief supplies of platinum ore are obtained from Russia, Colombia, Brazil, California,

and Australia. Of these, the Australian deposits are richer in O. in proportion to the platinum, and deposits have been found in Tasmania, where the O. is associated with iron. O. is used as a source of the 2 metals osmium (q.v.) and iridium (q.v.).

Osmium, metallic chemical element, symbol Os, atomic number 76, atomic weight 190.8. It occurs associated with iridium in the alloy osmiridium, which is found in platinum ores in the following proportions: Russian ores, 4.1 per cent; Australian ores, 27.1 per cent; Californian ores, 9.6 per cent. The platinum ore is first treated with aqua regia, the osmiridium being left as an insoluble residue. This alloy is then fused with common salt in a current of chlorine, the iridium being converted into Na_2IrCl_6 , and the O. being converted into OsO_4 , O. tetroxide. Metallic O. is obtained by the addition of an alkaline formate. O. is a grey metal of sp. gr. 22.5; it fuses at about 2750° C. It forms a protoxide OsO , a sesquioxide Os_2O_3 , a dioxide OsO_2 , a tetroxide OsO_4 , etc. It forms well-defined alkaline salts called osmates and osmiumates, red or green in colour. When heated in a current of chlorine, the metal forms O. dichloride, OsCl_2 . O. is used as a catalyst, and the tetroxide is largely used in the preparation of specimens for microscopic examination.

Osmosis, percolation and intermixture of fluids separated by a porous membrane, first studied by the Abbé Nollet, 1748. He found that if a solution of cane-sugar was contained in a vessel, the bottom end of which was closed with an animal membrane (e.g. parchment) and placed in pure water, the latter entered into the cane-sugar solution, thus raising the level in the inside vessel until the hydrostatic pressure resulting was equal to the force tending to make the water enter. This force is known as osmotic pressure. A membrane which will allow simple water molecules to pass but which does not allow solute molecules to go through is known as a semi-permeable membrane. Quantitative work was done by Pfeffer using special semi-permeable membranes such as copper ferrocyanide precipitated inside the walls of a clay vessel. The actual selective flow of material through a membrane is called O. It was shown by van't Hoff that the laws of osmotic pressure are similar to those relating to gas pressure. The osmotic pressure of a solution varies directly with the concentration, temp. being constant, and also, for a definite concentration, is nearly proportional to the absolute temp., if the volume is constant. This corresponds with the laws of Boyle and Charles for gaseous pressures. Then, again, equimolecular quantities of substances when dissolved in the same volume of solvent exert equal pressures at the same temp., i.e. they are said to be isotonic. Ideally the molecular weight in grammes of a non-electrolyte when contained in 22.4 litres of water-solution at 0° C. exerts an osmotic pressure of 1 atmosphere. In actual practice such solutions would often be too concentrated to obey

the laws exactly. This law is true only of non-electrolytes and corresponds with Avogadro's hypothesis applied to gases, which states that equimolecular quantities of gases per c.c. at the same temp. exert equal pressures. The measurement of osmotic pressure furnishes a method of determining the molecular weights of non-volatile substances and of substances which decompose when vaporised. The method is rarely employed in practice, as the direct measurement of the osmotic pressure is difficult. In the case of electrolytes valuable information as to the degree of ionisation can be obtained by comparing the observed osmotic pressure with the theoretical value,

$$\pi = n - 1$$

where m is the 'degree of ionisation,' n is the number of ions given by 1 molecule of the electrolyte (e.g. for NaCl , $n = 2$, Na^+ and Cl^-) and 1 is the ratio of observed to calculated osmotic pressure. The phenomenon of O. is constantly taking place in living bodies, both animal and vegetable.

Osmund, St (d. 1099), Eng. prelate and saint, b. in Normandy. He came to England with the Conqueror, and about 1070 became chancellor. In 1078 he was made Bishop of Salisbury (Old Sarum), where he completed the cathedral and estab. a chapter of secular canons. He is particularly remembered as the compiler of the liturgical services for his diocese, now known as the Sarum Use (q.v.). He was canonised in 1457.

Osmunda, or **Flowering Ferns**, genus of very handsome ferns, so called because the brown sporangia are borne in branched masses at the tips of the huge fronds where the leafy portion disappears. The fronds are twice or thrice divided into pinnae, and sometimes attain a length of 6 ft. or more. There are a number of species; the only Brit. one, *O. regalis*, the royal fern, is one of the most handsome. O. root fibre, which is now largely used in the cultivation of orchids, is mainly obtained from *O. claytoniana*, a native of N. America.

Osnabrück, Ger. tn in the *Land* of Lower Saxony (q.v.), on the Haase, 73 m. W. by S. of Hanover (q.v.). It was made a bishopric by Charlemagne (q.v.), and belonged to the Hanseatic League (q.v.). By the treaty of Westphalia (q.v.) the see was ruled alternately by Rom. Catholic and Protestant bishops. In 1803 the see was secularised and passed to Hanover. The Rom. Catholic see was again instituted in 1858. There is a fine Gothic cathedral (11th-13th cents.), and there are other medieval churches, a Gothic Rathaus (where the treaty of Westphalia was signed), and some anc. houses. There are important iron, steel, and paper industries. During the Second World War O. was first bombed by the R.A.F. in July 1941, and thereafter it was bombed frequently. It was important to hasten the capture of O. in the Allies' 1945 campaign, because it was by the railway from the tn that the Germans transported V2 weapons into Holland. On 2 April, following the crossing of the Rhine by the

21st Army Group, a Brit. airborne force crossed the Dortmund-Ems canal and approached O.; on 4 April Brit. armoured spearheads crossed the Weser NE. of O., and next day the tn was taken by the Brit. First Commando Brigade (*see* WESTERN FRONT IN SECOND WORLD WAR). Pop. 124,961.

Osorno, tn of Chile, cap. of the dept. of O., on the State Railways 590 m. S. of Santiago. The city, which is a distributing centre for an important agric. region, was founded in 1558 and soon developed into one of the chief tns of the country. Some of its streets still preserve much of their colonial character, but modernism is the dominant note to-day. It is a fine tourist centre, with lakes and snow-capped volcanoes to the S. The Instituto Alemán, indicative of the Ger. character of the city, is an instance of the prevailing concrete construction. There is an airfield 2 m. away at Pampa Alegre. Pop. 40,120.

Osprey, Fish Hawk, Fishing Eagle, or **Bald Buzzard** (*Pandion haliaetus*), cosmopolitan bird of prey which feeds on fish, and is the only member of its genus. Its length is about 2 ft and its wing expanse nearly 6 ft. The plumage is dark brown on the upper surface and white on the under parts. The head and throat are white with streaks of light and dark brown. O.s are somewhat gregarious in habit, and the nest is often made in trees near the seashore or lakeside. In it are laid 2 or 3 white eggs, blotched with crimson. The O. is practically extinct in Britain.

Ossa, or **Kissavos**, mt in N. Thessaly, Greece, E. of the R. Peneus. Mt Olympus is opposite, and between them is the vale of Tempe. O. is 6405 ft high. *See also* PELION.

'Osservatore Romano' (It. for 'Roman Observer'), daily evening paper issued from the Vatican state. It was founded in 1860 by a group of Italians who had no official connection with the Vatican, but was acquired by the Church during the pontificate of Leo XIII. It is a semi-official organ (unlike the *Acta Apostolicae Sedis*), but one column of it is supplied from official sources. It is generally held to reflect the policy of the Vatican, and the Pope's speeches and decisions appear in its pages. Its circulation suffered heavily when engaged in dispute with the Fascists, who rendered its sale practically impossible, but later it returned to normal. The daily circulation is now 320,000.

Ossietians, Iranian-speaking people of the Caucasus, who live on the N. and S. slopes of the central part of the main Caucasus range. They numbered 354,000 in 1939. Mostly Orthodox Christians, some are Sunni Muslims. O. are descendants of the medieval Alans (q.v.). From the 17th cent. N. O. were subject to Kabarda (q.v.) princelings; from the 18th cent. they were under strong Russian influence, and all O. were annexed to Russia in 1801-6. *See* NORTH OSSETIAN AUTONOMOUS REPUBLIC and SOUTH OSSETIAN AUTONOMOUS OBLAST. *See*

also W. Kolarz, *Russia and Her Colonies*, 1952.

Ossett, municipal bor. in W. Riding of Yorks, England, 2½ m. W. of Wakefield. It has coal-mines, engineering works, and cloth mills, and is the centre of an area engaged in the reclamation of wool, and the preparation of mungo, merino, etc. At S. O. there are mineral springs. Pop. 14,600.

Ossewabrandwag (Ox-wagon Sentinel), an organisation, secret in its method of operation and membership, now (1956) apparently negligible, formed by and among Afrikaners with the avowed purpose of maintaining the Afrikaans language as a means of keeping alive Afrikaans culture and thus stimulating nationalism and republicanism. It derives some of its influence from the inspiration that drove the Voortrekkers to uproot themselves from their ancestral homes (c. 1830) and go N. out of reach of Brit. domination. Its militant activities and pressure groups threatened to become a serious embarrassment to the National Party, and whilst in office two successive Afrikaans Prime Ministers, Hertzog and Malan, condemned their disruptive and quasi-treasonable activities, while the late Prime Minister, Strijdom (1893-1958), publicly expressed the same views.

Ossiacher, Lake, *see* CARINTHIA.
Ossian (Fawn), latinised form of the Gaelic Oisín, a semi-mythical Gaelic bard who is claimed by both Scotland and Ireland, and the presumed author of a number of narrative poems dealing with the deeds of Finn MacCummhail and Cuchulain. About the middle of the 18th cent. James Macpherson (q.v.), a Scottish tutor, claimed to have discovered and trans. these poems, which had existed in the highlands from time immemorial in oral tradition. Doubts were cast on the genuineness of their source, Dr Johnson maintaining that they were an invention of Macpherson's, and a prolonged controversy ensued. It is now generally supposed that Macpherson composed a great part of these works, though he drew upon anc. sources. *See* T. W. Rolleston, *Myths and Legends of the Celtic Race*, 1911, and G. F. Black, *Macpherson's Ossian and the Ossianic Controversy*, 1926.

Ossietsky, Carl von (1889-1938), Ger. pacifist and journalist, b. Hamburg. He served in the regular army in the First World War and afterwards went to Berlin in the hope of founding a popular front against war. He became (1928) editor of *Die Weltbühne*, a paper of advanced pacifist opinion. In 1929 one of his contributors accused the Reichswehr of secretly rearming in defiance of the Versailles Treaty and O., with his contributor, was sentenced to 18 months' imprisonment. In 1931-2 he was imprisoned on an alleged charge that he had revealed military secrets; after being released he was re-arrested when the Nazis came to power and charged with being an enemy to the state and was in prison, 1933-6. While in prison in a concentration camp he was awarded the Nobel prize for peace

and Australia. Of these, the Australian deposits are richer in O. in proportion to the platinum, and deposits have been found in Tasmania, where the O. is associated with iron. O. is used as a source of the 2 metals osmium (q.v.) and iridium (q.v.).

Osmium, metallic chemical element, symbol Os, atomic number 76, atomic weight 190.8. It occurs associated with iridium in the alloy osmiridium, which is found in platinum ores in the following proportions: Russian ores, 4.1 per cent; Australian ores, 27.1 per cent; Californian ores, 9.6 per cent. The platinum ore is first treated with aqua regia, the osmiridium being left as an insoluble residue. This alloy is then fused with common salt in a current of chlorine, the iridium being converted into Na_2IrCl_6 , and the O. being converted into OsO_4 , O. tetroxide. Metallic O. is obtained by the addition of an alkaline formate. O. is a grey metal of sp. gr. 22.5; it fuses at about 2750° C. It forms a protoxide OsO , a sesquioxide Os_2O_3 , a dioxide OsO_2 , a tetroxide OsO_4 , etc. It forms well-defined alkaline salts called osmates and osmiumates, red or green in colour. In 1931-2 he was imprisoned on an alleged charge that he had revealed military secrets; after being released he was re-arrested when the Nazis came to power and charged with being an enemy to the state and was in prison, 1933-6. While in prison in a concentration camp he was awarded the Nobel prize for peace

for 1935. He d. of tuberculosis, which he had contracted through his maltreatment in the concentration camp at the hand of the Nazis.

Ossification, formation of bone (see BONE).

Ossining, tn in Westchester co., New York, U.S.A., on the E. bank of the Hudson R., 31 m. N. of New York. It was known as Sing Sing till 1901. The chief manufs. are chemicals and machinery, and there are iron foundries. It contains the state prison of Sing Sing. Pop. 16,098.

Ossola Valleys, see DOMODOSSOLA.

Ossoli, see FULLER, SARAH MARGARET.

Ossory, anct kingdom of Ireland in the SW. of Leinster. There are sees of that name, both of the Rom. Catholic and Protestant churches.

Ostade, *Adriaen van* (1610-85), Dutch painter, b. Haarlem, a fellow pupil of Brouwer under Frans Hals. His pictures consist of scenes from Dutch peasant life, and are conspicuous for their rich colouring and spirited touch. Among his pictures are 'The Alchemist,' in the National Gallery, 'The Fiddler,' 'Peasants in an Ale-house,' 'The Smoker,' 'A Village Tavern,' 'A Painter's Studio,' 'Peasants Dancing,' 'The Village School,' 'The Fish Market,' and 'A Village Fête.'

Ostade, *Isaack van* (1621-49), Dutch painter, b. Haarlem, was the brother and pupil of *Adriaen O.* Some of his works are 'A Village Inn,' 'Interior of a Dutch Peasant's Cottage,' 'Winter Landscape with Figures,' 'A Fish Auction' (Glasgow), 'Village Scene' (National Gallery), 'Frost Scene,' 'A Frozen River,' 'A Village Street,' 'A Frozen Canal in Holland,' and 'Travellers Halting at an Inn.'

Ostberg, *Ragnar* (1866-1945), Swedish architect, b. Stockholm, was educ. there, then studied abroad, returning 1900. His buildings in Stockholm include his masterpieces, the City Hall, 1911-23, the High School for Boys, and the Nautical Museum. Elsewhere he built the theatre at Umeå, and extensions to Upsala Univ. He became prof. of architecture in Stockholm, 1921; and was awarded the R.I.B.A. Gold Medal in 1926.

Osteitis, inflammation of the bone (see CARIES). *O. deformans* (Paget's disease) is a chronic disease of uncertain cause in which bone tissue is absorbed and later replaced by excessive deposits of bone tissue under the periosteum (q.v.) and within the marrow cavity. These deposits calcify, and there is distortion and enlargement of the affected bones—mosty the skull, spine, pelvis, and tibia.

Ostend (Flem. *Oostende*; Fr. *Ostende*), city in the prov. of W. Flanders, Belgium, a fashionable seaside resort on the N. Sea, 77 m. WNW. of Brussels by rail. After Antwerp and Ghent it is one of the main ports of Belgium. It exports butter, fruit, vegetables, rabbits, oysters, and other foodstuffs, chiefly to England, is the H.Q. of the main body of the Belgian fishing fleet, and maintains a cross-channel service with Dover. The *digue*, or sea wall, constructed of solid granite, extends for 3 m. along the shore, and the piers (*estacades*) guard the harbour entrance.

There is a school of navigation, an important fish market, the summer palace of King Leopold I. presented to him by his aunt, Queen Victoria, in 1873, a casino which attracts many visitors, and parks. Its lighthouse was destroyed during the First World War, but has since been rebuilt. Though an old tn, fortified in 1583, with a stirring hist., most of the buildings are modern. In the First World War it was taken by the Germans in Sept. 1914, and became a naval base for Ger. submarines. A Brit. naval raid was made on 22-3 April 1918, and on 9-10 May the Brit. Navy, by sinking the *Vindictive*, partially closed the harbour. The tn was finally re-entered by the Allies in Oct. 1918. O. again suffered much from war in 1940, and was heavily damaged under Ger. occupation. Since 1945 considerable restoration has taken place. The people are engaged in the hotel trade, in fishing, shipbuilding, and manufs. of ropes, sails, nets, salt, and lace. Pop. (1955) 53,300.

Osteolepids, early crossopterygian fishes (q.v.) belonging to the suborder Rhipidistia. They occur in Old Red Sandstone and Carboniferous rocks.

Osteology, that part of anatomy which deals with bones and their uses. See BONE.

Osteomyelitis, inflammation of the medullary cavity, or 'marrow,' of a bone. The bone marrow, being highly vascular, is prone to infection by blood-borne organisms. Injury often appears to be a predisposing factor. O. is more common in children and young people whose bones are not yet fully grown. Since the septic inflammation of O. is hemmed in by bony walls, the resulting abscess is contained under tension and, as there is no ready outlet for the pus, there is considerable toxæmia and fever, with constitutional upset. There is death of surrounding cancellous bone (see CARIES) and sequestrum (q.v.) formation. Pus must be surgically drained, but antibiotics now hasten the cure of what used to be a lengthy and grave illness.

Osteopathy, complete science of healing based on the normalising of the body and its functions on the assumption that a structural derangement of skeletal parts (the 'osteopathic lesion') is the significant factor in all disease. By manipulation it endeavours to remove such abnormalities and thus re-establish the integrity of the body in its functional activities. The theory of O. was formulated by an Amer. doctor, Andrew Taylor Still, in 1874. O. must be distinguished from manipulative surgery as practised by orthopaedic surgeons (see under MANIPULATION) and 'bone setters.' The bone setter is a manipulator of joints. According to Still, all diseases are caused by obstruction of arteries or nerves by the pressure of maladjusted bones, especially of the vertebrae of the spinal column. In 1935, in a memorandum to a Bill before Parliament, O. was defined as 'a developing system of treatment of disease by manipulative methods.' There are now sev. osteopathic colleges in the U.S.A., the original being at Kirksville, Missouri.

The general offices of the Amer. Osteopathic Association are in Chicago. The Brit. School of O. was founded in London (16 Buckingham Gate, SW.1) in 1917. The practice is legalised in all the Amer. states, and in much of Canada. In Great Britain osteopaths have made repeated endeavours to obtain state recognition of their system. In 1931 an unsuccessful application was made by the Brit. Osteopaths Association for a royal charter. On 4 occasions—the last in 1935—parl. bills were introduced with the object of securing for osteopaths a status similar to that held by registered medical practitioners. All were unsuccessful. In 1946 the London College of O. was founded in Dorset Square, NW.1, with the object of teaching the theory and practice of O. to qualified medical men. The address of the General Council and Register of Osteopaths Ltd is 12 Clarges St, London, W.1. Pub.: the *Osteopaths Quarterly*. See G. Macdonald and W. Hargrave-Wilson, *The Osteopathic Lesson*, 1935; C. Hill and H. A. Clegg, *What is Osteopathy?* 1937; W. Haycock, *The Expanding Concept of Osteopathy*, 1956; R. W. Puttick, *Osteopathy*, 1956.

Oster Ringun, see ESTERGOOM.

Ostergötland, prov. of Sweden, containing sev. lakes, lying between Lake Vättern and the Baltic. There are iron and copper mines, and cheese is made. Chief tn. Norrköping. Area 4266 sq. m.; pop. 357,126.

Osterley, dist. in the bor. of Heston and Isleworth, Middx, England, about 10 m. from London, and lying across the Great W. Road. To its N. is O. Park (in the bor. of Southall), which contains a fine mansion built c. 1575 for Sir Thomas Gresham, founder of the Royal Exchange; it was decorated and remodelled by Robert Adam, c. 1761–80.

Osters, second largest of the Faeroe Is. (q.v.). Area 111 sq. m.; pop. 7000.

Osterode: 1. Ger. tn in the Land of Lower Saxony (q.v.), at the foot of the Harz Mts (q.v.), 52 m. SSE. of Hanover. It has textile manufs. Pop. 16,500.

2. See OSTRODA.

Osterreich, see AUSTRIA.

Ostfold, co. of Norway, with Sweden to the E. and SE., its W. coast being part of Oslo Fjord. It is primarily industrial, but there is also considerable agriculture. Area 1613 sq. m.; pop. 189,000.

Ostia, anc. port of Rome (q.v.), situated on the S. mouth of the Tiber (q.v.), 14 m. SW. of the city. According to Strabo it was founded by Ancus Marcius (q.v.). Claudius I (q.v.) built an improved harbour 2 m. NW. (*Portus Ostiensis*, or *Portus Augusti*), and another (*Portus Trajani*) was built by Trajan (q.v.). The prosperity of the tn derived from its salt works, but after the 4th cent. AD it declined. There was a temporary revival when the tn was fortified by Pope Gregory IV in the 9th cent., and another when Cardinal della Rovere (later Pope Julius II, q.v.) built a castle here in the 15th cent. The modern bathing resort of Lido di Roma is on the coast of the Tyrrhenian Sea, 2 m. SW. of O.

Ostiaks, see KHANTY.

Ostmark, name given to Austria by the Ger. Gov., after its incorporation into Germany in 1938 (see AUSTRIA, *History of Austria from 1918*).

Ostracism (Gk *ostrakon*, a potsherd), democratic measure introduced at Athens by Cleisthenes (c. 487), but not used after 417 BC. It was intended as a check upon any person who in any way whatever endangered the constitution, and the procedure was as follows. Each year the assembly voted to decide whether or not O. should take place. If the vote was in favour, each citizen then wrote the name of his intended victim on a potsherd; the ballot was secret, and anyone who was thus named on 6000 potsherds or more was banished for 10 (later 5) years, though without loss of property or civil rights. Only 10 persons are known to have been ostracised, and *ostraka* applying to each of them have been found. They include Miltiades, Themistocles, Cimon, and Alcibiades. See J. Carcopino, *L'Ostracisme athénien*, 1935.

Ostracoda, order of minute crustacea belonging to the subclass Entomostraca and consisting of about 2000 species. An ostracod usually leaves the egg as a nauplius, is of low and simple form, and uses only 3 or fewer appendages in mastication. The *Cyprid*, belonging to the family Cypridae, is a common type of ostracod, having a bivalve enveloping shell resembling a mollusc, a body without segments, and 7 pairs of appendages.

Ostracoderms, ('shell-skinned'), primitive armoured jawless vertebrates without paired fins belonging to the class Agnatha (q.v.).

Ostrau, see OSTRAVA.

Ostrava (Ger. Ostrau): 1. Region (*kraj*) in central Czechoslovakia, bordering on Poland. It is part of the former prov. of Moravia (q.v.) and includes some dists. of Silesia (q.v.). The centre of the region lies in the basin of the Odra (see ODER), in the W. is the E. end of the Sudetic Mts (q.v.), and in the E. is part of the Carpathians (q.v.). Area 1746 sq. m.; pop. 790,500.

2. Moravská Ostrava (Moravian O.), Czechoslovak tn, cap. of the region of O., on the Ostravice near its confluence with the Odra. It stands in the 'Moravian Gap,' between the Sudetic and the Carpathian Mts, the classic military gateway from Vienna to Poland. During the Second World War it was taken by the Russians in April 1945 (see EASTERN FRONT). There are important coal, iron, steel, engineering, petroleum refining, and chemical industries. Pop. 181,000.

3. Slezská Ostrava (Silesian O.), Czechoslovak tn in the region of O., on the Ostravice opposite Moravská O. It has coal and engineering industries. Pop. 21,000.

Ostrich (*Struthio*), largest living bird, the male standing about 8 ft high. A native of Africa; but the name is sometimes given to the rhea, a native of S. America. The single species (*S. camelus*) forms the order Struthioniformes and is found in most parts of Africa S. of the

Sahara and in the Arabian and Syrian deserts. The bill is wide and flat, the small head has large eyes, while the long neck has a sparse covering of down feathers. The long legs have the lower parts of the 'thigh' naked and feet with two large toes bearing broad claws. The adult male's body is covered with black feathers, the plumes of the wings and tail being white; females and young males have grey feathers. The male is polygamous and incubates the eggs at night, but the female may sit on them during the day.

Zoological Society of London

OSTRICH

The O. tends to occur in deserts and open plains, where it is found in small flocks. It runs at high speed (exceeding that of a horse) with the head outstretched and the wings spread. The food is mainly vegetable and the O. can go for a long time without water.

The O. has long been valued for its plumes, and the production of O. feathers is still a fairly important farming activity in S. Africa. For many years the birds were hunted and shot before their plumes were removed, and it is only comparatively recently that O.s have been domesticated. Young birds were first enclosed in S. Africa in 1857; yet in 1865 only 80 were in captivity. After 1870 greater attention was given to their domestication. The chief centre of the modern feather industry is at Outshoorn (q.v.); at the peak period (c. 1906-12) of O. farming there were some 400,000 O.s in this dist., but by 1939 there were under 20,000 birds.

A flock of O.s under modern systems of farming is given the free run of about 1000 ac. of veldt, where the birds pick up a good deal of rough food. In addition, lucerne or some other similar crop is grown at the rate of about 1 ac. for 3 birds. The birds usually pair in May or June, and a pair of birds breeds as often as 3 times a year; the hen lays an egg every other day, a sitting numbering from 12 to 20 eggs; and if they are removed, as many as 120 may be laid in the course of a year.

The O. chickens hatch out at the end of 6 weeks, and for the first 50 or 60 hrs are given no food, but allowed to bask in the sun. In the first 6 months of life their growth is very rapid. At 6 months the chick feathers are removed by clipping, and 2 months later the dead quills are pulled out. At 18 months they are full grown, though not fit to breed till twice that age. Usually it is the 3 rows of feathers at the tips of the wings and the tail feathers that are taken, the quill being cut about 2 in. from the socket. The quill stumps are removed 2 months later to allow a new crop of feathers to appear. An exceptionally good bird should yield from 20 to 26 oz. of feathers, and should give about 60 long whites and from 60 to 70 long blacks, in addition to the body feathers.

Ostrich, South American. see RHEA.

Ostróda (Ger. Osterode), tn of Poland, in Olstyn prov., on the Drweca, 20 m. WSW. of Olstyn (q.v.). It was formerly in E. Prussia (q.v.), and was badly damaged during the Second World War. There is a trade in timber and agric. produce. Pop. 10,000.

Ostrog (Ukrainian Ostroh), tn in the Rovno oblast of W. Ukraine, 120 m. NE. of L'vov. Known since 1100, O. in the 16th cent. was an important centre of Russian (Ukrainian) Orthodox culture (academy founded late 1570's, Church Slavonic Bible printed in 1581 by Ivan Fedorov, q.v.). Pop. (1931) 13,000.

Ostrogoths, see GOTHIS.

Ostrov Vrangelya (Wrangel Island), is, in the Arctic Ocean off the NE. coast of Siberia. It was discovered in 1867 by an Amer. whaler, T. Long, although von Wrangel made an expedition in search of it. It consists mainly of bare rocks which rise to a height of 2500 ft in Mount Berry. Three meteorological stations are now maintained by the U.S.S.R., set up in 1926, 1946, and 1955.

Ostrovskiy, Aleksandr Nikolayevich (1823-86), Russian playwright, belonged to Gogol's school of Critical Realism. His plays dealt with the many ills of contemporary Russian society, particularly those of the merchant class. O. exercised a dominating influence on playwriting in Russia in the second half of the 19th cent., and is considered the real founder of Russian national dramaturgy. His plays are still very popular and many of their titles have become proverbs.

Ostrowskia Magnifica, hardy perennial plant (family Campanulaceae), a native of the Bokhara Mts. It sometimes exceeds 7 ft in height and bears huge campanulate blooms, lilac, blue, or pure white. It needs protection in winter.

Ostrya, genus of 4 deciduous trees, family Betulaceae. *O. carpinifolia*, Hop Hornbeam, of S. Europe and Asia Minor, and *O. virginiana*, Ironwood, of E. N. America, are cultivated for their ornamental qualities.

Ostuni, It. tn in Apulia (q.v.), 19 m. WNW. of Brindisi (q.v.). It has a 15th-cent. cathedral. Pop. (com.) 31,300.

Ostwald, Wilhelm (1853-1932), Ger.

chemist, b. Riga, Latvia. In 1887 he was appointed to the chair of chem. at Leipzig Univ., but retired from this position in 1906. He also held the position of director of the Electro-chemical Institute of Leipzig in 1898, and was the first exchange prof. at Harvard Univ. in 1905. In 1909 he was awarded the Nobel prize for chem. His process of forming nitrogen oxides by the oxidation of ammonia enabled Ger. manufs. of explosives in the First World War to be maintained despite the loss of Chilean nitrate imports. His numerous works embrace general chem., principles of natural science, energy, electro-chem., and monism; and works on Comte, Schopenhauer, etc. His autobiography, *Lebenslinien, eine Selbstbiographie*, was pub. 1886-7.

His son, Wolfgang (1883-1943), was b. Riga, from 1922 held the first chair of colloidal chem. at Leipzig, and became a leading authority on this subject.

Ostyako-Vogul'sk, see KHANTY-MANSIJSK.

Ostyaks, see KHANTY.

O'Sullivan, Seumas, pseudonym of James Sullivan Starkey (1879-1958), poet, b. Dublin. In 1923 he founded the *Dublin Magazine*, which he ed. for the rest of his life. A mystical poet of the Celtic twilight school, he wrote *The Twilight People*, 1905, *Verses Sacred and Profane*, 1908, *The Earth-Lover*, 1909, *Poems*, 1912, *Requiem*, 1917, *The Lamplighter*, 1929, *Twenty-Five Lyrics*, 1933, *Personal Talk*, 1936, *Dublin Poems*, 1946, and *Translations and Transcriptions*, 1950. Collections of essays are *Impressions*, 1912, *Mud and Purple*, 1917, *Common Adventures*, 1926, and *The Rose and Bottle*, 1946.

Osuna (Rom. Gemina Urbanorum), Sp. tn in the prov. of Sevilla, with Iberian and Rom. remains, a Renaissance church, and some old mansions. There was once a univ. (1549-1820). It has a trade in sparto, olive-oil, fruit, and wine. Pop. 20,000.

Oswald, St (c. 605-41), King of Northumbria (634-41), and son of Ethelfrid of Bernicia. He defeated the Welsh king, Cadwallon, at Heavenfield (identified with St O.'s Cocklaw, near Chellerford, Northumberland), and thus fought his way to the throne. He had previously become a convert to the Christian faith at Iona, and with the help of St Aidan, on becoming King of Northumbria, estab. Christianity throughout the kingdom, founding the Lindisfarne bishopric. His festival is celebrated on 5 Aug. To commemorate his victory over Cadwallon, O. raised the first cross over the Christian altar in Bernicia. He was defeated in battle and killed by Penda, at a place then called Maserfield (probably Oswestry).

Oswald, St (d. 992), Eng. monk and Archbishop of York, said to be of Dan. descent. He was associated with St Dunstan and St Ethelwold in the revival of eccles. discipline and monastic life in England, himself founding the abbey of Ramsey and the monastery at Worcester, which later became the cathedral priory. He was made Bishop of Worcester in 961 and Archbishop of York in 972.

Oswaldtwistle, urb. dist. and tn of E. Lancs, England, 3 m. ESE. of Blackburn. It has cotton mills, collieries, stone quarries, and chemical works. Pottery is manuf. Sir H. Peel was born (1750) at Peelford in the township and James Hargreaves invented the spinning jenny here in 1764. Pop. 12,133.

Oswego, city and cap. of O. co., New York, U.S.A., on the S.E. shore of Lake Ontario and 35 m. NW. of Syracuse. It has a good harbour and large shipments of grain, lumber, and coal. There are sev. iron foundries, machine shops, and oil works, and the manufs. include matches, engines, hosiery, starch, flour, textiles, etc. It is of historic interest because of its importance in Fr. and Indian wars. Pop. 22,647.

Oswego Tea, name applied to sev. species of *Monarda* plants, natives of N. America, by reason of the infused dried leaves being occasionally used as a beverage, given as a stomachic or in intermittent fevers. They are of the family Labiatae, and the particular species are the *M. purpurea*, *M. didyma*, and *M. Kalmiana*. *M. didyma* is one of the more attractive flowering plants native to E. N. America.

Oswell, William Cotton (1818-93), explorer, b. Leytonstone. He obtained an appointment in the E. India Co., and in India became an enthusiastic hunter of big game. Sent to S. Africa to recover his health, at Kuruman he was the guest of the famous missionary, Moffat, and his wife. In 1846, together with 2 Indian officers, he explored the Limpopo. Here he met with the kuabaoba or straight-horned rhinoceros, which he believed to be a separate species of the white rhinoceros. After another year in India O. returned to the Cape (1848), and joined the Livingstones at Koloban (1849). With Livingstone and Mungo Murray he took part in the discovery of Lake Ngami, and in the exploration of the Kalahari desert. This notable expedition, by traversing wastes previously impassable to Europeans, succeeded in connecting the pastoral uplands, from which big game had been hunted, with the lakes and rivs. of the equatorial part of the continent. If he found the 'sand distressingly heavy and sun fiery hot,' he describes the scenery along the R. Zouga, the outlet of Ngami, as magnificent, with baobabs 75 ft in circumference. For his share in this expedition O. received a medal from the Paris Geographical Society, and the kebaba rhinoceros was named after him. He also took part in the discovery of the Zambesi, which the party first came upon in Sebituane's country, where it was called the Seshéké (discovered 4 Aug. 1851). But notwithstanding O.'s eminent services to geography, and the loyal attitude of Livingstone towards him, his work soon passed into oblivion, the cause of this being his invincible laziness as a writer; indeed the earliest story of the expedition was learned through letters from Livingstone. See life by his son, W. Edward O., 1900.

Oswestry, tn of Shropshire, England, 20

m. NW. of Shrewsbury. The trade is chiefly agric., livestock marketing, tanning, insulated equipments, and printing, and there are railway workshops. It has Wednesday markets. There is an ancient grammar-school, founded in 1407, and the church originally belonged to a monastery, founded in memory of St Oswald, said to have been slain here in 641. O. was the original seat of the great family of FitzAlan from whom descended the earls of Arundel and the Stuart kings. Pop. 11,500.

was an outstanding champion of Christianity and a patron of learning and the Church.

Osymandyas, see RAMESES II.

Osyris, genus of evergreen shrubs (family Santalaceae). *O. alba*, the prin. species, bears racemes of small white flowers, followed by red berries. It is a native of S. Europe, and is half hardy in Britain.

Otago, prov. dist. of New Zealand, S. Is., situated to the S. of the prov. dists. Canterbury and Westland. It was one of

High Commissioner for New Zealand

CENTRAL OTAGO: LAKE WAKATIPU

The photograph shows Queenstown on Frankton Arm, and the Remarkables.

Oświęcim (Ger. **Auschwitz**), tn of Poland, in Katowice prov., near the mouth of the Sola R., 20 m. S. of Katowice (q.v.). There are coal-mines in the dist., and the tn has a power station. Pop. 7000. See AUSCHWITZ and CONCENTRATION CAMP.

Oswy (fl. 641-70), King of Northumbria. He succeeded to Bernicia on the death of his brother, St Oswald (q.v.). His early attempts to reunite Deira, now virtually a Mercian prov., and Bernicia failed. In 654 Penda (q.v.) determined to conquer O., and in a battle against overwhelming odds at an unidentified place called Winwaed in W. Yorks, Penda was killed (654). O. was now overlord of Mercia and S. England, but in 657 Mercia threw off his rule. For the rest of his reign he was simply King of Northumbria. O.

the 6 original divs. of the colony, which since 1876 have been abolished and the co. system adopted. It is divided into 2 areas: O. Portion and Southland Portion. The mts run from NW. to SE., the chief ranges being the Barrier Mts, the Kakanui Range, the Crown Mts, the Hector Mts, Richardson Mts, Eyre Mts, Aika Mts, Livingstone Mts, and Takitimu Mts. The chief rivs. occur on the E. coast, those on the W. being short torrential streams, and of the former the Clutha, which discharges the drainage from lakes Hawea, Wanaka, and Wakatipu, has the largest volume of any riv. in New Zealand. The Mataura drains the country to the S. of Lake Wakatipu, and the Waiau R. discharges the waters of lakes Te Anau and Manapouri. The fiord-like lakes lie in long narrow valleys, and are famous for

their fine scenery; and of these the chief are Wakatipu, with a depth of 1230 ft. and Lake Manapouri, 1462 ft deep. Among industries may be mentioned the rearing of livestock, arable agriculture, and mining, the prin. crops being wheat, oats, and barley, as well as all sorts of vegetables and fruits. In 1955 there were 42 cheese factories and 3 butter factories. O. has an important woollen-milling industry. Gold occurs in large quantities, and also coal, hewn stone, and slates. The cap. is Dunedin, which is picturesquely situated on the SW. side of O. harbour. It was founded in 1848 by members of the Free Church of Scotland, and owed its early prosperity to the gold-mining of O. It is the seat of Otago Univ., and the prin. school of mines. Area (O. Portion) 14,050 sq. m.; (Southland) 11,170 sq. m.; pop. (O. Portion) 168,935; (Southland) 81,000.

Otaheite, see TAHITI.

Otariidae, see FUR SEAL.

Oturu, seaport on the W. coast of Japan, off the is. of Hokkaido on Ishikari Bay, 90 m. N. of Hakodate. It has the most important fisheries of the is., and is especially a herring fishing centre. It manufs. agric. implements, vegetable oils, spirits, etc. Pop. 188,000.

Otavallo, tn. of N.E. Ecuador, on the railway, 90 m. from Quito and 16 m. from Ibarra. It is the centre of an agric. dist. in an Andean basin 8400 ft above sea level. Its industries include wool, carpets, and ponchos. Pop. 9000.

Otavi, mining centre of SW. Africa, in Damaraland. Deposits of lead and copper are worked in the dist.

Otea, see GREAT BARRIER ISLAND.

Otford, vil. of Kent, England, 2½ m. N. of Sevenoaks. It has traces of a Rom. villa, and was the scene of battles fought by Offa of Mercia and Canute. There are ruins of the palace built by Archbishop Warham in the early 16th cent., and a few Tudor houses in a good state of preservation. Pop. 2437.

Otfried (c. 800-70), religious poet, b. in Alsace. Having studied in the abbey of St Gall and Fulda, where he had Rabanus Maurus (see RABANUS MAGNENTIS MAURUS) for his master, he joined the Benedictine monks and entered the monastery at Weissenburg. He wrote *Liber Evangeliorum*, a political harmony of the gospels in Old High German, printed at Basel in 1571. O. is the oldest Ger. poet known to us by name. See study by D. A. McKenzie, 1946.

Othere, Onthere, or Ottar (d. 890), 'the old sea-captain who came from Helligoland,' Norse navigator and explorer of Alfred the Great's reign. He made 2 voyages between 880 and 900, in one of which he is said to have sailed round the N. Cape into the White Sea.

Othmar, St (Otmár, Audemar) (d. 759), was of Teutonic origin: in 720 he became abbot of the dilapidated monastery of St Gall. There he introduced the Benedictine rule, and made St Gall the most important abbey of Switzerland. He d. in prison after an unjust condemnation by an eccles. tribunal, after persecution

by 2 neighbouring counts. His feast is on 16 Nov.

Otho, Marcus Salvius (c. AD 31-69), Rom. emperor. In 58 he was sent by Nero to govern Lusitania, in order to separate him from his wife, Poppaea Sabina, whom Nero afterwards married. In 68 he supported Galba's rebellion against Nero, and when Galba became emperor accompanied him to Rome. He expected to be nominated as Galba's successor, but Galba preferred Plao, and O. formed a conspiracy. Galba and Plao were killed, and O. was proclaimed emperor on 15 Jan. 69. In Germany, however, Vitellius had been proclaimed likewise by his own troops; he marched on Italy and defeated O., who then killed himself (16 April 69).

Otho (Holy Rom. Emperors), see OTTO.

Otho, or Otto, of Freising (c. 1111-58), historian, son of Leopold, margrave of Austria. He was made bishop of Freising by his half-brother, Conrad III. His great work is a world hist., *Chronicon seu historia de duabus civitatibus*, in 7 books, coming down to 1146, which was continued by Blasius to 1210. He also wrote a hist. of the Emperor Frederick I. See C. Mierow, *The Two Cities* (Eng. trans. of Hofmeister's ed. of the *Chronicon*), 1928.

Othonna, genus of S. African trailing shrubs or herbaceous plants (family Compositae) with tuberous roots and yellow flowers. *O. capensis*, African ragwort, is a useful plant for hanging baskets or pots.

Othonnopsis, genus of shrubs (family Compositae), with decorative grey glaucous leaves and showy yellow flowers borne in late spring. *O. cheirifolia*, a low, evergreen shrub of N. Africa, is easily grown on a dry rocky or hot border, but needs protection in winter.

Othrys, or Heliovo, lofty mt range in S. Thessaly, Greece, shutting in the Thessalian plain on the S. It extends from Mt Tymphrestus, a summit of the Pindus Range (S.), E. through Phthiotis to the coast, separating the Peneus and the Spercheus. The summit Gerakovouni is about 5670 ft.

Othorrhynchus, genus of weevils or plant-eating beetles. Many cause great damage to cultivated crops, both in the larval and beetle states. They can be destroyed by spreading pieces of sacking near infested plants and collecting them during the daytime while they seek shelter.

Otis, James (1725-83), Amer. statesman, b. Barnstable co., Massachusetts. He was a prominent member of the Massachusetts House of Representatives, and is especially famous for his speech of 1761 in support of the liberty of the colonies with regard to taxation. He was one of the organisers of delegates to the Stamp Act Congress of 1765. He pub. in 1762 *Vindication of the Conduct of the House of Representatives of the Province of Massachusetts Bay*, in which he defended the Assembly for its rebuke of the governor for calling upon it to pay for protection against Fr. privateers which it had not sought, and *Rights of the British Colonies Asserted and Proved*, 1764, etc. See lives by W. Tudor, 1823;

F. Bowen, 1847; and F. W. Sprague, *Birthplace of the Patriot James Otis*, 1917.

Ottis Media, see E.A.R.

Otley, tn in the W. Riding of Yorks, England, 9½ m. NW. of Leeds, on the R. Wharfe. Near by is Farnley Hall, where Turner painted many of his pictures, and where there is a fine private collection of his works. There is a 17th-cent. grammar school, and the seat of the Fairfax family is at Denton Park near by. O. has an agric. trade and manufs. of leather goods and machinery, and in the vicinity are woollen and worsted mills. Pop. 11,330.

Otocyon, see Dog, *African Wild Dogs*.

Otoliths, or **Ear Stones**, are concretions, usually stony, which occur in the ears of fishes, and which are in contact with the sensory cushions supplied by the acoustic nerves. Their function is as an organ of balance, and they vary greatly in size, but are commonly minute. In the cod they are as big as the thumb-nail, and resemble porcelain in colour and texture. Frequently they are the only parts of a fish's anatomy which survive decay, and their variation affords a clue in many cases to species. Corresponding concretions occur in many invertebrates.

Otoml, Indian tribe of the Mexican plateau. They are probably a people of immense antiquity, dating from before the Toltec invasion, and were driven S. and partially subdued by the Aztecs or Nahuas. At the time of the conquest of Mexico they inhabited the mountainous dist. W. of the Mexican lakes. They number about 280,000, plus an equal number of mestizos, and are scattered through Guanajuato, Hidalgo, Querétaro, and Mexico states, N. and NW. of Mexico City.

Otranto (auct. Hydruntum), It. seaport in Apulia (q.v.), on the Strait of O. (q.v.), 22 m. SE. of Lecce (q.v.). In later Rom. times it succeeded Brundisium (see BRINDISI) as the chief It. port for Greece, and it retained its importance until its sack by the Turks in 1480. It has an archiepiscopal cathedral, and a ruined castle from which Horace Walpole (q.v.) took the title of his romance, *The Castle of Otranto*. There is a trade in fish and agric. produce. Pop. 3400.

Otranto, Strait of, strait, 45 m. wide, lying between the 'heel' of Italy and Albania, and joining the Adriatic Sea (q.v.) to the Ionian Sea (q.v.).

Otsago, lake in O. co., New York, U.S.A., 60 m. NW. of Albany. It is 8 m. long and 1 m. wide, and is the source of the Susquehanna R. It is the Glimmerglass of James Fenimore Cooper's tales.

Otsu, city of Shigaken, Japan, on Lake Biwa, 9 m. SE. of Kyoto. It was the auct. cap. and is now the seat of prefectural gov. Long noted for its silk and rayon manufs., it has also a large cotton industry, and produces sewing machines and engines. Pop. 107,000.

Ottava Rima, It. 8-line stanza of 10-syllable or 11-syllable lines used for chivalric romance and in mock-heroic poetry. There are other decasyllabic octaves, such as that used by Chaucer in *The Monk's Tale* and, later, by Spenser with or without that adoption of the

Alexandrine which converts it into the Spenserian stanza. The O. R. stanza with 6 heroic lines, rhyming alternately, followed by a couplet on a new rhyme (*abababcc*) was introduced into England by Sir Thomas Wyatt. The O. R. was used by many It. writers for romantic poems with a narrative basis and it was especially effective in mock-heroic verse (q.v.) as exemplified in that of Luigi Pulci, Ariosto, Francesco Berni (qq.v.), and others. It was occasionally used by Elizabethan poets, e.g. Drayton's heroic poem *Mortimeriados*, in rhyme-royal stanzas, and afterwards remodelled in O. R. as *The Barons' Wars*, 1603; but more often by translators such as Edward Fairfax, in his rendering of Tasso, and Sir John Harrington, in his version of Ariosto. It was also revived by translators in the 19th cent., e.g. by Wm. Tennant who, in 1812, pub. *Asiatic Fair*, a mock-heroic poem in O. R. full of fancy and humour; Wm. Stewart Rose in his trans. of *Orlando Furioso*, 1823-31; and John Hookham Frere (q.v.) in *The Monks and the Giants* and *Arthur and the Round Table*, purporting to be by Wm. and Robert Whistcraft. But its outstanding application to mock-heroic uses was by Byron, founding partly on Frere and partly on Ariosto and other Italians, and especially exemplified in *Don Juan*, *The Vision of Judgment*, and *Beppo*. It was also used for purely romantic poetry by Shelley in *The Witch of Atlas*, and Keats in *Isabella*; the latter showing the possibility of expressing tenderness and pathos in O. R. despite its inherently unsuitable structure for that purpose, while Shelley overcomes such difficulties by his unique gift of flowing melody. See Egerton Smith, *The Principles of English Metre*, 1923.

Ottaviano, It. tn in Campania (q.v.), 10 m. E. of Naples (q.v.). It is at the NE. foot of Vesuvius (q.v.), and has an auct. castle. Pop. 14,500.

Ottawa: 1. Episcopal city, port of entry, and cap. of the dominion of Canada, in Ontario, on the Riv. O., at its confluence with the Rideau, 101 m. W. of Montreal. O. is on both the Canadian National and Canadian Pacific main railway lines, and lies 220 m. NE. of Toronto and 110 m. W. of Montreal. It is a handsome city, picturesquely situated on a cluster of hills overlooking the O. Riv.; it is regularly laid out in rectangular blocks between the Chaudière and Rideau Falls, and is divided into two parts by the Rideau Canal. Much money has been spent in recent years in improving its parks, drive-ways, and general appearance. The chief buildings are the gov. buildings (1859-65) on Parliament Hill, the Rom. Catholic cathedral of Notre Dame, Christ Church Cathedral, Rideau Hall, the residence of the governor-general in the suburb of New Edinburgh, and the univ. The Gothic group of the Parliament Buildings dominates the city. Their central Peace Tower has a splendid carillon, and a noble memorial chamber to Canada's dead of the First World War. O. has a Ro. n. Catholic univ. (1849), normal school (primary teachers' training college), technical

school, collegiate institutes (senior high schools (q.v.)), public schools, free library, and a splendid park system. Besides its 2 cathedrals there are over 80 churches. It has fine residential districts. Here is held the ann. central Canada exhibition. The chief industry of the tn is lumbering. Thousands of men spend the winter in cutting down the timber, which is floated down to O. by the spring floods. The output of the O. lumber-mills is enormous. There are also manufs. of flour, iron goods, leather, and matches. The

National Film Board, Canada

OTTAWA: THE CHÂTEAU LAURIER HOTEL

In the foreground are locks of the Rideau Canal.

Chaudière Falls (200 ft wide and 50 ft high), on the O. Riv. between O. and Hull, supply splendid water power to drive the factories situated along the banks of the riv. Within 50 m. of O. are installed hydro-electric plants, to a capacity of 1,023,500 h.p. The city is the social and educational centre of Canada and contains many museums, galleries, and educational institutions. The site of O. was discovered in 1613 by Champlain, who named the riv. that joins the O. here the Rideau. The city's origins date back to 1826, when a tn grew up around the H.Q. of the Brit. Army engineers who were building the Rideau Canal, which, with the chain of Rideau Lakes further S., affords navigation for small craft to Lake Ontario at Kingston, 90 m. S. The commanding officer of the engineers was Col. By, and

the settlement was first called Bytown. The tn was incorporated in 1854 and the name changed to Ottawa, after the great riv. on its N. side. In 1858 Queen Victoria chose it to be the cap. of Canada, at that time comprising only what are now the provs. of Quebec and Ontario. In 1867, on confederation, it was made the cap. of the dominion. It returns 2 members to the dominion House of Commons and 3 to the Ontario Legislature. Pop. 208,911, O. being the sixth city in size in Canada, following after Montreal, Toronto, Vancouver, Winnipeg, and Hamilton.

2. City, co. seat of La Salle co., Illinois, U.S.A., on Illinois and Fox Rs. and Illinois Waterway, 40 m. SW. of Aurora, in a grain-growing, dairying, and coal-mining area. O. manufs. glass, clay products, radium dials, etc. Starved Rock State Park is near by. Pop. 17,000.

3. One of the largest rivs. of Canada, rises in lat. 48° 30' N., long. 76° W., on the watershed on the opposite side of which rise the St Maurice and Saguenay. After a course of over 700 m. it falls into the St Lawrence by 2 mouths, which form the is. of Montreal, and its drainage area measures about 80,000 sq. m. During its course it widens into numerous lakes of considerable size, and is fed by many important tribs. The O. is connected with Lake Ontario at Kingston by the Rideau Canal. An immense lumber trade is done on the riv.

Ottawa, tribe of N. Amer. Indians, of Algonquian stock, whose original home was on the upper O. Riv. They fought many wars with Eng. and Amer. colonists during the 18th and 19th cents. One of their chiefs was the famous Pontiac (q.v.). To-day they number under 2000, mostly in Michigan.

Ottawa Conference, Imperial economic conference of the Brit. Commonwealth of Nations, held at Ottawa in July 1932. A series of trade agreements were concluded between the U.K. Gov. and the govts. of the dominions, the general principle being to grant free entry for dominion imports into the U.K. market in consideration of preferences for U.K. exports in dominion markets. These agreements were for a period of 5 years ending July 1937, but were to continue unless either party gave 6 months' notice of termination. The O. C. tried to dovetail the new protectionist policy of Great Britain into the long-standing protectionist policies of the dominions. Great Britain and the dominions assumed reciprocal obligations, both of a general and a detailed character, to give preferential treatment to each other's commerce. Foreign critics, like Brit. free traders, suggested that the Ottawa treaties were a violation of Great Britain's international obligations and an unprovoked attack on the livelihood of neighbours. Though some of the colonies, especially the rubber- and tea-producing colonies like Ceylon and Malaya, would have preferred the continuance of the free-trade system, others, like the W. Indies and Mauritius, wanted a sheltered market for their basic

products. The Ottawa programme has long been obsolescent, if not obsolete, for in the course of the immediately succeeding years agreements were made which considerably modified the treaties or agreements made as a result of the conference. It soon became evident that the empire market could not attempt to give complete shelter to all producers in the empire. Foreign nations, moreover, retaliated where they were penalised in dominion markets so as greatly to damage some leading dominion export industries, notably Australian wool, although Australian dairy produce, lamb, fruit, and wine exporters were able to ignore overseas reactions, having secured a privileged position they had won in the Brit. market. Hence Australia moved gradually away from the doctrine of Ottawa and towards that of the world market. A corresponding movement in Great Britain has acquired comparable momentum.

In 1938 the U.K. and Australian Govs., by way of prelude to their new treaties with America, issued a joint statement proclaiming that the imperial market was not large enough to satisfy the productive energies of their peoples. They again alleged their vital interest in the system of imperial preferences, but qualified this by insistence on an even greater interest in the worldwide movements of trade, shipping, and capital. Canada, too, saw opportunities of expanding trade through an economic *rapprochement* with the U.S.A., and in 1938 both the Canadian and U.K. Govs. signed agreements with the U.S. Gov., by which time all the sovereign govts. of the empire were ready to sacrifice substantial preferences for the sake of a revival in world trade. The Atlantic Charter (1941), Mutual Aid Agreement (1942), Hot Springs Conference Resolutions (1943), and the General Agreement on Tariffs and Trade Conferences at Geneva, Havana, Annecy, and Torquay (1947-51) henceforth thrust the advocates of imperial preference on the defensive until Mr J. Diefenbaker's (q.v.) advent to power in Canada in 1957. See DUMPING; FREE TRADE; GENERAL AGREEMENT ON TARIFFS AND TRADE; IMPERIAL PREFERENCE; PROTECTION; TARIFFS. See text of the (anti-Ottawa) resignation letter of the 10 Brit. Free Trade Ministers, 28 Sept. 1932; J. B. Condliffe, *Reconstruction of World Trade*, 1940, and *Commerce of Nations*, 1950; F. C. Benham, *Great Britain under Protection*, 1941; D. Abel, *A History of British Tariffs, 1923-1942*, 1945; R. S. Russell, *Imperial Preference*, 1947.

Otter (*Lutra lutra*), most adaptable member of the weasel tribe, able to climb, swim, and run for a short distance as fast as a fox. O.s vary in size and weight; the average adult's head and body are about 2½ ft. and the tail 1½ ft. long. The skull, with its small facial space, bears a considerable resemblance to that of a seal, and the neck is large, so that the head appears to be directly attached to the body. The tail is long, tapering, and flattened, the limbs are short and the toes webbed. The fur is perfectly suited to

the O.'s amphibious life; it consists of long, close, glistening hairs, with a short, fine underfur. O.s appear to breed only once a year, but cubs have been found in every month, though from mid winter to May is probably the usual littering time. The female makes a nest in a hollow in a riv. bank, and the cubs remain with her for the greater part of their first year. The dog O. is polygamous, and wanders great distances, travelling by night and lying in holes during the day. O.s appear to have a periodic desire for salt water, and frequently descend to estuaries and the sea coast, where they live on rock fish, molluscs, and crustaceans. In fresh water, eels and frogs, as well as a few birds and mammals, form the prin. food. O. hunting is the only form of chase with a pack of hounds hunting the scent that is pursued from May to Aug. There are over 20 estab. packs of otterhounds in Britain. See *Encyclopaedia of Sport* and R. Colville, *Beagling and Otter-hunting*, 1930.

Otterburn, vil. of Northumberland, England, on the R. Rede, 23 m. from Hexham. About ½ m. distant is the site of Chevy Chase battle, fought between the English and the Scots (1388), in which Hotspur was defeated by the Earl of Douglas. Pop. 360.

Otterhound, descendant, like other hounds, of the old S. hound, and long bred in a few dists. for the very exacting sport of otter hunting, in which it is unrivalled. It is exceedingly sagacious, and has much of the fine qualities and powers of the bloodhound and foxhound, while it is essentially a water dog, capable of great endurance. The rugged head is somewhat between those of the 2 hounds mentioned; eyes large and deep-set, showing the haw; ears long and sweeping, set low and lying close, not feathered down to the tips; and nose large with expanding nostrils. The neck is rather long and muscular, with a loose folded dewlap, the back is wide and arched, the shoulders sloping, and the chest is deep but not wide. The feet are large and spreading, with firm pads and strong nails. The stern is carried gaily when the hound is at work, and is thick and well covered, affording assistance in steering in the water. The coat is abundant, long, and close at the roots, and hard, wiry, and waterproof. The colour may be grey, buff, yellowish, black, or rufous-red mixed with black or grey. The average height is about 23 in.

Ottery St Mary, mrkt tn and urb. dist. of Devon, England, 12 m. E. of Exeter, on the R. Otter. The vale of Otter is noted for its beautiful scenery and trout fishing. The par. church of St Mary is one of the finest in England. Its hist. may be traced back to 1061 and a Norman font has been discovered. In the 14th cent. Bishop Grandison rebuilt much of the 13th-cent. structure, transforming it into a collegiate church, which status it held until the Reformation. The building bears striking similarities to Exeter cathedral, on which Grandison also worked. The dist. contains good examples of Elizabethan architecture at Cadhay and

Knighthood. Escot Grange was the 'Fair-oaks' of Thackeray's *Pendennis*. Coleridge was b. in O. St M. The ann. carnival, said to have originated in 1688, is held on 5 Nov. Pop. 4000.

Otto I, or Otto the Great (912-73), Holy Rom. Emperor, son of Henry the Fowler, at whose death in 936 he was crowned King of the Germans at Aix-la-Chapelle. He stopped the progress westwards of the Magyars and Wends, made Bohemia, Denmark, and Poland his tributaries, and estab. a great empire throughout central Europe. His great victory against the Magyars (955) was especially outstanding. In 961 he invaded Italy for the second time and was crowned emperor of the W. (962) for the second time. See K. Hampe, *Otto der Grosse*, 1923; R. Holtzman, *Kaiser Otto*, 1936; M. Lintzel, *Die Kaiserpolitik Ottos*, 1943.

Otto II, or Rufus (955-83), Holy Rom. Emperor, son of O. I and Adelaide of Italy. He had been crowned joint emperor in 967. On the death of his father in 973 he was forced to fight for his crown against his cousin, Henry of Bavaria, whom he defeated and sent into exile. He then invaded France and succeeded in laying waste Champagne, but was defeated at the Aisne, and eventually lost Lorraine. He subsequently had to deal with a revolt in Rome and a Gk attack in S. Italy.

Otto III, or Otto (980-1002), Holy Rom. Emperor, son of O. II and Theophano, daughter of the Gk emperor. He succeeded to the throne as a child of 3 in 983, and during his minority great power was obtained by Crescentius whom he later put to death (998). In 996 O. was crowned emperor by Pope Gregory V, his relative. His anti-Ger. feelings are shown in his support for the Poles and Hungarians; he was eventually driven from Rome by a rebellion.

Otto IV (c. 1171-1218), Holy Rom. Emperor, son of Henry the Lion, Duke of Bavaria, and Matilda of England. He spent some time at the court of Richard I of England, and assisted him in his wars with Philip Augustus. In 1197, on the death of the Emperor Henry VI, O. became the Guelph candidate for the throne in opposition to Philip of Swabia, supported by the Ghibellines. After a long struggle Philip was victorious, but he was assassinated in 1208 and O. was crowned emperor in 1209. He at once became involved in a conflict with Pope Innocent III, and was excommunicated and deposed (1212). Frederick II being elected emperor in his place. In 1214 he was utterly defeated at Bouvines by the Pope's ally, Philip Augustus.

Otto I (1815-67), King of Greece, a son of the King of Bavaria. He was invited to become King of Greece, 1833. His rule was never very stable: a revolution in 1843 resulted in the granting by O. of a constitution, but in 1862 a further revolution led to his abdication, and he went into exile in Bavaria, where he d.

Otto, Nicholas, see GAS ENGINES.

Otto of Roses, see ATTAR OF ROSES.

Otto the Great, see OTTO I.

Ottoman Bank, prin. foreign bank in Turkey. It was estab. in 1863 as the Imperial O. B. (an Anglo-Fr. institution) by imperial firman under a concession from the Turkish Gov. The title was altered to O. B. in 1925. It has a branch in every important tn in Turkey. The chief offices are in Istanbul, London, and Paris. The O. B.'s agreement with the Turkish Gov., which was extended in 1925, 1933, and again in 1952, expires in 1975.

Ottoman Empire, see TURKEY.

Ottrelite, blackish- or greenish-grey mineral, occurring in shining oblong plates more or less hexagonal, in argillaceous schist. It belongs to the chloritoid group, and is probably monoclinic.

Ottumwa, city, cap. of Wapello co., Iowa, U.S.A., rail centre on Des Moines R. with hydro-electric plant in agric. and coal-mining area, 75 m. ESE. of Des Moines. It has meat-packing plants, foundries, and iron works and manuf. farm and mining machinery, tools, and mill-work. Pop. 33,600.

Otus, see ALLOIDAE.

Otway, Thomas (1652-85), dramatist, b. Trotton, Sussex. He was educ. at Winchester and Christ Church, Oxford, and afterwards went on the stage. He was unsuccessful as an actor, but used his theatrical experience in writing plays. His tragedy, *Alcibiades*, was produced in 1675 with Mrs Betterton and Mrs Barry in the cast, and *Don Carlos* followed in 1676. *Titus and Berenice*, a tragedy adapted from Racine, and *The Cheats of Scapin*, a farce from Molière, were acted on the same night in 1677, and *Friendship in Fashion* appeared in 1678. But O. is best remembered for *The Orphan*, 1680, and *Venice Preserved*, 1682, both of which have been frequently revived. He excelled in depicting the stronger passions, and has been called 'the most pathetic and tear-drawing of our dramatists.' But his plays brought him little money; his short life was marked by poverty and misery, and he is said to have d. of starvation at an inn. His works were ed. by T. Thornton in 1813, with a life. See his life by Dr Johnson; also R. G. Ham, *Otway and Lee*, 1931.

Otztal, valley in the prov. of Tirol, Austria, through which the Ötz flows N. from the Ötztal Alps (Wildspitze, 12,470 ft) to join the Inn. It is known for its scenic beauty.

Ouachita, or Washita, riv. rising in W. Arkansas, U.S.A., connected with the Mississippi by the Tensas series of bayous. It flows E., SE., and S. through Louisiana into the Red R., 35 m. NW. of the latter's confluence with the Mississippi. Length about 605 m., navigable to Arkadelphia, Arkansas.

Oudenaarde (Fr. Audenarde), tn in the prov. of E. Flanders, Belgium, on the R. Scheldt, 15 m. SW. of Ghent. Its tn hall dates from the 16th cent. Once noted for its tapestries, it now manufs. linen and cotton, and has tanneries. Marlborough here defeated the French under the dukes of Burgundy and Vendôme (1708). Pop. 6600.

than when the opposite conditions obtain. Mobile troops, acting in conjunction with air units, are able to obtain information at comparatively great distances from the O., and give them timely warning on such important points as strength and direction of the enemy's march. In their turn they must ensure that their own position is not observable from the air or by enemy telescopes. The body detailed for outpost duty moves forward covered by a screen of scouts. Behind this screen the outpost commander chooses his line, and decides on the positions for the various portions of his force. Patrols are also sent out to observe special points and ground not in view from the outpost but near enough to it to be of value to the enemy. Persons passing through the outpost line are challenged, and the outpost commander is given definite orders as to the disposal of the various kinds of individuals who may endeavour to pass.

Outram, Sir James (1803-63), soldier, b. Derbyshire. He entered the Indian Army in 1819, and soon acquired an excellent reputation not only as a soldier but also as a political agent. In 1842 he was described by Sir Charles Napier as 'the Bayard of India.' He rendered valuable service in the first Sikh war, and from 1847 to 1851 was resident at Baroda, and from 1855 in Oudh. He went with Havelock to the relief of Lucknow, and commanded the garrison there during the second siege. He was created baronet in 1858, and appointed military member of Lord Canning's council. He pub. sev. books on India. See lives by Sir F. J. Goldsmid, 1880, and L. J. Trotter, 1903.

Outward Bound Trust, formed in 1946 to take over the first O. B. school. The sea school at Aberdovey founded in 1941, and to establish further schools which would enable the trust to train 5000 boys each year. The idea of the O. B. organisation was conceived by Kurt Hahn (then headmaster of Gordonstoun) and Lawrence Holt (of the Blue Funnel Line) who together estab. the original sea school. Schools are intended to be residential, to provide courses of 26 days' duration for boys of 15-19, and to 'give boys from all walks of life an opportunity of training through the sea, mountains, or other natural elements, as a means of developing their own capacity to face hazards, difficulties, hardship, and emergencies of all kinds.' Schools are based on Christian principles but without political or sectarian bias. Three further schools have now been estab., a mt school at Eskdale, Cumberland, another sea school at Burghhead on the Moray Firth, and a second mt school at Watermilllock, Ullswater. In 1951 the trust decided to adapt its training for girls, and sev. special courses have been held in collaboration with the Central Council of Physical Recreation. It is hoped to run 3 schemes for girls annually, each lasting 26 days and open to girls aged 16-19. The London H.Q. of the O. B. T. are at 123 Victoria Street, S.W.1.

Ouverture, Pierre Dominique Toussaint

L., see TOUSSAINT.

Ouvrandra, see APONOGETON.

Ouzel, or Ousel, see BLACKBIRD; DIPPER; RING OUSEL.

Ovalle, tn. of N. Chile, named after a former president, 60 m. S. of Coquimbo. It is the centre of a fruit-growing and mining dist., watered by the Limari R., and wool is also grown. There are thermal springs in the vicinity. Pop. 32,650.

Ovals. *Cartesian Ovals*, elaborated by Descartes; the locus of a point so moving that the sum or difference of given multiples of its distances from 2 fixed points remains constant. Its equation is expressed in the form $r_1 \pm \mu r_2 = a$. The ellipse and hyperbola belong to the family since if $\mu = \pm 1$, $r_1 \mp r_2 = a$, which is a well-known property of the ellipse and hyperbola, the former if the + sign is taken and the latter if the - sign is used.

Cassini's Ovals, the locus of a point so moving that the product of its distances from 2 fixed points is constant, or $r_1 r_2 = c^2$. In the figure these points are indicated by H and S and if $HC = SC = c = a$ the oval becomes a lemniscate the polar equation of which is $r^2 = 2a^2 \cos 2\theta$. The inner curve represents a Cartesian oval and the outer curve a Cartesian oval.

Ovambo, one of the prin. native races of SW. Africa. They are a Bantu race, engaged in agriculture. They still have an unimpaired tribal organisation. They came into SW. Africa at a later date than the Hottentots (12th cent.), but before the Hereros, and made their home in the N. of Hereroland. Every O. tribe has its special organisation and particular customs. In physical appearance and growth of hair the O.s resemble the Hereros, but a thickset build predominates, whereas the Hereros are often tall. Many O.s, like the Hereros, in former times bore a tribal token on their eye-teeth, and their pleasures were raiding and protracted expeditions in the uninhabited parts of the tribal ter. Their chief food is a porridge of Kaffir-corn and millet, milk, meat, beans, melons, and ground-nuts. They make plates, bowls, and baskets, both ornamental and useful. Their numbers approximate to 120,000. Ovamboland, even under Ger. rule, was left to the operation of its own tribal organisation, and it represents to-day the one area in SW. Africa in which the organisation can be utilised by the administration as an organ of gov. Its area is about 16,000 sq. m. See H. Vedder, *South-West Africa in Early Times* (trans. by C. G. Hall), 1938. See also HERERO.

Ovar, tn of Portugal, in Aveiro dist., on the Aveiro lagoon, 15 m. N. of Aveiro (q.v.). It has sardine fisheries, and paper and hardware manufs. Pop. 7000.

Ovariectomy, or **Ovarietomy**, in surgery the removal of the uterine appendages, e.g. the ovaries and the Fallopian tubes. It was first performed by M'Dowell of Kentucky in 1809, and by Charles Clay of Manchester in England in 1842. In 400 cases which the latter dealt with, the mortality was over 25 per cent; but this major operation, once regarded as one of the gravest in the sphere of surgery, is now associated with a lower mortality than any other.

Ovary forms, together with the tubular appendages, the female reproductive system. There is one on each side of the uterus, which is placed in the centre of the pelvic cavity. Each is contained in a fold of peritoneum known as the broad ligament, and connected to the uterus by the Fallopian (uterine) tube. Each O. contains groups of germinal cells, known as Graafian follicles, and in the centre of each of these is a primitive ovum. It has been estimated that there are 30,000 such ova in the O., and these follicles are all connected by and embedded in tissue known as the stroma of the O. The Graafian follicles are contained in the superficial or cortical portion, while the deep or medullary portion is highly vascular, and is reddish in colour. The O. is oval and is about $1\frac{1}{2}$ in. long and $\frac{1}{2}$ in. thick. Ovulation, or rupture of the wall of the Graafian follicle, occurs in the majority of women midway between 2 menstrual periods, and so an ovum is liberated and passes by way of the Fallopian tubes into the uterus. If it has been fertilised, it then further develops, as explained under BIOLOGY and EMBRYOLOGY, while if not it is thence extruded. The O. produces the female sex hormone oestrone; another hormone, progesterone, is formed in the corpora lutea which develop from the ruptured Graafian follicles. See ANATOMY; BIOLOGY; EMBRYOLOGY.

In plants the O. is that part of the pistil which contains the ovule, and from which the fruit will later be formed. See BOTANY; FERTILISATION; FLOWER; FRUIT; SEED.

Ovary (in botany), see FLOWER; FRUIT; FERTILISATION.

Ovation, lesser triumph (q.v.) awarded to a Rom. *imperator* who had achieved minor success or success in a minor war. The Senate did not head the procession; the general entered on foot or horseback instead of in a chariot; he was clad in the *toga praetexta*, or ordinary magistrate's robe, instead of the *tunica palmata* and *toga picta*, and was crowned with myrtle instead of laurel. A sheep was sacrificed instead of an ox, hence the term (*ovis*, sheep).

Oven. The oldest types of O. are arched in shape, and built of stone or brick, and are heated by burning a wood fire within them. When the walls are thoroughly hot, the fire is raked out and the material to be baked inserted on a long narrow

wooden shovel called a peel. The baker's O. commonly in use is an improvement upon this type. Thus the fire is confined to a separate fire-place, either opening into the O., fixed within it, or so arranged that it can be moved about it, so ensuring equable heating. Tile or stone is mostly used for the bottom, or sole, of the O., and a draw-plate, or movable false bottom, is substituted for the peel. Coke or anthracite is often used as fuel. O.s for more general use are best made of iron, and are usually heated externally by flues, regulated by dampers, which convey the heat from a fire. For domestic use O.s are heated by superheated steam, by gas, or by electricity, coal, etc., and contain iron shelves which may be moved up or down to regulate the amount of heat which reaches the article to be cooked. Special O.s are made for biscuits and confectionery, containing revolving bands on which the material is baked. The temp. may be gauged by a pyrometer.

Oven-bird, popular name for a family, Furnariidae, of S. Amer. passerine birds. It is so called on account of its wonderful oven-like nest, which is a massive structure, weighing often about 8 lb., and placed on the bough of a tree. It is composed of mud and pieces of sticks and straw and animal hairs. The white eggs are laid upon a bed of soft dry grass in a large chamber which is reached through an antechamber. The birds are monogamous, and share the duties of incubation. Darwin, in his *Naturalist's Voyage* 1845, gives an interesting description of 2 species, both of a reddish tint of plumage. One, *Furnarius cunicularius*, builds its nest at the bottom of a narrow cylindrical hole.

Oven, anc. bor. of Cheshire, England, now a ward of the urb. dist. of Winstond (q.v.). St Chad's church, restored in 1534 and in 1870, dates back to the 12th cent., and is probably built on the site of an even earlier church. The right of holding a cattle fair was granted by Edward I.

Overbeck, Johann Friedrich (1789-1869), Ger. painter, b. Lübeck. At Rome, with others, he formed in 1810 the Pre-Raphaelite brotherhood known as the Nazarenes, the object of which was to revive Ger. art on a purely religious basis. He was the leader of the revival of Rom. Catholic art, intensely idealistic but not a great painter. Among his best works were the frescoes at Berlin dealing with the life of Joseph; the 'Vision of St Francis,' at Assisi; 'Jerusalem Delivered,' at Rome; 'Christ in the Garden,' at Hamburg, etc. See studies by H. Atkinson, 1882; W. Howitt, 1886; K. G. Heise, *Overbeck und sein Kreis*, 1928.

Overburden, see MINING.

Overbury, Sir Thomas (1581-1613), poet and courtier, b. Warwicks, was educ. at Oxford and the Middle Temple. In 1601 he met Robert Carr at Edinburgh, and went with him to court. In 1608 he was knighted and became the king's sorvitor-in-ordinary and in 1609 travelled in the Netherlands. He had been involved in the intrigues of Carr (then Viscount Rochester) with Frances, Lady

Essex, but opposed Rochester's design to obtain Lady Essex's divorce and marry her. He thus gained the lady's enmity, and in 1613 was sent to the Tower on a trivial pretext, and there was apparently slowly poisoned by her agents. An inquiry was held in 1615, and 4 of the conspirators were hanged. Rochester (then Somerset) and Lady Essex, who were then married, were pardoned. See E. A. Parry, *The Overbury Mystery*, 1925; W. McElwee, *The Murder of Sir Thomas Overbury*, 1952.

Overcrowding, Abatement of. The Sanitary Act, 1866, dealt with the subject of O., and it has been dealt with in all subsequent legislation on housing. The Housing Act, 1935, which was sponsored by the minister of health (Sir Kingsley Wood), introduced new measures for the abatement of O. and the fixing of a national standard of accommodation. The Housing Acts, 1936, 1957, Part IV, re-enacted these provisions. The minister of health remains the central authority for O.

O. is defined in the Housing Act, 1936, by reference to either the number of persons sleeping in the same room or the number of persons in relation to the number and floor area of the rooms. A dwelling-house is deemed to be overcrowded at any time when the number of persons sleeping in the house either (a) is such that any 2 of those persons, being persons 10 years old or more of opposite sexes and not being persons living together as husband and wife, must sleep in the same room; or (b) is, in relation to the number and floor area of the rooms in which the house consists, in excess of the permitted number of persons as defined in the Sixth Schedule to this Act. In determining the number of persons sleeping in a house, no account shall be taken of a child under 1 year old, and a child who had attained 1 year and is under 10 years old shall be reckoned as one-half of a unit.

Number of persons permitted to use a house for sleeping. For the purpose of this Act the expression 'the permitted number of persons' means, in relation to any dwelling-house, either (a) the number specified in the second column of Table I in relation to a house consisting of the number of rooms of which that house consists; or (b) the aggregate for all the rooms in the house obtained by reckoning, for each room therein of the floor area specified in the first column of Table II, the number specified in the second column of that table in relation to that area; whichever is the less. For the purposes of Table I, no regard is had to any room having a floor area of less than 50 sq. ft.

Table I

No. of Rooms	No. of Persons
1	2
2	3
3	5
4	7½
5 or more	10

with an additional 2 in respect of each room, in excess of 5.

Table II

Floor Area of Room	No. of Persons
110 sq. ft. or more	2
90 sq. ft. or more, but less than 110 sq. ft.	1½
70 sq. ft. or more, but less than 90 sq. ft.	1
50 sq. ft. or more, but less than 70 sq. ft.	½
under 50 sq. ft.	nil

The standard of O. may be relaxed by the minister only where a large proportion of the housing accommodation in the area is constituted by dwelling-houses consisting of few rooms or rooms of exceptional floor area, and then only after consultation with the Central Advisory Committee. The local authority may also relax the standard by licence, but only owing to the existence of exceptional circumstances, including seasonal increases of pop., e.g. influx of visitors at holiday times. In any event there is a time limit on relaxations. Both the landlord and the occupier are made responsible for O. and there are statutory defences available, e.g. if alternative accommodation was offered and refused. The steps to be taken by the local authority with regard to O. are by way of inspection and report, followed by proposals for new accommodation, and the dates when these steps have to be completed are fixed by the minister. If the result of the inspection is such as to call for a *redevelopment scheme*, the local authority will have to pass a resolution to that effect and within 6 months prepare a redevelopment plan for submission to the minister (see CLEARANCE AND REDEVELOPMENT). As from the expiration of 6 months from the appointed day, the local authority, on the application of the landlord or occupier, must state the number of persons permitted, and make an entry thereof in the rent book.

Information as to the rights and duties in respect of O. may be published by the local authority. A landlord must inform the local authority of any case of O. in his houses within 7 days after the fact first comes to his knowledge. See also HOUSING and OVERFILL.

Over-current, electric current exceeding the maximum for which the circuit is designed causing O. relays to open circuit-breakers, switch-off motors, and generally activating protection devices. It may result from overload, short circuit, or switching operations.

Overhead Charges, also described as 'indirect expenses,' 'establishment charges,' 'oncost,' 'burden,' are those business expenses, such as rent, management salaries, bookkeeping, accountancy, and interest on loans, which cannot be directly arrived at in a particular piece of work and are usually provided for by a sufficient amount being added to the other charges to maintain the required profit. Different expenses in business fall under the description of O. C. or direct charges, according to the methods of the firm and the nature of the work; e.g. the wages of a man in the

factory are a direct charge on the work done, while the wages of a man in the warehouse may be a charge on the business as a whole. See W. A. Lewis, *Overhead Costs*, 1949.

Overijse, tn in the prov. of Brabant, Belgium, 10 m. SE. of Brussels. There are about 11 000 hothouses on the ter. of this com., which is famous for its cultivation of grapes. Early tomatoes, strawberries, peaches, and roses are also raised here. Pop. 11,000.

Overijssel, or **Overysel**, prov. in the NE. of the Netherlands, extending from the IJsselmeer to the Ger. frontier. The land consists largely of sandy flats, covered with waste stretches of heath and fen, but there is some fertile pasture ground along the shores of the IJsselmeer, where cattle-rearing and cheese- and butter-making are the chief industries. Reclamation in the E. has added to the fertile soil (see also **NORTH-EAST FOLDBER**). Cotton-spinning is carried on in the dist. of Twente, and fishing in the ports of the IJsselmeer. The prin. tns of the prov. are Zwolle (cap.), Enschede, and Hengelo. Area 1295 sq. m.; pop. (1954) 718,430.

Overland, Arnulf (1889-), Norwegian lyric poet, b. Kristiansund. He has used his poetry as a weapon, crying out against social injustice in such poems as *Brød og vin* (Bread and Wine), 1919. He made a creed of Socialism and scorned Christianity, in *Ordt alvor til det norske folk* (Words in Earnest to the Norwegian People), 1940. He challenged Hitlerism in his poems in *Den røde front* (The Red Front), 1937, and when the Germans invaded Norway he estab. the pattern of Norwegian resistance with his powerful poems, later collected under the title of *Vi overlever alt* (We shall live through All), 1945. His poems combine a masterly form with a profound love of truth and justice. He was put in a concentration camp as a result of these poems, but was liberated in 1945. His *Samlede Dikt* were pub. in 2 vols. in 1947.

Overlord, **Operation**, code name given to the allied invasion of Ger.-occupied Europe, mounted across the Channel. See **WESTERN FRONT IN SECOND WORLD WAR**.

Over-Seas League, founded by Sir Evelyn Wrench and incorporated by royal charter in 1910, with world H.Q. at Over-Seas House, St James's, London, and branches and representatives all over the world. It is open to membership by election, and on payment of the appropriate subscription, to Brit. subjects and Commonwealth citizens irrespective of party, colour, or creed. The O. L., with a membership, at the end of 1956, of over 53,000, seeks by means of cultural activities and social amenities to increase mutual knowledge and understanding between members of the various parts of the Commonwealth. To this end branches with club facilities are estab. in Great Britain at Edinburgh, Glasgow, Belfast, Nottingham, Cardiff, and Torquay; in Australia at Sydney, Hobart, Melbourne, Adelaide, Perth, and Brisbane; in New Zealand at Wellington,

Auckland, and Christchurch; in Canada at Toronto; and in Malta at Valetta. In many other places in the U.K. and overseas there are active branches without premises. Membership of the League carries entitlement to amenities everywhere. A magazine, *Overseas*, is pub. every other month and received by all members.

Overseas Territories, those forming part of the Commonwealth outside the fully independent and the self-governing tera. They formerly comprised mostly Crown Colonies, i.e. those in which the Crown retained the control of the Executive, but now, by common usage, signify those with elected assemblies, and sometimes with no elected, but with nominated, members in their legislatures. They may be (1) 'pure', where the whole legislature is nominated, or (2) semi-representative, where part of it is chosen by election; thus invariably an official majority exists, although traditionally in most cases the Crown not only retains the right of veto on local legislation, but also the power to legislate directly by Order in Council.

The term Crown Colony was not in general use until the 1840's. It was the antithesis to the old colonial system of representative gov., and in its earliest use the term meant those conquered or ceded colonies in which the Crown retained, consciously, full authority. It was to provide for the gov. of Senegambia and of Quebec that the Crown Colony came into operation; the old representative system was impracticable or unsuitable because in the one an African pop. was incapable of assimilating itself to that system, and in the other there was an alien Fr. pop. Trinidad, when taken by Abercromby, was largely inhabited by Sp. people, who could hardly be expected to reconcile themselves to the abrogation of Sp. law or institutions. Later, however, the term Crown Colony became used for other colonies, whether conquered or settled. In the latter category, if the colony was settled by Brit. immigrants, these were generally supposed to take Eng. law and institutions with them (see **COLONIAL LAW**). Later still the term came to include a class of settled colony, under the authority of the Crown, in its pre-representative stage, e.g. New S. Wales in its early settlement period. It also came to embrace settled colonies in the tropics in which representative gov. was considered impracticable, e.g. Sierra Leone; the W. Indian colonies upon their abandonment of the old representative system, e.g. Jamaica by its own initiative in 1866 after the Negro insurrections and the general upheaval following emancipation; the conquered tropical African colonies of the late 19th cent.; and the colonial protectorates (q.v.). By this time the criterion of the Crown Colony, which originally sprang from the classic distinction between conquered and settled colonies, came to be founded on the distinction between self-governing colonies and non-self-governing colonies.

Brit. declared colonial policy to-day is

to guide ters. towards responsible self-gov. within the Commonwealth. To that end considerable attention is being given to social and economic reconstruction, education in its widest sense, and the development of responsibility in local gov., upon which political advancement depends. New constitutions have been introduced in many colonies, and major constitutional reforms have been inaugurated; there are very few ters. where there have not been constitutional changes since the close of the Second World War. The field for political advancement is greatest in Africa, and so far-reaching are the changes in some cases that the term Crown Colony has become a misnomer; e.g. the Gold Coast was granted independence and membership of the Commonwealth in 1957 under the name of Ghana. Nigeria has become a Federation with responsible govs. at the centre and in the regions, some of which have early expectation of achieving a restricted measure of internal self-gov. The Central African Federation, embracing the ters. of S. Rhodesia, N. Rhodesia, and Nyasaland, was estab. in 1953. A less restrictive and wider qualitative franchise now exists in Kenya. In Tanganyika an enlarged Legislative Council, with membership divided equally between the 3 main racial groups of the ter., European, Asian, and African, came into being in 1955. In Uganda a new ministerial system at the centre was inaugurated in 1955, together with a more widely representative Legislative Council in which African members (who sit on both the gov. and representative sides of the House) numbered 30 out of a total of 60. In the W. Indies the Caribbean Federation (q.v.) was estab. in 1958. See also COLONIAL DEVELOPMENT AND WELFARE; also COLONY; and COLONIAL TRUSTEESHIP.

See E. Jenks, *The Government of the British Empire*, 1937; Margery Perham, *Native Administration in Nigeria*, 1937; H. L. Hall, *The Colonial Office: a History*, 1937; Sir C. J. Jeffries, *The Colonial Empire and its Civil Service*, 1938; E. Barker, *Ideas and Ideals of the British Empire*, 1941; E. Walker, *Colonies*, 1944; P. T. Bauer and B. S. Yamey, *The Economics of Underdeveloped Countries*, 1957; Lord Hailey, *An African Survey* (revised 1956), 1957.

Overseas Trade, Department of, former joint dept of the Foreign Office and the Board of Trade, comprising the former Dept of Commercial Intelligence of the Board of Trade and part of the Foreign Trade Dept of the Foreign Office. It was formed in 1917 to promote and develop overseas trade, and later took over Foreign Office duties connected with commercial intelligence and with the commercial diplomatic and consular services. Since the Second World War it has been absorbed in the Board of Trade (q.v.).

Overseer, parochial official charged with the supervision of the poor in England and Wales. The office was estab. in 1601 and abolished in 1927. The O. formulated

and levied poor-rates, and prepared valuation, jury, and voters' lists.

Overspill may be said to mean the movement of persons and employment from congested and overgrown cities and tns to places at some distance capable of development and expansion as more or less self-contained communities. The term is comparatively recent in its application to housing, and O. is virtually the result of the Second World War. The Town and Country Planning Act, 1944, dealt mainly with 3 problems: 'blitz', 'blight', and 'overspill'.

Subsequent to the First World War, sev. of the larger local authorities adopted schemes of O. under the Housing Act, 1925. Thus the London Co. Council built a number of satellites at distances up to 10 miles, as at Dagenham in Essex; and as Manchester City Council did at Wythenshawe; and Liverpool City Council at Speke. In the two last instances the areas have since been incorporated in their respective cities. Liverpool is now building at Kirkby, which adjoins the city but remains in the area of the Lancs. Co. Council. This method still remains available to the local housing authorities. *New Towns* (q.v.) set up under the New Towns Acts, 1946-56, have been provided in 15 centres principally to deal with the problem of decentralisation or O. for the relief of Greater London.

Town Development Act, 1952. The purpose of this Act is to promote orderly and friendly arrangements between local authorities when steps are taken to decant O. pop. from one area to another. Accommodation for industrial and other activities should be included in the development for which provision is made, and also all appropriate public services, facilities for public worship, recreation, and other amenities. The Act represents an attempt to find a solution to this difficult problem within the framework of local gov. It affords an opportunity for local authorities to show their willingness and ability to co-operate in working out practical schemes for their mutual benefit. There are undoubtedly many small tns which could, with advantage, be expanded and which could afford to provide better social, cultural, and other communal facilities if they had the larger resources which an increase in pop. brings with it.

A co. dist. in which such developments are taking place is called a 'receiving dist.' The minister is authorised to make contributions to the council of a receiving dist. towards housing rate fund contributions, land acquisition, site preparation, and other works, main water and sewerage, and payments to a riv. board or drainage authority. A local authority, other than the council of a receiving dist., may provide for the compulsory acquisition of land. See also NEW TOWNS.

Overstone, Samuel Jones Loyd, 1st Baron (1796-1883), banker, b. London, educ. Eton and Trinity College, Cambridge. He was M.P. for Hythe during 1819-26, and contested Manchester in 1832. He succeeded his father as head of Jones

Loyd & Co., bankers (merged in London and Westminster Bank in 1864), in 1844. He was a great authority on banking and finance, and the Bank Act of 1844 was based on his principles. He wrote several treatises on currency, etc.

Overtones, see HARMONICS.

Overtown, tn in N. Lanarkshire, Scotland, 1½ m. SE. of Wishaw; it has extensive iron works, and is situated on the verge of the Clyde valley fruit-growing area. Pop. 2400.

Overture, work intended to serve as an opening to a larger composition, usually an opera, but often an independent composition for concert use, strictly speaking to stand first in the programme, but by no means always so used. It can nowadays be a piece of programme music, like a symphonic poem on a small scale, based on some literary subject or play, or description of some natural scene or historical incident. In the 18th cent., however, it was a suite of dances preceded by a large-scale prelude (slow introduction and fugal *allegro*) which was, strictly speaking, the 'overture' to those dances. The earliest operas had no O.s as such, but were generally prefaced by a prologue, often sung. The instrumental prelude became popular in Italy in the late 16th and early 17th cents., and was known as a *sinfonia* or *toccata*. The form of the It. dramatic O. assumed a more permanent character with Scarlatti, who divided it into 3 sections. Lully, in France, laid foundations for the classical symphony by also dividing the O. into 3 parts: a slow introduction, a lively *allegro* in fugue form, and a dance form, generally a minuet. This type, called the Fr. O., became popular in England, and was used by Purcell and Handel. At this stage of its development the O. bore little or no reference to the work it prefaced, so that it was not unusual for the O. to one opera to be played before the performance of another; and O.s were also written for oratorios and ballets. The reforms instituted in the field of the O. by Gluck and Mozart are of the utmost importance. The former closely identified the O. with the opera it prefaced, making it 'something analogous to the work itself,' and often (as, for example, in *Alceste*) joining it without a break to the first scene. Mozart further solidified the relationship between O. and opera by sometimes introducing into the former themes from the latter. Meanwhile in the concert-room the O. had branched off in another direction, developing into the symphony. In the late 18th cent. the It. O. became increasingly important. The early O.s of Cherubini foreshadowed those of Rossini, with their use of the cumulative *crescendo* now known as the 'Rossini *crescendo*.' Beethoven, continuing the forms of Gluck and Mozart, raised the O. to greater expressive and dramatic heights. The great *Leonora* O. No. 3 is, to all intents and purposes, a distillation of the opera *Fidelio* in symphonic form. The *Egmont* and *Coriolan* O.s are in the nature of independent compositions suitable for concert use. The O.s of Weber also adhere to the classical

form, and are closely allied with the operas, using themes appearing in them. In the 19th cent. an interest arose in the concert O. which, although it was usually written with a dramatic subject in mind, bore no relation to any opera. An example is Tchaikovsky's *Romeo and Juliet*, which resembles the symphonic poem more than the operatic O. Wagner employed the O. in various ways, and no two of his can be said to be alike. With the exception of the O. to *The Flying Dutchman*, which is in classical form, his most important O.s may be divided into 2 main groups, according to their functions: as a prelude, to suggest what is to follow, as with *Tannhäuser*, *Tristan*, and the *Meistersinger*; and primarily intended to set the proper mood, as with *Lohengrin* and *Parsifal*. Yet another type of O. is chiefly a pot-pourri of themes from the opera, arranged with an eye for their effectiveness. Among modern composers the trend of the O. is toward the shorter form, intended to prepare the mood of the opera. In Puccini's operas it has all but disappeared, and its disintegration can be watched in Verdi's, few of which have full-dress O.s (e.g. *La forza del destino*), some have preludes setting the general atmosphere (e.g. *Traviata*, *Aida*), and in the last two (*Otello*, *Falstaff*) the curtain rises almost immediately.

Over-voltage, voltage at any point of a circuit exceeding the maximum for which the circuit is designed, activating O. relays or being relieved through surge diverters, spark gaps, arc-suppression coils, or lightning arresters. It may be caused by thunderstorms, direct lightning stroke, or switching operations.

Overysel, see OVERJESSEL.

Ovetum, see OVIEDO.

Ovid (Publius Ovidius Naso) (43 BC-c. AD 17), Lat. poet, b. Sulmo (Abruzzo) of an ancient equestrian family in easy circumstances. He was well educ., and trained for the Bar, studying for some time at Athens and settling at Rome. He had considerable forensic ability, pleaded in the court of the contumviri, and was made one of the *tresviri capitales*; but on coming into his father's estate left the law to take up poetry and pleasure. He had many friends, and lived a gay and licentious life in Rome and at his country seat. He was 3 times married, but only his third marriage was a success. In AD 8 he was suddenly banished by Augustus to Tomis, now Constanza, on the Black Sea. No reason for this is certainly known; but the cause is obscurely hinted at in sev. places in his works. He appears by an indication to have been in some secret, possibly, as has been suggested, about the emperor's grand-daughter Julia, of which Augustus wished to remove all evidence. But the ostensible cause of his exile was the immoral tendency of his love poems (cf. *Tristia*, ii. 207; iii. 49). O. suffered much from the climate and the lack of company. He was never allowed to return to Rome, and died in exile. His work is distinguished by its spontaneity and ease, its graceful elegance, and play of fancy; its descriptions of passionate,

tender, and pathetic scenes; its insight into human nature; and, previous to his exile, its air of gaiety and joyousness. The licentiousness of much that he wrote may be partly condoned by the manners of his age. His *Amores*, addressed to a certain (probably imaginary) Corinna, appeared in 16 B.C. His tragedy, *Medea*, which was praised by Quintilian and Tacitus, is now lost. The *Epistolae* or *Heroides* are imaginary love-letters written by famous heroes and heroines, and among the most refined and graceful examples of Lat. elegiac poetry. His *Medicamina Faciei Femineae*, on cosmetics, was followed by the *Ars Amatoria* (3 books) and the *Remedia Amoris*, dealing respectively with the methods of conducting and of getting over love affairs. His *Metamorphoses* (15 books), on which he based his hopes of immortality, never received his final corrections. It is brilliant and interesting, and contains passages of great beauty. The *Fasti*, designed to be in 12 books, of which only 6 were completed, is a poetical commentary on the calendar, dealing in elegiac metre with festivals and mythology. The period of his exile produced only comparatively unimportant works, including *Tristia Epistolae ex Ponto*, *Ibis*, *Halieutica*, and *Nux*. The best complete ed. is still that of N. Heinsius-P. Burmann (4 vols), 1727; but there are many modern eds. and trans. of separate works. See E. K. Rand, *Ovid and his Influence*, 1936; F. A. Wright, *Three Roman Poets*, 1938; H. Fränkel, *Ovid, a Poet Between Two Worlds*, 1945; L. P. Wilkinson, *Ovid Recalled*, 1955.

Oviedo *y Valdés*, Gonzalo Fernández de (1478-1557), Sp. historian. b. Madrid. In 1514 he was sent by Ferdinand to St Domingo in the W. Indies as inspector-general of the trade of the New World, and during his term of office acted with great cruelty and barbarity to the Indians. On his return to Spain he pub. his *Sumario de la Historia General y Natural de las Indias Occidentales*, 1526. His prin. work is the *Quinquagenas*, containing a full account of the most important persons in Spain, their lineage, arms, revenues, etc., together with a fund of private anecdote.

Oviedo: 1. Sp. prov. in Galicia (q.v.), on the Bay of Biscay, also called the prov. of Asturias (q.v.). It is mountainous, containing part of the Cantabrian Mts (q.v.), and its valleys are picturesque and very fertile. Iron, coal, cobalt, and other minerals are found. Area 4205 sq. m.; pop. 901,500.

2. (ancient *Ovetum*, later *Civitas Episcoporum*) Sp. tn, cap. of the prov. of O. It grew up around an 8th-cent. monastery. In the 9th cent. it was the cap. of the kingdom of the Asturias, and it was, later, a centre of resistance to the Moors. It was sacked by the French in 1809, and was badly damaged during a rising of Asturian miners against the gov. in 1934. There is a Gothic cathedral, mainly 15th cent., which has beautiful windows, and the tower of which is one of the finest in Spain, and there are many other ancient buildings, including an 8th-cent. cloister.

The univ. dates from 1608. O. has iron works, and manufs. munitions, textiles, and leather goods. Pop. 112,850.

OVIEDO, AND THE CATHEDRAL

Oviparous, in zoology, term applied to birds, reptiles, fishes, and insects whose mode of reproduction is by the exclusion of a germ in the form and condition of an egg, the hatching of which takes place outside the body of the female parent. The lowest mammals (platypus and the spiny ant-eaters), all birds, most reptiles and fishes, and most invertebrates are O. See also OVOVIVIPAROUS.

Ovoca, see **AVOCA**.

Ovolo, in classical architecture, a convex moulding, see **MOULDINGS**.

Ovoviviparous, in zoology, term applied to animals whose mode of generation is by the exclusion of a living foetus more or less extricated from the egg-coverings, and which has been hatched within the body of the parent as an egg, i.e. without any placental attachment to the womb, so that the offspring have not been developed through direct connection with the blood-vessels of the mother, as in truly viviparous animals. Examples are the marsupials (except the bandicoots), the viper, fishes, such as certain rays, sharks, and toothed carps, the aphids (green flies), and various other invertebrates.

Ovule (Lat. diminutive of *ovum*, an egg), minute body of a circular or oval shape which occurs in the ovary of the carpel of a flowering plant. O.s may be solitary or numerous, and after fertilisation by the action of pollen become seeds. They consist principally of the nucellus, a central mass of tissue covered by one or more coats of integuments, and in most cases they are attached by a short stalk or funicle to the placenta, a ridge of tissue in the ovary. At the anterior end, the

micropyle, a narrow canal or opening leads to the nucellus. Down this the pollen tube passes in fertilisation. The form of the O., its arrangement on the funicle, and the relative position of the micropyle vary in different families. In Ranunculaceae, for example, the O. is always inverted, so that the micropyle and funicle adjoin. The O.s are grouped in the placenta in various ways, the chief being axile, free central, and marginal.

Owain ap Gruffydd, see GLENDOWER, OWEN.

Owari, or Bishiu, anct. prov. of Japan, corresponding to the present-day Aichi-ken; largely a fertile plain, rice, wheat, barley, and horse-radish are extensively produced, and poultry rearing is important. The local clay is used in ceramics, an industry begun in 1297. Chief tn: Nagoya.

Owen, John (1560-1622), epigrammatist, b. Plas Dhu, Caernarvonshire, educ. Winchester and Oxford; he became headmaster of King Henry VIII School at Warwick. His Lat. epigrams, which have both sense and wit in a high degree, gained him much applause, and were trans. into English, French, German, and Spanish.

Owen, John (1616-83), Puritan cleric, b. Stadhampton, Oxon, and educ. at Oxford, whence he was driven by Laud's statutes. Originally a Presbyterian, he changed to Independency. In 1649 he accompanied Cromwell to Ireland, and in 1650 to Edinburgh. As dean of Christ Church, Oxford (1658), he was one of the 'triers' of ministers appointed by Cromwell. After the Restoration he was ejected from his deanery, but was favoured by Clarendon, who tried to persuade him to conform by offers of high preferment. Charles II also held him in regard, and gave him money for the Nonconformists; and he was allowed to preach to a congregation of Independents in London. His great learning and ability made him a formidable controversialist, especially against Arminianism and Rom. Catholicism.

Owen, Sir Richard (1804-92), naturalist, b. Lancaster. He studied anatomy at Edinburgh under John Barclay, and, coming to London, held various posts in the Hunterian Museum at the College of Surgeons. He made his name with the pub., in 1832, of a memoir on the pearly nautilus. In 1836 he was appointed the first Hunterian prof. of comparative anatomy and physiology. His prin. works at this time were a *Catalogue of the Physiological Series of Comparative Anatomy*, 1833-40, *Odontography*, 1840-5, and *British Fossil Mammals and Birds*, 1844-1846. In 1856 the queen placed at his disposal for life Sheen Lodge in Richmond Park, and he became director of the Natural Hist. Museum at S. Kensington, for the estab. of which he was largely responsible. His *Anatomy and Physiology of the Vertebrates* appeared in 1868. He was undoubtedly the first anatomist of his day, and one of the greatest that ever lived. See life by his grandson, Rev. R. Owen, 1894.

Owen, Robert (1771-1838), Welsh Socialist, b. Newtown, Montgomeryshire, was a precocious lad who came to London, worked as a shopman in London and Manchester, and eventually became the owner of successful cotton mills at Chorlton. There, eventually, he instituted a system of co-partnership, and started schools for infants. His scheme, then an entire novelty, attracted much attention, and drew many famous persons to visit and consult him. He wished to improve the conditions of labour, and especially of child labour, and he was the prime mover of the Factory Act of 1819. His open declaration of religious scepticism made his schemes suspect. His communistic settlements in England and America proved to be failures, and he suffered considerable financial losses on account of them. His autobiography appeared in 1857-8. See lives by L. Jones, 1890; F. Podmore, 1906; G. D. H. Cole, 1930.

Owen, Robert Dale (1801-77), Scottish-Amer. social reformer and author, son of the preceding. Born and educ. in Glasgow, he accompanied his father to New Harmony, Indiana, 1825. In 1835 he was elected to Indiana Legislature, and was a member of Congress, 1843-7. O. took a leading part in founding the Smithsonian Institution, and was U.S. minister at Naples, 1853-8. Some of his puba. are *Footfalls on the Boundary of another World*, 1860, *Policy of Emancipation*, 1863, *The Wrong of Slavery*, 1864, *Debatable Land between this World and the Next*, 1872, and an autobiography, *Threading my Way*, 1874.

Owen, Sir Stanley, see BUCKMASTER.

Owen, Wilfred (1893-1918), poet, b. Oswestry, Shropshire. Educ. at Birkenhead Institute and London Univ., he was for a time tutor to a Fr. family near Bordeaux. In the First World War he enlisted in the Artists' Rifles, but was invalided out in 1917 and sent to Craiglockhart War Hospital, where Siegfried Sassoon (q.v.) was his fellow patient and encouraged him in verse-writing. Sent back to France as a company commander, he won the M.C. but was killed a week before the armistice in the crossing of the Sambre Canal. His *Poems*, 1920, ed. by Sassoon, shatter the illusion of the glory of war and bring home to us both its hollowness and wreckage and the beauty it has ruined. In technique his work is distinguished by the extensive use of assonance in place of rhyme, a feature in which O. looked forward to the later school of Auden and Spender (qq.v.). See *The Poems of Wilfred Owen*, ed. with memoir by E. Blunden, 1931.

Owen Falls, rapids of the Victoria Nile in Uganda, situated 3 m. below the Ripon Falls (q.v.) at Jinja. In 1949 an agreement between the Brit. and Egyptian Govs. was concluded for the construction of a dam here, for the production of hydro-electric power and the control of the Nile waters. Plans for this work were prepared and approved by the Egyptian Ministry of Public Works and the Uganda authorities. The scheme was formally opened by Queen Elizabeth II in April

1954. The cost was estimated in 1954 at \$26,000,000; the scheme will be operated by the Uganda Electricity Board. The estimated capacity is 150,000 kilowatts. See also NILE.

Owen Glendower, see GLENDOWER, OWEN.

Owen Sound, co. of Grey co., Ontario, Canada. It lies at the head of the large bay of the same name on the SW. shore of Georgian Bay (Lake Huron), and owes its name to the great impression made by the fine natural harbour on Capt. Owen, who conducted the first hydrographic survey of the Great Lakes shortly after the war of 1812-14 with the U.S.A. Owing to his glowing description the Brit. officials gave his name to the bay. The original name of the settlement was Sydenham, changed to O. S. in 1851. Incorporated as a tn in 1856, it became a city in 1920. It lies 110 m. NW. of Toronto, on both the Canadian Pacific and Canadian National railways. It is an important livestock shipping centre, and its chief industries include furniture; marine, mining, and heavy castings; woodenware; refrigerators; knitting; steel boats; stoves and furnaces; bolts, screws, and wire; tanning; lumber; paint and varnishes. Pop. 17,346.

Owen Stanley Mountains, mt chain in the E. of Australian New Guinea. The highest peak is Mt Victoria (13,200 ft), but there are sev. peaks over 10,000 ft high.

Owens, John (1790-1846), cotton merchant and founder of O. College, b. Manchester. He entered his father's business, and soon making a large fortune he was able to bequeath \$96,000 for the erection of a college, on the condition that no test of religious belief or profession should be imposed on staff or students. See VICTORIA UNIVERSITY.

Owensboro, co. seat of Daviess co., Kentucky, U.S.A., on the Ohio R. It is an area of agriculture, oil and gas wells, coal-mines, clay, sand, and gravel pits, and timber. It is an important oil centre, tobacco market, and shipping point, with boat connections. O. manufs. radio valves, light bulbs, furniture and wood products, machinery, foodstuffs, and clay and metal products; it has distilleries, and there is an airport. Pop. 33,651.

Owl (order Strigiformes), distinguished from all other birds of prey, except the osprey, by the tarsus (of the leg bones) being half the length of the tibia, while the outer toe is able to be turned backwards or forwards at will. Another distinction is in the absence of the aftershoot present in the feathers of all hawks; this is a small accessory plume which springs from the under side of the main feather. O.s are mostly nocturnal in habit, but some hunt for food in full daylight. The head is always large, the neck short and contracted, the eyes are directed forwards and are surrounded by a characteristic ruff of feathers. The short beak is hooked. O.s have long been the subject of much superstition, being universally regarded as birds of ill omen. This has undoubtedly had much to do with their ruthless persecution, and only in recent years has it been

realised that they are the most important check upon the excessive multiplication of rodents. In addition to these, reptiles, fish, and insects are eaten, and some species have been observed to feed on carrion. Indigestible remains of the food are cast up in the form of pellets.

Of the Brit. species, the barn, white, screech, or church O. (*Tyto alba*) is the most widely distributed throughout Britain. The colour of the plumage varies, but the upper parts are commonly tawny buff mottled with grey, white, and brown, and the under surface is whitish, or

John Markham

TAWNY OWL

sometimes yellowish, with grey spots. The face is white and the bill yellow, and a heart-shaped pattern of feathers is formed round the eyes and beak. The legs are long and covered with downy feathers. The eggs, which in all O.s are white, are laid in barns, church towers, and other buildings, as well as in hollow trees. The beautiful tawny or wood O. (*Strix aluco*) is more local in its distribution, and hides during the day in woods, commonly nesting in holes in trees. The ground colour is dark tawny or brown, approaching grey in some specimens. The short-eared or woodcock O. (*Asio flammeus*) frequents open places, and flies in the daytime as well as at night. Its distribution is more northerly than the others. The head, back, and wings are lightish brown, with darker brown patches; the under surface is buff or fawn, with blackish markings on the

breast; the legs are pale buff; and the toes, as well as the beak, are black. The eggs are laid on the ground in tufts of heather or furze, or on a clump of sedge or reeds. It is largely a winter migrant, appearing with the woodcock and departing in the spring. It is a great vole hunter. The long-eared O. (*Asio otus*) is distinguished by its ear tufts, which are about 1½ in. long. It feeds largely on sparrows, and is notorious for its habit of occupying other birds' nests. Other species which breed in Britain are the little O., which has been sev. times introduced and has spread rapidly of late, the beautiful snowy O., and the eagle O.

Owlglass, see EULENSPIEGEL.

Ownership, see POSSESSION and PROPERTY.

Owosso, city in Michigan, U.S.A., in livestock, grain, and coal area, 28 m. N.E. of Lansing. It manufs. stoves, plumbing supplies, and metal and wood products. Pop. 15,900.

Ox, domestic ruminant. A large number of varieties or breeds are distributed over the world. Their domestication began at a very early period of man's development, and the humped oxen of India (*Bos indicus*) have long been regarded as sacred. The European domesticated breeds are believed to have been derived from *B. primigenius*. The use of the ox as a draught animal was formerly very common, and still continues in many parts of the world.

Ox-bird, see DUN, OXBIRD.

Ox-bow, type of lake. By meandering courses, rivers may form great loops; the neck of such a loop being eventually severed, a horse-shoe-shaped backwater is formed. The deposition of silt blocks up the ends, thus forming an O. lake. They are found, for example, in the lower Mississippi valley.

Ox-eye Daisy, or Dog Daisy (*Chrysanthemum leucanthemum*), perennial herb of the Compositae. It has daisy-like flower-heads with white rays and yellow disk florets.

Ox-pecker, passerine, starling-like bird of the family Buphagidae, of which there are 2 species, found in Africa. In colour they are a dingy brown, with tawny under surface and tail. They are strong fliers, of great swiftness, and insectivorous in habit. The various names, of which rhinoceros bird is one, are derived from their method of seeking food on the backs of the ox and rhinoceros.

Ox-wagon Sentinel, see OSSEWABRAND-WAG.

Oxalic Acid $(\text{COOH})_2 \cdot 2\text{H}_2\text{O}$, the first member of the homologous series of dibasic acids of the general formula $\text{C}_n\text{H}_{2n-2}\text{O}_4$. It occurs as its acid potassium salt in many plants, especially in the wood-sorrel (*Oxalis acetosella*), and as its calcium salt in plant cells. In small quantities it is made in the laboratory by combining sodium and carbon dioxide at 360° C., or by quickly heating sodium formate to a high temp. It can be made by warming strong nitric acid (90 c.c.) on a water-bath, removing, and adding 25 gm. of cane-sugar. Oxides of nitrogen are

evolved, and after the reaction has abated the liquid is evaporated to small bulk. On cooling O. A. crystallises out. On the commercial scale it is prepared from cellulose in the form of sawdust. The sawdust is fused with a mixture of potassium and sodium hydroxides in iron pans. Potassium and sodium oxalates are formed, extracted with water, and treated with the requisite amount of sulphuric acid, when O. A. crystallises out in large, transparent, monoclinic prisms. The crystals contain 2 molecules of water of crystallisation, but slowly effloresce in the air, and become anhydrous at 100° C. It sublimes at higher temps. (160° C.), but is also partly decomposed into carbon dioxide and formic acid. Concentrated sulphuric acid decomposes it into carbon dioxide, carbon monoxide, and water. O. A. is easily oxidised by potassium permanganate in acid solution, and is estimated by means of a standard solution of the latter. The alkaline salts of O. A. are readily soluble in water. The 'salt of sorrel' of commerce is potassium quadroxalate $(\text{COOH})_2 \cdot (\text{COO})_2 \cdot \text{KH} \cdot 2\text{H}_2\text{O}$, useful for removing ink-stains. The calcium salt is insoluble, and serves to detect the presence of the acid. The acid is poisonous, but the calcium salt passes through the system unchanged. Thus, in case of poisoning, lime water or chalk is administered.

Oxalidaceae, dicotyledonous family of about 300 species, chiefly tropical, but a few of temperate zones; with alternate leaves without stipules, large 5-parted flowers in cymes, and capsular or berry fruits. Genera include *Averrhoa*, *Bio-phytum*, and *Oxalis*.

Oxalis, genus of annuals, perennials, and evergreens. The only Brit. species is *O. acetosella*, the Common Wood-sorrel. *O. corniculata*, Procurrent Yellow Sorrel, and *stricta*, Upright Yellow Sorrel have been introduced. Many handsome species are grown in the garden and the greenhouse, and one, *O. deppeii*, has edible and radish-like roots, for which the plant is a good deal grown in France. It is grown in Britain for its elegant umbels of rose-red flowers.

Oxenford, John (1812-77), author, b. Camberwell, London. An accomplished linguist, he trans. Calderón's *Vida es Sueño* and Goethe's *Dichtung und Wahrheit*. The knowledge of Schopenhauer's philosophy in England dates from the appearance of his essay on 'Iconoclasm in Philosophy' in the *Westminster Review* (Dec. 1876). From about 1850 O. was dramatic critic to *The Times*, his appreciations being rendered useless through their excessive and indiscriminate amiability. Two of his best known plays are *My Fellow Clerk*, 1835, and *Twice Killed*, a farce, 1835.

Oxenham, John, pseudonym of William Arthur Dunkerley (1852-1941), novelist and religious poet, b. Manchester. He was educ. at Old Trafford School and Victoria Univ. He spent his early years in commerce, travelling in France and the U.S.A. He later took up the business side of journalism and was associated with Jerome K. Jerome in the periodicals the

Idler and To-day. Turning to writing, he pub. his first novel, *God's Prisoner*, in 1898. This and succeeding romantic novels gave him a vogue, to which in 1913 he added the popularity of *Bees in Amber*, a book of verse. In 1914 his 'Hymn for the Men at the Front' became very widely known. This was followed by other vols. of poetry, and after the war he wrote a number of books on the life of Christ, including *The Cedar Box*, 1924, and *The Hidden Years*, 1925. See life by his daughter, 1942.

Oxenstierna, Axel Gustafsson, Count (1583-1654), Swedish statesman, b. Fano in Uppland, and educ. at the univs. of Rostock, Jena, and Wittenberg. He became chancellor of Gustavus Adolphus (1611). During the king's absence in Livonia and Finland (1614-16) O. looked after affairs at home. As a diplomatist he arranged the marriage between his youthful sovereign and Marie Eleanora of Brandenburg, drew up an agreement with Denmark jointly to occupy Stralsund (1629), and negotiated the favourable truce of Altmärk with Poland (1630). After Gustavus's death at Lützen (1632) it was his courage and resourcefulness which kept the Protestant League together, and led, in 1633, to the formation at Heilbronn of the Evangelical Union. In the Dan. war of 1643-5 his tactical skill again proved invaluable. During the brief rule of Queen Christina, O. was handicapped by the jealousy of his young mistress, but he nevertheless opposed her abdication.

Oxenstierna, Bengt Gabriëlsson, Count (1623-1702), Swedish statesman, was appointed governor of Masovia, Great Poland, Kulm, and Kujavia (the Polish provs. which his country had conquered) in 1655. His spirited and prolonged defence of Thorn against the Poles ended at length in a capitulation so dignified that its terms were afterwards included in the Peace of Oliva (1660).

Oxenstierna, Johan Gabriel (1750-1818), Swedish poet, b. Fano, a nephew of Count Gyllenborg. He wrote a trans. of *Paradise Lost*, besides a number of original poems and odes and a eulogy of Gustavus III., at whose letter-loving court his academic effusions and graceful idylls were much admired. O. undertook many political and diplomatic missions for his king and patron, who in return created him marshal in 1792.

Oxford, Edward de Vere, 17th Earl of (1550-1604), courtier and poet. He went to Cambridge Univ. at the age of 8 and succeeded to the earldom and the hereditary office of Lord Great Chamberlain in 1562, when he was 12. Subsequently he was tutored by his uncle, Arthur Golding, the translator (q.v.). Of unruly temperament, he lost his friends through his insolence and pride, and his fortune by extravagance. He had some reputation as a writer of short poems, many of which appear in Elizabethan miscellanies, and is said to have written plays, none of which has survived. O. is one of sev. claimants that have been put forward as the writer of Shakespeare's plays, but like the others he is not worth considering.

See SHAKESPEARE, WILLIAM; also P. Allen, *The Case for Edward de Vere, Seventeenth Earl of Oxford*, as 'William Shakespeare', 1930.

Oxford, Robert Harley, Earl of, see HARLEY ROBERT.

Oxford, city, co. bor. and bor. constituency, episcopal see, and co. tn of Oxon, is situated at the confluence of the Thames and the Cherwell, 52 m. WNW. from London (63½ m. by rail). Though the tn is famous chiefly for its univ., it owed its initial rise to other influences. It was situated between Mercia and Wessex, on one of the best of the fords across the Thames. Its importance in early times is shown by the first mention of it in hist., which occurs in the *Anglo-Saxon Chronicle* for 912. Here we read that in this year Edward, son of Ethelred, took possession 'of London and Oxford and all the lands obedient to those cities.' The tn probably made a stubborn resistance to the Norman invaders, and Domesday Book shows the reprisals which followed. To prevent further revolt the Norman governor, Robert D'Oilly, built huge works to keep the tn in submission. The remains of these are to be seen in the castle tower and parts of the churches of St Michael, St Peter in the E., and St Cross. The city again figures prominently in the troubles of Stephen's reign, and in 1142 the Empress Maud was besieged there, escaping over the riv. on the ice. But, with unimportant exceptions, the fortress was not again seriously attacked till the 17th cent., after which it ceased to rank as a place of strength, and rapidly fell into decay, though D'Oilly's tower has successfully weathered the storms of 8 cents., and even now is practically intact. In 1258 the Provisions of O. were drawn up there for the guidance of Henry III., and the Montfort rebellion thus took its rise. Again, in the civil war of Charles I's reign, O. figures as the chief cavalier centre, enthusiastic in support of the king.

Teaching is known to have been carried on at O. since the early years of the 12th cent. (see OXFORD UNIVERSITY). The fame of the univ. grew steadily, until by the 14th cent. it was the equal of any in Europe. But as the univ. grew, there was increased opposition between it and the tn, and this opposition often became so acute as to lead to terrific struggles. Now the univ. takes an active part in the city's administration, being directly responsible for the election of 12 of the 68 members of the city council. Only members of the univ. of the degree of M.A. or of a superior degree are eligible for election or to elect. A very interesting period in the hist. of O. is that which deals with the coming of the friars in the 13th cent.

The old tn of O. is built almost entirely in the angle formed by the Cherwell and the Thames, here called the 1sts. The 4 main roads of the tn meet at the place known as Carfax (derived from Lat. *quadri-furcus*, 'four-forked'). Carfax Tower, said to have been built in the reign of Edward III., shows indications of a much earlier date. It was renovated in

1896, and the curious 'Quarter Boys,' relic of bygone days, restored to use. N. from Carfax runs Cornmarket Street, continued further N. as Magdalen Street. Where Cornmarket Street runs into Magdalen Street it is crossed by a thoroughfare known under the successive names (E. to W.) of George Street, Broad Street, Holywell Street, and Long Wall Street. It sweeps round in a large curve, and roughly marks the boundaries of the ancient city in that direction. Some fragments of the old wall still remain, notably as part of the wall of Merton Gardens. W. from Carfax runs Queen Street, continued

mangled remains of Amy Robsart; and from its pulpit Keble preached his famous sermon on national apostasy. High Street passes over Magdalen Bridge. Magdalen Bridge commands fine views N. and S., the former the wooded heights of Headington Hill, with St Clement's Church in the middle distance, the latter Magdalen College school playing fields and a section of the botanic gardens. In High Street are the examination schools, used in the world wars as a military hospital, designed by Sir Thomas Graham Jackson, who also designed O.'s 'Bridge of Sighs,' connecting the 2 sections of Hertford College. Opposite to Hertford is the Bodleian Library, most of which was designed by Holt of York. Near it is the Clarendon Building which for many years was the home of the O. Univ. Press. Designed by Vanbrugh, both of its main elevations are stately; that on the S. contains a figure of Lord Clarendon, from the proceeds of whose book, the *History of the Rebellion*, the building was erected. The New Bodleian, designed by Sir Giles Gilbert Scott, was opened in 1947. Christ Church, one of the smallest, but certainly one of the most beautiful, of Eng. cathedrals, is a splendid example of Eng. church architecture. The pier-arches are early 12th-cent. work, as are the transepts and choir-aisles. 'Tom Tower' of Christ Church contains the famous bell from which the tower gets its name. The statue is that of Wolsey, who planned Tom Quad, and who conceived the Foundation of Christ Church, perhaps visualising the cathedral as a chapel for its members. O. has now expanded to take in many suburbs: Osney on the W., Grandpont on the S., St Clement's, Cowley, Headington, and Ifley on the E., and St Giles's, Summertown, and Wolvercote, which form a popular residential dist., on the N. At Wolvercote paper for the O. Univ. Press pubs. is made. There are sev. well-known schools in O. Magdalen College School was founded in 1480 by William of Waynflete for instruction in grammar; the college choristers, not originally members of the school, have since 1849 been boarded in the master's house at the expense of the college. St Edward's School, founded in 1803, was originally in New Inn Hall Street, being removed to Summertown in 1873. Others include Headington School, Milham Ford School, and O. High School for Girls.

Before 1914 O. was regarded solely as a univ. city and mrkt tn, printing being then its only considerable industry. Between the 2 wars the O. motor industry expanded rapidly, and the city's pop. rose from 67,000 in 1921 to 94,000 in 1938. By 1945 O. itself contained a pop. of 100,000. Extensive development has also taken place immediately outside its limits, so that the total pop. is really much larger. O., however, possesses few natural advantages for the location of heavy industry, and the success of the motor industry at Cowley must be attributed to the initiative and ability of its founder, Lord Nuffield. Unfortunately the only effective controls on building were those

Alfred Savage Ltd

THE RADCLIFFE CAMERA, OXFORD

as New Road. In Cornmarket Street is St Michael's Church: the tower is late 11th-cent. work. Not far from it is the church of St Mary Magdalene, an interesting building of various dates. Near by is the Martyrs' Memorial, a monument commemorating the martyrdom of Ridley, Latimer, and Cranmer, designed by Sir Gilbert Scott. S. runs St Aldate's as far as Folly Bridge, near which are moored the barges of the college boat clubs. Until near the end of the 18th cent., an anct watch-tower, known as Friar Bacon's Study, rose over the old bridge. Eastwards from Carfax runs the High Street, off which is the univ. church of St Mary the Virgin, built between the 13th and 15th cents., except for the baroque porch, erected by Laud's chaplain, Dr Morgan Owen, in 1637. It was in St Mary's that Cranmer was degraded previous to his martyrdom; to St Mary's were brought from Cumnor the

exercised by the physical geography of the site, and the built-up areas now resemble the spokes of a wheel radiating from Cartax, and separated by the valleys of the Cherwell and the Thames. The old walled city was planned on its cramped site at the S. end of the gravel terrace between the 2 rivs., and is in striking contrast to the unplanned development of recent years. In 1945 the city council appointed Dr Thomas Sharp, president of the Tn Planning Institute, to prepare a master-plan for the future development of O., and his advice has been followed in a number of matters. To relieve the congestion caused by the heavy traffic which was compelled to pass through the centre of O., in Sept. 1956 the minister of housing and local gov., then Mr Duncan Sandys, proposed the building of a by-pass through Christ Church Meadow. There was considerable opposition to the scheme, and in Feb. 1957 the O. City Council announced that they were unwilling to accept the proposal or to submit plans.

Since 1885 the city has returned only 1 member to Parliament; before that date it sent 2. Under the univ. franchise (discontinued in 1948), O. Univ. returned 2 members. Pop. 101,500. See J. Ingram, *Memorials of Oxford*, 1837; C. W. Boase, *Oxford* (in *Historic Tns* series), 1887; G. Smith, *Oxford and the Colleges*, 1895; P. Dearmer, *The Cathedral Church of Oxford*, 1899; A. Laug, *Oxford*, 1916; J. Wells, *The Charm of Oxford*, 1920; J. Betjeman, *An Oxford University Chest*, 1938; T. Sharp, *Oxford Replanned*, 1948; W. J. Arkell, *Oxford Stone*, 1948; C. Hobhouse, *Oxford* (5th ed.), 1952; J. C. Masterman, *To Teach the Senators Wisdom*, 1952. See OXFORD UNIVERSITY.

Oxford and Asquith, Emma Alice Margaret, Countess of, *née* Tennant (1864-1945). b. Peeblesshire, sixth daughter of Sir Charles Tennant, a wealthy ironmaster, and a descendant of Robert Burns. Her autobiography, 2 vols., 1920-2, recording her vivid impressions of leading men and women, portrays her in her uninhibited youth as an exceedingly versatile and unconventional young woman, a gay talker, a dashing rider to hounds, a student of Plato, and an inveterate flirt. Later she became a conspicuous member of the brilliant Victorian group known as 'The Souls,' of whom Arthur James Balfour was the moving spirit. 'The Souls' were moved by an interest in things of the mind, as opposed to the ordinary frivolous interests of the hour. The romance of her life was her meeting with the rising politician, Herbert Asquith, and her marriage to him in 1894. As a writer hers was a personal success rather than a noteworthy literary achievement. The secret of her brilliant reputation lay partly in her good fortune, but still more in her vivid and vital personality. Her publs., in addition to the famous *Autobiography of Marjot Asquith*, 1920-2, include *Places and Persons*, 1925, *Lay Sermons*, 1927, *Octavia*, 1928, *More Memories*, 1933, and *Off the Record*, 1944. She had 2 children, the Honourable Anthony Asquith, film producer, and a

daughter, Elizabeth (d. 1945), who married Prince Antoine Bibesco.

Oxford and Asquith, Herbert Henry, 1st Earl of (1852-1928), statesman, b. Morley, Yorks, and educ. at the Moravian School, Pudsey, the City of London School, and Balliol College, Oxford. He was called to the Bar after leaving Oxford, and quickly distinguished himself; he defended John Burns in 1887 in the case arising out of the riots in Trafalgar Square, and in 1889 he was junior counsel for the Irish Nationalist members in the Parnell case. In 1886 he became Liberal M.P. for E. Fife, a seat which he retained up to the year 1918. In 1892 he moved the vote of want of confidence which led to the fall of the Salisbury gov., and was rewarded by the office of home secretary in the Liberal Cabinet which was then formed. In 1877 he married Helen Melland, by whom he had 4 sons and 1 daughter. She d. in 1891, and in 1894 he married as his second wife Emma Alice Margaret (Margot) Tennant (see OXFORD AND ASQUITH, COUNTESS OF).

In the Boer War he was noted for rigid adherence to imperial ideas. But on the enunciation of the fiscal policy of Chamberlain, he led the movement which was to unite the Liberal party on economic grounds, and to sweep the country in 1906. In 1905, on the resignation of Balfour, he became chancellor of the exchequer in the Campbell-Bannerman gov., and soon became the most prominent man of the party. In April 1908, on the resignation of Campbell-Bannerman, he became Premier. In 1909, when the rejection of the budget by the Lords forced an election, he returned to attack, with the help of the Irish and the Labour members, the veto of the Lords. Following a general election, Nov. 1910, a Veto Bill was introduced and passed, after a threat of creation of peers had led to the withdrawal of the official opposition. In 1911 the Insurance Act was passed, and in 1912 Bills for the Better Gov. of Ireland and Welsh Disestablishment were introduced.

The dominating issue in politics in the years immediately preceding the First World War, while he was yet Premier, was Irish Home Rule. Then came the historic Curragh incident (see CURRAGH INCIDENT). Seely, then war minister, resigned, and Asquith announced that he proposed to act as war minister himself. He handled the situation with tact and skill. Negotiations were now continued for finding some *via media* which would give S. Ireland Home Rule, and at the same time meet the objections of such parts of Ulster as were affected. In Mar. 1914 he announced his readiness to give to each Ulster co. the option of excluding itself from the Irish Parliament. Negotiations were still going on when this and every other question of internal politics became submerged in the cataclysm of the First World War and Asquith immediately resigned the war ministry to Kitchener, and devoted his energies to securing the solidarity of the country against the common enemy.

As a peace Prime Minister he had revealed great qualities as a debater, and much dexterity as a party leader. Put to the test of war he showed, at all events in the earlier months, none of the indecision which seemed at a later stage to characterise his policy towards the questions of conscription and the shell shortage. His early speeches were admirable expositions of the purposes for which the country was fighting. But by 1915 there were criticisms within the country and within the Cabinet itself on Asquith's war policy,

Topical Press

LORD OXFORD AND ASQUITH

which became concentrated on the lack of suitable munitions. The result was a coalition gov., formed in April 1915, and including Conservatives, with Asquith still Prime Minister. Then came the Irish rebellion of 1916. After the execution of the ringleaders, Asquith visited Ireland in the hope of laying the foundations for an honourable settlement. Negotiations were set on foot between the leaders of the opposed Irish factions, Lloyd George being the gov. intermediary. A compromise was reached, but soon afterwards wrecked through the influence of the Unionist wing of the coalition ministry. Among the Unionists at this time conviction was growing that if the war was to be won Asquith should be superseded. The first blow was dealt by Lloyd George by his proposal of a War Council, from which the Prime Minister should be excluded, an exclusion which he defended on the ground that the independence of opinion from party influence would thereby be secured. Asquith refused, Lloyd George retaliated by sending in his resignation. Then Bonar Law and the other Unionist members of the Cabinet gave

notice to the Premier that they were no longer willing to co-operate with him, and he was thus forced into resignation, and Lloyd George displaced him as Prime Minister (1916). This was really the end of Asquith's long and distinguished record as a minister of the Crown. Apart altogether from the Home Rule imbroglio, the true cause of his downfall was his real or fancied inability to handle the shell-shortage problem. Where Asquith failed Lloyd George succeeded. The munitions were forthcoming, if at a huge price to the nation, and the war was won. But the transfer of power from the leader to his lieutenant naturally brought with it the bitterest acrimony between their respective adherents, and the cleavage was never healed.

In the 1918 'khaki' election Asquith was defeated by a Conservative supporter of Lloyd George. Ultimately he was returned for Paisley. Back in the House he endeavoured unsuccessfully to undermine Lloyd George; but by 1923 a superficial reunion between the Asquith and Lloyd George liberals had been reached, with Asquith acknowledged as party leader. After the election of 1923 the Liberals, holding the balance between the Conservatives and the Socialists, helped the Socialists into power for the first time; but the brief 8 months' reign of Ramsay MacDonald's first gov. was followed by the return of a Conservative gov., with a tremendous majority. Asquith, though still Liberal leader, once again found himself without a seat. In Feb. 1925 he was raised to the Upper House, with the title of Earl of O. and A., and a few weeks later he was made a knight of the Garter. The assumption that differences between Lloyd George and Lord O. had been healed was dispelled during the general strike of 1926 when, after the collapse of the strike Lord O. charged Lloyd George with pursuing a policy of his own towards the strike uncountenanced by his colleagues. The Liberal press, however, supported Lloyd George.

In 1926 Lord O. resigned the Liberal leadership; but his influence on the party as a whole had by now been negligible for some time. He d. 2 years later. His *Memories and Reflections*, pub. a few months after his death, contain well-balanced comments on some of the great events in his long political experience and characteristically restrained observations on the men of his time. See official life by J. A. Spender and C. Asquith, 1932; and his *Letters to a Friend* (ed. D. McCarthy), 1931 and 1934.

Oxford and Cambridge Cup, trophy competed for annually by Australian univ. boat crews. It was presented in 1893 by 'old blues' of Oxford and Cambridge.

Oxford Breed, see SHEEP.

Oxford Clay, sub-group of the Oxfordian div. of the Upper Jurassic, consists of layers of stiff blue and brown clay. It stretches from Dorset, where it attains a thickness of about 800 ft, through Oxford to Yorks, where it is about 400 ft thick. The beds are very fossiliferous, yielding *Ammonites* (*A. Jason*, *A. Cordatus*, *A.*

Duncant, A. Ornatus), Belemnites (*B. Hastatus*), and abundant Lamellibranchs (*Gryphaea dilatata*, *Ostrea*, etc.). *Ammonites Cordatus* and *A. Jason* occur as zonal fossils. Gastropods and Brachiopods are found, but are not plentiful. Fishes (*Hypodus*, *Lepidotus*, etc.) and some reptilian genera (*Ichthyosaurus*, *Plesiosaurus*) have been found. In France the rocks are represented by the 'Oxfordien,' and they are found in Germany at the base of the 'White Jura.'

Oxford Group, name given in 1928 to the movement initiated in Oxford in 1921 by Dr Frank N. D. Buchman (q.v.), who defined it as 'a Christian revolution, whose aim is a new social order under the dictatorship of the Spirit of God, making for better human relationships, for unselfish co-operation, for cleaner business, cleaner politics, for the elimination of political, industrial, and racial antagonisms.' In 1939 the O. G. was incorporated in Britain (under the Companies' Act of 1929) as an association not for profit, whose object is 'the advancement of the Christian religion.' It has been similarly incorporated in America and elsewhere. These corporations provide the legal and administrative basis for the work of Moral Re-Armament (q.v.). Objections have been raised against the system by orthodox churchmen on the grounds that it ignores the intellectual and institutional side of Christianity, and that enthusiasm is no alternative for sound reasoning and sacramental grace. See **Oxford Group**, *The Oxford Group and its work of Moral Re-Armament*, 1954.

'**Oxford Magazine**,' founded in 1883 by T. H. Warren of Magdalen and R. Lodge of Brasenose. It is pub. weekly during university term by an editorial committee of senior members, and is devoted to news, comment, articles, and book reviews bearing on univ. affairs and matters of academic interest.

Oxford Movement, known also as the Tractarian Movement, and by its supporters as the Catholic Revival, was an attempt to make members of the Church of England realise the primitive and Catholic principles on which the O. M. believed it depended. Its proximate cause was the gov.'s abolition of 10 Irish bishoprics in 1833, which caused many to ask on what the Church could rest if attacked by the gov. The reply came from Oxford in the insistence on the divine mission of the Church as the extension of the Incarnation. Newman dates the commencement of the movement from Keble's sermon at St Mary's, Oxford, on 14 July 1833. In the same year began the pub. of the *Tracts for the Times*. In 1834 Pusey gave the movement the weight of his learning and influence. Other names prominent in the origination of the movement were those of Newman and Froude. The *Tracts* evoked a storm of opposition, and many of the original leaders seceded to the Church of Rome. The events of this period may be studied in Newman's *Apologia* and Liddon's *Life of Pusey*. But the movement continued with increased vigour, and by the begin-

ning of the 20th cent. had transformed the face of the whole Anglican communion. It has promoted home and foreign missions, frequent services, a high standard of clerical life, and reverent ceremonial. See also **ENGLAND**, **CHURCH OF** and **RITUALISTS**. There are many books on the subject. See R. W. Church, *The Oxford Movement*, 1891; W. Walsh, *Secret History of the Oxford Movement* (5th ed.), 1899 (written from the point of view of an opponent of the movement); H. R. T. Brandreth, *Oecumenical Ideals of the Oxford Movement*, 1947.

Oxford Sheep, see **SHEEP**.

Oxford Street, famous London thoroughfare, a noted shopping centre, and forming the boundary between the city of Westminster and the bor. of St Marylebone. It follows the site of the Rom. road that ran from London to Silchester, and has been known at different times as 'the way from Uxbridge,' 'the road to Oxford,' and 'Tyburn road,' being the road to the famous gallows (see **TYBURN**). It was eventually named after Edward Harley, 2nd Earl of Oxford, who married the daughter of the Duke of Newcastle, who owned land in St Marylebone. It is crossed midway by Regent Street (q.v.). The Pantheon, a fashionable entertainment centre, stood near the E. end of the street from 1772 until closed in 1867. The E. extension, known as New O. Street, was added in 1847.

Oxford University. The beginnings of teaching at Oxford can be carried back as far as the early years of the 12th cent., when we read that it was the seat at which Theobald of Etampes gave instruction (c. 1115). As a corporate body the University probably took its rise towards the end of that cent. or the beginning of the 13th. After a number of earlier instruments, the position of the University is now effectively governed by the Universities of Oxford and Cambridge Act, 1923, under which a Statutory Commission was set up for Oxford, and many new statutes were made for the University and colleges. The University is a corporation consisting of masters and scholars united under the chancellor. The undergraduates and bachelors of arts have no voice in the gov. of the University, which rests with the senior graduates. Ordinary University business, including, especially, taking the initiative in considering and submitting to the Congregation of the University all University legislation, is carried on by the Hebdomadal Council, which was instituted in 1631 and consists of the chancellor, the vice-chancellor, a pro-vice-chancellor and the 2 proctors (all *ex officio*), and 18 other members, 6 elected by Congregation every 2 years for 6 years. Council's powers are limited because most of its decisions have to be ratified by Congregation (though ratification is often formal); and many parts of the University (e.g. Bodleian Library, Ashmolean Museum), though financed by the University, are managed by bodies which in their routine administration are largely independent of Council. Congregation (roughly, all the resident M.A.s

and persons holding higher degrees, numbering about 1200) amends if necessary and ratifies legislation submitted by Council, and has considerable powers in the election of the administrative bodies of the University. The Convocation of the University (roughly all M.A.s and persons holding higher degrees, whether resident or not, numbering nearly 20,000) now has few powers, including the election of the chancellor and the conferment of honorary degrees. The Auct House of Congregation was once concerned with

(Responsions) or have gained exemption. Among the scholarships offered are the Rhodes scholarships, founded in 1902 by Cecil John Rhodes and awarded to students from the Commonwealth and America. The Bodleian Library, founded in 1602, is also the general library of the University and contains about 2,000,000 vols. and about 50,000 MSS. There are also a number of departmental and college libraries. The relations between the University and colleges are intimate, all members of the colleges being members

Alfred Savage Ltd

THE SHELDONIAN THEATRE, OXFORD

education and discipline, but now has practically no other function than that of granting degrees. Its former functions were lost under an act of 1854, which created Congregation. Ceremonial functions of the University, which until 1669 were held in St Mary's Church, are held in the Sheldonian Theatre (built by Wren, 1669). The University possesses facilities in theology, law, medicine, *literae humaniores*, modern history, Eng. language and literature, medieval and modern languages, oriental studies, physical sciences (including mathematics), biological sciences, social studies, anthropology and geography, music, and agriculture and forestry. The University awards the usual degrees and diplomas and admits both men and women who have passed the entrance examinations

of the University, but the college corporate bodies are different from the University and manage their own property. Regent's Park College and Greyfriars were recognised in 1957. See ALL SOULS, BALIOL, BRASENORSE, CAMPION HALL, CHRIST CHURCH, CORPUS CHRISTI, EXETER, HERTFORD, JESUS, KEBLE, LINCOLN, MAGDALEN, MANSFIELD, MERTON, NEW, ORIEL, PEMBROKE, QUEEN'S, ST ANTHONY'S, ST BENET'S HALL, ST CATHERINE'S SOCIETY, ST EDMUND HALL, ST JOHN'S, ST PETER'S HALL, TRINITY, UNIVERSITY, WADHAM, and WORCESTER, which are men's colleges, and LADY MARGARET HALL, ST ANNE'S, ST JILDA'S, ST HUGH'S, and SOMERVILLE, which are women's colleges; also NUTFIELD COLLEGE. In 1958 there were about 8600 undergraduates. See Sir C. Mallet,

Oxford University Press, dept of the univ. wholly owned by 'the Chancellor, Masters, and Scholars,' and by far the largest institution of its kind in the world. It receives no grant from the univ., or from any other source, but is self-supporting, the profits being employed both as a source for working capital and to finance the pub. of learned works. It is governed by a univ. committee, the Delegates of the Press. Its prin. depts are (1) the publishing office at Oxford, responsible for the learned and educational books bearing the imprint 'At the Clarendon Press' (q.v.); (2) the printing works, also at Oxford; (3) the publishing dept in London, whose functions have for long included, in addition to the distribution of Clarendon Press books and Oxford Bibles and prayer books, the production of certain classes of books of a less strictly academic character (e.g. the World's Classics series, q.v.), and conveniently differentiated by the more general imprint 'Oxford University Press.'

The first Oxford book is believed to have been printed in 1478 (though the date on the title-page is 1468), but the continuous hist. of the press does not begin until 1585. Many notable works of learning were issued during the next 300 years, and a period of great expansion began towards the close of the 19th cent., coinciding with the growth of public education. The most widely known Oxford books are no doubt the Bibles and prayer books, and the dictionaries and reference books, notably the great *Oxford English Dictionary*, begun in 1884 and completed in 1928, and the *Dictionary of National Biography*, handed over to the delegates by its original publishers, Messrs Smith, Elder, in 1917.

Oxfordshire, or Oxon, midland co. of England, bounded on the S. by the R. Thames and Berks, E. by Bucks, NE. and NW. by Northants and Warwickshire, and W. by Glos. The surface is varied: the greater part of the co. lies in the Thames basin, but in the N. there are stretches of downs, while the S. is hilly, the greatest elevations being reached in the Chiltern Hills. Part of Wychwood Forest, disafforested in 1862, is found in the W. The chief riv. is the Thames, with its tribs., the Windrush, Evenlode, Cherwell, and Thame, none of which rises in the co. The scenery in the Thames valley is extremely beautiful, and includes many favourite riv. resorts: Henley, Goring, etc. The soil is good, and agriculture flourishes; the main crops are barley, oats, and wheat, while beans and turnips are also grown. Farming in all its branches is carried on, and cattle, sheep, and pigs are reared. Some iron ore is raised, and brickmaking is an

important industry. The chief manufs. are motor vehicles at Cowley, blankets at Witney, gloves at Woodstock, agric. implements and engines at Banbury (which is also famous for a certain kind of cake), with tweed, lace, and paper mills. The co. is served by the W. Region railway, and also by a branch of the Midland Region from Bleicester to Oxford. The co. includes 14 hundreds, and 2 parl. divs., each returning 1 member. The Roll-right Stones and the Devil's Quits at Slanton Harcourt are well-known prehistoric monuments. Oxford was the chief stronghold of the Royalists throughout the Civil war (1642-6), and was the scene of many engagements. Few of the old castles remain, the most notable being those of Oxford, Shirburn, and Bampton, while there are remains of such celebrated mansions as Minster Lovell, Greys Court, and Rycote. At Woodstock is Blenheim Palace (q.v.). Of all the monastic buildings that were the natural outcome of the close proximity of the univ. but few remain, the abbey church at Dorchester being the most important. There are a number of beautiful churches, besides those in Oxford (q.v.) itself, including those of Iffley, Adderbury, and Minster Lovell. Area 768 sq. m.: pop. 244,600. See *The Victoria History of the County of Oxford* (5 vols.), 1904-57; A. Mee, *Oxfordshire*, 1942; R. Turner, *Oxfordshire*, 1949; Joanna Cannan, *Oxfordshire*, 1952.

Oxidation, chemical process whereby substances take up or combine with oxygen, as, for example, when magnesium burns in air $2\text{Mg} + \text{O}_2 = 2\text{MgO}$. A substance containing hydrogen can sometimes lose some or all of it in the form of water when oxidised. Thus alcohol, $\text{C}_2\text{H}_5\text{O}$, is oxidised to acetaldehyde, CH_3CHO , by the oxygen-giving mixture of potassium dichromate and sulphuric acid. Further O., by the addition of oxygen, produces acetic acid, CH_3COOH . Thus the result of O. may be either an increase of oxygen or a decrease of hydrogen. Extending the term, we may say that the addition of a negative element or radicle is a process of O. whereby a compound corresponding to a higher degree of O. is obtained, e.g. $2\text{FeCl}_2 + \text{Cl}_2 = 2\text{FeCl}_3$ (see OXYGEN). Ferrous chloride is derived from ferrous oxide, FeO , and ferric chloride from ferric oxide, Fe_2O_3 . Thus O. sometimes involves valency increase.

Oxide Paint, paint in which the colour of the pigment is due entirely to inorganic iron compounds. The pigments mix well, are inert and permanent, and vary in colour from dark red to black through purple. They are chiefly used in external painting, in an oil medium.

Oxides are binary compounds formed by the union of elements with oxygen. They may be divided into 7 classes: (1) basic O., (2) acidic O., (3) neutral O., (4) amphoteric O., (5) sub O., (6) higher O., (7) composite O. Basic O. are the O. of metallic elements which react with acids to form salts and water, e.g. $\text{CaO} + 2\text{HCl} = \text{CaCl}_2 + \text{H}_2\text{O}$. Acidic O. are the O. of non-metallic elements which react with bases to form salts and water, e.g.

$\text{SO}_3 + 2\text{NaOH} = \text{Na}_2\text{SO}_4 + \text{H}_2\text{O}$. Some, but not all, of the acidic O. dissolve in water to form acids. Neutral O. are O. which are neither acidic nor basic, e.g. nitrous oxide (N_2O), carbon monoxide (CO). Amphoteric O. are O. of elements which are neither truly metallic nor truly non-metallic and which behave either as a basic O. or as an acidic O. under appropriate conditions, e.g. $\text{ZnO} + \text{H}_2\text{SO}_4 = \text{ZnSO}_4 + \text{H}_2\text{O}$; $\text{ZnO} + 2\text{NaOH} = \text{Na}_2\text{ZnO}_2$ (Na zincate) $+ \text{H}_2\text{O}$. According to the modern theory of acids and bases water is an amphoteric O. since it gives hydrogen ions (acidic) and hydroxyl ions (basic), viz.: $\text{H}_2\text{O} \rightleftharpoons \text{H}^+ + \text{OH}^-$. Sub O. are O. of metals or non-metals which contain less oxygen than the normal O. in which the element shows its normal valency, e.g. lead suboxide, Pb_2O . Higher O. are O. which possess more oxygen than the normal O. They include the peroxides which liberate hydrogen peroxide on treatment with a dilute acid, e.g. BaO_2 and dioxides which do not liberate hydrogen peroxide in this way, e.g. MnO_2 . Composite O. are O. of metals that react chemically as though they were mixtures of 2 O. of the same metal. These O. are not, however, mechanical mixtures of the 2 O., e.g. red lead, Pb_3O_4 , behaves as $2\text{PbO} \cdot \text{PbO}_2$, and on treatment with nitric acid forms lead nitrate from the PbO part and leaves PbO_2 as a brown residue. The above classification is not a hard and fast one.

Oxides, Alkyl, see ETHERS.

Oximes are compounds derived from the aldehydes (q.v.) and ketones (q.v.) by replacing the oxygen atom of the $-\text{CHO}$ or $>\text{CO}$ group by the radical $>\text{N} \cdot \text{OH}$. This replacement is usually effected by acting on an alkaline aqueous solution or suspension of the aldehyde or ketone with hydroxylamine hydrochloride, $\text{NH}_2\text{OH} \cdot \text{HCl}$, the alkali serving to liberate free hydroxylamine from the hydrochloride:

The O. are usually beautifully crystalline compounds, and are used in the separation and purification of the aldehydes and ketones. They are also of considerable interest from the point of view of stereoisomerism (q.v.).

Oxlip (*Primula elatior*), handsome plant with a very limited distribution in the E. cos. of England. It is intermediate in character between the primrose and the cowslip, but may be distinguished from the rather common hybrid between these 2 plants by the absence of folds in the throat.

Oxon, see OXFORDSHIRE.

Oxted, tn and par. of Surrey, England, in Godstone (q.v.) rural dist. O. has a church founded in the 13th cent., a 15th-cent. inn, and many old houses. Pop. 3799.

Oxus, see AMU-DAR'YA.

Oxy-acetylene Welding, see WELDING.

Oxychlorides are compounds which may be looked on as being intermediate between oxides and normal chlorides. Their formation is generally brought about by the addition of excess of water to the chlorides, but only a few metals form O., and the compound is not easily prepared pure or of definite chemical composition. (Non-metals such as phosphorus form O., e.g. POCl_3 .) The O. may be regarded as basic chlorides, or rather as the anhydrides of such, e.g. bismuth O. (BiOCl) may be regarded as the anhydride of the basic bismuth chloride.

Oxycoccus, see CRANBERRY.

Oxygen (symbol O; atomic number 8; atomic weight 16.00, standard; valency 2, and sometimes 4, in oxonium compounds, q.v.), is the most abundant and important element. It forms 23 per cent by weight of air, 89 per cent of water, and about a half of all the rocks which comprise the crust of the earth. It was discovered by Scheele (1771), but the discovery was not pub. until after Priestley (1774) had described its preparation from mercuric oxide. The gas is produced on the small scale by the decomposition of potassium chlorate. This is heated either alone or with a catalytic agent such as manganese dioxide. Thus $2\text{KClO}_3 = 2\text{KCl} + 3\text{O}_2$. On heating manganese dioxide to bright redness, O. is evolved, $3\text{MnO}_2 = \text{Mn}_3\text{O}_4 + \text{O}_2$. The gas may also be obtained by the action of sulphuric acid upon the dichromate or permanganate of potassium; by the action of heat on many oxides and O.-containing compounds (e.g. nitrates); by the action of strong sulphuric acid on peroxides; bleaching powder with a catalyst (cobalt oxide); sodium peroxide on water; hydrogen peroxide and manganese dioxide; and many other reactions. The O. made on the commercial scale is now obtained by the distillation of liquid air (q.v.) and as a by-product in some electrolytic operations. O. is a colourless gas, tasteless, odourless, and slightly heavier than air. One litre of the gas weighs 1.429 gm. at standard temp. and pressure. It is slightly soluble in water (1 c.c. of water dissolving 0.0489 c.c. of O. at 0° C. and 760 mm.), and also in molten silver, which absorbs about 20 times its own volume of the gas. The critical temp. of the gas is -118.8° , at which point a pressure of 58 atmospheres is required to cause its liquefaction. Liquid O. is a pale steel-blue liquid which boils at -182.5° , at which temp. its sp. gr. is 1.1315. The liquid is strongly magnetic. The gas is endowed with very powerful chemical affinities, combining with iron, phosphorus, sodium, and potassium at ordinary temps., i.e. the metals are oxidised. The process of oxidation may proceed so rapidly as to cause the metal or body to burn. Thus oxidation accompanied by light and heat is known as combustion. Many substances, not usually regarded as combustible, will burn in O. if the temp. be raised sufficiently. Thus steel wires will burn with rapidity and brilliancy if heated strongly

thousands are tinned and shipped to interior parts. The S. states get their O.s mainly from the Gulf of Mexico. As the beds are free from the diseases and parasites that have attacked the Brit. beds, the Amer. O. is very much cheaper. The Pinnadae are a family, with genera *Pinna* (fan-shells) and *Lima*, nearly related to the O. They are found chiefly in the Mediterranean, where they sometimes attain a length of over 2 ft. Fresh-water O.s (*Unio*), found in rivs. in America, are cultivated for the shells used in button-making. See J. R. Philpots, *Oysters and all about them*, 1890; J. Hornell, *Oyster Beds of Sind*, 1910; J. H. Orton, *Oyster Biology and Oyster Culture*, 1937; P. S. Galtsoff, *The Oyster Industry of the World*, 1951.

Oyster Bay, harbour, tn. and summer resort of Nassau co., New York, U.S.A., on the N. coast of Long Is. It is a terminus of the Long Is. railroad, and is, in addition, a favourite seaside resort and summer residence. O. B. is well known as the home of Theodore Roosevelt, who is buried near by. Pop. 42,594.

OYSTER-CATCHER

Oyster-catcher, Mussel-picker, or Sea Pie (*Haematopus ostralegus*), common bird on Brit. shores, though it often goes up rivs. many miles inland to breed; it may nest in Scotland at a height of over 1500 ft. The nest is usually a rough structure without lining. In it are laid 3 or 4 large eggs of a buff or stone colour, blotched with dark brown or black. Both sexes appear to share the duties of incubation. The young in their pretty, thick down are able to run about when only a few hours old, and in 5 or 6 weeks are able to fly. By the end of July the birds congregate in large flocks on the coast. The long bill is perfectly adapted for forcing open the shells of molluscs, but both marine and terrestrial worms and insects are also consumed. The birds are about 16 in. long; the head, neck, and upper parts are black, and the under parts white, but pure white specimens occasionally occur in large flocks.

Oyster Plant, see SALSIFY.

Oystermouth, see MUMBLES.

Ozanam, Antoine Frédéric (1813-53), Fr. scholar, b. Milan, and educ. at Lyons. Whilst studying law in Paris he associated with Chateaubriand and Montalembert, and became, with them, a champion of the Catholic revival. From 1840 onward he was prof. of foreign literature at the Sorbonne. His chief writings are *Dante et la philosophie catholique au XIII^e siècle*, 1839, and *Études germaniques*, 1847-9. See study by H. Auer, 1933.

Ozark Mountains, range of highlands, altitude generally 1000-1200 ft, which, beginning from the Missouri R., extend in a SW. direction almost to the Arkansas R. They traverse chiefly the states of Missouri and Oklahoma, but also cross S. Illinois and the NW. of Arkansas. Area approximately 60,000 sq. m.

Ozokerite, a wax composed of paraffin hydrocarbons, in consistency like spermaceti, occurring naturally in parts of Europe and the U.S.A. in association with coal. The colour varies from the white of the pure substance to green and yellowish-brown, and often shows a greenish opalescence. It melts at about 63° C. and is lighter than water. The impure solid found in Galicia and Rumania is purified by treatment with concentrated sulphuric acid and distillation. Original O. from Moldavia is soluble in ether, giving a yellow solution. The wax is used for making candles, sealing wax, paints, polishes, and insulating material.

Ozone, allotropic form of oxygen found in very small quantities in the lower atmosphere but in considerable quantities at a height of 30 m. above sea level. O. is formed out of the oxygen of the air by an electrical machine in operation, and when lightning discharges occur; it is also found in the oxygen prepared from the electrolysis of water. Varying quantities of the gas are obtained during many processes of slow oxidation at ordinary temps., e.g. oxidation of phosphorus in air. During the combustion of ether on red-hot platinum, a considerable amount of O. is formed. The gas is best obtained by exposing pure dry oxygen to the influence of the silent electric discharge. A simple apparatus for this purpose consists of a straight piece of narrow glass tube, containing a straight platinum wire inside which passes through the walls of the tube at one end and is there sealed into the glass. A second wire is wound round the outside of the tube. On connecting the end of the outer wire and the free end of the platinum wire to the terminals of an induction coil and passing a slow stream of oxygen through the tube, the issuing gas is found to be highly charged with O. O., as prepared above, is always mixed with excess of oxygen (80 per cent or more), and even in this diluted state it has a strong unpleasant smell which induces headache, and it has an irritating effect on the mucous membrane. The gas is slightly soluble in water, 4.5 c.c. dissolving in 1000 c.c. of water. It condenses to an intensely deep blue liquid which boils at -112° C., and is a very explosive substance. O. is a powerful oxidiser; it attacks and destroys organic matter,

indiarubber being quickly rotted through by its action. It decolorises vegetable colours, and acts at once upon most metals, silver and mercury being converted into oxides. Sulphides are converted into sulphates, and the gas also liberates iodine from potassium iodide. This latter constitutes a rough test for the presence of the gas, the liberated iodine forming a blue compound with starch solution. From the observation that 2 volumes of O. when heated to 250° C. are transformed to 3 volumes of oxygen, the difference between this latter gas and its allotrope is explained by giving O. the formula O_3 , i.e. it contains 3 atoms to the molecule, whereas the oxygen

molecule only contains 2 atoms. If this be the case then, since the molar weight of oxygen = 32, that of O. will be 48. This is confirmed by the rate of its diffusion, which is proportionately slower according to Graham's law. The O. present in sea air is supposed to explain its bracing effects. The gas is employed for purifying drinking water, for bleaching purposes, and for thickening oil. It has also been used for freshening the atmosphere in underground railways (e.g. in London). On the large scale it is prepared by suitable modifications of the electrical process described above.

Ozothamnus, genus now included in *Helichrysum* (q.v.).

P, sixteenth letter of the Eng. and other W. European alphabets, descended, through the medium of the Gk. Etruscan, and Lat. alphabets, from the N. Semitic *pe*, meaning 'mouth,' but it is unlikely (although many eminent scholars still hold such an opinion) that it represented in its original form a mouth. Indeed, the original name seems to have been chosen independently of the form of the letter, which was 4 or 7 (the script being from right to left). **P** is the thirteenth letter of the labial series (*p, b, f, v*) and is interchangeable with the other letters of the series. **P**, in Sanskrit, Greek, and Latin, is replaced by *f* in the Germanic tongues (see **F**). Words beginning with *p* in English and its kindred Germanic tongues are almost all of foreign origin (Slavic, Celtic, Latin), as *pain* (Fr. *peine*, Lat. *poena*), *plough* (Polish *plug*, *pit* (Lat. *puteus*, a well). The Gk preposition *apo* (Sanskrit *apa*) became in Latin *ab*; Gk *hupo*, Lat. *sub*; Sanskrit *upa*, Lat. *ob*; but before sharp letters, as *t* and *s*, the original *p* was retained in pronunciation, as is shown by inscriptions (*apstulit, optinui*). There are remarkable interchanges of *p* with the sharp guttural *k* or *q* (see **INDO-EUROPEAN LANGUAGES**, where the subdivisions into **P**-group and **Q**-group are mentioned). Thus for Lat. *quis, quod, quam*, the Oscan dialect had *pis, pod, pam*; Lat. *equus, coquo*, corresponded to Gk *hippos* (Aeolian *hikkos*), *pepo*; similarly Gaelic *mac* (son), *ceathair* (Lat. *quatuor*, four), *coig* (Lat. *quinque*, five), correspond to Welsh *map, pedwar* (Gk *pettores*), *pump* (Gk *pentē* or *pempe*). In Greek *p* is sometimes replaced by *t*, as *tis, tessares*, for *pis, pettores*. In such words as *redemption, consumption*, *p* has been introduced as an intermediary between the incompatible sounds *m* and *t*. The initial *p* of Lat. words has for the most part passed into French unaltered; in other positions *p* has become *v*; thus Fr. *évéque, cheveu, décevoir, pauvre*, from Lat. *episcopus, capillus, decipere, pauper*. See **ALPHABET**.

Paan (also **Patang**), tn. in the prov. of Szechwan, China. At **P** the bed of the Yangtze R. is nearly 10,000 ft above sea-level. A motor road from **P** to Chengtu was built in 1955.

Paarl, or **The Pearl**: 1. Dist. of Cape prov. of S. Africa, noted particularly for its vineyards.

2. Main tn of the **P**. dist., situated 36 m. N.E. of Cape Town. Some of S. Africa's best wines are produced here, and the largest wine cellars in the world, those of the KWV (Ko-operative Wijnbouwers Vereniging), are at **P**. It derives its name from 3 gigantic boulders, which dominate the tn, and from where there are magnificent views. There are large jam and canning factories, flour mills, and light industries. Pop.: Whites, 12,700; Coloured, 15,295; Bantu, 2538.

Paasikivi, Juho Kusti (1870-1956),

Finnish economist and statesman, who headed the Finnish delegation at the conclusion of the peace with Russia at Tartu in 1920. He negotiated later on many occasions for Finland with the Soviet Union, notably in Moscow, 1939, before the attack and in 1940 at the conclusion of the Winter War; Prime Minister, 1944-6, when he was elected President of Finland. He was re-elected in 1950 for a period of 6 years.

Pabianice, tn of Poland, in Łódź prov., 8 m. S.W. of Łódź (q.v.). It has textile, chemical, and machinery manufs. Pop. 37,500.

Paca, S. Amer. rodent mammals in the family to which the agoutis belong. There are only 2 species; these differ from the agoutis in having 5 digits on all the limbs in opposition to the 3 digits of their allies. The animals are remarkable for a curious structural peculiarity in the skull, the jugal arch being greatly developed and almost concealing the lower jaw. *Cuniculus paca*, the spotted cavy, is one of the largest of rodents, measuring about 2 ft in length, 14 in. in height; the body is covered with short, stiff, wiry hairs, and the tail is greatly reduced. It is nocturnal and vegetarian, lives in a superficial burrow in forests near water, the female produces a single young one at a birth, and the flesh is much sought after as food.

Pacaraima Sierra, range of mts in the Guiana Highlands, in lat. 4° N., and extending from W. to E. for over 500 m. They form a watershed between the basins of the Orinoco and Rio Branco R.s, and also between Venezuela and Brazil. Highest peak, Mt Roraima (9219 ft).

Pacasmayo, tn and port of Peru, in the dept of La Libertad, 65 m. N. of Salaverry. Connected by rail with Guadalupe and Chilote, **P**. exports rice, silver and copper, sugar, cotton, and hides. It has an airport. Pop. 7000.

Paocard, Michel Gabriel (1756-1827), Fr. physician and mountaineer, b. Chamonix, Haute Savoie. Between 1783 and 1786 he made many exploratory climbs on Mont Blanc (q.v.), 15,782 ft, which led to his discovery of a practicable route. With Jacques Balmat as porter, he made the first ascent by way of the Grand Plateau on 8 Aug. 1786. **P**. not only discovered the route but was throughout the driving force and leader. A handsome reward offered for the first ascent by the Genevese scientist, Horace Benedict de Saussure, went to Balmat through a misrepresentation of facts.

Pacchiarotto, Jacopo (1474-c. 1540), It. painter, b. Siena. From 1530 to 1535 he was concerned in conspiracies against the gov., and was compelled to flee into hiding in France. In 1539 he was exiled, but was allowed to return to Italy in 1540, the supposed year of his death. An 'Ascension' in the Siena Academy is

among the few existing authentic works accredited to him.

Pace, measure of length, derived from the Lat. *passus*. The latter, however, was measured from the heel-mark of one foot to the mark where it next touched the ground, thus equalling in the modern sense of the word 2 paces. The Lat. *passus* was a little less than 5 ft.; a thousand of them went to a Rom. mile.

Pacelli, Eugenio, see **PIUS** (popes), **Pius XII**.

Pacha, see **PASHA**.

Pachacamac, anct city of Peru, near the point where the Lurin valley reaches the coast, 12 m. from Lima, the site of which has been excavated by Pennsylvania Univ. The Incas (q.v.) adopted the earlier god P. as a god of earthquakes. To the Yuncas P. was a creator-god, and the tn was sacred and had a great pyramidal temple; it remained a sacred city under the Incas.

Pacheco, Francisco (1571-1654), Sp. painter, b. Seville. In 1611 he visited Madrid, and eventually opened a school of painting in Seville. Among his pupils here was Velázquez, who married his daughter. The latter part of his life was spent in literary work, chiefly on the subject of painting. Some of his best paintings are at Madrid and Seville.

Pachelbel, Johann (1653-1706), Ger. organist and composer, b. Nuremberg, pupil of Kerl, held organist's posts at various places until 1695, when he was appointed to St Sebaldus Church in his native town. He wrote suites, fugues, and other works, and is especially important for his variations on hymn-tunes for the organ, which directly influenced the chorale preludes of J. S. Bach.

Pacher, Michael (c. 1430-98), Ger. painter and wood sculptor, b. Neustift. He travelled to Italy, but beyond an interest in perspective he acquired little of the Renaissance learning in art. He is of importance as one of the late Gothic artists, master of the altarpiece in which architecture, sculpture, and painting were combined.

Pachmann, Vladimir de (1848-1933), Russian pianist, b. Odessa. His musical education was obtained in Vienna, and on returning to Russia in 1869 he continued his studies, beginning public performances in 1875. He was famous as a player of Chopin's music and received the Royal Philharmonic Society's medal, 1916.

Pachmarhi, tn and hill station of the Deccan, in Madhya Pradesh State, India, on the Mahadeo range, at an altitude of 3500 ft. It was the summer seat of gov. for the Central Provs. Pop. 6700.

Pachomius, see **MONASTICISM**.

Pachuca, cap. of the state of Hidalgo, central Mexico, 62 m. by road NE. of Mexico city. In the vicinity are silver mines of great antiquity, yielding at the present time a considerable quantity of ore. The surrounding hills are honey-combed with old workings. Three railways and a good motor road lead to Mexico city. Buildings of the Sp. colonial period include Las Casas (1670), now used as offices; Las Casas Coloradas (1785),

now courts of justice; and a former Franciscan convent (1596). It has a fine modern theatre, and another modern building is the Bank of Hidalgo. Pop. 54,000.

Pachydermata, classification of mammals, founded by Cuvier for a number of thick-skinned, non-ruminant, hoofed animals, e.g. elephant and hippopotamus. It has now been superseded.

Pacific Affairs, Institute of, unofficial non-sectarian, non-controversial organisation which aims at the improvement of the relations between the peoples of the Pacific area. It is directed by a Pacific Council, on which each of its constituent national units elects a member. The countries represented before the Second World War were the U.S.A., Japan, China, Hawaii, Australia, Canada, and New Zealand. It has a permanent secretariat, with H.Q. in Honolulu, which is responsible for the preparation and conduct of conferences and the promotion of research. It derives its support from research foundations and private contributions. The origin of the I. P. A. is traced to a group of business and professional men in Hawaii, and the proposal that representatives of the various peoples around the Pacific should meet and exchange views was carried out in the first conference, which met at Honolulu in 1925. Many conferences have been held since then and the proceedings pub. by the Univ. of Chicago Press. Many painstaking books on different topics have been pub. by members under the aegis of the institute, which, however, is not responsible for the opinions expressed in them. The I. P. A. series of monographs by various authors includes among the most recent K. Pelzer, Katrine Greene, J. D. Phillips, and Kate L. Mitchell, *Economic Survey of the Pacific Area*, 1942. Its periodical, *Pacific Affairs*, is pub. in the U.S.A.

Pacific Campaigns, or Far Eastern Front, in Second World War. *Japanese Invasion of the Southern Pacific and Eastern Asia.* By 1941 it was evident that the more moderate elements in the Jap. Gov. had been reduced to impotence by the military party (see **JAPAN, History**). Allied diplomatic circles considered, however, that Japan's military and financial resources were too deeply committed in China to permit her to attempt further military adventures elsewhere. Colour was lent to this belief by the 'negotiations' which were being ostentatiously conducted at Washington by Adm. Nomura and Mr Kurusu to settle Amer.-Jap. relations. In the midst of these bogus negotiations the Jap., without any formal declaration of war, swept down with their bombers and two-man submarines on Pearl Harbor (q.v.) (Hawaii) and other Amer. bases in the Pacific, and sank a Brit. gunboat in Shanghai (7 Dec. 1941). Within a day or two, apart from the severe damage in Pearl Harbour, Jap. bombers damaged the smaller Amer. bases at Wake Is. and Midway Is., attacked the Nanru Is. (Australian mandated ter.), bombed Guam (U.S. ter.), Hong Kong, the Philippines and other Is.,

and attacked Sarawak and Borneo. At the same time Jap. troops landed in N.E. Malaya. Thailand (Siam) surrendered at once and granted passage to Jap. forces landing in the S. It was obvious from the widespread nature of these attacks and their thoroughness that Japan had been preparing the blow for sev. months or even years. Britain and the U.S.A. then formally declared war on Japan.

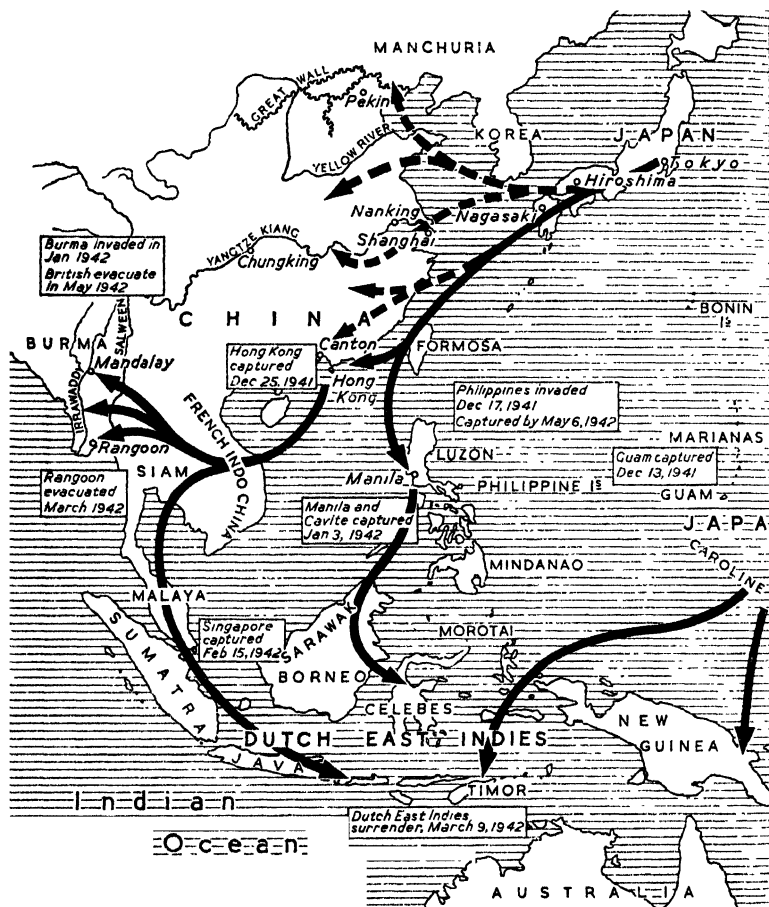

The hist. of the first few months' campaigns, following Japan's entry into the war, was one of futile bravery on the part of the allied forces against overwhelming odds. The crux of the whole situation was sea-power, and the Jap. Navy was in control at the very outset. The Amer. Navy had suffered at Pearl Harbor and in the loss of Guam and Wake Is. the worst blows in its hist. As early in the campaign as 10 Dec., Britain lost the great new battleship, *Prince of Wales*, and the *Repulse*, bombed and torpedoed by 60 Jap. bombers and 27 torpedo-carrying planes, while engaged in operations against Jap. landings off the Malayan coast, a hopeless if gallant mission, since the ships had no aircraft protection. In quick succession the Jap. overran most of the Philippines, subjecting the open city of Manila to merciless and indiscriminate bombing, seized Hong Kong, swept over the Malaya Peninsula and captured Singapore, prin. bastion and base of the allied nations in the Far E., and reduced one by one various strategic points in the Netherlands E. Indies. Then the tide of conquest approached Rangoon, entry port for the all-important Burma Road (see BURMA ROAD), down which Britain sent munitions to Chiang Kai-shek, and was imperilling India itself. Southward it now began to menace Australia. By early May Mandalay had fallen and a large part of Burma was in the enemy's hands. (For operations in Burma, see BURMA. SECOND WORLD WAR, CAMPAIGNS IN.) The general strategic plan developed quickly from the opening day of the Jap. attacks, their first aim being to break the ring of 'encirclement' constituted by the Aleutian Is., Pearl Harbour, Guam, Manila, Hong Kong, Malaya, and Singapore, by simultaneous attacks on all of them, and then, by breaking Amer. and Brit. resistance in these centres, to render it impossible for the Allies to get near enough to Japan to bomb Jap. cities. In the gloom of these early months from Dec. to 9 April the one bright outstanding feature was the heroic and protracted Amer. defence of the Bataan Peninsula by the forces under MacArthur (q.v.). When at length the resistance ended MacArthur had already been in Australia for 3 weeks, where he took supreme command of Australian, Brit., Dutch, and Amer. troops.

In the course of the Jap. conquest of the numerous is. of the S. Pacific the hardest fighting took place in the Philippines. Organised resistance by the U.S.-Filipino armed forces on the Bataan Peninsula came to an end by 9 April. Much credit must be given to the defence for the maintenance of their positions for

over 4 months against vastly superior forces. Approximately 200,000 Jap. troops were employed against a defending army of some 36,000. The U.S.-Filipino defence had succeeded in containing a huge Jap. army which might have been effectively employed in other theatres of war; a proportion of the Jap. fleet and a large number of valuable transports had been immobilised for 4 months; the struggle had cost a great many Jap. lives and made a severe drain on Jap. resources of material; and, finally, the U.S.A. had been given time to recover from the shocks of the lightning attacks on her bases in Hawaii and elsewhere and to take steps to organise her forces for a continuation of the struggle.

In the E. Indies the Japanese landed in Brit. Borneo on 16 Dec. and occupied Tarakan a week later. Then followed landings in Celebes and Amboyna, and heavy air raids on Surabaya, Palembang, Kupang, and Banka. The Dutch authorities, however, destroyed many of the oil wells at Palembang before leaving the place. Bali was invaded in mid Feb., and both that is. and Banka were seized soon afterwards. The Japanese then advanced on Java, captured Batavia, pierced the Dutch defences at Bandung, and completed the conquest of the Dutch E. Indies by mid March. Hong Kong succeeded in holding out for only a little over a fortnight (see HONG KONG). The earliest Jap. landings in Brit. Malaya took place on 8 Dec. in Kedah, when there were raids on Penang and Singapore. This campaign ended by 15 Feb., the whole of Brit. Malaya being conquered in the space of 10 weeks (see MALAYA. BRITISH, JAPANESE INVASION OF, 1941-2). Sarawak was not in a position to resist for long, and the Brit. garrison was withdrawn to watch Borneo, which itself soon fell. The threat to Australia came first with the bombing of Rabaul in the mandated ter. of New Guinea (10 Jan.), followed by invasion shortly afterwards. Rabaul was seized on 22 Jan. Then came numerous Jap. air raids on Port Moresby, an important Australian base in New Guinea.

Southern Pacific Campaign, 1942-3. During the first 6 months of the war against Japan allied naval losses had also been severe, and included 2 aircraft carriers, 11 cruisers, 22 destroyers, and 5 submarines. Early in April strong Jap. forces had even raided into the Bay of Bengal, where they sank the Brit. aircraft carrier *Hermes* and 2 heavy cruisers. On 1 June Jap. midgeet submarines actually penetrated Sydney harbour. But 5 days later Jap. forces received their first real check at the battle of Midway Is., when 4 of their latest carriers were destroyed, in addition to a heavy cruiser, and they also lost about 250 aircraft and 3500 men. After this the Japanese reorganised their forces and, later in the mid year, again assumed the offensive in the S. Pacific. Their jungle troops broke over the serrated crest of the Owen Stanley Mts in New Guinea and began to push towards Port Moresby. They also sent forces to occupy some of the Gilbert Is. and began to build

an airfield on Guadalcanal (q.v.) in the S. Solomon Is. But suddenly, on 7 Aug., the whole aspect of the Pacific warfare underwent a change, when Amer. task forces seized Tulagi Is. in the Brit. Solomons, and a beach-head, which included the almost-completed enemy airfield on Guadalcanal. However, on the night of 8-9 Aug. a Jap. cruiser div. and destroyers surprised the Amer. ships and sank 3 Amer. heavy cruisers and 1 Australian cruiser without much loss to themselves. Thus the supply problem for the Amer. marines who had been landed in the S. Solomons became serious, especially as the Japanese, landing men at night on Guadalcanal, now began a campaign of attrition. Yet so stubborn was

the fighting on either side that not until 9 Feb. 1943 did organized resistance end in the is. of Guadalcanal, Tulagi, Gavatu, Tanambogo, Makambo, and on parts of Florida. At the end of Aug. the Japanese entered Milne Bay, New Guinea, with some light reinforcements, but mainly with the aim of evacuating their invading troops. Australian combat troops, supported by Amer. and Australian air units, threw them back with heavy losses into the narrow confines of the peninsula N. of the bay, where large numbers were destroyed and all their heavy equipment was lost.

The collapse of the Jap. attempt to take Milne Bay was the first serious reverse which their land forces had suffered

in the New Guinea area. It was realised by the allied command that the effect of the recapture of the above-mentioned Solomon Is. would be largely counteracted if their forces were driven out of New Guinea. By retaking the Solomons they checked a threat to the sea communications between the U.S.A. and Australia, besides securing a possible base for future operations. The continued possession of New Guinea, and particularly of Port Moresby on its S. side, was essential to the defence of N. Australia. The Jap. troops landed at Buna, advanced and occupied Kokoda on the N. slopes of the Owen Stanley range, and, in the early days of Sept., were steadily climbing towards the pass 7500 ft above

sea-level in the mt range which constituted the real defence line of Port Moresby. The Japanese were within 30 m. of Port

covered with dense jungle, the Australians gallantly saved the greatest threat of all to their homeland. The chief contributory factors in this were the effective bombing of Jap. supply lines and the Jap. defeats in the Solomons, and also the out-flanking part played by Amer. ground forces flown in haste to New Guinea. The Japanese were driven back to the N. down-slope of the Owen Stanley range and were now fighting desperately to retain their foothold near Buna on the N. coast.

The position in the Solomons, however, had slightly deteriorated in Sept. and Oct., when the enemy began a heavy attack by land, sea, and air. But in the large-scale naval fight between surface vessels off Savo Is. between Guadalcanal and Florida the Japanese were successfully repelled in this, their strongest bid to recapture the S. Solomon Is. (see NAVAL OPERATIONS IN SECOND WORLD WAR). Except for losses of warships on either side, the situation, broadly, had remained unchanged since the previous Aug., after the Americans had seized Tulagi and the new airfield on Guadalcanal. But the Japanese held Bougainville, the northernmost of the group, in some force with airfields and anchorages, and they had anchorages in most of the intermediate is., such as Shortland and the New Georgia group. But Guadalcanal and Florida, with the harbour of Tulagi, remained firmly in the grip of the Allies, and the seizure of these 2 key positions had disrupted the whole Jap. plan of campaign. In Oct. the Americans hit a Jap. battleship and 3 cruisers and sank some destroyers. But a much heavier naval action was fought in the Solomons area between 12 and 15 Nov. when the Japanese suffered severe losses (see NAVAL OPERATIONS). This action marked the conclusive defeat of by far the strongest Jap. attempt to recapture Guadalcanal. The Allies were now free to threaten the enemy position in New Guinea, and their advance on Buna on the N. coast now developed under MacArthur. Allied troops occupied Buna on 2 Jan. 1943 after bitter fighting. However, the Jap. garrison at Sanananda near Buna was not yet overcome, and the enemy was also entrenched at various other points near the coast from Amboga to Madang. Further, though the work of the allied air force was improving, it had not prevented the Japanese from sending reinforcements into Lae, Salamaua, Finschhafen, and Madang.

During the first 6 weeks of 1943 Jap. resistance in Papua, on Guadalcanal, and in the Solomons was brought to an end, but from that time until July the Allies stood on the defensive in this area of the Pacific, checking severe Jap. counter-offensives. At the same time the ascendancy won by their air forces prevented any further aggressive enemy movement

by sea. But Japan, although at the fullest reach of her arm, hung on grimly, and the situation could be altered with any reasonable speed only by another allied offensive. This offensive began at the end of June under MacArthur. The Allies seized Rendova, an is. 5 m. S. of New Georgia. On New Georgia itself a landing was made without opposition. Viru harbour was taken, but stiff resistance began when the Allies approached the Jap. chief base in the central Solomons at Munda, on New Georgia. In New Guinea a fresh landing was made in Nassau Bay, where Australian and Amer. forces joined hands close to Salamaua. The port of Rabaul, which had been the Jap. advanced base in the Pacific since Jan. 1942, was the palpable objective of the Allies, but the struggle for it was likely to be hard. Long-range guns put ashore at Rendova islet were now shelling Munda airfield, only 5 m. distant. But though Munda at length fell on 6 Aug., the whole converging movement on Rabaul, begun late in June, made but slow progress. The attack in New Guinea had come to a standstill and, after the fall of Munda, the Japanese dug themselves in on Bairoka, with reinforcements. The Allies were in fact struggling in a vile country, thick jungles, dense thickets, and gullies, against carefully entrenched enemy positions. The scale of the original operation had to be modified. The factor compensating for the slowness and costliness of the land fighting, however, was the increasing scale of Jap. losses in the air and on sea. This was significant not merely in relation to the fighting in the Solomons area, but to the whole 'co-prosperity' (see NEW ORDER) sphere which Japan had to patrol and supply.

A strong force of U.S. and Canadian troops, supported by naval vessels, occupied Kiska in the Aleutians after landings which began on 15 Aug. The Japanese had already abandoned it. MacArthur, in a combined operation in New Guinea, brought off a notable success in effecting a strong landing near Lae, the result of which was to draw a ring round the powerful Jap. bases there and at Salamaua. The Japanese were taken by surprise when an Australian force was put ashore (4 Sept.) to the N.E. of Lae, thereby cutting it off from Finschhafen at the mouth of the bay. The next day Amer. paratroops were dropped in the Markham valley behind Lae, where they were joined by Australians who had covered over 50 m. through jungle and swamp from the Salamaua area to meet them, a remarkable feat of endurance involving a forced march of 5 days. The expeditionary force was protected by a strong screen of Amer. warships and aircraft. Heavy raids on the night of 3 Sept. had temporarily neutralised the Jap. bases on Wewak, Madang, and Rabaul. Jap. aeroplanes rarely appeared, and their navy did not try to intervene. The landing troops poured ashore without hearing a single shot and Lae fell to allied forces on 16 Sept. Lae was an important victory because it was from this base, with its

good anchorage, its airfields, and its coastal connections running to E. and W., that the Japanese directed the defence by land and air of their chain of strongholds, which at one time stretched as far as Buna and Gona. Salamaua fell to MacArthur a few days after the landing near Lae. It had been held by the Japanese since 7 March 1942. Soon after, the Japanese were turned out of Finschhafen by Gen. Blamey, the Australian commander, after he had made a daring landing in the enemy's rear and after some 11 days of fighting. But the pivotal place remained, as always, Rabaul in New Britain. With the hope of at least temporarily neutralising it, a very heavy air attack was launched by the Allies on 12 Oct. Three destroyers, 2 medium-sized merchant ships, 43 small sea-going vessels, and 70 harbour craft were sunk. The Japanese made what seemed to be a strong counter-offensive against Finschhafen, but though supported by air strength, they were thrown back into the Sattelberg. Bougainville Is. was at this time the only Jap. stronghold barring the Allies' way from the central Solomons to Rabaul. There was a second raid on Jap. shipping there on 4 Nov. (see NAVAL OPERATIONS IN SECOND WORLD WAR).

A substantial improvement of the Allies' position in the S. Pacific was effected by the capture on 20 Nov. of the Gilbert Is. (a Brit. colonial dependency) after a short and remarkably successful Amer. combined operation. The recapture of the airfields and harbours of the is. was calculated appreciably to extend the effective range of allied action in the Pacific and, correspondingly, to increase greatly the strain on Japan's naval position, besides bringing nearer the fulfilment of the hope of menacing the big Jap. base at Truk and of the positions in their mandated areas, the Caroline and Marshall Is. Yet perhaps the more immediately important consequence of the capture of the Gilbert Is. was the evidence it afforded of the Allies' growing naval strength in the Pacific.

The battle of New Britain began in mid Dec., when contingents of the Sixth Amer. Army landed on the S. coast of the is. between Gasmata and Cape Gloucester. No Jap. warships and only a fraction of the strong Jap. Air Force in the is. opposed the landing. The increasing activity of the Amer. bomber squadrons over the aerodromes and harbours of New Britain was probably the chief cause of this Jap. loss of the initiative by sea and air which was noticeable at Lae, again in the capture of the Gilbert and Marshall Is., and now again in New Britain. The end of the year, however, found the Japanese still firmly installed in the Ramu valley and on Huon Peninsula in New Guinea, and still holding Madang there, while in New Britain the Americans near Cape Gloucester were meeting with stiff resistance.

It is evident that throughout the period from the early Jap. conquests in the Pacific down to the sinking of the Bismarck Sea convoy on 3-4 March 1943,

and even later in the year, the initiative rested mostly with Japan. The Allies, however, took the initiative in occupying the S. Solomons (Aug. 1942), and again in the limited counter-offensive which Wavell's forces began in W. Burma in mid Dec. 1942. The allied victories in the battles of the Coral Sea (4-8 May 1942), Midway (4 June), the Solomons Sea (12-15 Nov.), the Bismarck Sea (2-4 March 1943), the Papuan campaign (Aug.-Nov. 1942), the action in Milne Bay (31 Aug.), and at Wau (30 Jan. 1943)

had attacked when Russia was pre-occupied elsewhere and when America was still unprepared, even psychologically, for war at all. Other factors which contributed to Japan's success were the utter inadequacy of the defences of the E. possessions of the W. powers and the fact that they underestimated the quality of the Jap. armed forces and Jap. powers of strategy, and also the disparity in lines of communications. Thus all those areas which Japan had coveted as essential units of her 'co-prosperity'

Imperial War Museum: Crown Copyright

LANDING OF U.S. REINFORCEMENTS AT GUADALCANAL, SOLOMON ISLANDS

In the circle are three Japanese planes. Henderson airfield, much bombed and heavily shelled, is in the upper left section of the picture.

were all essentially defensive victories in which the Allies thwarted the designs of the enemy and resisted further aggressive moves on his part. Jap. success in the first 6 months of the war was of so sweeping a character that the Allies could not hope to recover until preparations on the largest scale were completed, and indeed it seemed that the initiative must remain with the Japanese until Germany was defeated, so as to relieve a great weight of sea and air power for concentration in the Pacific. Japan had, in the early months, occupied the richest colonial area in the world, and thereby secured unrestricted access to the raw materials, the lack of which had been the great weakness in her economy. Her success was only in part due to the fact that she

sphere were conquered with but slight loss and in less than 6 months. Yet, curiously enough, the Japanese then seemed to falter. The enemy had occupied Burma and yet did not proceed to the invasion of India, and the probable explanation of this hesitancy was that the speedy progress of her forces had strained her lines of communication. At all events, the Japanese then directed their efforts southward, in the direction of the Solomons and New Guinea, apparently for seizure as stepping-stones to the occupation of Australia and New Zealand. But they sustained an unqualified defeat in Milne Bay and again in the major naval engagement off Guadalcanal (12-15 Nov. 1942), while in Papua the Australians had checked their hazardous overland advance

on Port Moresby, the Owen Stanley range proving to be too formidable a natural obstacle for their troops. But they stabilised their positions at Gona, Sanananda, and Buna, and so compelled the Allies to begin long siege operations against all three. After being expelled from these points their forces, operating from Mubo, S. of Salamaua, tried to take Wau, the main allied base in the goldfields area in N.E. New Guinea, their chief objective being the strategic airfield there, but they were foiled. In all this difficult period of the Allies' ordeal the severest strain was that imposed by the Papuan campaign, which involved dour and bitter fighting in which no quarter was given and none expected, and in which the Australians fought with such distinction. The Papuan campaign estab. the interdependence of land, sea, and air. Swift, efficient co-ordination in the use of all arms marked the early Jap. successes and demonstrated to the Allies that only a tremendous development of air and sea power, either alone or in co-operation with land forces operating either from Burma so as to reach the China coast, or from Australia, or from both, could be expected to achieve the task of expelling the enemy from his numerous consolidated positions in the S. Pacific, in Burma, and in S.E. Asia.

Whether or not Japan could be defeated by taking the war into China was very doubtful. The one obvious way to defeat her was to gain command of the Jap. seas. That alone would make it possible for the Allies to blockade the country and to construct airfields on small is. within a range from which to maintain constant air attack on Japan's home base and so, gradually, to cut off reinforcements and supplies from the Jap. armies on the Chinese mainland and elsewhere. Thus the vital war against Japan was the war at sea, and the advances being made into Jap.-controlled seas and the whittling-down of Japan's sea power by the destruction of both warships and merchant ships were bringing nearer the day when the Jap. fleet must emerge and try to repel the allied fleets. The longer Japan postponed this decisive action, the greater grew the odds against it.

By the beginning of 1944 the initiative on and above the seas and among the multitudinous is. was entirely in the hands of the Allies. On the ground, too, the balance was against the Japanese, the Americans and Australians being now their equals in the arts of jungle warfare. Of the Jap. garrisons previously located among the Solomons only a few troops remained, marooned on Choiseul, and the garrison of Bougainville. In New Britain itself, apart from the strong Rabaul garrison, the Jap. troops were in occupation of a number of ports, which could communicate with each other only by sea, the is. being as dense with jungle and as trackless as New Guinea. From the Jap. failure to intervene in the defence of the Gilbert Is. or to attack the escorts of the expeditionary forces disembarked on New Britain or on the N. coast of New

Guinea, it was evident that their offensive strength at sea had been so impaired by their losses of aircraft-carriers, cruisers, and destroyers that they had resigned the initiative and were condemned to a naval defensive of diminishing strength. Also, since the development of the allied counter-offensive, the Jap. mercantile marine had been subjected to almost daily air attack, and Amer. airmen and their Chinese allies had begun to strike hard at its vessels in S. Chinese and Indo-Chinese ports; Brit. and Amer. aircraft were making the Singapore-Rangoon route perilous; and all over the W. Pacific from the Jap. coasts to the E. Indies it was being subjected to relentless attrition by Amer. submarines. The allied successes did not, of course, presage a speedy termination of the Pacific campaign, nor mark the end of 'island-hopping,' since the seizure of Is. air-bases was a necessary condition of the allied advance either in this theatre or farther W.; but they revealed the ability of the Allies to hold and to exploit the initiative which their sea power had regained.

Attacks on Marshall and Caroline Islands: Paramushir, Kuriles, Northern Pacific. Powerful Amer. air forces, land-based and carrier-borne, were sent by Adm. Nimitz, at the end of Jan. 1944, to attack Jap. bases in the Marshalls. Amphibious forces then landed in the Roi and Kwajalein areas and estab. beach-heads near the enemy bases. Strong opposition was encountered, but Namur was soon captured, and of the Kwajalein garrison of 2000 some 1250 were slain for nominal Amer. losses (2 Feb.). On 4 Feb., by bright moonlight, an Amer. fleet under Rear-Adm. W. D. Baker poured hundreds of tons of shells into Paramushir, in the Kuriles, the prin. Jap. naval and air base in the N. Pacific. The naval bombardment was followed by a bombing attack, the Japanese being taken by surprise and evidently demoralised. These operations marked the first attack of the war on Jap. home ter., apart from an Amer. air raid on Tokyo early in the war. On 16 Feb. strong Amer. task forces of hundreds of aeroplanes by daylight attacked Truk, the great Jap. naval base in the heart of the Carolines. Towards the end of March the U.S. Pacific Fleet made heavy attacks on the Jap.-held Palau Is., some 550 m. E. of the Philippines. The attacking force included aircraft carriers and battleships, and the attacks were co-ordinated with other attacks made by bombers on the Carolines. In these attacks 25 Jap. ships, including 2 destroyers, were sunk, and 200 aircraft destroyed.

New Guinea Landings. Early in the New Guinea campaign small garrisons of Dutch E. Indian troops manned isolated outposts in Dutch New Guinea, supported by small detachments of Americans. Towards the end of March Australian troops were landed, strategic considerations demanding that these outposts, which guarded the approaches through Torres Strait to Port Moresby and Darwin, should be consolidated. This part of New Guinea has a central mt barrier even more

AUSTRALIAN TROOPS IN NEW GUINEA

Members of an Australian infantry battalion in their positions at Green Snipers Pimple, Shaggy Ridge. The capture of this point gave the Australians a feature which dominated the Japanese line of communication and opened the way to Bogadjim.

formidable than the Owen Stanley range, while the coastal region is a large swamp covering tens of thousands of square miles. A month later allied forces landed at 3 different points in N.E. New Guinea, capturing the Humboldt Bay region and Hollandia. This move was a spectacular development in the long-range plan designed to free New Guinea from Jap. control. The operation involved the biggest assembly of air, sea, and land forces yet seen in the SW. Pacific, including a formidable aircraft-carrier force which kept watch for possible enemy interference which might come from the air. By the end of May the end was in sight for the Japanese in New Guinea. Strong isolated centres of resistance survived in the coastline between Alexishafen and Hollandia, but they were a diminishing quantity.

The sea-power of the Allies was unchallenged in a circle radiating from their powerful New Guinea bases. MacArthur's forces were steadily edging westwards. Hollandia, like other selected spots, was attacked from the air, and convoys with strong naval support took in troops and much equipment for the capture and reconstruction of strategic airfields. No considerable opposing force was met in these months. Remarkable work was done by the Americans on this newly recovered ground. It was well suited to spanning the gap of ocean and is, between allied ter. in the Pacific and Japan. It was an engineering expedition rather than a plan of battle. Moreover, by expending the maximum in explosives, ammunition, and supplies, the Americans conserved the lives of their soldiers. They realised that it did not pay to risk man-power to attain an objective that could be won as easily with arms or machinery. Thus highways were carved out of mts or thrown across sago swamps as occasion required; huge bulldozers forced their way through kapok plantations and diverted rivers. Amphibious craft piled from ship to shore in the rush to bring up supplies. Air-strips were laid down swiftly and, having served their brief purpose, were discarded. Possession of advanced fields enabled bombers and fighters to be over enemy ter. at all hours, and all the nearer enemy fields had now come under persistent Amer. and Australian bombing. At night patrolling torpedo-boats were destroying all surface craft they could find. Doomed and desolate at the other end of New Guinea stood Rabaul, a monument to the art of encirclement in war. It was now a target for allied bombers whenever they chose to attack it.

Invasion and Capture of Saipan. Guam retaken. The next important operation was that of the Amer. expeditionary force on Saipan Is., 15 June, most important of the Marianas, 1500 m. S. of Japan. This bold Amer. action was a direct challenge to the enemy in a vital area; for the loss of Saipan would threaten the inner ring of Japan's conquests and her communications through the China Sea. Japan decided to try a surprise attack on the U.S. Fifth Pacific Fleet, which, together with Brit. naval units, was engaged in protecting the forces invading Saipan. On the evening of 20 June, however, an attack on the Jap. fleet was made by Amer. aircraft and naval units, which bombed and sank 3 carriers, 1 battleship, a destroyer, and smaller vessels, there being no actual loss of ships on the Amer. side. In these engagements the Americans lost 110 aircraft as against 335 Japanese. Saipan was now virtually lost to the enemy. Originally it had a Jap. garrison of 20,000, in an area of 70 sq. m. Of that garrison 19,000 died fighting. Amer. casualties were correspondingly heavy, 15,000 in killed and missing. This was by far the biggest-scale fighting in the is., as also the most ferocious. It was found that there remained at least 45,000 Japanese in the Wewak-Aitape area of New Guinea, and there were signs that they.

too, cut off by allied sea-power, would, like the Saipan garrison, fight to the last. But the Saipan victory proved that the Allies held the initiative. The gradual, if slow, approach of allied arms to Japan proper was marked on the night of 9 July, when Amer. Superfortresses attacked the Jap. mainland for the second time within a month, bombing installations at the great naval base of Sasebo, on Kyushu Is., and industrial objectives at Yawata, 65 m. farther E. The loss of Saipan precipitated a political crisis in Japan, for Tojo ceased to be Prime Minister, a new ministry being formed under an admiral and a general. Added to the loss of Saipan was the knowledge of the military and naval chiefs that utter disaster threatened Japan in the S. seas, and in that 'co-prosperity' sphere which Japan had marked out as her own. Defeat in Burma, where the much-publicised invasion of India had proved a costly failure; the mounting losses of the Jap. mercantile marine (Brit. submarines at this time sank over a score of Jap. supply vessels, besides damaging others); the impotence of the navy to rescue, reinforce, or even revictual the starving and fever-stricken armies marooned in New Guinea and other Pacific is.—these were the fruits of Tojo's stewardship. His successors could have no very good hope of extricating Japan from the plight into which Tojo had led her by his policy of dispersing Jap. strength over a multitude of is. which falling sea-power could not defend. On 21 July an Amer. expeditionary force of marines and infantry invaded the much-battered and important is. of Guam, which had fallen to the Japanese on 12 Dec. 1941, and which is the southernmost and largest of the Marianas, 130 m. S. of Saipan. The invading force went ashore under cover of a heavy bombardment from carrier aircraft and warships of the Fifth Fleet and estab. beach-heads at all predetermined points. Guam's importance to Japan lay in the fact that it covered her supply line through Burma and the Dutch E. Indies. Amer. tanks were landed within 4 hours of the attack on 21 July. The struggle, however, promised to be a hard one, comparable to the fighting in Guadalcanal. But by 10 Aug. all organised resistance had ceased.

American Invasion of the Philippines. Thousands of Japanese still remained in Brit. New Guinea, New Britain, New Ireland, and the Solomons; but all were watched by allied garrisons at well-chosen vantage-points and subjected to almost daily bombing, besides being worn down by starvation and disease. Hence these large bodies of enemy troops were no longer a menace, though sooner or later they would have to be dealt with. Thus the Allies were free to develop their campaign against the Philippines. On 15 Sept. Amer. marines and army assault forces of Adm. Nimitz's command landed in the Palau Is., Japan's nearest and strongest bastion E. of the Philippines, 550 m. away. Simultaneously Gen. MacArthur's force successfully occupied

the Morotai Is., 300 m. SE. of the Philippines. The way for both landings had been prepared by massive attacks on the central Philippines by carrier aircraft of the Pacific Fleet a few days earlier. A week later, on 2 consecutive days, carrier-based aircraft raided Manila for the first time, a convincing proof of the Allies' rapidly growing superiority in carriers. By this date (25 Sept.) the U.S. Third Fleet in the far W. Pacific had sunk 122 ships (excluding 61 small craft), damaged 137 ships and 109 small craft, and destroyed 980 aircraft. These operations of the Third Fleet had forced the Japanese to withdraw their naval forces from their former anchorages in the Philippines and seek new refuges in the same general area. Japan's sea lanes were now confined to the China Seas, the rest of the wide Pacific being dominated by the U.S. fleet, while the Jap. Navy stood off, unwilling to risk an encounter. The war-makers of Japan evidently believed before 1941 that if they could get all the known is. airfields and build a few others in the outer periphery they would be unassailable. They omitted from their calculation the tremendous industrial potential which permitted the Americans to go into any is. or atoll, tear down tracts of jungle, and build there new first-class air-strips in days or weeks. Heavy blows now rained down on Jap. shipping resources. The expected Amer. invasion of the Philippines began on 20 Oct., when, in a great amphibious operation, MacArthur's forces seized the E. coast of Leyte Is., 600 m. N. of Morotai and 2500 m. from Milne Bay, whence the offensive, in effect, had begun 16 months previously. By seizing Leyte, which lies between Luzon and Mindanao, the Americans split the Jap. forces (estimated to number 225,000, under F.-M. Count Terauchi) in the Philippines in two. The landing was preceded by a devastating naval and air bombardment. Within 10 days the Americans had disorganised the Jap. defence of Leyte, the enemy's losses in killed and wounded being 14,400, or half their force, and also captured virtually all Samar, the is. next to Luzon. Tacloban, the cap. of Leyte, and its airfield were captured soon after the landing, as also was the airfield at Dulag, thus giving the Americans airfields from which eventually the rest of the Philippines might be won back. Great as was the real strategic significance of the invasion of Leyte, the political and moral aspects of MacArthur's return to the Philippines in Filipino eyes tended to overshadow the military aspect, for in 1942 nothing had so deeply underlined the truth of Japan's initial advantage as her capture of the Philippines, despite the utmost efforts of a supremely tenacious defence. Simultaneously with the advance into Leyte, the Jap. Navy sustained a very heavy defeat in the Philippine Sea, some 58 Jap. warships being sunk or damaged (for details see NAVAL OPERATIONS). The conquest of Leyte was practically completed before the end of the year, the Jap. losses being over 80,000, compared with some 10,400 Amer. casualties.

On 9 Jan. 1945 MacArthur led the invasion of Luzon. The invasion was one of the biggest amphibious operations of the war, over 100,000 men being landed, with their supplies and great quantities of tanks and guns, from an armada of 1000 ships, including 800 transports. President Osmena, of the Philippine Commonwealth, issued a proclamation on 10 Jan. exhorting all Filipinos to rally to MacArthur's forces. Bombing of key-points and bridges on the railway from Manila to Lingayen, of airfields close to Manila, and of bases at Baguio and Rosario, to the NE. of Lingayen Gulf, seriously obstructed the movement of Jap. reinforcements towards MacArthur's chosen battle-ground on the great central plain.

Manila captured by the Americans. The Jap. rout in Luzon was a foregone conclusion, for their local air-power and airfields had been destroyed long before MacArthur's landings, and their garrison had been much depleted in a vain effort to stave off defeat in Leyte. Moreover, MacArthur's intelligence service throughout the Jap. occupation had been remarkably reliable, being supported by Filipino co-operation. Four Amer. divs. were employed at the beginning of the campaign. One held the right and two the left flanks, while the main advance was made by the 37th Infantry Div. towards Manila. Subsequently the 1st Cavalry Div. was added, and these 2 divs. reached the outskirts of Manila on 3 Feb. Meanwhile diversionary landings had been made in Subic Bay and on the Batangas Peninsula, while an airborne div. moved northward from Batangas to close the pincers. The whole plan was well conceived, but the Japanese so neglected their opportunities that it was never put to any severe test. A Jap. force still held out within the walls of the old Sp. city of Manila with desperate ferocity, but it was already unlikely (16 Feb.) that the rest of the Jap. garrison could be of more than a nuisance value in the country around Baguio or farther N. In W. Luzon Bataan was captured (16 Feb.) by the Americans after landings on the S. coast.

Sumatra Raided. On 24-29 Jan. 1945 2 strong attacks were made by aircraft of the E. Fleet on Jap. oil refineries on Sumatra. A powerful force, commanded by Sir Philip Vian, struck a crushing blow at the enemy's oil supplies. These attacks were made by carrier-borne aircraft on refineries at Palembang in S. Sumatra. At the same time as this heavy blows were struck at Iwojima in the Volcano Is. by battleships and cruisers, which bombarded the is. on 24 Jan.

Tokyo bombed. Invasion of Iwojima. The first of a series of air attacks on Japan was begun on 16-17 Feb. 1945, when 1500 Amer. aircraft attacked Tokyo and Yokohama. These aircraft were launched from an immensely powerful Amer. naval force, which included a score of the fastest and largest carriers, escorted by battleships. The air attack on Tokyo gave the Japanese a terrible lesson in Amer. power. The command of the sea secured by the battles off the Visayas in

Oct. 1944 had given the Amer. high command the opportunity of carrying the war to the heart of Japan whenever it chose. While Adm. Mitscher's task force of carriers and escorts was thus engaged, another force was in action off the Bonins, which are less than 700 sea miles from Tokyo Bay. This force was bombarding and bombing the enemy's positions on the already much-bombed is. of Iwojima as a prelude to landing. Amer. marines landed on Iwojima on 19 Feb. Some 800 vessels, including battleships, took part in the attack. The invasion of Iwojima was one of the sternest tests in the hist. of America's wars, and Amer. casualties were heavy, for the enemy was seasoned and expert and took every advantage of the broken, boulder-strewn terrain, and was strongly supported by artillery, mortars, rockets, and machine-guns, besides extensive minefields.

Battle for Intramuros ended. In Manila there had been some weeks of most bitter fighting, but by 20 Feb. the Japanese had been compressed into an area of only 1200 yds by 800 yds in the walled city of Intramuros. Jap. casualties in the 6 weeks' campaign on Luzon were at this date (20 Feb.) 92,000 and the Amer. 13,000. The battle for Manila ended on 24 Feb. 3 weeks after the Americans had entered the city.

The Americans in Corregidor. MacArthur returned to Corregidor on 2 March, 3 years after the Japanese had overpowered the exhausted Amer. garrison and he himself had flown to Australia. Its reconquest began on 18 Feb., when the first Amer. assault troops landed after a massive bombardment had silenced the great guns of the forts. Some 3000 Amer. infantry and paratroops, who carried out the attack, were opposed by double the number of Japanese; but their casualties were relatively light, while the Japanese left over 4200 dead. The battle for Luzon was now reaching its end. Amer. airborne troops, having captured Balayan, had reached the S. end of the is.

Further Raids on Japan. Further air attacks were made on Japan on 9 March, by which time some 15 sq. m. of Tokyo, the heart of the city's business and industrial dists., were only a blackened and smouldering ruin. At the same date other Superfortresses, which had flown from bases in the Marianas, attacked Nagoya in great strength. Osaka was pounded on 13 March.

Invasion of Okinawa. Japanese Fleet defeated South of Kyushu. Tokyo's Arsenal Area burned out. In a carrier-plane assault on the Inland Sea, 18-19 March, a task force of Adm. Spruance's fleet, under Vice-Adm. Mitscher, damaged a score of Jap. ships and destroyed about 500 planes. No Amer. ships were lost, and Amer. aircraft losses were extremely light.

An Amer. force of about 100,000 men, supported by a large fleet of warships, including a Brit. task force under Sir Bernard Rawlings, invaded Okinawa, largest of the Ryukyu Is. (67 m. long), some 325 m. SW. of Kyushu, in the biggest

amphibious operation of the Pacific war. The landings began on the W. coast on 1 April, and very soon 2 airfields were captured. The Jap. garrison numbered some 100,000 men. It was to be expected that the Japanese would offer fanatical resistance, especially as the distance of the is. from the Jap. mainland was only half that between Japan and the is. of Iwojima (660 m.), which latter was now in Amer. hands. The Jap. fleet slipped out from its Inland Sea bases with the evident intention of attacking the Amer. invaders of Okinawa or the allied warships protecting the land forces there. But on 7 April 6 of the enemy warships, the 45,000-ton *Yamato*, 1 light cruiser, and 4 destroyers, were sent to the bottom, while another destroyer was set on fire, in a 2-hour engagement with aircraft of Mitscher's carrier force, 60 m. S. of Kyushu. Of all the enemy ships engaged only 3 destroyers escaped. Only 1 ship of the U.S. force suffered minor damage and 17 naval aircraft were lost. In all engagements during the 2 days the Japanese lost 417 aircraft. It was calculated by Amer. naval officers that in this engagement Japan lost about a quarter of what remained of her navy.

Meanwhile Amer. marines were pushing northwards in Okinawa against negligible resistance, but Amer. troops moving southwards were making only slow progress. On 20 April, in one of the fiercest battles of the Pacific war, 3 Amer. infantry divs., after a deadlock of a fortnight, launched an attack against these intricate defences following one of the heaviest bombardments ever made in the support of amphibious troops. Meanwhile Amer. Superfortresses continued their series of attacks on Tokyo and other tns in Japan.

The Battles for Okinawa. There was to be no easy conquest of Okinawa. As a vital outer defence to the Jap. mainland the Jap. troops in Okinawa meant to fight to the death. The number of their dead had risen to nearly 39,000 by 10 May, at which date the N. half of the is. was under Amer. control. A few days later Amer. infantry were fighting in Naha, chief tn of the is. The allied objective was to secure airfields on Okinawa for intensified air raids on the Jap. mainland, and the Japanese had to prevent this at all costs. Many 'suicide' attacks at terrific cost were made by Jap. planes against Amer. warships and ground forces at Okinawa. By the beginning of the eighth week of the great battle for the S. part of the is. the Amer. troops had not yet broken the main line of the Jap. defence. Though they had made their initial landings without opposition, they had been able to advance only 7 m. in as many weeks. Though by 20 May the total of Jap. dead had risen to more than 48,000 out of a force estimated to have been in the beginning 85,000, their fighting was still as resolute, skilled, and fierce as ever, though they were constantly under fire from naval guns, ground artillery, and small guns, and from aircraft many times greater than the fire they could return. The Amer. losses by this date were 8300 dead and 22,200 wounded.

Tarakan invaded. Australian and Dutch troops, who landed on Tarakan Is., off the N.E. coast of Borneo, on 1 May, soon gained control of nearly all the practicable area, including the cap., the roads, and the oilfields, leaving the Japanese with only the central hilly part. Here again, as on Okinawa, Jap. resistance was most tenacious and the natural obstacles were great.

Japanese Cities bombed. Meanwhile massive air raids were being constantly carried out against the Jap. mainland cities. Some 9 sq. m. of densely populated Nagoya, one of the largest centres of Jap. aircraft and machine-tool production, were laid waste on 13 May, when 500 Superfortresses from the Marianas bombed the N. and N.E. areas of the city with 3500 tons of incendiary and explosive bombs. This was the fourth time Nagoya had been heavily attacked by Superfortresses. Two days later Nagoya was again attacked with incendiaries, and on 26 May a strong force of Superfortresses dropped 4000 tons of incendiary bombs on Tokyo. Yokohama was attacked for the first time by Superfortresses on 28 May. At the same time further blows were struck at Tokyo and at Kawasaki, between the cap. and Yokohama. On 5 June nearly 500 Superfortresses made an incendiary attack on Kobe, the targets being railway stations, steel works, and shipyards. A similar force of bombers made a daylight raid with incendiaries on 31 May on Osaka, the targets being harbour facilities, shipyards, aircraft-propeller works, and electric power stations. Six days later the city's arsenal was attacked by bombers with high explosives as well as incendiaries.

Wewak and Bougainville Battles. Meanwhile it remained to reduce the Jap. troops still holding out in parts of New Guinea and the Solomons. In an amphibious operation Australian troops captured Wewak Peninsula and Wewak airfield in N. New Guinea in an assault aimed at the capture of the major Jap. base of Wewak (11-13 May). By 15 May the Australians were in control of Wewak harbour. Elsewhere in the S. Pacific there was heavy fighting in Bougainville Is. In 6 months of fighting on this is. the Australians had killed 5000 Japanese and advanced 60 m. S. to the Pororei R. and 75 m. N. to Bonia Peninsula and estab. themselves across the Hongorai R.

Okinawa almost conquered. The conduct of the Okinawa campaign did not satisfy all Amer. critics, some of whom pronounced the campaign to be a set-back. Truman announced that army casualties on Okinawa between 18 March and 29 May were 10,221 killed and missing and 27,704 wounded. Jap. deaths were sixfold those of the U.S.A. On 2 June a fresh landing was made by Amer. troops on the Chinen Peninsula. Most of the peninsula was occupied on the 4th, together with almost all the Naha airfield. Only 16 sq. m. of the is. remained in Jap. hands on 11 June, but the campaign was still difficult. By 20 June the Jap. defence of Okinawa was in its last stage, for of the original

garrison estimated at 100,000 only some 2000 were now still alive, and these were trapped. With the reduction of the is., the Americans had secured an air base of incalculable value, being only 330 m. from the nearest Jap. home is. From this base and from bases in Iwojima and the Marianas the Americans were now able to bomb Japan daily with such a weight of explosives as had never been dropped anywhere before. Moreover, from Okinawa they could now maintain such a command of the approaches to Japan from the S., from the Chinese mainland, and from Korea, that the Jap. dwindling stream of supplies from the outside world would soon be almost stopped; for on its E. coast Okinawa had a deep-water anchorage big enough for a great fleet, and sheltered from typhoons.

Japanese Garrisons in the Philippines, Solomons, and New Guinea marooned. Truk bombarded by British Fleet. While the weight of the allied attack on the heart of Japan was now increasing rapidly, its front was being steadily broadened. In the Philippines the enemy's situation was desperate, for MacArthur's forces were crushing the remnants of the largest army which the Japanese had sent overseas since they attacked Britain and America. What the Jap. war leaders feared above all was the explosion of the legend of a divinely assured inviolability of the Jap. homeland, and so far allied bombers had destroyed nearly 1,250,000 buildings and rendered 5,000,000 persons homeless in half a dozen of the chief cities from March to May, and still the attacks were mounting in power. In the SW. Pacific the Australians were steadily wearing down the resistance of the marooned garrisons in New Guinea, New Britain, and Bougainville. In the central Pacific large garrisons, by-passed by the Americans, sat aimlessly in Truk and other atolls awaiting the supplies that never came. Truk atoll, the 'Gibraltar' of Japan, was attacked by the Brit. Pacific Fleet on 14-15 June. Aircraft carriers, cruisers, and destroyers left the place a battered wreck; but it was still estimated to hold a garrison of 40,000, and therefore still constituted a threat to allied forces and bases in the SW. Pacific area. Meanwhile the Allies opened new fronts in Borneo and in China. While Australian and Dutch troops were overcoming Tarakan, other Australian forces landed on Labuan and at points near Brunei in the N. of Borneo. In China the Japanese at length seemed to be losing ground, for a Chinese advance won back Foochow, while another Chinese attack from Kweichow was threatening the Jap. land communications from Indo-China.

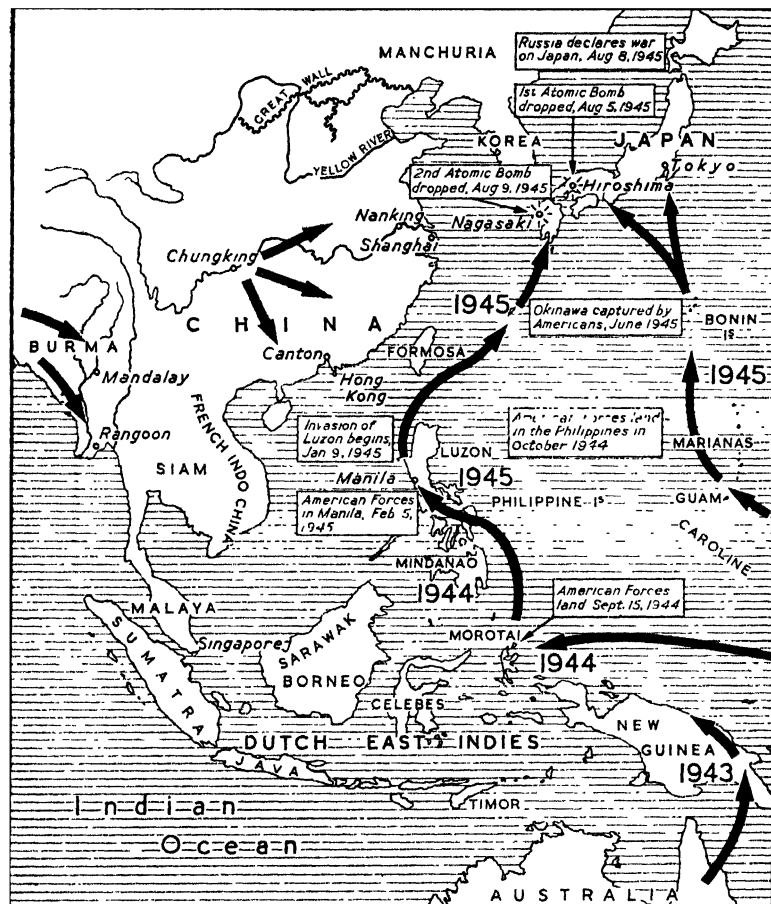

Japanese Key Defences on Borneo isolated. The Battle for Balikpapan. Australian troops, under cover of a combined Amer. and Australian naval escort, made a further landing in N. Borneo on 19 June at the refinery centre of Lutong in the Brit.-protected state of Sarawak, the Japanese making no attempt to hinder the landing. Other Australians landed on 1 July at Balikpapan, in SE. Borneo,

after a heavy naval and air bombardment by U.S. forces. MacArthur went ashore with the first wave of assault troops. The Jap. key defences on Borneo had now been isolated by this new landing, following on the seizure of the bases of Tarakan Is. and the Brunei Bay area and Miri oil-field. Furthermore, the strategic Macassar Straits, gateway to the Java Seas, were now controlled by allied surface craft, as well as by aircraft and submarine. The whole extent of Java and the important ports of Surabaya and Batavia were now within easy flight range. Allied ships could now, with land-based cover, go to any point in the SW. Pacific. But there was very heavy fighting for Balikpapan. The main part of the tn fell to the Australians on 3 July. A scene of desolation confronted the Australians as they doubled from the encircling ridges into the centre of the tn, which the Japanese finally surrendered almost without a fight.

Anglo-American Naval Air Attacks on Tokyo Area. More than 1000 naval aircraft of the Amer. Third Fleet struck at Tokyo on the night of 9 July. Four battleships, 4 cruisers, and 14 destroyers also took part. This was the thirty-fourth consecutive day of air attacks on the Jap. mainland. Two days later Adm. Nimitz announced confidently that the Americans had won 'complete mastery of the skies over Tokyo.' The main is. of Honshu came under terrific attack on 9-10 July. Hundreds of carrier-borne bombers swept over the 100-m.-wide Kanto plain, aircraft centre of Tokyo's defences, while incendiaries and explosive bombs rained down on half a dozen industrial tns. On the 16th Brit. ships took part for the first time in air attacks in great strength against the Tokyo area.

Thus the storm of attack now beat more fiercely every week on the airfields, ports, and industrial cities of the Jap. homelands. Blows that at first were struck from the air alone were now also being delivered by the Amer. and Brit. fleets. So far the Jap. battle fleet, sorely crippled by its heavy defeat off the central Philippines the previous Oct. and by the great air attacks it had subsequently endured, had remained passive and had done nothing to protect coasts which the Jap. people had until this period believed inviolable. Even the suicide aircraft which had often inflicted loss and damage on the allied fleets in May-June were now conspicuously absent in these latest operations.

In Jap. home waters, most important of the sev. theatres in which the Far E. war was being fought out, the concentration of allied strength had now reached massive dimensions. Great fleets had gathered together. The ring of allied air bases was contracting and closing in on Japan. Attack which in the previous spring could be launched only by bombers of the longest range from the Marianas and Guam could now be delivered from Okinawa. Steaming boldly inshore on 15 July, where the rugged Muroran hills are plainly visible, the Amer. battleship *Iowa* and other ships of the bombardment group

pounded the great Nihon steelworks and Wanishi iron-mills on Hokkaido. Not a single Jap. plane appeared, nor did the shore batteries reply. Extensive damage was inflicted by Brit. and Amer. carrier-aircraft on 16 July on Jap. warships, merchantmen, and airfields in the Tokyo area. On 20 July, a force of 600 Superfortresses dropped 4000 tons of incendiary and other bombs on the industrial cities of Choshi, Hitachi, Fukui, and Okazaki.

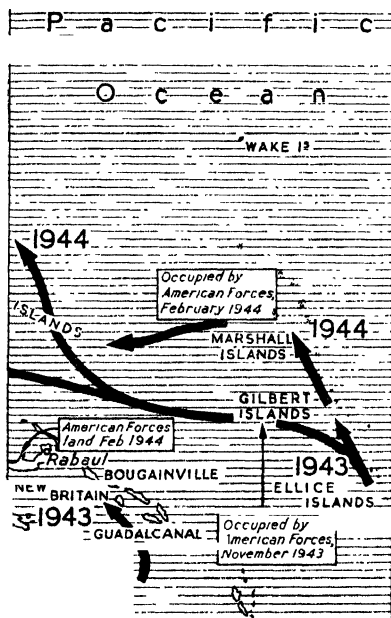

Australian Victories in Borneo. Meanwhile the Australians in Borneo crossed Balikpapan Bay, landing on its W. coast and pressing inland against negligible resistance. But in the N. and NE. there was bitter resistance. However, the Australians took the Manggar airfield on

10 July and on the 10th captured Mt Batochampar, the fall of which marked an important stage in the campaign. Samboja, two-thirds of the way to the main oil production area, was taken on 20 July.

Anglo-American Air Attack on Japanese Fleet. Further Superfortress Raids on Japanese Cities. Adm. Halsey's Anglo-Amer. carrier aircraft, towards the end of July, attacked the Jap. fleet in its bases at Kure and Kobe. One battleship, 2 carriers, 3 cruisers, 1 destroyer, and 3 submarines were sunk, and 4 destroyers, 2 destroyer escorts, and 6 freighters damaged. Some 94 Jap. planes were wrecked and 56 others damaged. Opposition was negligible.

FAR EASTERN FRONT · 1943-45

 Allied thrusts
and progress across
the Pacific battle area

Heavy air attacks on Jap. industrial centres continued. On 1 Aug. 800 Superfortresses, the largest force launched against Japan in the war, dropped a record load of 8000 tons of bombs on the industrial towns of Hachioji, Toyama, Nagasaki, Mito, and the petroleum estab. at Kawasaki.

Mounting Toll of Japanese Naval Losses. Jap. shipping continued to suffer ever-increasing losses. During July Amer. aircraft from Okinawa destroyed or damaged 250 Jap. vessels totalling 250,000 tons. The object of this intensified air war was to cut off Japan from her sources of raw materials, food, and fuel, but irreparable damage was also done to her internal communications, naval bases,

airfields, and factories. To accomplish these purposes Okinawa was being expanded into the greatest air base in the world. The Jap. navy had virtually disappeared as a fighting force. Japan seemed to repose some hopes on the suicide aeroplane as a secret weapon, but while this aeroplane had unquestionably done damage, it was negligible as an effort to diminish the terrible crescendo of air attack that was now crashing down upon the ports and cities of the homeland.

The Atomic Bomb. *Russia declares War on Japan.* On 6 Aug. a selected port, Hiroshima, was made the victim of the Anglo-Amer. new secret weapon, the first atomic bomb. Only 1 bomb was dropped on that day, but it had an explosive power equal to 20,000 tons of trinitrotoluene and had more than 2000 times the blast power of the largest bomb used up to that time. Small wonder that part of Hiroshima, a town of 244,000 inhab., was wiped out at one single blow (see further HIROSHIMA). Then on 8 Aug. Russia declared war on Japan, and on the next day the Red Army attacked along the Manchurian border.

Japan surrenders. A second atomic bomb was dropped on 9 Aug., this time on Nagasaki. The bomb used here was said to have rendered obsolete that used against Hiroshima. One-third of Nagasaki was wiped out. The use of the atomic bomb received even at the time a mixed reception from public opinion both in America and in Britain, and, subsequently, its use at this stage of the war, when Japan was already clearly defeated, has been questioned on moral grounds by numerous commentators and thinkers. It is only necessary to state here that the bombs were a means of hastening the collapse of Japan. For apart from having no defence to the new bomb, Japan's sole recent successes in the war were those won by suicide aircraft, which had sunk 24 warships and damaged 164 others with great loss of life. Months before the dropping of the first atomic bomb Japan had been brought to measurable distance of collapse as a result of the destruction of her fleet and the increasing air blows at the homeland, although Japan still had a very strong army (in the homeland 2,000,000 trained professional military personnel, in China, Manchuria, and Formosa 3,000,000 men), and a considerable air force (11,000 aircraft, of which 6000 were combatant types). Japan had, however, entered the war with 12 battle-ships and now had but 1, the *Nagato*, and even that was heavily damaged and without a crew. Of her 9 front-line carriers the *Hatake* and the *Katsuragi*, both heavily damaged, alone remained. Of 19 heavy cruisers, only 2 remained, both badly damaged. Similarly, of 24 light cruisers, but 2 were left. The number of destroyers, estimated originally at 165, was now reduced to 26, sev. of which were badly damaged. Of the original 140 first-line submarines only 16 remained, in addition to 6 former Ger. U-boats. Even so, the invasion of Japan might have been resisted to the end, and would no doubt

have entailed enormous casualties, a prospect which was unquestionably eliminated by the dropping of the atomic bomb. The same day the atomic bomb was dropped on Nagasaki the Jap. Gov. announced their readiness to accept the Allies' Potsdam terms of surrender, provided they did not prejudice the prerogatives of the emperor. The Allies' reply, while not asking for the emperor's abdication or dethronement, made it clear that his authority, together with that of the Jap. Gov., should be subject to the allied supreme commander from the moment of surrender and that the emperor himself would be required to authorize and ensure the signature by the Jap. Gov. and the imperial general H.Q. of the surrender terms, and, further, that the emperor must issue orders to commanders in the field to cease fire and surrender their arms, and be ready to issue any other orders which the allied supreme commander might demand in order to give effect to the surrender terms. On 14 Aug. Japan surrendered, and it was on that date therefore that the Second World War came to an end. The emperor issued orders for all Jap. forces to cease fire. At the same time Marshal Vassilevsky sent the Jap. Kwantung Army an ultimatum to surrender its arms by 20 Aug. By 17 Aug. Jap. forces had begun to surrender on sev. sectors of the Manchurian front. Hostilities in Bougainville ceased by 19 Aug. On 20 Aug. Lord Mountbatten, supreme allied commander of the SE. Asia Command, broadcast directions to F.-M. Count Terauchi, commander of the Jap. Southern Army, to send a representative with plenipotentiary powers to meet his chief of staff at Itanogoon, and the meeting took place there on 26 Aug. By 23 Aug. the Japanese in the Philippines were beginning to surrender in large numbers as the news of the capitulation reached the mt fastnesses.

Russian Campaign in Manchuria. In broad outline this whirlwind 16-day campaign, in which the Russian armies were under the supreme command of Marshal Vassilevsky, consisted in the envelopment of the 3 main Jap. fortified areas: the Hallar-Solun area in W. Manchuria, the Sungari-Sakhalyan in N. Manchuria, and the maritime area in E. Manchuria. Operations were planned to take every advantage of the superiority of Russian armour over Jap. anti-tank weapons. Attacking on a broad front in the E., Marshal Meretskov's forces came to grips with the main forces of the Jap. Third Army in the first days of the campaign by outflanking the frontier defence zone. From the N. Gen. Purkayev, by a wide manoeuvre to Mergen, surrounded the Jap. 123rd Infantry Brigade and blockaded the Sakhalyan defence zone. Up the valley of the Sungari other forces of Gen. Purkayev's command thrust towards Harbin. From the W. Marshal Malinovsky by-passed all Jap. positions W. of the great Khingan range by throwing armour forward in a spectacular advance. By 20 Aug. the Russians had conducted vast enveloping moves which

brought the whole of Manchuria from the borders of Inner Mongolia to the sea of Japan, and from the middle Amur to the Yellow Sea, within the grasp of their armies. Soon afterwards Russian airborne troops landed in the tns of Dairen and Port Arthur and began to disarm the garrisons. By the 23rd the Russians were in occupation of the whole of Manchuria, S. Sakhalin, and the Is. of Shumshu and Paramushiro in the Kurile archipelago. On that day the Jap. Kwantung Army, after unsuccessful counter-attacks, laid down their arms and surrendered to the Red Army.

Allied Troops enter Japan. Amer. airborne troops landed at Atsugi airfield, 18 m. from Tokyo, on 28 Aug. to prepare for the formal occupation under MacArthur. A huge armada of allied warships had now assembled off the coast of Japan. Four-fifths were Amer. ships, the rest mainly Brit., together with Brit. Dominion and some Dutch. Some 9 allied ships entered Tokyo Bay on the same date. The main landing of allied troops began the next day, airborne forces arriving in strength at the Atsugi airfield, while Amer. and Brit. marines disembarked at Yokosuka naval base. Meanwhile (30 Aug.) a strong Brit. naval force, under Rear-Adm. Harcourt, entered the harbour of Hong Kong. No actual instruments of surrender had yet been signed owing to the physical difficulties imposed by great distances and the fact that large numbers of Jap. forces were scattered over far-flung areas of the Pacific. But on 2 Sept. Jap. envoys, in the presence of 50 allied generals and other senior officers, signed the allied instrument of unconditional surrender aboard the Amer. battleship *Missouri* in Tokyo Bay, and immediately afterwards a convoy of 42 ships entered the bay and landed 13,000 Amer. troops for the march on the cap. There were other formal surrenders to be made in Luzon, New Guinea, the Solomons, Malaya, and Burma; but with the signing of the instrument of surrender on the *Missouri*, Japan had at last come to the end of her dream of conquest. MacArthur signed the surrender documents as supreme commander, Adm. Nimitz signed for the U.S.A., Adm. Sir Bruce Fraser for Britain, Gen. Heu Yung-chang for China, Lt.-Gen. Kuzma Deevyanko for Russia, Gen. Blamey for Australia, Air-Vice Marshal Isitt for New Zealand, Gen. le Clerc for France, and Gen. L. H. van Oyen for the Netherlands. Mamoru Shigemitsu, former ambas. in London for the emperor, and Gen. Yoshijiro Umezu for the Jap. Imperial General Staff. Some 200,000 Jap. troops on various by-passed Pacific Is. laid down their arms on 3 Sept. at 5 minor surrender ceremonies aboard Amer. warships in the SW. Pacific. These were Truk, naval strongholds in the central Carolinas, Palau, the Bonins, N. of Guam, Rota in the Marianas, and Pagan, N. of Saipan.

British Forces enter Singapore. Adm. Sir Arthur Power, commander-in-chief of the E. Indies Fleet arrived at Singapore on 3 Sept. with a Brit. naval force, Royal

Marines having taken over Penang the same day. Brit. and Indian troops landed at Singapore on 5 Sept.

The surrender in the SW. Pacific was signed on board H.M.S. *Glory* in St George's Channel, 28 m. SE. of Rabaul, on 6 Sept. Gen. Inamura, commander-in-chief in the SW. Pacific, handed his sword to Lt.-Gen. Sturdee, commanding the Australian First Army, and both he and Adm. Kusaka, commanding the Jap. fleet in the area, signed the surrender.

Surrender in South-east Asia Area. The official surrender in SE. Asia took place in the council chamber of the municipal buildings in Singapore. The Jap. representatives were Gen. Itagaki in place of Count Terachi, the supreme commander, and the commanders of the Jap. armies in Siam, Burma, and Singapore, and of the enemy fleets based on Singapore and Surabaya. At the head of the allied officers was Adm. Mountbatten, the supreme commander of the area, with Lt.-Gen. Slim, commanding the forces in the area of SE. Asia, Adm. Sir Arthur Power, Air Marshal Sir Keith Park, and Lt.-Gen. Wheeler, deputy supreme commander.

Japanese surrender in New Guinea. It was not until 13 Sept. that Gen. Adachi, commander of the Jap. Eighteenth Army, surrendered the Jap. forces in New Guinea to Maj.-Gen. H. C. H. Robertson, commander of the 6th Australian Div. Thus ended a long and arduous campaign in which the Australians encountered some of the toughest enemy forces in the Pacific. The Australians had succeeded the Americans in Nov. 1944, but for some time could only act on the defensive in New Guinea and in its satellite is. Bougainville. Wewak, garrisoned by 20,000 Japanese, was not taken until the end of March 1945, and the final offensive in Bougainville was not launched by the Australians until early in April. But by the end of July the Jap. 41st Div. had been virtually annihilated, while in Rabaul the Australians were effectively containing an enemy force of no fewer than 50,000 men.

Burma and Hong Kong surrendered. On the same day (13 Sept.) Gen. Ichida signed the instrument for the surrender of Burma to the Brit. Twelfth Army at Rangoon (see further BURMA, SECOND WORLD WAR, CAMPAIGNS IN). The Japanese in Hong Kong did not surrender until 16 Sept., though the R.N. had been in possession of the dockyard since 30 Aug.

Japanese Atrocities. The State Dept. in Washington lost no time in apprising the world of Jap. atrocities. The dept. on 5 Sept. pub. a long document containing the unsavoury story of 'Japan's barbaric torture and wanton murder' of Amer. prisoners of war and charging Japan with the violation of practically every law concerning the treatment of prisoners of war and internees.

Pacific Girdle, see under IGNEOUS ROCKS; VOLCANO.

Pacific Ocean, largest div. of the hydrosphere, extends from the Southern Ocean (lat. 40° S.) to Bering Strait, i.e. practically to the Arctic Ocean; it is, however, coextensive with the Southern Ocean to 80° S. lat.; it divides the Old and New Worlds, and is roughly bisected by 170° S. long.; greatest breadth, 10,000 m.; length, 7000 m. In shape it is very roughly pentagonal, very broken to the W. and SW., where it communicates with the Indian Ocean; it has an area of 63,634,000 sq. m., nearly 40 per cent of the whole water extent of the world. The temp. and salinity show no very marked abnormalities, though the P. O. is in general less saline than the others.

Coast-line. The coasts of America which meet the P. O. are steep and even, with fjord formation in the N. and S. Australia shows a somewhat similar coast, but the Old World presents a series of fringing seas with festooned is. enclosing them, and a much gentler slope of coast; the continental shelf is here more extensive. The drainage area is relatively small, only a little more than one-quarter that of the Atlantic, although the actual ocean surface is 12 times as great. The terrigenous deposits are correspondingly small and nearer land, mostly covering the fringing seas. Red clay occupies about three-fifths of the whole area lying towards the E.; globigerina ooze, two-thirds of that in the Atlantic, occupies the intermediate depths towards the W. and off S. America.

Depth. The average depth of the P. O. is 14,000 ft. and it exceeds that of the other oceans; the W. is deeper than the E., and the N. than the S. Some of the great depths appear to lie up against the festooned is., e.g. the Tuscara Deep (maximum 4685 fathoms), lying along Japan and the Kuriles for 400 m., and the Aldrich Deep, E. of New Zealand (maximum 5155 fathoms). The greatest known depth is 5940 fathoms (6½ m.), in the Marianas Trench 200 m. SW. of Guam, sounded in 1951 by the Admiralty survey ship H.M.S. *Challenger*. The Amer. *Cape Johnson* sounded the previous record depth, 5773 fathoms in the Mindanao Trench, in 1945.

Islands. The P. O. is notable for its large number of oceanic is. grouped in the central and W. regions; they are all volcanic or coral, many being atolls, and number over 2500, with an area of 70,000 sq. m. The P. O. is unique in its complete girdle of volcanoes on the continental coast and is., with accompanying manifestations of earthquakes.

Currents. Under the influence of the winds a clockwise swirl is formed in the N. Pacific; the waves produce a N. equatorial current along lat. 15°, turning N. by the Philippines, and joining irregular branches from the E. Indies and China Sea to form the Kuro Siwo, the Gulf Stream equivalent, at Formosa; this becomes a W. wind drift in lat. 45° N., branching opposite Vancouver to form S. the California current, N. a swirl following the Alaskan coast. A cold Arctic current enters from Bering Strait and circulates through the sea of Okhotsk and the Japan Sea, making the mainland coast ice-bound in winter. An equatorial counter-current is well estab. over the E. part, but less so in the W. In the S. Pacific the trades cause a S. equatorial current along the equator and to 15° S., branching very irregularly in its westward course, among the Is. to the W., and forming 4 distinct currents, turning southward to form the great anti-clockwise swirl. These unite in their eastward course about lat. 40°, to branch opposite S. Chile, N. forming the Peru current, S. joining the W. wind drift round Cape Horn.

History. Balboa sighted the P. O. from Panama in 1513. Magellan sailed through the strait bearing his name in 1520, and gave the name to the ocean. In 1577 Drake, the first Englishman to enter the P. O., sailed N. to California and across to the Moluccas. In the 17th cent. the Australasian region was explored, and a more careful and detailed extension of the work occupied the 18th cent. Many scientific expeditions were carried out during the 19th. Valuable contributions to the survey work of the P. O. have been made by the Jap. Gov., as well as by the U.S. oceanographical dept of the navy. For campaigns in the Second World War see PACIFIC CAMPAIGNS OF FAR EASTERN FRONT IN SECOND WORLD WAR. See also OCEAN; TERRA AUSTRALIS INCOGNITA. See Q. Brigham, *Index to the Islands of the Pacific*, 1900; T. R. Saint-Johnston, *South Sea Reminiscences*, 1922; F. Zorck, *Annalen der Hydrographie*, 1928; W. G. Ivens, *Island Builders*, 1930; G. E. R. Deacon, *Dynamics of the South Ocean*, 1937, and *Hydrology of the South Ocean*, 1937; J. W. Vandercook, *Dark Islands*, 1938; J. A. Williamson, *Cook and the Opening of the Pacific*, 1949; R. Gibbings, *Over the Reefs*, 1949; and bibliography of OCEAN AND OCEANOGRAPHY.

Pacific Steam Navigation Company, see ROYAL MAIL LINES LTD.

Pactolus, in ancient times the name of a brook in Lydia, Asia Minor, now called Sarabat. It rises in Mt. Tmolus, and flows past Sardis into the Gulf of Smyrna. The golden sands of P. were proverbial, and to them legend attributed the wealth of Croesus.

Pasuvius, Marous (220-c. 131 BC), the greatest of the Rom. tragic poets, b. at Brundisium. He was the nephew of Ennius, on whose style he modelled that of his own dramas, which were based on Gk originals. He also devoted some of his time to painting. He died at Tarentum.

See E. H. Warmington, *Remains of Old Latin*, II (text and trans., Loeb Library), 1936; W. Beare, *The Roman Stage*, 1950.

Padang, tn and port of Sumatra, Indonesia. It is on the SW. coast, and trades chiefly in coffee, tobacco, copra, hides, gold dust, and spices. P. is also a trade centre for coal mining and agricultural produce. Pop. 52,000.

Paddington, parl. and metropolitan bor. of NW. London, situated N. of the bor. of Kensington. The name means 'the settlement of Padda's people.' Until c. 1820 it was still a vil., but its choice as terminus for the Great Western Railway in 1832-8 brought rapid development. The P. Canal to Uxbridge was originally built 1795-1801, then in 1805 linked with the Grand Union Canal, finally extended to the Regent's Canal and thus to the Thames at Limehouse. The famous Shillibeer omnibus service from P. Green was opened in 1829. P. returns 2 members to parliament. Area 1367 ac.; pop. 125,000. See also BAYSWATER.

Paddle-steamers, forerunners of screw-driven steamships, are boats propelled by paddle-wheels, which are driven by steam. The use of boats with paddle-wheels dates from very ancient times, both the Romans and Egyptians being acquainted with some form of them; in later times R. Valturinus in his work *De Re Militari* (1472) records the use of paddle-boats. Dr Denis Papin, a native of Blois, suggested towards the close of the 17th cent. that his invention of a steam cylinder fitted with a piston could be applied to work paddle-wheels, but the idea does not appear to have been successfully carried out. T. Savery invented a steam-condensing system, which he claimed could be applied to ships; J. Hulls claimed that he was the actual inventor of the paddle-steamer, in which he used ideas of Savery and Papin, but his boat does not seem to have worked successfully. The *Pyroscop* of the Marquis de Jouffroy was successful in travelling up the Saône unaided in 1783, but no commercial success followed. The boat built by S. Moray in 1797, with 2 paddle-wheels, gave the best results experienced till then. In 1803 Robert Fulton made his first trip, and in 1807 Stevens built a paddle-steamer, the *Phoenix*, which plied for 6 years on the Delaware, whilst in the same year the *Clermont* of Fulton reached a speed of 5 m.p.h. on a trial trip. During the next decade the number of steamers on the Mississippi increased, and from 1835 the speed attained was greater. In Scotland Symington in 1802 built a stern-wheel steamer, but the *Comet* of Henry Bell, first built in 1804 and wrecked in 1820, was the first paddle-steamer employed regularly and successfully in Great Britain. P. have proved useful as minesweepers owing to their shallow draught. For the varieties of wheels see PADDLE-WHEEL.

See R. Murray, *Marine Engineering and Steam Vessels*, 1852, and E. C. Smith, *Short History of Naval and Marine Engineering*, 1938.

Paddle-wheel, wheel used for propelling a boat or ship. As originally tried, it

consisted essentially of a series of paddles or paddle-like spokes inserted in an axle drum or wheel. The term was avoided by the 18th-cent. inventors and theorists, who spoke of a 'water-wheel,' a 'rowing-wheel,' 'revolving oars,' etc. The name P. gradually came into use after 1815. In its eventual development flat boards were fitted more or less radially round the circumference, so as to press backward like a succession of paddles against the water. Two wheels are generally used, one on each side of the vessel, a little aft of midship, so as to catch the tops of waves; in riv. steamers, where there is no great depth of water, one only, placed at the stern, is sometimes used. The floats of the earlier paddle-boats were fixed rigidly to the wheel. Later feathering P.s, in which each float is fixed to a pin at the back and connected at the centre of the wheel to a small eccentric device, were used. By this method the old 'churning of the water' is lessened. The use of paddles has been discontinued in favour of screws for cargo boats and ocean-going ships. The efficiency of the paddle is greatest at a certain constant immersion; and when draughts vary the level of floats must vary also. Rolling affects the paddles and strains the engines, as one paddle offers very great resistance while the other is racing. The speed of the floats depends on the diameter of the wheel; more breadth is required for vessels with paddles, as each paddle is about one-fourth of the breadth of the boat, but they are very suitable for excursion steamers, being fast, easily managed and started. See PADDLE-STEAMERS.

Paddy and Paddy Bird, see RICE and RICE BIRD.

Paderborn, Ger. city in the *Land of North Rhine-Westphalia* (q.v.), at the SE. foot of the Teutoburger Wald (q.v.), 90 m. ENE. of Düsseldorf. Charlemagne (q.v.) held the first Saxon parliament in P. in 777, and the city was the scene of a meeting between Charlemagne and Pope Leo III in 799. In the Middle Ages the city was a member of the Hanseatic League (q.v.). It was made a bishopric in 805, and is now the seat of an archbishop. Among its notable buildings are the cathedral (11th-13th cents.), the 11th-cent. Bartholomaeus Kappelle, and the 17th-cent. Rathaus. There was a univ., 1614-1819. Cement and furniture are manuf. Pop. 47,000.

Paderewski, Ignacy Jan (1860-1941), Polish pianist, composer, and statesman, b. Kurylowka, in Podolia, son of a Polish gentleman farmer; studied at Warsaw and Berlin. Always remarkable for strong personal views as an artist, he developed his talent in his own way from the first, and such piano instruction as he received at Warsaw was merely part of the curriculum; and when, in 1876, he made his first public appearance, it was mainly with the purpose of introducing his own compositions (pieces in the form of Polish dances), which at that time he was not technically proficient enough to play more than passably well. He taught at

Warsaw and Strasburg, 1878-84. It was at Strasburg that he met the actress Modjeska, a gifted countrywoman of his, who persuaded him to become an interpretative artist, and he placed himself under Leschetizky in Vienna, 3 years' intensive work turning him into a finished executant. He appeared at Vienna, 1887; toured Germany, 1888; visited Paris, 1889; London, 1890; and America, 1891. He toured Europe extensively until his second marriage, in 1899, to Baroness de Rosen, afterwards devoting himself principally to composition, although he still played occasionally. He wrote some good piano music, especially his popular *Polish Fantasia* with orchestra; his opera *Manru* was produced at Dresden (1901) and New York (1902), and his *Symphony at Boston* (1909). His idol was his countryman, Chopin, in the interpretation of whose passionate, whimsical, and splenetic moods he was unapproached.

He was politically active in the cause of Poland during the First World War, and was first Prime Minister and Minister of Foreign Affairs of the Polish Republic, 1919-20. The idea of creating a Polish army outside Poland was his (1916), and with that aim he was sent to America as delegate of the Polish National Committee which had been formed in Paris. Soon after the armistice he went to London to seek help in reconstituting the new Polish state. His presence, subsequently, in Poznan at a time when there was danger of Poland having some association with Germany roused the Poles there to tremendous enthusiasm, and a revolt broke out which resulted in most of the prov. of Poznan being wrested from the Gers.; its transfer was confirmed by the treaty of Versailles. It was at the peace conference that he was at his best as a statesman; if he claimed less than his countrymen desired, he acquired for Poland the goodwill and confidence of the other delegations. He retired to his estate in California in 1920, and in 1922 returned with *clat* to the concert stage. P. received many honours, including, in 1925, the G.B.E. Univs. in all parts of the world conferred honorary degrees on him. Oxford made him D.C.L. and Cambridge Mus.D. See lives by E. A. Baughan, 1915; H. Opieński, 1929; R. Landau, 1934; C. Phillips, 1934; A. Gronowicz, 1943; and *Memoirs*, ed. by Mary Lawton, 1939.

Padiham, tn. of Lancs, England, 3 m. NW. of Burnley. The inhab. are engaged in the manuf. of textile goods, engineering, furniture manuf., mining, etc. Pop. 10,000.

Padishah (*pad*, throne, and *shah*, sovereign), title assumed by the former sultans of Turkey and applied by E. peoples to European sovereigns.

Padova, see PADUA.

Padre Pio (1887-), religious name of Francesco Forgione, It. Capuchin friar resident near Foggia, Italy. He is a stigmatic, marked with the 5 wounds of Christ, and is visited by pilgrims from many countries, especially the U.S.A. With their offerings a hospital has been

built on the most modern lines at San Giovanni Rotondo, near Foggia. *See* P. Carty, *Padre Pio the Stigmatist*, 1955. *See also* STIGMATISATION.

Padstow, seaside holiday resort and port of N. Cornwall, England, on the estuary of the Camel, 5 m. NW. of Wadebridge. Pop. 2400.

Padua, Duke of, *see* ARRIGHI.

Padua: 1. Prov. of Italy, in SE. Veneto (q.v.). It is part of the great N. plain of Italy, but contains the Euganean Hills (q.v.) in the W. It has a small outlet to the sea in the SE. on the lagoon of Venice (q.v.). The chief rvs. are the Brenta, Bacchiglione, and Adige (qq.v.), and there are many canals. The prin. tns include P., Este, and Monselice (qq.v.). The prov. is mainly agric.: livestock, cereals, rice, wine, and fruit are produced. Area 828 sq. m.; pop. 706,000.

2. (It. *Padova*; anct. *Patavium*) It. city, cap. of the prov. of P., on the canalised part of the Bacchiglione, 22 m. W. of Venice (q.v.). Its origin is said to go back to the time of Troy (q.v.). It was sacked by Alaric I, and in 452 by Attila (qq.v.). In 1318 it came under the rule of the Carrarese, and in 1405 was taken by Venice. It was occupied by the Fr. in 1797, was ceded to Austria in 1814, and became part of united Italy in 1866. The 16th-18th-cent. cathedral has a baptistery dating from the 12th cent. The great Romanesque-Gothic Basilica of St Anthony (*see* ANTONY OF PADUA), the 6 Byzantine domes of which tower above the tn, contains the tomb of the saint; the high altar of the Basilica has bronzes by Donatello (q.v.), whose magnificent equestrian statue of Gattamelata stands in the piazza outside. In the little church of S. Maria all'Arena there are frescoes by Giotto (q.v.), and in the church of the Eremitani (restored after bomb damage during the Second World War) there still remain a few of the famous frescoes of Mantegna (q.v.). Other notable buildings of P. are the Palazzo della Ragione (12th-15th cents.), the 8-domed church of S. Giustina (16th cent.), and the celebrated Caffè Pedrocchi (1831). The univ. (1222) was a great seat of learning in the Middle Ages; among those who taught in it were Pietro di Abano and Galileo (qq.v.). P. has a botanical garden (1545) and a library (1629). The civic museum has a splendid collection of paintings. P. has a large trade in agric. produce, and has brewing, distilling, engineering, chemical, silk, confectionery, and furniture industries. Pop. 177,000. *See* C. Foligno, *The Story of Padua*, 1910 (Medieval Towns); G. Newman, *A Century of Medicine at Padua*, 1922; and H. la Farge, *Lost Treasures of Europe*, 1946.

Paducah, co. seat of McCracken co., Kentucky, U.S.A., 85 m. SW. of Evansville, Indiana. It is a hub of rail, river, and air transport, and the trade and industrial centre of W. Kentucky. It has shipyards and railroad shops, and manufs. clothing, textile machinery, shoes, radios, cooperage, and concrete products. It is the dark-tobacco market of the U.S.A. Pop. 32,828.

Padus, *see* Po.

Paean, the physician of the gods, but later Gk writers use P. as a title of Apollo in his aspect of healer. Later the word was a 'song of thanksgiving' and 'hymn of victory,' meanings derived apparently from 'Hail, Paean,' an invocation to Apollo.

Paedobaptists (Gk for child, and baptist), those who practise infant baptism. Since this is the normal Christian practice, the term is rarely used. *See also* ANTIPAEDOBAPTISTS; BAPTISM.

Paeslignian Dialect, *see* LATIN LANGUAGE AND LITERATURE.

Paecny, genus of herbaceous and shrubby perennials (family Ranunculaceae) which includes some of the most magnificent garden flowers. The herbaceous kinds are the harder and are more widely cultivated than the shrubby tree of mt P.s. These, if grown out of doors, need protection from spring frosts; they are very valuable for gentle forcing under glass. *Paeonia moutan* is naturalised on Steep Holme in the Severn.

Paer, Ferdinando (1771-1839), It. composer, b. Parma, where he studied. He became *maestro di cappella* at Venice and began to compose operas at the age of 20. In 1798 he was invited to Vienna, where his wife was engaged at the It. Opera, and the next year produced his best work, *Camilla*, there. In 1803-6 he was conductor at the Dresden Opera, and in 1807 became *maitre de chapelle* to Napoleon I. He remained in Paris to the end of his life, directing the It. Opera in 1812-27. Historically the most interesting of his many operas is *Leonora, ossia l'amore coniugale*, 1804, an It. version of the libretto of Gaveaux's *Leonore*, of which that of Beethoven's *Fidelio* is in turn a Ger. translation.

Paestum (Gk *Posedônia*, modern *Pesto*), Gk colony in Lucania, S. Italy, situated near the bay which took its name from the tn (Paestanus Sinus—gulf of Salerno). It was founded by colonists from Sybaris about 600 BC. After the Lucanians had conquered the city it fell into the hands of the Romans, who, in 273 BC, also founded a colony there. After suffering at the hands of the Saracens during the 9th cent., and being partially destroyed during the 11th, it was eventually abandoned during the 16th cent. The ruins of 2 Doric temples at P. are among the most remarkable remains of antiquity. Although the battle of the Salerno beach raged all around them in the Second World War, the temples of P. escaped all damage. Indeed, the war actually helped archaeological interests, for, while digging a gun-emplacement near the site, Brit. troops came upon evidence of a prehistoric cemetery. Regular excavations were subsequently conducted under the auspices of the Neapolitan Museum.

Paetus, *see* THRASEA, PAETUS P.

Pagan, anct. ruined city of Upper Burma, 92 m. SW. of Mandalay. From AD 849, when it was founded by King Pyin Oye, to the day it was sacked by the barbarian hordes of Kublai Khan (q.v.) in 1287, it served as Burma's cap.

It is one of the archaeological wonders of the E. Perched on the 70-ft cliffs of the E. bank of the riv. stretch the shrines, monasteries, and bell-shaped pagodas of the city which make it a resort of Buddhist pilgrims. There are 5000 of these monuments still standing. The Brit. Fourteenth Army crossed the Irawadi near P. in Feb. 1945, in the advance against the Japanese in Mandalay, but fortunately P. was spared the ravages of war.

Pagani, Gregorio (1558-1605), It. painter, learnt his craft from Santo di Titi and Lodovico Cordi (Cigoli). A fine colourist, he helped to renew the inspiration of his native school of Florence. The 'Family of Tobit' and some frescoes in the church of Santa Maria Novella, which are his best-known works, are all in that city.

Paganini, Niccolò (1782-1840), It. violin virtuoso, b. Genoa, where he studied under Costa; later he worked also under Rolla and Ghiretti at Parma. Having put in a prodigious amount of technical practice, he began his actual career when 15 years old. For nearly 40 years, with some interruptions, he toured Europe with sensational success, amassing a very considerable fortune; but he did not visit England until 1835. After 1835 he lived in semi-retirement, dividing his time between Parma and Paris, where his gambling propensities led almost to his ruin (1836). He is remembered chiefly for his wonderful technique, his double-stopping and harmonics being unsurpassed, as were also his roundness and beauty of tone in soft passages. But his dissolute character and general lack of refinement marred his interpretations, and his virtuosity too often led him into extravagance. As a composer for string instruments (including the guitar) he produced work of distinctive character. See life by J. Pulver, 1936.

Paganism (Lat. *paganus*, countryman), name given first to the polytheistic religions of the Greco-Roman world by the early Christians because the country folk were the last to abandon the ancient beliefs and practices. It is probable that the earliest manifestation of religion was monotheistic and that P. arose from a tendency in primitive man not only to distinguish the divine attributes but also to deify natural phenomena. These phenomena are easily recognisable in the familiar deities of Greece and Rome. The anthropomorphic character of the pagan gods led inevitably to the exaltation of human passions. The Jews were the first to recognise the intimate link between P. and amorality, and the denunciations of it in their law and prophets are summed up in the magnificent epistle of St Paul to the Romans. See M. A. Beugnot, *Histoire de la destruction du paganisme en Occident*, 1835; E. de Pressenac, *The Ancient World and Christianity*, 1888; and F. C. Conybeare, *Myth, Magic, and Morals*, 1909.

Page, Sir Earle Christmas Grafton (1880-), Australian statesman, b. Grafton, New South Wales, member of the house of representatives for Cowper, New South Wales, since 1919. P. served in the Australian Imperial forces in the First

World War, entered Parliament as a member of the newly formed country party in 1919, was leader of the party, 1920-39. As deputy Prime Minister and Treasurer in the nationalistic country party coalition gov., 1923-9, and chairman of the Australian loan council, 1924-9, he was able to exert considerable influence on economic development and to achieve a settlement of commonwealth state financial relations on terms which were to increase the commonwealth power considerably. In the coalition gov. in the thirties he held the important offices of minister for commerce, 1934-9, 1940-1, and minister for health, 1937-9, and was leader of the Australian trade delegations to the U.K. 1936-8. Sev. times acting Prime Minister, he was Prime Minister of the commonwealth for a short period in 1939. P. was Australian representative in the Brit. war cabinet 1941-2. When the Liberal country party gov. was formed in 1949, P. became minister for health again, retaining that office until 1955.

Page, Sir Frederick Handley (1885-), aeronautical pioneer, and inventor of the slotted wing for aircraft. He was one of the early pioneers of flying, and founded Handley Page Ltd in 1909. In 1908 he joined the Royal Aeronautical Society, and was its president from 1945 to 1947. In the First World War P. designed and built the heavy bomber, the world's first multi-engined aircraft, and in 1919 he was running a civil aircraft service to the Continent. Under his direction Handley Page Ltd became one of the leading aircraft manufacturers, and provided 65 per cent of the Imperial Airways fleet when the two concerns were merged in 1924. His H.P. 42 airliner was an outstanding machine in the 1930's. During the Second World War Handley Page Ltd produced the Harrow, Hampden, and Halifax bombers, and the Hastings military transport. Among P.'s other designs are W's's, Hannibals, and Hermes, and recently the giant Victor jet bomber.

Page, Thomas Nelson (1853-1922), Amer. author and diplomat, b. Oakland, Hanover co., Virginia. He practised law at Richmond, 1875-93, and was ambas. to Italy, 1913-19. His literary work after the First World War showed an intense admiration of Italy. His pub. include *In Ole Virginia*, 1887, *The Old South*, 1891, *Marse Chan*, 1893, *Pastime Stories*, 1894, *The Old Gentleman of the Black Stock*, 1896, *The Negro—the Southerner's Problem*, 1904, *Robert E. Lee*, 1911, *Life of Thomas Jefferson* (in It.), 1918, *Italy and the World War*, 1926. He will live in Amer. literature by his charming sentimental stories of Virginia, in which the protagonists are the plantation owners and their devoted slaves and body servants. He was one of the first and most successful in employing negro dialect. See R. Page, *Thomas Nelson Page, a Memoir of a Virginia Gentleman*, 1923.

Page, youth of noble or gentle birth who waits on royal and noble personages. In the days of chivalry, that is, down to the 15th cent. a boy desirous of becoming an esquire and afterwards a knight

served an apprenticeship as P. at court or in the castle of some nobleman. The modern P.s of honour or P.s of the presence, etc., who are attached to royal households and who figure on ceremonial and state occasions, are not unlike the *pueri paedagogiani* who served the Rom. emperors.

Pagellus, well-known genus of the family Sparidae, belongs to the sub-div. *Pagrina*, in which the members have a single series of long front teeth and rounded molars on the sides of the jaw. The species live in the warmer seas; all are carnivorous, and many are edible. *P. centrodontus* is the common sea-bream, and may be found in Brit. waters.

Pagenstecher, Hermann (1844-1932), Ger. ophthalmologist, b. Langenschwalbach, brother of Alexander P. (1828-79), founder of the Wiesbaden Eye Hospital (1857). Educ. at Wiesbaden and at the univs. of Würzburg, Berlin, and Prague, in 1868 he was assistant at the Univ. Hospital of Greifswald, and in 1869 at the Wiesbaden Eye Hospital. At his clinic in the Taunusstrasse he received patients from all over the world, effecting many remarkable cures. Queen Victoria, the Empress Frederick, and many other royal persons were among his patients, but he made no distinction between the rich and eminent and the poorest patient, treating all alike with the same degree of skill and care. P. wrote many essays on professional subjects, his *Atlas of the Pathological Anatomy of the Eye*, 1873-9, being the best known.

Paget, Henry William, see ANGLESEY, FIRST MARQUES OF.

Paget, Sir James (1814-99), surgeon, b. Great Yarmouth, Norfolk, entered St Bartholomew's Hospital in 1834. Here, while still a student, he discovered *Trichina spiralis*, the cause of trichinosis. He qualified in 1836, and 3 years later was appointed demonstrator of morbid anatomy at St Bartholomew's, proving a very popular teacher. In his early years he did a considerable amount of medical and other journalism to augment his meagre income. He was appointed assistant surgeon to St Bartholomew's Hospital in 1847 and full surgeon in 1861. He was elected a fellow of the Royal Society in 1851, and in the same year commenced practice as a surgeon, with phenomenal success. He maintained his interest in physiology and was a great surgical pathologist. He was created a baronet in 1871 and appointed serjeant-surgeon to the Queen in 1877. He was president of the Royal College of Surgeons in 1874 and vice-chancellor of London Univ., 1884-95. Two diseases are named after him—Paget's disease of the nipple (eczema with subsequent cancer) which he described in 1874, and osteitis deformans (a disease of bone) described in 1876. His works include *Lectures on Tumours*, 1851; *Lectures on Surgical Pathology*, 1853; and *Clinical Lectures and Essays*, 1875. He prepared the catalogue of the pathological specimens at the Royal College of Surgeons in 1842. See *Memoirs and Letters of Sir James Paget*, by S. Paget, 1901.

Pagi Islands, 2 is. belonging to the Montawi chain, off the W. coast of Sumatra. They are of volcanic origin, and have an irregular surface, which is densely wooded. The chief products are coconuts, sago, trepang, and timber. Pop. 5000.

Pagnol, Marcel (1895-), Fr. playwright and film director, b. Aubagne near Marseilles. After studying in Marseilles, he became a teacher of English in S. France, and from 1922 in Paris, but left his profession soon afterwards and took up writing for the stage. After his first success *Topaze*, 1928, a satire, he produced a trilogy of plays on Marseilles characters, *Marius, Fanny, and César*, 1929-36, which were made into films. Turning from play-writing to film-producing, P. founded a film company and started editing a review called *Les Cahiers du film* for the advocacy of his ideas on the art of the cinema. He stressed the importance of dialogue and simplicity in films. His films include *Merlusse*, 1935, *La Femme du Boulanger*, 1938, *La Belle Meunière*, 1947, *Manon des Sources*, 1952, *Judas*, 1953, *Lettres de mon Moulin*, 1954. P. was the first film producer to be elected to the Académie Française in 1946. His trilogy was revived in 1954 as a Broadway musical entitled *Fanny*. See P. Brisson, *Le Théâtre des Années folles*, 1943, and R. Lalou, *Le Théâtre en France depuis 1900*, 1951.

Pagoda, Portuguese word, a corruption of the Sanskrit *dagoba*, which means a tomb shrine. It is a term used in the E. for a temple where the relic of Buddha is enshrined. There is a very handsome and massive P. at Tanjore, the upper portion being an elongated and elaborately sculptured pyramid 100 ft. in height. The most imposing and, at the same time, the most holy of the Burmese P.s is the Shweg Gagon P. at Rangoon. The Siamese *phra* is either pyramidal with a cylindrical turret, or bell-shaped with a slender spire. Unfortunately the marvellous Chinese P., known as the Porcelain Tower of Nanking, was destroyed by the Taipings in 1856. The P. belonging to the temple of Horiuji in Japan has only 5 storeys; large ones have as many as 13.

Pagodite, see AGALMATOLITE.

Pago-Pago, harbour of the is. of Tutuila, Amer. Samoa, which nearly bisects the is. It was ceded to America in 1872 for a coaling station. It is one of the best harbours in the South Seas, and until 1951 was a U.S. naval station.

Pagus Aurelianensis, see ORLÉANAIS.

Pahang, state of the Federation of Malaya, until 1946 one of the 4 states known as the Federated Malay States under Brit. protection. It lies entirely on the E. side of the main range and has 130 m. of its E. border on the China Sea. It comprises 13,820 sq. m. The major portion of P. is fairly flat, though varied with low hills, but on the SW., W., and NW. there is a mountainous chain separating P. from Selangor (q.v.) and Perak (q.v.) and rising to a height of over 6000 ft. in the area called the Cameron Highlands. On the N. range separating P. from

Kelantan (q.v.) and Trengganu (q.v.) the highest peak, Gunung Tahan, reaches 7186 ft. The country is fairly well intersected with rivs. and streams, the longest being the P. R. (over 200 m.) which, as the Telom, rises in the hilly regions of the NW. and, fed by many tribes, the largest of which are the Tembeling, Jelai, and Lipis, flows first in a southerly direction, through the middle of the state, and thence in an easterly direction, and has its outlet at Pekan on the E. coast. The state includes the is. of Tioman, some 25 m. off the coast in the China Sea. The seat of gov. is at Kuala Lipis. The sultan resides at Pekan, near the mouth of the P. R. The country is rich in gold, tin, and galena, and produces fine specimens of mats, baskets, etc., woven from pandanus fibre. The dynasty that once ruled P. was descended from the rulers of the royal house of Malacca, and before that house became extinct in 1699 its P. branch provided many rulers for the older throne of Johore, which directly represented the Malacca dynasty (see MALAYA, *History*). Thereafter P. came under the suzerainty of the new sultans of Johore who, when they removed to Rhio and Lingga (is. states S. of Singapore), left a member of their own house as *dato' bendahara* in charge of P. In 1887 Sir Frederick Weld negotiated a treaty with the bendahara, promising Brit. help in the event of external aggression and arranging for a Brit. agent to be stationed at his cap. At the same time the title of sultan was substituted for bendahara. In 1888 the sultan applied for and obtained Brit. protection, and the appointment of a resident. The present sultan came to the throne in 1932. P. was invaded by the Japanese in Jan. 1942 and the Brit. forces, outnumbered, withdrew from the Kuantan area (6 Jan.) after flooding the large P. Consolidated tin mine. Pop. 295,000. **Fahari**, see INDO-EUROPEAN LANGUAGES.

Fahlavi, or **Bandar Pahlavi**, dist. and port of Persia, situated on the Caspian Sea. The port was formerly called Enzell. Pop. of dist. c. 40,000; of port c. 25,000.

Fahlavi, Middle Persian, or Middle Iranian, terms employed for the dialects and scripts used in the ter. of Persia, or Iran, under the Arsacid and Sasanian dynasties (see PERSIA, *Language and Literature*). The term P., which is a phonetic modification of *Parthavi* or *Parthava*, as on the inscriptions of Darius, meaning 'Parthian' (Gk *Parthyaioi*, Lat. *Parthi*), does not indicate that P. was the language of the Parthians, but that both the speech and the script developed in Parthian times, i.e. when Parthia dominated Iran, and Iranian and Parthian became practically synonymous terms.

Alexander the Great's conquest of Persia in 331 BC not only put an end to the Achaemenian dynasty of Persia and to its script (cuneiform writing, q.v.), but also dealt a heavy blow at its religion (Zoroastrianism), its language (Old Persian), and its national culture. In the troubled years which followed the collapse

of Alexander's empire there arose the Arsacid dynasty of Parthia, while the language of Persia had undergone considerable modification and new scripts were devised. The ultimate decline of Parthian power helped the renaissance of the Persian national spirit, which found expression, in AD 226, in the founding of the Sasanian dynasty: while the Arsacid dynasty was considered to be foreign, the Sasanids rated themselves as a national dynasty, and their founder, Ardashir or Artakshshir (in graced form, Artaxerxes), traced his descent from the Achaemenians. The Sasanids, following the tradition of their great 'ancestors', immortalised their deeds in rock sculptures, and inscriptions written in P. Until the Arab invasion of Persia there must have been considerable production of P. literature, particularly on subjects connected with Zoroastrianism. The destructiveness of the Muslim conquest and the imposition of the Arabic alphabet on the newly converted Persians account for the fact that comparatively few P. works have survived. For this survival we are indebted to the Paraces, the descendants of the Persian Zoroastrians, who were compelled to flee to India in the 8th cent. AD. Indeed, the study of P. was stimulated in 1871 by the discovery of 52 P. writings in the library of a Parsee high-priest in Bombay. Since then many more MSS. and inscriptions have been found. The surviving books owe their preservation to their religious character or to their connection with the Avesta (i.e. the Zoroastrian sacred literature), written in an Old Persian dialect, now called Avesta, and in a most cursive script (probably of P. origin) of 50 signs, also termed Avesta. The book Avesta (q.v.) is invariably accompanied by the Zand, which is the traditional commentary of the Avesta, and is written in P. While the origin of the P. forms of speech is more or less clear, being a natural development of Old Persian dialects, it is far from clear how the P. systems of writing developed. They cannot have been creations of an individual, because in that case the P. script would have been more consistently worked out, and the almost contemporary appearance of 2 or more varieties would be inexplicable. It may, therefore, be assumed that the P. scripts were a natural development from local cursive Aramaic scripts (see ALPHABET). At least 3 varieties of the P. alphabets are distinguishable: (1) the NW. P., termed also Pahlavik or Arsacid, the script of the Parthians; it appears on coins and gems of the Arsacid dynasty; (2) the SW. P., termed also Parsik or Sasanian, the script of the Persians proper; it appears in 2 forms, monumental (on the Sasanian inscriptions) and cursive (of the P. books); (3) the E. P., of which only a cursive form is known.

Paiforce, officially the Persia and Iraq Command, a force which came into existence in April 1941 at about the time of the Iraq rebellion (see IRAQ, *History since 1914*), its purpose being to check a possible move by the Nazis to conquer the Middle E. In

the nature of things, thus early in the war, large forces could hardly be created by the Allies at a moment's notice, and the nucleus of P. was a single brigade and a field regiment of Royal Engineers. The force expanded and contracted according to military exigencies and, again according to exigencies, changed its role. After Syria had been occupied by the Allies and Iraq recovered, P. went into Persia and prepared to meet a Ger. attack either through Turkey or via the Caucasus or both. When that threat had vanished, P. became the indispensable link with Russia, and responsible for the deliveries of war material to the Red Army. This Russian 'lift' was in fact the chief achievement of P., and is described in a Stationery Office book (with illustrations) issued in 1949.

Paignton, popular seaside resort of Devonshire, England, on Torbay, 2½ m. SW. of Torquay. Among places of interest are the remains of the bishop's palace, once the residence of Miles Coverdale, translator of the Bible into English; and Oldway Mansion and gardens, once the home of the Singer family, now the town's civic centre. Pop. 25,369.

Paiho (white riv.), riv. of N. China, rises near the Great Wall, N. of Peking, on the slopes of the Mongolian Mts, and flows generally SE., past Tientsin, to fall into the Gulf of Chihli at Taku, after a course of 350 m. It is connected by the Grand Canal or Yun Ho with the Hwang-ho and Yangtze-kiang. There is a bar of stiff clay at its mouth which greatly detracts from its value as a waterway, and its waters are thick with silt, but it is navigable by steamers as far as Tientsin and by native boats to T'ung-chou. Its largest trib. is the Hung-ho. See TAKU.

Pain, Barry Eric Odell (1864-1928), humorous author, b. Cambridge. He was educ. at Sedburgh and Corpus Christi College, Cambridge. A story of his, entitled 'The Hundred Gates,' appeared in the *Cornhill Magazine* in 1889. After leaving college he went to London, took to literature as a profession, and became known as a clever and humorous writer of fiction. His works include *Eliza*, 1900, *Eliza Getting On*, 1900, *The Memoirs of Constantine Dix*, 1905, *Wilhelmina in London*, 1906, *The New Gulliver*, 1913, *Me and Harris*, 1916, *The Problem Club*, 1919, *If Summer Don't* (parody of *If Winter Comes*), 1922, *Dumphy*, 1927, and *The Later Years*, 1927.

Pain, see EMOTION; THERAPEUTICS; TOUCH.

Paine, Thomas (1737-1809), author and politician, the son of a small farmer at Thetford, Norfolk. He became an excise officer in 1761, but, agitating for the removal of grievances, was dismissed from the service. In 1774 he went to America with a note of introduction from Benjamin Franklin, and 2 years later pub. *Common Sense*, in which he discussed the causes of the war with England. He held various posts in the Amer. Army and under the Amer. Gov. until 1787, when he returned to England. In 1791, in reply to Burke's *Reflections on the French*

Revolution, he pub. the first part of *The Rights of Man*, and when a year later he issued the second part he had to flee to France to escape prosecution. He was at once elected a member of the Convention, in which (1793) he opposed the execution of Louis XVI, and was imprisoned until the death of Robespierre. He pub. *The Age of Reason* in 1794. He went again to America in 1802, to find neither welcome nor even charity, and died 7 years later in New York. His writings were forcible

THOMAS PAINE

enunciations of the abstract rights of man, and were highly regarded by the Radical party in England. See lives by C. Cohen, 1945; W. E. Woodward, 1945; H. M. Fast, 1946; and J. Dos Passos, 1948.

Painlevé, Paul (1863-1933), Fr. statesman, b. Paris, was successively prof. at Lille Univ. and the Sorbonne, and in 1904 prof. of mechanics and engineering at the École Polytechnique. He wrote a book on aeronautics, which is recognised as a classic, and founded the Fr. Air League. A Socialist deputy in 1906, as chairman of the Navy Committee he initiated the policy of concentrating the Fr. fleet in the Mediterranean, and thereby promoted the development of the Entente Cordiale; minister of public instruction, 1915, and war minister, 1916, he was responsible for appointing Pétain, with Foch as chief of staff, to succeed Nivelle. Prime Minister for a few months in 1917, he was defeated as a candidate for the presidency in 1924, but became Prime Minister again in 1925, and also finance minister. He held a number of other ministerial posts between 1926 and 1932. He wrote many philosophical and scientific works, including a book on the analytical theory of differential equations. See life by E. Charles, 1925.

Painted Lady (*Vanessa cardui*), butterfly of the family Nymphalidae, migrates to Britain from N. Africa. The caterpillar breeds on thistles and other plants.

Painter's Colic, *see* COLIC; LEAD POISONING.

Painting, in art, may be defined as the imitation or representation of objects by colour laid upon a uniform surface.

PRIMITIVE MAN. Primitive P.s. largely to secure food by magic intent, were made by Palaeolithic man on the walls of his caves. Cave-paintings in France and in Spain are of special interest. These P.s., executed in little more than red and black, as records of animals in movement and as drawings, have never been surpassed. The artists had remarkable qualities of vision, feeling for mass, rhythm, and expressive line. Though many outlines may better be termed 'drawings,' the studies of Henri Breuil (q.v.) indicate that the cave artists used brushes of various sizes and kinds. The P.s. while near perfection in themselves, are scarcely related to each other. Possibly they were made for religious as well as for magical purposes, and to convey practical information in connection with hunting, and possibly also because to make them gave pleasure to the artist. Their strength and delicacy, feeling for line, tone, and movement, make a curious link with the sophisticated modern art of Western Europe.

PAINTING IN ANTIQUITY. In primitive form the existence of this art may be traced among the earliest known civilisations, as in Babylon, Egypt, India, Mexico, and Greece. Painted tiles, bas-reliefs, and statues have been found. Historical wall-paintings, especially on the walls of tombs, were common among many early races. The wooden cases of the Egyptian mummies were brilliantly coloured, as may be seen from the specimens in the Brit. Museum, and the P.s. on the walls of the Etruscan tombs are also famous. There is some ground for believing that the art of P. in Greece may have been brought to the same degree of perfection as the arts of sculpture and architecture, though probably lacking in any feeling for perspective, linear or aerial. It was not an independent art in its beginnings, but subservient to sculpture, architecture, or primitive engraving. Hard and definite linear drawing filled up with colour marked the first attempts in the grand art, which has since been developed both technically and intellectually to express infinitely more than mere outline. Egyptian art was intended more as a decoration, a record, and a symbol than as an imitation of nature, and probably Assyrian and Babylonian P.s. had the same aim. Later on a faithful representation of nature became one of the most important results the painter desired to achieve; while according to modern ideas something far higher and more elusive than mere resemblance to, or imitation of, external nature—the delineation of the inner soul by the artist's sympathy and insight—must be added to beauty of composition, arrangement, and detail to constitute a truly great picture. The Egyptians apparently knew a variety of pigments, while the Greeks, at least till the time of Apelles, used mainly 4—white,

red, yellow, and black (perhaps including blues). The designs on Gk vases and pottery are the prin. means left to us for forming any estimate of the art of P. among the Greeks. The discoveries at Mycenae, Crete, round the Aegean, and elsewhere by Sir Arthur Evans and others have also made important additions to our knowledge. To Cimon of Cleonae (c. 6th cent. bc) was ascribed, among other innovations, the introduction of 'catagrapha' (foreshortenings?) and an attempt to apply the rules of perspective. Polygnotus of Thasos, who settled at Athens

British Museum

SPHINX, SLAB FROM CAERE

about 563 bc, was one of the greatest masters of antiquity, and was praised by Aristotle, Pliny, and Pausanias. To his 'Athenian school' succeeded those of Ionia and Sicily, among the chief names being those of Parrhasius, Timanthes, Zeuxis, Pamphilus, and Apelles (5th and 4th cents. bc). The remains of early Rom. art are more abundant. After the sack of Corinth by Mummius (146 bc) many fine works of art were brought to Rome and exhibited. Valuable wall-paintings based on Gk originals have been excavated from the ruins of Pompeii and Herculaneum, the baths of Titus, and other noted buildings in Rome.

The introduction of Christianity marked a new period in the hist. of P. With it the purely decorative representations of mythology were superseded by the symbols of Christianity. Pictorial expression was made to serve a double end—that of

commemorating Christ's Passion, and of keeping the truths of the Christian faith alive in the hearts of the early catechumens. Thus in the catacombs one finds constant repetition of symbols such as the Lamb, the Good Shepherd, and others, which, while being purposely unintelligible to the uninitiated, held for the initiate encouragement and hope. Later, after the official estab. of Christianity in the reign of Constantine, the great pagan basilicas turned into Christian churches were decorated with mosaics, mostly of a symbolical character, or with figures of the Trinity and the saints, such as are to be seen still in the churches of S. Maria Maggiore, S. Giovanni Laterano in Rome, and those of Ravenna (see separate *ts.*). To this period belong also sev. illuminated MSS. and images after the style of the Russian *ikons*, all of which betray Byzantine influence and manner of expression. After the 8th cent. fresco P. was introduced, and took the place of the mosaics, and, while affording a wider scope to the imagination, continued for some time to be tied down by the old tradition, both in composition and in design.

To make the course of European P. clear we must then first reckon with Byzantine art, which implies the products of the Christian culture centred in Byzantium (Constantinople) between AD 330 and the arrival of the Turks in the 15th cent. Gk and E. influences both had a part in it, and a rigidly conventional style was the result, found in Greece, the Gk islands, the Balkans, and spreading on the one hand to Russia, on the other to Italy. This form of P. had a long separate existence. Thus a remarkable exhibition at the Tate Gallery, 1953, showed the vitality of Byzantine P. in Yugoslavia between the 11th and 14th cents. El Greco (1541-1614) was trained in Crete in the Byzantine style in the 16th cent.

ROMANESQUE. A related but more westerly development was that of the Romanesque—a word applying equally, like many later descriptions of European art, to architecture, sculpture, and P. Romanesque P. may be arbitrarily dated from c. AD 1000 to c. 1250. The painter worked for the Church, producing frescoes, formal and monumental in style; and examples are to be found in the Teutonic lands, France, and N. Spain.

GOTHIC PAINTING (c. 1150-c. 1500) gradually evolved from Romanesque. Gothic, in the main, was a style belonging to NW. Europe, and its principal products were to be found in France, Germany, England, and to some extent in Spain. Burgundy and Flanders were two great centres. The enlargement of the windows in the Gothic church had a great effect on P., limiting the art of fresco and encouraging the production of painted portable panels. Another cardinal influence was the demand for and output of missals and 'books of hours,' ornamented with painted miniatures. Thus early Flem. P., so wonderfully represented by Jan van Eyck (c. 1390-1441), owes its minute detail, individual characterisation, and sense of colour to the Franco-Flem.

school of miniaturists which flourished at the end of the 14th cent. In Italy, as in the N. countries, the introduction of the painted panel marked the beginning of a reaction against the stiff Byzantine tradition. On the other hand, the practice of fresco P. was not affected by architectural styles such as the N. Gothic, and in the creation of the wonderful It. school this long and steadily continuing tradition must be reckoned with. By unhurried stages, the It. painters advanced to technical perfection and mature expression—which makes it hard to assign a definite date to the Renaissance art which is Italy's glory. In P. the first notable signs of an effort to replace the Byzantine convention by a more natural style are to be found in the work of Duccio di Buoninsegna at Siena and Cimabue (1255-1315) at Florence, but the first really great master was Cimabue's follower at Florence, Giotto (1267-1337). Giotto's frescoes at Assisi, Padua, and in the church of St Croce, Florence, were a new type of creation, in their science of composition and colour and their natural and dramatic presentation of sacred subjects, and his influence dominated Florentine P. until the end of the 14th cent.

RENAISSANCE PAINTING, centred in Italy, may be dated from c. AD 1400 to c. 1600. It had many ingredients, and can be divided into distinct phases. It was, first, the product of a scientific spirit, a desire for knowledge, and of full mastery of the artist's means. A study of the human figure (inspired also by the return to Greco-Rom. ideals of beauty) was one aspect; Antonio Pollaiuolo (1432-98) will serve as an example of the new anatomical study in P. Perspective, foreshortening, and the rendering of movement were all problems to solve, and the study of perspective is exemplified in Paolo Uccello (c. 1400-75). Armed with full technical equipment and knowledge, painters were able to express a greater range of thought and feeling than before. The full and truly astonishing fruition of Renaissance P. is found in what may be called the Middle period, c. 1500-30, the period of Leonardo da Vinci (1452-1519), Raphael (1483-1520), Michelangelo (1475-1564), Giorgione (1477-1510), and Titian (c. 1477-1576). Profound subtlety ('Mona Lisa'), majestic beauty (Raphael's 'Stanze'), sensuous beauty (Giorgione's 'Tempest', Titian's 'Sacred and Profane Love'), power and drama (Michelangelo's Sistine Chapel), were its product. The almost bewildering richness of the It. Renaissance stemmed also from the great number of regional and city-state 'schools' of P., fostered by art-loving princes. Florence, Siena, Umbria, Verona, Venice, Parma, all had their groups of masters and assistants, while Rome drew from each region some of its choicest talent. Rome until the 19th cent. was to be the great centre of European P., though meanwhile the influence of the It. Renaissance spread elsewhere in Europe. The late Renaissance (c. 1500-1600) is marked by 'Mannerism,' an attempt to combine the varied excellences of the masters;

Annibale Caracci (1580-1620), founder of the Eclectic School at Bologna, is an example.

EUROPEAN PAINTING. Surveying European P. as a whole at this point two main factors must be taken into account. One is the rise of oil-painting; the other the growth of distinct national schools. The discovery of the oil method and the use of varnishes are commonly assigned to the Van Eycks in the early 15th cent., and this process was introduced from Flanders into Italy by way of Venice, Florence, and

(1471-1528), express respectively the 'Old German' or medieval and the Renaissance spirit. The Thirty Years War brought German P. to an abrupt end. Flanders, after its early flowering with Van Eyck, Van der Weyden, and others in the 15th cent., had a second more racially distinct school dominated by the genius of Rubens (1577-1640). Holland, which during the early cent. had few representatives of any note, entered a great period of art in the 17th cent., when it achieved independence, with a host of painters of an essentially

Turin Gallery.

Naples. It soon became the favourite medium throughout Europe as needing less speed and decision than fresco and admitting of retouching and correction. In addition, it opened fresh aesthetic possibilities. One was richness of colour, obtained by successive glazes, as in the work of Titian. Another was its value in rendering effects of light and shade. Thus we find Caravaggio (1573-1610) exploiting powerful contrasts under artificial lighting, and in the 17th cent. the perfection of a characteristically oil technique, by Rubens, Rembrandt, and Velázquez. The growth of national schools was bound up with the growth of nationalism, or of favourable conditions in a particular region. German P. reached its height at the beginning of the 16th cent. Its 2 greatest representatives, Matthias Grünewald (c. 1460-1528) and Albrecht Dürer

national or local type and, in Rembrandt, a universal genius. Spain achieved a singular eminence in this cent., the quality of a few great masters. El Greco first (1545-1614), then Velázquez (1599-1660), Murillo, and Zurbaran, exerting a great influence which has continued to modern times.

France, like Italy, developed steadily in P., keeping an equi-poise between N. and S. (or It. and Flem.) influences which its geographical position helps to explain. As a Lat. country it shared the inheritance of Italy. The figure painters of the age of Louis XIV closely followed the methods of Raphael, as may be seen in Lebrun (1619-90). Nicholas Poussin (1594-1665), who spent most of his life in Rome, was steeped in the spirit not only of the It. Renaissance but also of classical antiquity. On the other hand, the attachment of

Claude of Lorraine to landscape was N. in origin, and the influence of Rubens on Watteau (who came from Valenciennes) was appreciable. With the great exceptions of Poussin and Claude, the age of Louis XIV found expression in decorative P. below the level of greatness. A native grace and charm combined with technical mastery make the succeeding age more typical, with Watteau, Boucher, Fragonard, and Chardin.

England, for various reasons, came late into the field, but in the 18th cent. developed a great and truly national school which begins with Hogarth (1697-1764). Its characteristics were the rejection of artificiality and pomp; an interest in social life of every kind (appearing in Hogarth's studies of modes and manners); paintings of animals and sport; and an agreeable informality in portraiture which both Sir Joshua Reynolds and Thomas Gainsborough display. The realism of the Dutch painters had great influence, especially in fostering landscape, perhaps the greatest Eng. achievement in P. Wilson, Gainsborough, Crome, Constable, and Turner raised oil-P. to magnificent heights. Parallel was the growth of a school of water-colour unique in European art in which the names of A. Cozens, J. R. Cozens, Turner, Girtin, Cotman, and Rowlandson (both in landscape and social comment) are illustrious.

BAROQUE. In spite of the many interesting differences of national character shown in the rise of national schools, it remains true that in European P. certain main currents pursued an international course. Thus it is possible to speak of Baroque P., apart from nationality, as a trend existing between c. 1600 and c. 1750. It was, in one sense, a kind of propaganda for both the religious and temporal power, and aimed especially at striking and grandiose effect. Rubens's vast mural P.s, e.g. the Marie de Medicis cycle, serve as an outstanding example.

Rococo. To this succeeded Rococo P. (c. 1730-70), less serious in mood and aiming at decorative charm. Boucher in France is typical, and in Spain the style is exemplified by Goya's early painted designs for tapestries. It came abruptly to an end with the Fr. Revolution and the great changes that heralded the 19th cent.

NEO-CLASSICISM AND ROMANTICISM. As a whole the 19th cent. presents a curious contrast between the kind of P. acceptable to a new, middle-class type of patron and the P. of artists struggling in the face of opposition and misunderstanding to express their time. It is not to be wondered at that the hist. of 19th-cent. P. is to be studied in a series of new and even militant 'movements.' To begin with there was an attempt to create a new 'classicism.' In France, David (1748-1825) sought to convey the spirit of the Fr. Revolution by reminders of the heroic republicanism of ancient Greece and Rome, executed in a severe style. In Germany, through the teachings of Winckelmann, to emulate Gk art was looked on as the only salvation. Against

this tendency, Romanticism grew in opposition—as an emotional mood rather than a style of P. Among Germans it took the form of a return to the religious spirit of the medieval past; and the so-called 'Nazarenes,' led by Cornelius and Overbeck, from about 1810, tried to estab. a national, romantic school. Romanticism in Eng. P. is represented by the heights, distances, and splendours of Turner's art; in France by the passionate and dramatic canvases of Géricault and Delacroix. Neo-Classicism may be dated c. 1760-c. 1840 and Romanticism from c. 1800 to c. 1850.

English landscape P. undoubtedly played an important part in the 'return to nature.' Constable's 'Haywain' at the Salon of 1824, together with examples of the water-colour school, deeply impressed Fr. painters. The romantic feeling for nature is exemplified by the Barbizon School from c. 1830: but the decadence of Romanticism produced much P. of dubious value. One result was the so-called 'historical' or costume picture, of which every European country provides examples, telling some entertaining story and pleasing the public with representations of past finery but devoid of real merit. Realism, the truth of contemporary life, and also the search for a vital principle in form and colour, were the antidotes.

REALISM AND IMPRESSIONISM. In England realism is exemplified by the Pre-Raphaelites, in their early enthusiasm for 'truth to nature,' and the P.s produced under this inspiration, notably in the 1850's; in France by the realism of Courbet (1819-77) and of Manet (1832-83), which was succeeded by the very important movement known as Impressionism (q.v.). Elements of Impressionism already existed in the work of Constable and Turner, in their respective efforts to express light in terms of colour. This was essentially the realistic aim of the Fr. painters, who began to pursue it before 1870 but became known as Impressionists from 1874. They were inspired considerably by the recent scientific researches into colour and to some extent by photography. So the first exhibition (1874) embodied two main principles: (1) Landscape, done out of doors, was treated as a single vision seen in a flash, not as a collection of separate objects seen successively. (2) The use of spectrum colours and of 'complementary' colour to give a more vivid interpretation of light, i.e. the shadows on a stone, instead of being a deeper stone colour, would be green or violet, according as the light which fell upon the stone tended in itself to be red or yellow. Claude Monet's work is one example of this approach. Monet's Impressionism depends on the vividness produced by the direct translation of light into colour when working in the open from nature. His colleague, Pissarro, also practised for a time a severe form of Impressionism under the influence of Seurat's *pointillisme* (1886). This consisted in laying spots of pure colour side by side on the canvas so as to blend when

seen at the right distance. But this proved too mechanical. It was also a defect of the Impressionist method that form was neglected in the pursuit of atmospheric effect. Renoir and Degas both turned their backs on this form of Impressionism. Renoir, who left enchanting works while still under the inspiration of the new-found methods, turned to a solid treatment of form with rich glowing colour recalling the Venetians and Rubens; while Degas, retaining much of the love of light effect, felt himself to be first a draughtsman and urged his colleagues to consider new combinations of drawing rather than colour. These two great painters stand out by reason of their superb draughtsmanship, lovely colour, and sound picture making—Renoir with his lyrical enthusiasm for flowers, sunny landscape, and women, Degas with his passion for figures in movement and his original composition.

The POST-IMPRESSIONISTS (q.v.), innovators in their separate ways, brought back a feeling for rhythm and mass, line and silhouette. Cézanne, in particular, wanted a return to solid and secure picture-making. He realised that there must be a balance between designing in the second dimension and in the third. Shapes must suggest weight and solidity and be welded together in a more architectural treatment. All this had to be done by means of patches of perfectly related colour which denied neither the colour of light nor the local colour of objects. His later work, however, foreshadows the abstract painters of the 20th cent. Van Gogh, too fiery to be content with Seurat's method, evolved a violently linear method of drawing in paint with bright-coloured lines laid on flat, bright areas of colour, with an almost complete absence of shadow effects. Gauguin in the S. Seas found the subjects he needed for his rich decorative treatment of shapes by silhouette and local colour.

FAUVISM (1906) arose from a feeling that previous movements were exhausted, and a desire to use colour more freely to an emotional purpose. Matisse produced a shorthand system of colour and drawing which, emptying out all photographic influence, makes excellent decoration. It looks spontaneous, but is the result of study and knowledge. Of the others (who included Utrillo, Friesz, Dufy, Segonzac), Picasso, Braque, Derain went on to Cubism (q.v.). The nature of CUBISM and its many phases make it difficult to describe in words. Study of Cézanne's later method led to a splitting up of forms into separate planes, to geometrical essentials. These planes are recombined so that an effective design transpires, but the original recognisable form frequently disappears. The partly recognised form is probably the chief cause of annoyance to those who do not understand Cubism. Periods of analysis and mathematical abstraction followed. Designs in superimposed layers of coloured or patterned papers, small objects fixed to the surface, with drawing and P. linking these effects together, were devices which

illustrate the divorce of P. from its old function of representation. The work of Picasso, Braque, Juan Gris, Francis Picabia, and Fernand Léger illustrates various aspects of the Cubist idea. In Italy Futurism (q.v.) was in technique an offshoot of Cubism and also a protest against classic calm as seen in the dead atmosphere of museums. Violent action was to be painted—an aim more suited to the cinema. Marinetti's poems gave it a flying start, but the movement was short-lived, though in their attempts to show successive motions on the same canvas, or a number of things seen individually at the same time, the works of Gino Severini, Giacomo Balla, and Umberto Boccioni have a curious interest. Expressionism (q.v.) arose independently in Germany about 1906. The emphasis is on feeling rather than form. Kandinsky (a Russian), Franz Marc, and Paul Klee founded a group while influenced by Picasso. Kandinsky's art is a compound of Cubism, Ger. mysticism, and psychoanalysis. Klee, a precursor of the surrealists, had a whimsical invention and feeling for the spontaneous products of the mind and hand. He once described one of his pictures as 'taking a walk with a line'—a fair enough description of many of them. Georg Grosz in his scenes of night life revealed the hysteria prevalent in Germany after the close of the First World War. Dadaism was the final expression of frustration after the war, but left nothing noteworthy.

SURREALISM, which began to gain ground from about 1925 and was influential until shortly before the outbreak of war in 1939, chiefly consists in the relating of forms seldom found together in everyday life, and giving the impression of a dream-world or a nightmare. Its chief value has been not only to explore the 'unconscious,' but to restore something of imaginative vision to P. Dali remains its most striking exponent, but the movement has established no style of P. Chirico in 1913 was already doing remarkable P.s of classical landscapes, buildings, horses on the seashore. Since then he has repudiated his early work. Henri Rousseau stands apart as a genuine modern primitive. An official in the Paris *octroi*, he painted at week-ends jungle and bourgeois scenes in a naive style which is poetical and decorative. Not all Fr. painters have taken to entirely new forms of P. Vuillard and Bonnard, for example, remained faithful to the portrayal of quiet domestic life in bourgeois surroundings—Vuillard a lovely colourist with a strong feeling for pattern, Bonnard a late follower of the Impressionists. Rouault, originally a designer of stained glass, is individual in his portrayal of the horror and agony of life in his tragic figures and faces. Yet the final outcome of this amazing series of movements in P. is a tendency to complete abstraction, notable not only in the young painters of the School of Paris but also in active younger circles in England and the U.S.A.

ENGLISH PAINTING FROM 1870. The artistic movements which may arise from

discussion in restaurants and cafés are seldom found in England. Impressionism, however, found a footing at the Grosvenor Gallery Exhibition of 1877, and later in the New Eng. Art Club (1886), which also included John Sargent, the Amer. portrait painter, W. R. Sickert, a link with the Impressionism of Whistler and Degas, who painted with gusto racy or drab subjects, and Augustus John, a great Romantic artist and brilliant draughtsman, famous for portraits and compositions of gipsy life. Wiston Steer, O.M., whose Impressionism derived originally from France, returned to the Eng. tradition of Constable. The first Post-Impressionist exhibition in England was

ment; his influence has revived today and sev. young painters show it. He was the founder of the 'Vorticists,' who had as their mouthpiece a pub. entitled *Blast*. His style was intensely virile and his drawing highly idiosyncratic. Later formations were the Camden Town Group (1911) and the London Group (see above).

The period between the world wars produced many promising painters. Edward Bawden and Eric Ravilious both continued a fine tradition of Eng. water-colour drawing with gaiety and humour. Many young painters found effective scope for their topographical P. as war artists or in recording Britain. The war artists were better as recorders of the way things

PAUL NASH: THE MENIN ROAD, 1918

held in 1910, created an uproar, and gave a great impetus to many Brit. painters. Duncan Grant is an example with his robust treatment of solid forms in resonant colour. The war artists of 1914-18 also did striking work in the new idiom. C. R. W. Nevinson relied on a sharp geometrical style and for a while a reduction of forms to the near-abstract. Edward Wadsworth did something similar in his own style. Wm Roberts interprets natural shapes rather in terms of machinery, his pictures being meticulously organised. Henry Lamb, Eric Kennington, Stanley Spencer, with his highly personal vision continuing a vein of Pre-Raphaelitism, and the brothers Paul and John Nash are all associated with this period. Paul's formal structural P.s show Cubist influence. He was the moving spirit in 'unit one,' a group 'devoted to design as a structural pursuit,' while John's water-colour landscapes are notable for economy of means and cool planning. Wyndham Lewis was one of the few Eng. artists to be directly affected by the Cubist move-

ment. But a few were able to convey something deeper, notably Graham Sutherland and John Piper, who did bring out the horror and the devastation of war. For this they were well equipped by a style that goes far towards the abstract. But Eng. traditional water-colour painters such as Samuel Palmer have also helped to form their style. The drawings of Henry Moore, the sculptor, go farther still and remain the deepest expression of what humanity went through. Other painters who should be mentioned are Matthew Smith, an early follower of Matisse, whose directness of handling goes with a Fauve warmth of colour, and Mark Gentler, a Jewish artist, whose still lifes and portraits are excellently composed and beautifully painted. Of recent tendencies the most vigorous connect with Wyndham Lewis or Piper and Sutherland and the Brit. Romantic painters. On the other hand, the Euston Road Group, formed by Victor Pasmore, Claude Rogers, and others as a protest against

intellectualism, with the aim of 'painting things as they are,' has left a sturdy vein of realism.

THE PRESENT SITUATION. The state of the artist is more precarious than ever before, on account of the violent changes in the social system. Patronage in the old style is dead, and the only prospect for the artist is to become a week-end painter. The crisis is now and the outlook gloomy, in spite of the excellent intentions of such bodies as the Arts Council. In Russia the painter is paid by the State, which claims his work when finished. His livelihood is thus assured, but he has to submit to a rigid direction from the State in relation to subject matter and style. Soviet P. shows the influences of European P., but at a level of undistinguished naturalism. In France, as indeed in Europe, it is still Picasso, Matisse, and Braque who dominate the scene.

Taking a wide survey of P. in the last hundred years, and of ideas of P. in the world as a whole, one sees that the result of a less conservative attitude in Europe has been the realisation of merit in the art of non-European countries. The effect of the 'discovery' of the Jap. colour-print on the 19th-cent. P. is well-known. The appreciation of the exquisite qualities of Chinese landscape P. is also of comparatively recent date. P. in the Orient, however, as in Europe, has shown a tendency to abandon tradition in favour of the methods of the School of Paris.

That P. is vigorously pursued in the U.S.A. and the Brit. Dominions there can be no doubt; nor should one exclude Mexico, where a striking national school has come into being. Here again one notices that modern means of communication and the wide distribution of books containing reproductions of pictures have not made for an entirely local or regional art. The U.S.A. has always had its links with Europe in P., first with England in the colonial period, then with the schools of Munich and Paris; and if in recent times a Thomas Benton (b. 1889) or a Reginald Marsh (b. 1898) give the actuality of the Amer. scene, many more are fascinated by the abstract art that comes from Paris. Canada has had a notable modern school of landscape, while Australia vigorously faces the task of interpreting a continent—the paintings of Sidney Nolan, e.g., showing appreciation not only of a primeval landscape, but of the rough early hist. when the bush-ranger was to be found. In Mexico the P. of Rivera, Orozco, and Siqueiros shows its own effort to reconcile tradition and modernity. *See also* DUTCH ART; ENGLISH ART, *Painting*; FLEMISH ART; FRENCH ART; GERMAN ART; IMPRESSIONISM; ITALIAN ART; LANDSCAPE; PORTRAITURE; POST-IMPRESSIONISM; SEASCAPE; SPANISH ART; STILL LIFE; and articles on art under countries.

Painting and Decorating. Painting is the covering of a surface with paint in order to prevent its deterioration by exposure to the air. Decorating is artistic, as well as utilitarian, in its aim. The term covers paper-hanging, decorative painting, and the use of decorative paints and coloured washes on ceilings and walls. Both painting and decorating are frequently done by the amateur as well as the professional.

Exterior Painting. Various types of brushes are used, differing according to the article painted. For painting door panels, gates, etc. brushes at least 2 in. wide are normally used, and brushes 1½ and 1 in. respectively for painting window-sashes and smaller surfaces. The latter are sometimes called sash tools. Only brushes of high quality produce a perfect finish. After use it is necessary to clean the brushes thoroughly in turpentine and soapy water. The surface to which the paint is applied, whether it is iron or wood, should be clean and dry. Dirt and moisture cause harmful chemical action, and moisture can produce blisters on the paint film. If in bad condition the old paint must be stripped with a blowlamp and scraper, holes and splits filled in with putty or one of the many special fillings such as Alabastine, and the surface (if wood) sandpapered. If the old paint is not much blistered the surface should be cleaned down with a solution of sugar soap and water, followed by a wash with clean water, and sandpapering follows, if necessary. Before painting ironwork all rust and scale are removed with a wire brush. Three coats of paint are generally used, priming, under coat, and top coat. The priming covers flaws and irregularities in the original surface, and provides a secure foundation for the subsequent coats. A red-lead paint is used as a primer on wood and iron. Special primers are used for plaster surfaces. The under coat provides both good adhesion to the primer and a foundation for the top coat. As paint films change considerably in volume during drying and weathering, and also contract and expand with changes in temperature and atmosphere, it is

necessary to choose paints which do not differ greatly in constitution from the paint of the following coat. An ordinary oil paint can be used as a top coat with a coat of good outside varnish as a protection, or with a varnish paint, known as 'hard gloss.'

Interior Painting. It is not generally necessary to burn off the old paint. Grease marks may be removed with a weak solution of sugar soap, which is then washed off with clean warm water, and the surface rubbed down with a soft cloth. A very fine glasspaper gives a smooth surface. If the new paint is a similar shade to the old only one coat of paint should be necessary; but if the old paintwork is of a dark colour and a cream or light finish is required an under coat must be applied.

Distemping Ceilings. Brands of distemper or whitewash are obtainable in powder or paste form which require only the addition of water. The decorator should be equipped with 2 buckets of water, a distemper brush, and a sponge before commencing to wash off the old whitewash. The brush is then filled with water and applied to the ceiling. Approximately 1 square yard at a time is well soaked, and the water then sponged off, the second bucket of water being used to clean the brush and sponge. When all the whitewash has been removed the cracks in the ceiling and frieze are cleaned out with a pointed knife and stopped up with plaster of Paris or similar filling. A coat of size is applied to prevent the plaster from absorbing the distemper, and the distemper or whitewash follows. In order to avoid brush marks the work is done as rapidly as possible so that the edges of one section do not dry before the next is commenced. It is usually best to begin the work at a point in the room farthest away from the light. For walls an oil-bound distemper is used. Distempers are available in a wide range of colours.

Paper-hanging. Various types of designed paper can be used. In choosing the paper the size and use of the room in question should be considered. Repetitive patterns in a bedroom are not generally thought restful, and for small rooms neat, unobtrusive patterns are usually preferred, since the size and brightness of a pattern can make the room seem smaller. The overall patterns, or patternless papers, are now the most popular. It is advisable to strip off the old wallpaper entirely before fixing the new; to do this the old paper should twice be thoroughly soaked in water, and the paper then pulled away with a stripper. Cracks and holes in the walls are then filled in with plaster of Paris, Alabastine, or Koenig's cement. Perfectly straight edges to the paper are essential if it is to be butt-jointed. This produces a better finish than the lap-jointed paper. Paste can be purchased which only needs mixing with cold water to be ready for use, but a flour-and-starch paste is also good. It is wise to use a lining paper on a bad surface, the wallpaper being pasted over it. If the paper

is to be hung edge to edge (butt-joint) the first piece of paper may be hung in any corner of the room; if lap-jointed the papering should be started at the farthest corner away from the door. The paper is placed on a boarded trestle table, 21 in. wide, for pasting. When this is done the paper is pasted to the wall by attaching the top right-hand corner against the picture-rail, raising or lowering the left hand to bring the paper plumb, and pressing the paper on the wall with a paper-hanger's brush, working from the top downwards. For attaching to ceilings the paper is folded over a roll which is lifted with one hand while the end is attached with the other. Embossed materials such as Lincrusta are stiffer than paper, and can, if desired, be oil-painted.

Mass-production Methods in Painting. Painting by a brush is in many cases too slow a process to be economical, and often does not give very satisfactory results. Flowing is used on large flat surfaces such as the sides of trucks. The top is painted so that the paint flows over the surface, draining into a trough from which it can be pumped up for use again. Dipping is satisfactory where the paint is fulfilling an essentially protective function, since it enables the paint to penetrate parts which the brush could not touch. It can be applied only to articles where the paint can run off uniformly. The articles are put on a travelling belt which takes them through a paint bath into a drying chamber. Spraying, where the paint is sprayed through a nozzle, is chiefly used in the case of cellulose lacquer, e.g. in painting motor cars.

Some Decorative Methods. Staining and graining are common methods of decoration in paintwork. Staining is the imitation in paint of hardwood, such as mahogany; graining is the imitation of natural wood. Plastic and cellulose paints and enamels are also used in decorative work. Satisfactory results require a high degree of skill.

See E. W. Hobbs, *Painting, Enamelling, Paper-hanging, and Distemping*, 1937; D. Miller, *Interior Decorating*, 1937; J. P. Parry, *Painting and Decorating*, 1938; J. Mason, *Painting and Decorating*, 1948; W. P. Matthew, *Home Decorating*, 1948; and A. E. Hurst, *Painting and Decorating*, 1949.

Paints consist of finely powdered, insoluble materials, principally pigments (q.v.) suspended in liquid binding media, and possess the property of drying to adherent films on exposure to the atmosphere or the application of heat. They are used for the decoration and protection of all types of articles and buildings, and for artistic purposes. The principal function of pigments is to impart colour and opacity, although there is a further group of materials, known as extenders, which are often loosely classified as pigments. The most common extenders are ground barytes, blanc fixe (precipitated barium sulphate), asbestos (fibrous talc), china clay, and whiting (calcium carbonate); and whilst they impart little or no colour or opacity, they are widely used to lower raw

material cost. Providing this is not carried to excess, no harm results; indeed, in certain circumstances the presence of extenders may strengthen the film of paint and even improve its durability.

Binding Media consist of drying or semi-drying oils and/or resins and are thinned, if necessary, with suitable solvents such as turpentine, white spirit (turpentine substitute), the coal-tar hydrocarbons (benzol, toluol, xylol, and naphtha), or, in the case of special paints, with certain alcohols, esters, ketones, and chlorinated hydrocarbons. Linseed oil is still the principal drying oil used in paints, although large quantities of tung oil (chinese wood oil) and dehydroxylated castor oil are also used. Tung oil dries more rapidly than linseed oil and is more water- and chemical-resistant, whilst dehydroxylated castor oil has a degree of chemical and water resistance approximately half-way between the two: it also yellows much less on exposure, but tends to dry with a film which remains tacky for a long time. A number of other oils such as perilla, soya bean, oilcica, stillingia, sunflower seed, hempseed, tobacco seed, and various fish oils are also used to some extent. It is nearly always necessary to process such drying oils by refining or by heat treatment in order to improve their performance. Heat treatment increases the viscosity of the oil, usually by partial oxidation and by polymerisation (a chemical process in which molecules of the same compound associate to form more complex molecules). Such treatment can profoundly affect flow, gloss, durability, chemical resistance, and drying time whilst removing such undesirable properties as 'ropiness' (the showing of brushmarks), wrinkling, and after-tack. It also permits a greater addition of solvent, thus lowering the price of the finished P.s.

Resins used in P.s can be classified as either natural resins or synthetic resins, although the former have to a very large extent been replaced by the latter. The commonest natural resin is rosin (colophony) (q.v.), which is the residue remaining after the distillation of turpentine from the exudation of the pine-tree; wood rosin is obtained by solvent extraction from old stumps of pine-trees. Whilst rosin can be used on its own in oils to form P. media, this is done only in the manufacture of the cheapest P.s. Its performance can, however, be much improved by reaction with lime, zinc, or glycerine, by hydrogenation and polymerisation, and by reaction with synthetic resins. The other main class of natural resins are the copals. These are derived from fossil or more recent forest remains, and usually bear the name of the district of origin, e.g. Congo copal or Sierra Leone copal. Nowadays these are mainly used in varnishes (q.v.). The earliest synthetic resin used in P. was made by reacting phenol with formaldehyde and combining the resultant resin with rosin in order to obtain solubility in oil. It was subsequently found that, by using more complex phenols, the rosin could be dispensed with, this resulting in resins having greater durability

and water and chemical resistance. These

are then mixed with drying oils to form media having good durability, gloss, and resistance to water and chemicals. The most important class of synthetic resins is the alkyds. These are made by reacting glycerine or pentaerythritol with phthalic anhydride and drying oils. Other modifications can also be made, such as the introduction of phenol or rosin. The alkyd resins give P.s of the highest durability, of excellent gloss retention, and good drying properties. They are also used in the manufacture of industrial finishes either on their own or, for stoving finishes, in admixture with urea resins (urea reacted with formaldehyde), or with melamine resins (melamine reacted with formaldehyde). See RESIN.

Driers must be added to P.s containing drying oils in order to accelerate the drying process. These are catalysts which increase the rate of oxidation or polymerisation of the oils. The driers used are usually the organic salts, such as the resinsates, linoleates, naphthenates, or octoates of lead, cobalt, and manganese, although other metals, such as iron, vanadium, and cerium, can be used.

Water P.s basically follow the above pattern, except that water is used in place of organic solvents, and additions of water-soluble or water-dispersible substances may be made. Distempers contain white pigment, usually lithopone, and whitening and may be bound with glue (non-washable distemper) or casein (fast-bound distemper). Oil-bound distempers contain glue and/or casein into which oil and/or resin is emulsified. Plastic emulsion P.s are water paints based on emulsions of synthetic resins such as polyvinyl acetate or poly-styrene, and are characterised by excellent washability and resistance to lime.

Manufacture of P.s is carried out mainly in two types of machine. The ball mill consists of a horizontal cylinder lined with steel or porcelain and containing a charge of steel balls or pebbles. The paint and the balls are turned round for a number of hours until the pigment is properly dispersed. Other mills are based on rollers which crush the mixture of oil and pigment between them, whilst refining is carried out by means of a single roll mill which causes the paint to pass between the roller and a fixed iron bar.

See Oil and Colour Chemists' Association, *An Introduction to Paint Technology*, 1949; S. R. W. Martin, *Synthetic Resin Chemistry for Students*, 1951; H. W. Chatfield, *Glossary of Terms Used in the Paint, Varnish, and Allied Trades*, 1951; L. A. Jordan et alii, *Oils for the Paint Industry*, 1951; M. R. Mills, *An Introduction to Drying Oil Technology*, 1952; Noel Heaton, *Outlines of Paint Technology*, 1956. See also LUMINOUS PAINT.

Paisiello, Giovanni (1740-1816), It. composer, b. Taranto, learnt his art from Durante, Cotumacci, and Abos. After his first successes with two comic operas fortune smiled on him in spite of the

formidable rivalry of Piccini and Cimarosa, a rivalry which aroused endless jealousies in P. For 8 years (1776-84) he enjoyed the lavish patronage of the Empress Catherine at St Petersburg, and after serving Ferdinand IV at Naples until 1799 he was engaged by Napoleon in Paris as musical director in his chapel. His *Barbiere di Siviglia* was very successful until it was displaced by Rossini's brilliant opera of the same name.

Paisley (in Rom. times *Vanduaara*), burgh on both sides of the White Cart R., 3 m. above its confluence with the Clyde, and 7 m. WSW. of Glasgow, in Renfrewshire, Scotland. A 15th-cent. decorated nave is almost all that is left of the old abbey church, which was founded in 1163 by Walter Fitzalan as a Cluniac monastery. In 1307 the English razed the abbey to the ground, and it had not long been rebuilt when it again suffered during the Reformation. It has now been carefully restored. There are a 16th-cent. grammar school and a technical college, and also in the town are statues to Robert Tannahill, the native poet; Robert Burns (q.v.); Alexander Wilson, the Amer. ornithologist; Sir Peter Coats (d. 1890), who presented the free library and museum; Thomas Coats (d. 1883), who gave the observatory and Fountain Gardens; and George Aitken Clark (d. 1873), the thread manufacturer, who helped to build the town hall. In the early 18th cent. the town was already noted for its manuf. of shawls (since gone out of fashion), silk-gauze, muslin, and linen; but the staple industry of to-day is the making of linen thread. Other industries include dyeing, bleaching, distilling, engineering, ship-building, and the manuf. of chemicals, carpets, etc. There is a good harbour. St James's Park (40 ac.) and Barshaw Park are the two largest open spaces. P. sends one member to Parliament. Pop. 93,700.

Paisley Terrier, see **CLYDESDALE**.

Paisy (1722- after 1784), monk of Khlendar, Mt Athos. Irritated at the contempt of Gk, Russian, and Serbian monks for Bulgarians, he compiled the *Slaveno-Bulgarian Hist.*, 1762, to show Bulgarians that they had cause for pride, not shame, in their past. The first work in anything like modern Bulgarian, it was circulated in MS. (printed only in 1844), and was the signal for the revival of Bulgarian national consciousness, a revival that culminated in the liberation of Bulgaria.

Paíta, port and cap. of the prov. of P., in N. Peru, in the dept of Piura at the mouth of the Chira R. It is the outlet for the chief cotton dists. The town has an old-world Sp. appearance and the buildings are mostly of wood. Its anct church has a miraculous statue of the Blessed Virgin. It exports, besides cotton, hides and skins, and Panama hats from Catacaos. Pop. 7200.

Päivrinta, Pietari (1827-1913), Finnish novelist, b. Ylivieska, was the son of a peasant, and made his name as a writer with stories of peasant life. He was one of the first to write fiction in Finnish, his

pubs. including *Tintti Jaakko*, 1883; *Synslehtiä*, 1900; and *Pikku kuvio elämästä*, 1904.

Pajou, Augustin (1730-1809), Fr. sculptor, b. Paris, won the Prix de Rome in 1748, and thus was sent at public expense to Rome to study art. On exhibiting his 'Pluto holding Cerberus in Chains' he was elected to the Academy. He carved excellent portraits of Mme du Barry, Bossuet, Buffon, Turenne, Pascal, and Descartes, and executed also the sculptures of the Salle de l'Opéra at Versailles. His 'Psyche Forsaken' was acquired by the Luxembourg.

Pakhoi, seaport, 12 m. SW. of Lien-Chou in W. Kwangtung prov., China. The native and foreign quarters are distinct, the latter being on a hill. Since 1876, when it was opened for international trade, the volume of its exports (indigo, aniseed, cuttle-fish, sugar, and cassia-oil) has grown enormously. Manganese ore is mined near by. Pop. 36,000.

Pakhsto, see **PUSHRU**.

Pakistan, a republic, member of the Commonwealth, formerly part of Brit. India, divided geographically into two parts more than 1000 m. apart, the W. portion consisting of the former Baluchistan, Sind, Punjab (part), and NW. Frontier areas, together with the adjacent states (except Kashmir, q.v.), the E. portion of Bengal (part) and Assam (part). For history prior to 1947 and general information, see **INDIAN SUBCONTINENT**.

Area and Population. The area of P. is 364,737 sq. m. and the pop. (1951) 75,842,165. Of the total, 86 per cent are Muslims. The prin. cities are Karachi (1,000,000), Lahore (850,000), Dacca (411,000), Chittagong (294,000), Hyderabad (202,000), Rawalpindi (237,000). P. is the largest Muslim state in the world.

Physical Features. The W. portion of P., lying to the NW. of India, contains much desert and barren rocky tracts. At the same time, it contains the great valley of the Indus, and the fertile and well-watered plain of the W. Punjab. In addition, in the former Sind Prov., there is the vast area served by the great irrigation systems stemming from the Sukkur Barrage on the Indus. The climate is one of extremes of temp., with a somewhat erratic and exiguous rainfall. The E. portion, lying E. and N. of Calcutta in India, is tropical, heavily watered, lying along and largely below the valley of the Brahmaputra, widely intersected by waterways and liable to flooding from a consistently heavy rainfall. The climate is warm and humid.

Agriculture. Agriculture is the main occupation of the people, nearly 80 per cent of the pop. being so engaged. The main food crops are rice and wheat, together covering 34,000,000 ac.; the main commercial crops are cotton, rape and mustard, and jute, together covering 6,250,000 ac. As has happened in nearly every country embarking upon intensive industrial development, there is a tendency to produce more cash crop and fewer food crops. The P. Gov. are therefore devoting much attention to schemes for

increased irrigation, use of fertilisers, improved seeds, and greater production per ac. Irrigation schemes aim at bringing more than 6,000,000 ac. under new cultivation.

Industry and Power. P. came into existence with little estab. industry. Planning has therefore started largely from scratch and covers a very wide field. There are a number of power projects at or nearing completion, of which the most important are Karnaphuli hydro-electric in E. P. (160,000 kW.), Warsak hydro-electric in W. P. (150,000 kW.), the Sui natural gas in W. P. (127,000 kW.). The jute industry in E. P. has received special attention. The fixation of the boundary

medicines. The estimated balance of exports over imports for 1955-6 is about 750,000,000 rupees (£57m.).

Education. Figures from the 1951 census show the percentage of literates in P. as 18.9. The Gov. have undertaken a vigorous drive to eradicate illiteracy. There are now 52,000 primary and secondary schools, some 180 colleges, 7 medical colleges, and 6 univs., Dacca, Karachi, Peshawar, Punjab, Sind, and Rajshahi, accommodating some 80,000 students. The univs. are assisted by Gov. grants.

Communications. P. has of necessity 2 railway systems, the NW. Railway in W. P., with a mileage of 5344 m., and the E. Bengal Railway, with a mileage of 1703

E.N.A.

PESHAWAR: A STREET IN THE BAZAAR QUARTER

between P. and India had the curious effect of leaving the main jute supplies in P., but the mills in India. P. has now erected 13 jute mills in her own ter. Among other industries receiving particular encouragement are paper, chemicals and fertilisers, cement, iron and steel, sugar, and textiles. Crude petroleum production has been increased between 5 and 6 times since 1947, and exploration for further resources is in progress. Industrial expansion generally is the subject of a comprehensive five year plan begun on 1 April 1955.

Trade. Since 1950 P. has had a consistently favourable trade balance. At first the prin. commodities exported were jute, cotton, wool, hides and skins, and tea. The emphasis is, however, changing from primary commodities to processed goods, in particular manufactured jute goods, cotton yarn, and cloth. Imports of cotton piece-goods, twist, and yarn have largely disappeared, and the prin. imports now appear to be mineral oil, machinery, metals and ores, and drugs and

m. More attention is being given at the present time to improvement of stock and track than to expansion; owing to the shortage of coal, large purchases have been made of diesel-electric locomotives. In E. P. inland waterways are of major importance. There are 2870 m. of navigable waterways, with over 1000 self-propelled craft in operation. Civil aviation, which provides the only speedy communication between W. and E. P., is rapidly developing under the Gov.-sponsored P. International Airlines Corporation, Karachi, Dacca, and Chittagong all being recognised international airports.

Defence. The P. Defence Services, which consisted originally of those sections of the former Indian Army allotted to P. on partition, began their independent existence with not a few handicaps, but with the highest traditions and a gallant record. An officer training school was opened at Kohat in 1949, and the P. Military Academy at Kakul in 1948. The old Staff College at Quetta was taken over, and continues to be a model of its

kind. One of the greatest handicaps was the lack of any ordnance factory, all the existing ones being located in Indian ter. A new ordnance factory centre and tn is now being developed at Wah. For the Navy, 2 big projects have been a naval base at Chittagong and a naval dockyard at Karachi. The P. Air Force College at Risalpur is expanding and, though many officers still go abroad for advanced training, home facilities are on the increase.

Currency and Finance. The monetary unit is the rupee of 16 annas. Until July 1955 the sterling equivalent of 1 rupee was 2s. 2d.; it was then devalued to 1s. 6d., on a parity with the Indian rupee. The

Dominion under the provisions of the Indian Independence Act, 1947. In 1949 the Constituent Assembly began its consideration of the future constitution. The deliberations proved long and difficult. In 1955 sufficient agreement had been reached for the Governor-General to appoint a new Constituent Assembly, and the new constitution came into force on 23 Mar. 1956. P. is now a Federal Democratic Islamic Republic, continuing her membership of the Commonwealth of Nations, and recognising the Crown as the symbol of the free association of the independent members and as Head of the Commonwealth. The federation is of the

The High Commissioner for Pakistan

THE JETTY AT THE SADAR GHAT, CHITTAGONG, EASTERN PAKISTAN

change indicated the development of P. from a self-contained and almost wholly agric. country into an increasingly industrialised and exporting one, imposing the necessity to adjust her finances more closely to international trends in finance. Revenue receipts have increased from 667.6m. rupees (£50m.) in 1948-9 to 1276.8m. rupees (£96m.) in 1955-6 (estimated). Revenue expenditure has similarly increased from 647m. rupees to 1276.2m. rupees (£96m.). Apart from the large increase in both totals, the most significant feature in the receipt figures is the fact that, while customs receipts continue to constitute the largest single item, the increase has been greatest in income tax, sales tax, and central excise, a clear indication of the rapid internal development; on the expenditure side, the greatest individual increases are to be found in the beneficial and social services, both being 4-5 times greater. Civil works have increased 3 times. The sterling balances at Dec. 1955 stood at \$64.1m.

Constitution. In 1947 P. became a

2 units, E. P. and W. P., and all previous divisions into provs. and states have been abolished. It is provided that the President must be a Muslim, and a unicameral legislature is estab. of 300 members, the National Assembly, the members being directly elected on a basis of parity between E. and W. P. Each of the 2 units has its own Assembly and Cabinet. The judiciary is independent, and provision is made prohibiting discrimination of any kind against minority and non-Muslim communities. A provision of particular interest is that no law shall be enacted which is repugnant to the injunctions of Islam as laid down in the Holy Quran and *Sunnah*, and that a Commission shall be appointed to recommend the manner and stages by which this provision shall be given effect, and to compile a list of those Islamic injunctions to which legislative effect can be given. The constitution also provides that these provisions shall not affect the personal laws of the non-Muslim citizens or their status as citizens or any provision of the constitution.

History from August 1947. It would be difficult to conceive more disadvantageous circumstances than those in which P. began her independent existence. Although agreement was reached between India and P. by Dec. 1947 on the division of the financial assets and liabilities of the former Gov. of India, and of the armed forces, there were a host of intractable problems. The frontier demarcation, combined with the complete lack of confidence between the 2 new Govs., and between Muslims and Hindus, set in motion wholesale communal massacres, followed by an unparalleled exodus of

waters. On top of all this, it should be recalled that the percentage of Muslims in the main administrative services of the former India, including the Indian Civil Service, had always been low, that communications between the 2 parts of P. virtually did not exist, and that internal differences and rivalries between the provs., such as Sind, the Punjab, and Bengal, soon proved that they were at least as powerful as the uniting emotion of a free Islamic state. In addition, P. had to stand the death of her founder and first Governor-General, Mahomed Ali Jinnah (q.v.), in Sept. 1948, and the

PARLIAMENT HOUSE, KARACHI

Camera Press

refugees in both directions. The worst effects were felt in the Punjab, but Calcutta also was a scene of tragedy, as also many towns in the N. of India, including Delhi itself. It stands to the lasting credit of Mahatma Gandhi, Jawaharlal Nehru, and Liaquat Ali Khan that they allowed no considerations of personal danger or political esteem to interfere with their joint and determined efforts to end this senseless holocaust. Within 3 months law and order had mainly been restored, but unfortunately not the confidence between the 2 Govs., or indeed between the peoples of the 2 countries. P. thus started on the worst possible terms with her immediate neighbour, with whom her whole political, administrative, and economic life had till then been integrated. Feelings were, of course, exacerbated by the events in Kashmir (q.v.), a problem which unhappily subsists, and by a lack of definition in the terms regarding the use of the waters of the great rivs. which irrigate the Punjab and of the canal

assassination by a fanatic of her first Prime Minister, and Mr Jinnah's closest confidant, Liaquat Ali Khan (q.v.), in Oct. 1951.

Against such a background it is not surprising that the hist. of P. since 1947 is mainly of internal affairs, and among them largely matters of political adjustments. It is indicative of the difficulty and delicacy of those adjustments that it took from 1949 to 1956 to reach agreement on the terms of the constitution (see above). It is worth mentioning that the difficulties were not wholly due to political considerations and that a very real problem, not yet wholly solved, arose from the determination to found both the constitution and the body of P. law upon the principles and injunctions of Islam, the latter in particular being open to divergent interpretations. The political rivalries and dissensions are much too intricate to detail in this article, but it must be mentioned that in 1956 the Muslim League, the Gov. party welded and held

together by Mr Jinnah and Mr Liaquat Ali Khan, suffered a total eclipse in E. P., and went into opposition in the Central Assembly. Mr. H. S. Suhrawardy, leader of the Awami league, became prime minister in succession to Mr Mohammed Ali in Sept. 1956, leading a coalition of his own and other parties; after his resignation he was succeeded by Mr. I. I. Chundrigar in Oct. 1957. On Mr Chundrigar's resignation, Mr M. Firoz Khan Noon became premier in Dec. 1957.

Wheeler, *Five Thousand Years of Pakistan*, 1950; Lord Birdwood, *A Continent Decides*, 1953; O. H. K. Spate, *India and Pakistan*, 1954; Gov. of Pakistan, *Constitution of the Islamic Republic of Pakistan*, 1956.

Pakkhto, see PUSHTU.

Pakkoku, dist., with an area of 6210 sq. m., in Upper Burma. Arid regions are interspersed between the fertile valleys of the Yaw, Myittha, and Mön-Sesamun. Oil is found at Yenangyat. Millet and sugar, and also maize, vegetables, rice, and tobacco, are cultivated. The tn of P. (30,000 inhab.), situated on the Irrawadi, is a lumbering centre. Pop. 560,000.

Palace (Lat. *palatium*, from Mons Palatinus), word adopted in varying forms (*palais*, *palast*, *palazzo*, *palanquium*, O.E. *palent*) by all European languages. Properly applied to imperial and royal residences, as to those of an emperor, king, or pope, it is also used by extension for any sumptuous habitation. Any episcopal residence receives this name in England, as Fulham, Lambeth, and Cuddesdon palaces. Windsor Castle is the finest example of an Eng. P. in the original sense. The derived meaning of a spacious and attractive building is familiar in the modern 'picture P.' and other places of entertainment.

Palace Court (*Curia Palatii*), court erected by the highly unconstitutional Charles I in 1631 to try personal actions arising within 12 m. of Whitehall Palace, whether either of the litigants was of the royal household or not. The judges were the steward of the king's household and the knight-marshal; but later it was presided over by a barrister-deputy, and held weekly in Scotland Yard. Together with the other exceptional and prerogative courts, the Court of Marshalsea and the Court for the Honour of Peveril, it was abolished in 1849, the pending causes being transferred to the common pleas (q.v.) or the co. courts, and the records handed over to the custody of the master of the rolls.

Palace Theatre, in Cambridge Circus, London, opened 31 Jan. 1891 as the Royal English Opera House under the management of Richard d'Oyly Carte, with Sullivan's *Ivanhoe*, which ran for 155 performances. The theatre failed and was saved by Charles Morton, who

made it into a world-famous theatre of varieties. It became a revue theatre in 1913. The P. T. has since been noted for musical comedy. It was damaged by bombs in the Second World War.

Paladin, name given to the 12 peers of Charlemagne, such as Roland, and also to knights-errant generally. The exploits of the P.s form the theme of the French national epic known as *Chansons de Geste*, the matter of which tended to centralise about one person, Charlemagne, the champion of Christianity and chivalry against the hated Saracen. The word P. is derived from Lat. *palatinus*, and literally denotes a courtier, member of a royal household, or a person connected with a palace (q.v.).

Palaeobotany, the science of fossil plants. Knowledge of the flora of the geological past is gained by examination of fossils (q.v.), i.e. plants or their parts which were embedded and remained undisturbed in mud, sand, or ooze while the sediments hardened into rocks. Other fossil specimens were petrified by the infiltration of water containing mineral substances such as silica in solution. In many cases, although the plants have decayed, they have left clear and detailed impressions in fine-grained sediments. Casts of hollow stems and bulky seeds yield considerable information with regard to the morphology of the plant. Some plant remains are found in amber and other fossilised secretions. The organic substance of plants (mainly cellulose and lignin) in time becomes converted into coal, the carbohydrates changing into hydrocarbons. However, the cuticles and spore-coats may remain virtually unchanged, and it is possible to extract cuticles from very ancient rocks.

The earliest plant fossils are those of Pre-Cambrian simple algae, resembling modern blue-green algae (Cyanophyceae), and possibly of iron bacteria. In the Palaeozoic era, from the beginning of the Cambrian to the end of the Silurian periods, the only plant fossils are those of marine algae of the blue-green, green (Chlorophyceae), and red (Rhodophyceae) groups. In the Lower Devonian strata are found the earliest land plants, the Psilophytales, but these show such marked differences from fossils of earlier aquatic plants that it seems probable that there were intermediate forms hitherto undiscovered, perhaps because conditions may not have favoured preservation. The plants of the Upper Devonian were much better developed, and included seed-bearing trees from 30 to 40 ft high. In these strata many of the plants subsequently so prolific in the Carboniferous period made their first appearance. The ancestors of modern Horsetails and Lycopods were well-developed trees during this period; ferns were abundant, and also fern-like seed-bearing plants, the Pteridosperms. The abundance of vegetation at this time may be judged from the coal formed by slow decomposition of these plants under the enormous pressure of subsequent strata. In the early and middle periods of the Mesozoic era, the

cycad-like Bennettitales and conifers became predominant, and towards its close primitive flowering plants appeared. These became increasingly abundant from the Tertiary to the Quaternary periods of the Cainozoic era, and included many forms similar to those of living flowering plants. P. is essential to the study of the relationships and the evolutionary development of plants (see GEOLOGY). The study of spores and pollen-grains, palynology (q.v.), not only reveals the composition of ancient forests, but is economically important at the present time. See D. H. Scott, *Studies in Fossil Botany*, 1920, and *Extinct Plants and Problems of Evolution*, 1924; F. H. Knowlton, *Plants of the Past*, 1927; R. Crookall, *Coal Measure Plants*, 1929; A. C. Seward, *Plant Life through the Ages*, 1931; J. Walton, *Introduction to the Study of Fossil Plants*, 1940; and L. Emborger, *Les Plantes Fossiles*, 1944.

Palaeo-ecology, an aspect of Palaeontology (q.v.) concerned with the ecology of fossil organisms.

Palaeogeography, study of climatic conditions and of the distribution of land and sea in the geological past. See GEOLOGY PALAEONTOLOGY.

Palaeography (Gk *palaio*s, anct.; *graphein*, to write) is the branch of knowledge which seeks to decipher (that is, to read and interpret), to date, and place any kind of anct writings. In the widest sense of the word it deals with all anct written documents or engraved monuments, in any language, on any writing material, from any period. There are, however, certain branches of study which treat of particular kinds of written documents, such as numismatics (q.v.), which deals with inscriptions on coins; sphragistics, which treats of writings on seals; and epigraphy, which deals mainly with anct inscriptions cut, engraved, or moulded on hard material, such as stone, metal, or clay. Thus P. in the narrow sense of the word deals mainly with the softer materials on which handwriting, as distinguished from monumental engraving, has been inscribed; that is, with writing that is painted or traced in ink or colour, with a stylus, brush, reed, or pen, on such materials as paper, parchment, papyrus, linen, or wax. Still, there are certain exceptions, and sometimes P. has to inquire into the employment of metals, clay, potsherds, wood, and other writing materials. The line between P. and epigraphy is therefore not absolute. Typical examples of the border line are *ostraca* (documents written in ink on potsherds after the vases have been broken) and *graffiti* (wall-scribbings, discovered in large numbers at Pompeii).

On the other hand, the distinction between P. and epigraphy is less superficial than it may appear. The forms of written letters, similar at first to the engraved letters of the inscriptions, develop more swiftly, and with few exceptions the difference is maintained in all scripts. Writing materials have always played a great part in the external development of the single letters. Other

factors are as follows: (1) The necessity of speed in writing, assisted by innate laziness, produces the various cursive scripts. Under the pen of the expert scribe, who sought to save time, the letters naturally assumed less-exact shapes, as strokes were slurred, superfluities were dropped out, angles were curved; letters were linked together, these forms becoming similar to each other (so that it is hard to distinguish them); abbreviations were employed. (2) This tendency is counteracted by the reader's demand for clearness. In anct times writing not only served as an instrument of private communication, but it was also applied to the purposes of literature. No author would allow his writings to be pub. in a form which could not be perused with ease; thus neatly written books were essential, and with the necessity for multiplying literary works, the creation of a formal kind of writing suitable for books intended for the market was the natural result. (3) Aesthetic reasons: the study of the development of writing as dependent on aesthetic reasons is the subject of calligraphy. In some countries the profession of calligraphist was held in high esteem; indeed Chinese, Arabic, and Indian calligraphy has reached very high levels. According to some scholars, the importance of calligraphy in Christian MSS. was impaired by the development of the art of miniature. However, the desire for the writing to look beautiful on the whole makes for clearness, though in some cases it produces excessive uniformity, the scribe as it were forcing all the letters into one mould so that they should not spoil the regularity of his line or page. Naturally these various motives and inducements differed in relative strength with the purpose of the written document.

Hence the student of P., in its numerous branches (Indian, Greek, Latin, Hebrew, Arabic, etc.), generally distinguishes 2 classes of handwriting, the ordinary cursive script, or current hand, common to all and employed for everyday-life purposes, and the carefully written literary or book-hand, in which works of literature were usually written. The 2 classes, however, cannot always be kept absolutely distinct. Between them there might be a whole series of varieties which had some of the peculiarities of each group. For instance, a kind of book-hand might be employed by a trained scribe, often for some official reason, in drawing up a document which more usually would be inscribed in cursive characters; or cursive writing might be employed by a scribe copying books for private study.

In P. large letters are called *majusculae*, small letters *minusculae*. A variety of the capitals or majusculae of the Gk and Lat. monumental scripts is known as *uncials*, which are a modification of the monumental letters, in which curves are freely introduced as being more readily inscribed with the pen on soft material. Uncials are the ordinary characters used in early Gk papyri and vellum MSS., as well as the most anct extant forms of the

Lat. book-hand. They were doubtless the characters best adapted for calligraphy. The semi-uncial script, i.e. the mixed hand of uncials and minuscule letters, which was the main book-hand from the 5th to the 9th cents. AD, was easier than the uncials and more calligraphic than the cursive minuscule. The Gk and Lat. minuscule are derived from the majuscule. Although they already appear in the last centuries BC, a full minuscule alphabet was only slowly developed. Out of the Rom. cursive minuscule, various national minuscule arose (It. or Lombardic; Merovingian in France; Visigothic in Spain; Germanic; and particularly the Insular or Anglo-Irish hands). From the period of Charlemagne to the close of the 15th cent., the Caroline or Carolingian hand, to which is mainly due the blending of the majuscule and the minuscule, and later also the 'block-letter,' were the more important hands. The 15th cent. witnessed the dissolution of the later 'national' hands of the Middle Ages. The neat humanistic or renaissance hand, then introduced in Florence and employed for literary productions, developed into the: (1) Venetian minuscule known as *italica*, probably the most perfect form of letters and the most clearly legible which has yet been invented, and (2) the 'Rom.' type, perfected in N. Italy, chiefly at Venice. The monumental type of the Lat. alphabet, taken over for the majuscule, and both forms of the minuscule, the Roman and the *italica*, spread all over the world. In England they were adopted, from Italy, in the 16th cent.

The study of P., in all its branches, is of the greatest scientific and practical importance to ancient and medieval hist., to classical philology, to textual criticism, and to other branches of historical science. A particular branch of P. termed papyrology (q.v.) deals with the decipherment and interpretation of writings on papyrus. See also LETTERING.

In recent years there has been a revival of those styles of handwriting practised in 16th-cent. Italy, particularly by the great writing-masters of Rome and Florence. The so-called 'Chancery Script,' based on a 15th-cent. It. cursive hand adopted by Pope Nicholas V for the briefs written in the papal chancery, has been revived in Britain and the U.S.A., and is encouraged in some Eng. public schools. For an example of one of the original hands from which the modern styles have been developed, see VICENTINO, LODOVICO DEGLI ARRIGHI.

LANGUAGE; HEBREW LANGUAGE; LATIN LANGUAGE; etc.

Palaeolithic (Old Stone Age), see ARCHAEOLOGY; CAVE ART; FLINT IMPLEMENTS; STONE AGE.

Palaeologus, name of an illustrious Byzantine family, which first appears in hist. about the 11th cent. The family grew in power and importance until Michael P. became emperor of Byzantium as Michael VIII in 1261. He d. in 1282, but the dynasty he founded lasted for nearly 2 centuries. The line of the emperors after Michael VIII is as follows: Andronicus II (1282-1328); Andronicus III (1328-41); John V (1341-7); (John Cantacuzene ruled as John VI 1347-55); John V then ruled again (1355-76); Andronicus IV (1376-9), who deposed John V for that space of time; John V, who won the throne again from 1379 to 1391; Manuel II (1391-1423), whose co-ruler was John VII (1399-1412); John VIII (1423-48); and Constantine XI (1448-53), who fell in the siege of Constantinople by Mohammed II. The family also furnished rulers to sev. principalities, whilst a branch ruled in Monteferrat from 1305 to 1533. Andrew P., supposed to be a descendant of Constantine XI, was a claimant for the Byzantine empire, but resigned in favour of Charles VIII of France.

Palaeoniscids, a primitive Palaeozoic group of fresh-water chondrosteian ray-finned fishes, possessing a fusiform body, ganoid scales, and a heterocercal tail. Some were deep-bodied and lived in still waters. They lived from Devonian to Jurassic times, but were most abundant in the Carboniferous.

Palaeontology, science of fossils (q.v.) which deals with the life of past geological ages. As biology is subdivided into botany and zoology, so P. is regarded as consisting of Palaeobotany (q.v.) and Palaeozoology; the former deals with fossil plants, and the latter with fossil animals.

All the main categories of vertebrate animals (fishes, amphibia, reptiles, birds, mammals, man), including a large number of extinct groups, are represented in the fossil record, and can frequently be seen to grade into each other. The main groups of fossil invertebrates are as follows: (1) Protozoa (animals of the earliest type, such as foraminifera, radiolaria, etc.); (2) Porifera (comprising the sponges); (3) Coelenterata (including corals, stromatoporoids, hydrozoans, and jellyfishes); (4) Echinodermata (sea-urchins, starfish, crinoids, etc.); (5) Annelida and other kinds of worms; (6) Arthropoda (crustaceans, trilobites, arachnids and insects); (7) Bryozoa; (8) Brachiopoda; (9) Mollusca (lamellibranchia, gastropods, cephalopods); (10) Hemichordata (graptolites). Each of these phyla is broken up into classes and still further into orders, families, genera, and species. The fossils obtained from the rocks are generally more or less fragmentary, but from these fragments it is possible to form an accurate conception of the entire organism. From a single

tooth, bone, or shell fragment, the palaeontologist can form a fair conception of the complete organism. From the nature of the fossils the conditions of deposition of a geological formation can be surmised, the nature of the climates of past ages may be judged, and the physical configuration of the lands and seas of past time determined (see FOSSIL). To the biologist the study of fossils is of considerable importance, since not only are they the ancestors of modern species, but many groups now extinct (graptolites, trilobites, etc.) often throw light on the relationships of existing animals and plants. In some cases anct forms serve to connect groups which at present appear to be quite distinct, e.g. the earliest known bird, *Archaeopteryx* (q.v.), shows affinities with reptiles.

In spite of the imperfection of the record of life in past ages, the theory of evolution receives great support from palaeontological evidence. Many groups of animals undergo gradual modification when traced through series of strata. The early forms of life gradually become more abundant, deploy into various environments, become more specialised, reach their acme, and then die away again. A review of the fossils which are found in the geological systems reveals that there is a passage from the lower to the higher forms of life, each type becoming more and more specialised with the progress of time. Thus trilobites and lower forms of life occur in the Cambrian and Ordovician systems, fishes appear in the Silurian, amphibia in the Carboniferous, reptiles in the Permian, and birds and mammals in the Jurassic. On the other hand, some species, such as the brachiopod *Lingula*, have persisted almost unchanged from the Ordovician period up to the present day. See FOSSIL; PALAEOBOTANY; PALAEO-ECOLOGY; MICRO-PALAEOLOGY; EVOLUTION; GEOLOGY. The fossil hist. of man is dealt with under ANTHROPOLOGY and MAN. See C. A. von Zittel, *Text-book of Palaeontology* (trans. C. E. Eastman), 1900-2, and *History of Geology and Palaeontology*, 1901; R. S. Lull, *Organic Evolution*, 1917; A. S. Romer, *Vertebrate Palaeontology*, 1945; H. Woods, *Palaeontology: Invertebrata*, 1946; A. Morley Davies, *Introduction to Palaeontology*, 1947; H. H. Swinerton, *Outlines of Palaeontology*, 1947; ed. J. Piveteau, *Traité de Paléontologie*, 1952-5; R. R. Shrock and W. H. Twenhofel, *Principles of Invertebrate Palaeontology*, 1953; E. Neaverson, *Stratigraphical Palaeontology*, 1955.

Palaeopolis, see ELIS.

Palaeo-Siberian Languages, see LINGUISTIC FAMILIES.

Palaeozoic (Age of Anct Life) includes the Cambrian, Ordovician, Silurian, Devonian, Carboniferous, and Permian geological systems. In the Lower P. the only fauna were invertebrates and fishes, whilst at the end of the age reptiles appeared. The characteristic fossils of P. times are the trilobites (q.v.).

Palaephatus, name (which is perhaps a common pseudonym) of sev. anct Gk

writers, 4 of whom are mentioned by Suidas (q.v.). The first was an epic poet, a native of Athens, who is said to have flourished before Homer. The second was a writer of Paros or Priene in the time of Artaxerxes Mnemon. The third was an historian of Abydos, the contemporary and friend of Aristotle. The fourth was an Alexandrian grammarian according to Suidas, or a peripatetic philosopher according to Tzetzes. For the last named see J. Schrader, *Palaeophalea*, 1893, and N. Festa, *Mythographi graeci*, lii. 2, 1902.

Palaestra (Gk *palaistra*, a wrestling school), name of a public place which in Grecian times was appropriated to exercises in wrestling and athletics generally. These were under official control, and were especially, though not exclusively, for the athletes training for the public games.

Palafox y Melzi, José de, Duke of Saragossa (1780-1847), Sp. patriot and soldier, descended from a distinguished Aragonese family. He accompanied Ferdinand VII to Bayonne (1808), and on the latter's imprisonment headed the patriotic party in Aragon, and tried to prevent the Fr. invasion. His bold and courageous defence of Saragossa (1808-9) was one of the most brilliant exploits of modern hist., its fame rivaling that of the anct siege of Numantia. P. was imprisoned by the Fr. at Vincennes till 1813, and then returned to Spain. See C. Oman, *Peninsular War*, i, 1902.

Palagonite, isotropic glass, yellow, brown, or green in section, resulting from the alteration and hydration of basic glass or basalts. P. tuff is found among the products of the volcanoes of Sicily and Iceland, and has also been observed in the Carboniferous tuffs of central Scotland.

Palaic Language, see INDO-EUROPEAN LANGUAGES.

Palaioaphos, see LAPHOS.

Palamedes, Gk hero of the Trojan war, son of Nauplius of Euboea, his story belonging to the post-Homeric cycle of legends (see Stasinus's *Cypria*). He was deputed by the Greeks to induce Odysseus to join in the Trojan war. This he did by exposing the latter's feigned madness, thus incurring his enmity. He was falsely accused of treason by Odysseus, Agamemnon, and Diomedes, and stoned to death. See Philostratus, *Heroica*, 10; Euripides, *Orest.*, 422; *Frag.*, 581; Ovid, *Metam.* xlii. 56.

Palamedes, or Palomides, Sir, one of King Arthur's knights, the knight 'that is yet unchristened, who has many a bout with Sir Tristram,' mentioned in Malory's *Morte d'Arthur* (books ix and x).

Palanquin, type of litter used in the E., and carrying 1 person: the present form is a closed box, an earlier form being open. Poles are passed through rings, and the P. is carried by 2 or by 4 men.

Palaquium, a genus of 6 trees, family Sapotaceae, native to Malaya, Ceylon, and India; *P. gutta* being the chief source of Gutta-percha (q.v.).

Palar, riv. of India, rises in Mysore and flows into the Bay of Bengal, S. of Madras. Its water provides irrigation,

and is supplied to the Kolar goldfields, the chief dam being at Aroot. Length 230 m.

Palate, roof of the mouth. It is composed of the *hard P.*, a bony structure covered with mucous membrane, and the *soft P.*, an aggregation of muscles covered with mucous membrane. The hard P. is formed by the palatine processes of the superior maxillary bones and the palatal bones. It has a slight ridge called the *palatine raphe* in the middle line which ends anteriorly in a little eminence called the *palatine papilla*; a number of ridges run transversely across the anterior portion of the P. The soft P. is composed of the muscles known as *tensor palati*, *azypos uvulae*, *palatoglossus*, and *palatopharyngeus*. A soft projection known as the *uvula* hangs downwards at the rear of the oral cavity. Behind the free edge of the soft P. is the pharyngeal isthmus communicating with the *naso-pharynx*. A ridge of mucous membrane runs from the soft P. to the edge of the tongue on each side, and is known as the *anterior palatine arch*. Another ridge forming the *posterior palatine arch* is situated about $\frac{1}{4}$ in. to the rear, and between the two ridges is an oval mass of lymphoid tissue called the *tonsil*. See also CLEFT PALATE.

Palatinate (Ger. *Pfalz*), former ter. of Germany, originally consisting of a dist. on the Rhine (q.v.) around Heidelberg (q.v.). This dist. was subsequently (1329) united with a portion of Upper Bavaria later known as the Upper P. In 1156 it was granted by the Emperor Frederick I to his step-brother, Duke Conrad of Swabia, succeeded by Duke Henry of Brunswick. Frederick II took away the P. from the latter in 1215 and gave it to Louis, Duke of Bavaria, whose son Otto married Agnes, the daughter and heiress of Henry. Thus the P. came into the possession of the Bavarian family in whose hands it remained until 1559, when the line became extinct. Frederick III of the Simmern dynasty, who associated himself with the Reformed Church, then became ruler of the P.; and Heidelberg, the cap. of the electors palatine, became a great centre of Calvinism. In 1648 the Lower P. was given to Charles Louis, the son of Frederick V (q.v.), and a new or eighth electorate was created in his favour. During the War of the Sp. Succession John William, the elector of the Lower P., received the Upper P. also, but the latter was restored to the elector of Bavaria at the end of the war. On the death of the Elector Maximilian Joseph, the last of the Bavarian male line, in 1777, the two P.s were reunited. In 1801 the portions of the Rhine P. on the l. b. of that riv. were taken by France, Baden received Heidelberg, Mannheim, etc., and the rest fell to Hesse-Darmstadt, Nassau, etc. By the treaties of Paris of 1814 and 1815 the P. was again divided up, the greater portion being granted to Bavaria and the rest to Prussia and Hesse-Darmstadt. Later the diminished Lower P. formed a dist. of Bavaria, with Speyer (q.v.) as cap. The Upper P. formed a dist. of Bavaria under the title of Upper P. and Regensburg, with Regensburg (q.v.) as cap. Lower P. is

now part of the *Land of Rhineland-P.* (q.v.), and Upper P. of the *Land of Bavaria* (q.v.).

Palatine (Lat. *palatium*, a palace). A count P. was, under the Merovingian kings of France, a high judicial officer. After the time of Charlemagne a similar title was given to any powerful feudal lord to whom a prov. was made over with judicial powers, and the dist. so governed was called a palatinate or co. P. There were 3 co. P. in England (Lancaster, Chester, and Durham), which were made separate regalties on account of their respective proximity to the frontier of Wales and to that turbulent Northumbrian prov. which could not be accounted a portion of either England or Scotland. In virtue of their regal rights, the counts P. had their courts of law, and could pardon treasons, murders, and felonies. Lancaster was probably made a co. P. by Edward III. Henry VI was hereditary duke and count P. of Lancaster, and on his attainer the duchy and co. were forfeited to the Crown, and conferred on Edward IV, afterwards on Henry VII and his heirs for ever. There is still a chancellor of the duchy and co. P. Chester is said to have become a co. P. when made over by William the Conqueror to Hugues d'Avranches. In the reign of Henry III it was annexed to the Crown by letters patent, and since that time has been vested in the eldest son of the sovereign, or in the Crown. Durham seems to have first become a palatinate when William the Conqueror conferred upon Walcher the bishopric and dukedom of Durham. The palatinate jurisdiction continued united with the bishopric till 1836, when it was vested in William IV and his successors. Pembroke was at one time a co. P., but ceased to be so in Henry VIII's reign. In very early times there were a number of similar privileges in Scotland.

Palatine Hill (*Mons Palatinus*), hill on which, according to tradition, Romulus founded the city of Rome (q.v.), the Capitoline Hill being occupied by Sabines. The P. H. is SE. of the Capitoline and NNE. of the Aventine; traces of its fortifications are still visible. In later times it was the seat of the imperial residence, whence the Eng. words 'palace' and 'palatial.'

Palau, or Pelew, Islands, group of the W. Caroline Is. in the W. Pacific Ocean. Lat. 2°-9° N.; long. 130°-135° E. There are 26 is., of which 6 are inhabited. The largest is Babeltop (Babelthnap), and next in order are Korror, Arguar, Pelelin, and Eilmalk. The total area is about 190 sq. m. The group is surrounded by a coral reef. The is. are mountainous, well watered, and fertile. They were sold to Germany by Spain in 1899. In 1914 they were occupied by Australia, and the treaty of Versailles placed them under Jap. mandate. After forming a major Jap. base during the Second World War, the P. I. came under U.S. trusteeship for the U.N. in 1943. Pop. 6200.

Palawan, formerly *Paragua*, one of the Philippine Is., to the W. of the group, between the China and Sulu Seas. The

is., which has a length of 275 m. and a breadth of 25 m., acts as a sort of breakwater, whence its name (meaning 'shoal' in Bulj language). The chief products are coconuts, rice, rubber, sugar, and timber. Cattle are raised, and there are manganese mines. It was developed as an air base by the Japanese, who occupied it from May 1942 until March 1945. Area 4550 sq. m.; pop. 43,813. Cap. Puerto Princesa (pop. 15,177).

Palazzo San Gervasio, It. tn, in Basilicata (q.v.), 23 m. NE. of Potenza (q.v.). Pop. 9000.

Palazzolo Acreide (anc. Akrai), tn in Sicily (q.v.), 22 m. W. of Syracuse (q.v.). It was founded in 661 BC and has remarkable Gk remains. Pop. 13,000.

Palazzolo Sull'oglio, It. tn, in Lombardy (q.v.), 18 m. NW. of Brescia (q.v.). It has a trade in textiles and agric. produce. Pop. 12,100.

Pal'chinskij, Pëtr Ioakimovich (d. 1930), Russian engineer and politician. Before the First World War he played an important role in technocratically minded industrial circles. During the war he was a leading member of the Central War Industries Committee, and after the February revolution (q.v.) in 1917 was Deputy Minister of Trade and Industry in the Provisional Gov. (q.v.). P. defended the seat of the gov., the Winter Palace, against the Bolsheviks in October (see OCTOBER REVOLUTION). He later worked in the State Planning Commission, but was accused of sabotage and shot. At the Industrial Party (q.v.) trial in 1930 P. was alleged to have set up an underground League of Engineering Organisations which later developed into the Industrial Party.

Pale, The, or The English Pale, name applied to that part of Ireland in which Eng. law was acknowledged. The dominion of England was for some centuries after the conquest of Ireland by Henry II restricted to the P., the boundaries of which varied, but which included Kildare, Louth, Meath, and Dublin (qq.v.). The P. as an entity disappeared when Ireland was completely occupied in Elizabethan times. See IRELAND, History; see also E. Curtis, *A History of Ireland*, 1937.

Palekh, settlement, former vil., in the Ivanovo oblast of Central Russia, 35 m. SE. of Ivanovo. Since the 16th cent. it has been the centre of ikon painting in Russia, and since 1922 the painting of lacquered papier mâché articles has been carried out. P. painters have restored the frescoes in the cathedrals of the Moscow Kremlin (since 1946).

Palembang, tn of Sumatra, Indonesia, 45 m. from the mouth of the Musi, or P. R. P. is the most important commercial city in the is., and is a trade centre for areas producing rubber and oil; contains oil refineries, iron foundries, and shipyards. Exports include petroleum products, rubber, timber, coffee, etc. There is an airport. P.'s output of 4,250,000 tons of petroleum annually in the years before the Second World War represented 55 per cent of the net total output of the Netherlands E. Indies. In 1948 P. was cap. of

the temporary autonomous state of S. Sumatra; it became part of the Rep. of Indonesia in 1950. Pop. 109,000.

Palencia, Alfonso de, or Alphonsus Palentinus (b. c. 1423, d. after 1492), Sp. historical geographer. He studied under George of Trebizond in Italy, and became historiographer to Isabella of Castile. His works include a *Chronicle of Henry IV*, 1454-74; and *Decades* (in Latin, down to the taking of Baza from the Moors), 1491.

Palencia: 1. Sp. prov., in León (q.v.). It is a high, open plateau, lying S. of the Cantabrian Mts (q.v.), and has a severe climate. There are many fertile valleys of the Carrion and other tribs. of the Duero (q.v.). Grain, wool, wine, and honey are produced. Area 3257 sq. m. Pop. 237,550.

2. (anc. Pallantia) Sp. tn, cap. of the prov. of P., on the Carrion. It has a fine Gothic cathedral, begun in 1321, containing paintings by El Greco and Zurbarán, and sev. other interesting churches. The first univ. in Spain was founded here in 1208, but was transferred to Salamanca in the same century. Rolling stock, agric. machinery, textiles, pottery, and soap are manuf., and there is a bell-foundry. Pop. 43,900.

Palenque, vil. of Chiapas, Mexico. It is celebrated for its ruins of anc. temples, the finest of which is called the Great Palace. There are 10 detached buildings in all, amongst which are the Temple of the Cross, the Temple of Inscriptions, and the Temple of Beau Relief.

Paléologue, Georges Maurice (1859-1944), Fr. author and diplomat, b. Paris, of an old Byzantine family (see PALAEOLOGUS). Educated at the Lycée Henri IV, he held diplomatic posts in Tangier, Rome, Germany, China, Korea, and Bulgaria, was ambas. to Russia, 1914-1917, and secretary-general of the Ministry of Foreign Affairs, 1920-1. His pub. include *L'Art chinois*, 1888; *La Russie des tsars pendant la Grande Guerre*, 1921-2; *Le Roman tragique de l'Empereur Alexandre II*, 1923; *Cavour*, 1926; *Les Entrepreneurs de l'Impératrice Eugénie*, 1928; *Guillaume II et Nicolas II*, 1935; *Alexandre I*, 1936. His secret diary on the Dreyfus case 1894-9 was pub. posthumously and trans into Eng. 1957. In 1928 he was elected to the Academy.

Palermo: 1. Prov. of Italy, in NW. Sicily (q.v.). It is mountainous, with the riv. valleys of the Torto, S. Leonardo, and Belice. The long coast-line on the Tyrrhenian Sea has extensive bays and bold promontories. The coastal plain is narrow except for the fertile Conca d'Oro in the NW. The prin. tns include P., Partinoco, Bagheria, and Castelbuono (qq.v.). Area 1920 sq. m.; pop. 1,072,000.

2. (anc. Panormus) It. seaport, cap. of the prov. of P., and chief tn of Sicily. It is on the N. coastal plain of the Conca d'Oro, on a bay of the Tyrrhenian Sea. Of Phoenician origin (see PHOENICIA), P. later became a stronghold of Carthage (q.v.). It was subsequently taken by Pyrrhus (276 BC), the Romans (254 BC), the Vandals (AD 440), Belisarius (535),

and the Normans (1071) (q.v.). In the time of the Emperor Frederick II (q.v.) it made an important contribution to It. literature (see ITALIAN LANGUAGE AND LITERATURE). There was severe damage, particularly to the harbour area, during the Second World War. P. has a magnificent Gothic archi-episcopal cathedral (12th-16th cents.) containing 6 royal tombs, including that of Frederick II. There are other fine churches, a royal palace, a univ. (1777), a picture gallery, and a museum. The harbour is good, and there is a splendid promenade stretching for a mile along the bay. Tobacco, glass, furniture, and machinery are manuf., there are iron foundries, and there is a trade in fruit, nuts, wine, and olive oil. Pop. 501,000. See C. Diehl, *Palermo et Syracuse*, 1907.

Palestine, city and the cap. of Anderson co., Texas, U.S.A., 151 m. N. of Houston. It has a cotton compress and iron foundries. Pop. 12,500.

Palestine, anct and biblical country lying at the extreme E. end of the Mediterranean, to the S. of Syria. It forms a NW. strip of Arabia balancing the SE., El Yemen. The commonest term for it in the Heb. Bible is 'the Land of Canaan' (*Eres Kena'an*). It is also known as the Holy Land, as the Land of Israel (*Eres Pizrael*), and, in part, as Judea. The term P., a Gk word (*Palaistinë*), which means 'Philistine-land,' is used for the whole country first by Herodotus (5th cent. bc). Originally, however, the term P. (Heb. *Pelesheth*) was applied to the mere strip of coast lying between Jaffa and Gaza (see Exod. xv. 14), but, like the term Canaan and other geographical terms, it was gradually employed to denote the whole country.

BOUNDARIES. P. is a historical-geographical expression rather than a political entity. The area contained within its boundaries varied from time to time. The natural and historic boundaries of P. run on the S. from the gulf of Aqabah across the desert of Sinai to the Mediterranean coast. Desert country borders its E. frontier also. Its W. limit is the Mediterranean Sea. The N. limits are difficult to determine; it may be said, however, that they run from the desert on the E., along the slopes of Mt Hermon over to the Litani R. and where the Lebanon and Anti-Lebanon first break into a series of elevated plateaux, and thence over to the Mediterranean coast. P. is about 150 m. in length from N. to S., with a width of about 35 m. at the N. and about 40 m. at the S., its area being about 10,000 sq. m. (approximately that of the Netherlands). Under the Brit. mandate P. was bounded on the N. by the Fr. mandated ters. of Syria and Lebanon, on the W. by the Mediterranean, on the S. by Egyptian ter., and on the E. by Transjordan, though this was also included in the Brit. mandate. The N. boundary was settled by an Anglo-Fr. convention of 1920, and ran from the Mediterranean, between Tyre and Acre, across the Upper Jordan valley to Banias, and thence again S. to the NE. shore of Lake Tiberias

and to Samakh. Since 1948, the country has been divided between Israel, Jordan, and Egypt, about four-fifths of the total area being in Israel.

HISTORICAL-GEOGRAPHICAL SETTING. Though the country was small, its situation was and still is one of very great strategic importance. P. forms a bridge between Asia and Africa, and in anct times it formed the main communication between the great empires of Babylon and Assyria, important centres of civilisation on the Tigris and Euphrates, and Egypt, which through many centuries was one of the great world powers. P. was the bridge over which flowed all the traffic between these great commercial powers. Another stream of traffic, less considerable, crossed the country in another direction, from S. Arabia to Phoenicia. Culturally, also, P. drew continuously from Egypt and the valley of Euphrates, and as nearly all important elements of anct culture originated in one or the other of these 2 centres, P. became acquainted with all significant developments of anct E. civilisation. But not all the traffic that passed over the bridge was peaceful. The rivalry between Egypt and the Mesopotamian powers was inveterate. Whenever their armies advanced to attack one another the route led necessarily through P.; therefore P. became an international battle-ground and a pawn in the game of war. It is this position, with its fundamental significance, also in its later hist., which renders P. unique. P. has, besides, always been the 'refuge of the drifting populations of Arabia.' Never sought for itself alone, except by the Hebrews and the crusaders, P. has been overrun constantly by invaders from the N. seeking Egypt, or by the return attack. Thus the Hittites, Egyptians, Assyrians, Babylonians, Persians, Greeks, Syrians, Arabs, and Seljuk Turks in turn devastated it. Alexander passed through to Egypt in 331 bc; the wars of the Seleucides and Ptolemies passed over it; Pompey in 63 bc brought it under Rom. rule; the crusaders estab. themselves there from 1099 to 1187; Napoleon in 1799 abandoned his first ambition on its soil. Yet its destiny was typified by the Arab conquest in AD 640; there is everything to attract the desert tribes, but nothing for others except the religious sentiment of Christians and Jews, which later, linked with national consciousness, has given the latest impetus to the hist. of P. (see *Modern History*).

PHYSICAL FEATURES. The land divides simply into the Maritime Plain (subdivided into the fertile plain of Sharon, from Mt Carmel to Jaffa, and the sandy plain of Philistia, to the S.) along the coast, the Shephelah or low hills, the Central Range, the Jordan valley, and the E. Range; the Central Range is further broken by the plain of Esdraelon between Galilee and Samaria, and falls away steadily and broadly as the Negeb or S. country. N. of Esdraelon this range runs up to the mts of Lebanon, of which indeed it is the S. extension. In the N. of Galilee its peaks reach a height of

about 4000 ft. The main dips are based on the geological formation; limestone rocks form 2 folds with a great synclinal valley between the valley of the Jordan; the cretaceous limestone of the Central Range passes under the calcareous sandstone of the Shephelah, which is overlaid by the raised beaches and sea-beds of the Maritime Plain. The Jordan valley forms a deep fault in the earth's crust. From the small lake Huleh (q.v.), just above sea-level, the R. Jordan runs in a narrow valley, dipping so steeply that on reaching the sea of Galilee it is almost 700 ft below sea-level. The descent continues, but not so steeply; the riv., however, contrives in its wanderings to travel about three times the actual

Sea, has 3 rivs., the Arnon, Jabbok, and Yarmuk, flowing due W. into the Jordan. Hauran, corresponding to the anct Trachonitis and Auranitis, a volcanic region covered with a basaltic lava, and showing characteristic denudation, lies N. of the Yarmuk and is partly (in the N.) barren. The tableland rises steeply to 2000 ft. the W. wall sloping more gradually to between 800 and 1500 ft of the Central Range. To the E. there is the Hauran mt range, now the home of the Druses. Jaulan, to the W., corresponds to the Gk Golanitis. The S. part of the Hauran is well watered, and probably coincides with the dist. known in the Bible as Bashan and later as Batanea. This was regarded by the Hebrews as an especially fertile

Jewish National Fund

A GALILEAN LANDSCAPE: ON THE RIGHT IS MOUNT HERMON

distance (which is about 65 m.) between the sea of Galilee and the Dead Sea (q.v.). The latter is 1292 ft below sea-level. S. of the Dead Sea, in which the riv. loses itself, the valley (known as Wadi 'Arabah (Arabian Ghôr)) continues through the desert and gradually rises to the head of the Gulf of Aqabah. There are hot springs in the bed of the Dead Sea, and the strata are bituminous; in addition, there is no outlet, and evaporation leaves the water both dense and bitter. Its banks are largely of marl fringed with clean gravel. Within the Ghôr and about the Dead Sea were the 'five cities,' Sodom, Gomorrah, Admah, Zebolim, Zoar. The Ghôr has a tropical heat and rank vegetation, thorn bush and broom, and jungle of cane and oleander; it abounds in marsh with its accompanying malaria. Jericho has been its only tn. Beyond these main natural divs., again, the land is cut up into distinct and separated parts well reflected in the anct tribal divs., and giving an independent character productive of internal unrest.

East Palestine (see also TRANSJORDAN), from Hermon to the S. end of the Dead

area. Between the Yarmuk and the Jabbok (Zerqa) are forested high ridges, the Gilead of the Bible, the Galaaditis of the Greeks, while S. again lies the treeless plateau of Moab, with Ammon to the NE. This whole dist., called by the Arabs El Belka, was known in Rom. times as Peraea; then it was Jewish, while the ter. N. of the Yarmuk was mainly pagan.

HYDROGRAPHY AND VEGETATION. The hydrography of P. is typical of limestone country, with the addition of summer drought. The streams are plentiful and full in the hills in the rainy season, but soon become dry; in the Maritime Plain surface water is scarce, but is readily obtained by digging. Judaea has few springs, and water is stored in wells from the winter rains. As a consequence of this irregularity, the soil and vegetation are similarly varied, from the tropical vegetation of the Jordan valley to the barren moorland and desert. W. of Jordan the land is park steppe tending towards scrub. Trees include the oak, terebinth, carob, box, pine, cypress, plane, walnut, sycamore, palm, acacia, and shittim-wood. Much of the woodland consists of dwarf

trees, the wild olive, vine, arbutus, myrtle, juniper, and thorn. Of fruit there is plenty: the apricot, fig, orange, date, citron, pomegranate, mulberry, pistachio, almond and walnut, olive and grape. Wheat, barley, millet, maize, beans, pulse, lentils, tomatoes, onions, cucumbers, pumpkins, and melons are cultivated; but pasture is wild, short-lived, and sparse, though of excellent quality.

CLIMATE. There is every range of climate from the sub-tropical of the lower Jordan to the sub-alpine of the upper. On the Maritime Plain one is in Egypt; in the Shephelah in Italy; Judaea resembles inland Italy, and Moab inland Algeria. However, even in the winter the temp. only exceptionally falls below freezing-point. There are two seasons: the winter rains, commencing about Oct. and lasting till April, with typical desert fringe thunderstorms and hail, and snow on the mts; and the summer drought, with occasional morning mists, and regular heavy dews at night, while the heat of the day is sultry. The rains are brought by SW. and W. winds, the drier NW. blowing in the summer, and with an approach to land and sea-breeze conditions. In spring the Sherkiyeh (sirocco) or Khamasin, the hot desert wind, is common. The temp. tends to extremes and sudden changes, but in Judaea is more equable;

here the mean ann. temp. varies from 62° to 68°; 90° in summer, 46° in Feb. Throughout the land the climate is healthy, bracing, regular enough to induce steady labour, variable enough to produce anxiety and care. The lower Jordan valley, cut off from the sea breezes, is intensely hot. This heat causes rapid evaporation from the sea of Galilee and, especially the Dead Sea, and explains the fact that despite the millions of tons of water which the latter receives daily from the Jordan, its level does not rise.

ARCHAEOLOGY. Archaeology and hist. in P., as elsewhere, are complementary and interdependent studies. Various museums in Europe, America, and Asia preserve Palestinian antiquities; the most important of them is the P. Museum of Jerusalem, built with a gift of \$2,000,000 from John D. Rockefeller, junior.

P. has always been a lure to the archaeologist, especially for those who have worked to establish the historical accuracy of the Scriptures. Sober appraisal should be made of the nature, extent, and limits of the actual contribution which archaeology makes to our better understanding and true appreciation of the Bible. The great spiritual experiences deposited in the Bible cannot be tested by any material, historical, or literary evidences. On the other hand, the brilliant achievements of the last decades in the field of Palestinian archaeology have greatly added to our knowledge of the world in which Israel was set. Archaeology fills many gaps in the Bible, explains and illustrates many passages which would otherwise remain obscure.

Scientific surface exploration of P. may be said to have begun in 1838. In that year the Amer. theologian Edward Robinson, prof. at the Union Theological Seminary of New York city, started his extensive observations, which he continued until 1852. In 1865 the P. Exploration Fund (q.v.) was estab., and its first representative, Charles Warren, a Brit. ordnance officer, made a series of sketch-maps of the country, and (in 1867) carried out excavations on the Temple hill of Jerusalem. In the years 1872-8 the P.E.F. made a thorough survey of W. P. under the leadership of C. R. Conder and H. H. Kitchener (Lord Kitchener). The Amer. P. Exploration Society, in 1870, and, in 1898, the Deutsche Orient-Gesellschaft, as well as various other European and Palestinian societies, were founded on the model of the Brit. organisation. W. M. Flinders Petrie, who in 1890 excavated the mound (or tell) of Tell el-Hesi, in SW. P., may be considered as the father of modern archaeology of P. There was considerable archaeological activity in P. in the years following the First World War; from 1921 to 1936 no year passed without sev. excavations. The lead was then taken by Brit. organisations (P.E.F., Brit. School of Archaeology, Wellcome Archaeological Expedition, etc.), often in co-operation with Amer. organisations (Amer. School of Oriental Research, Univ. of Chicago, etc.) or the Heb. Univ. of Jerusalem.

Among the most notable excavations carried out recently are those by the Univ. of Pennsylvania Museum at Bethshan (1921-33), by the P.E.F. and the Brit. School of Archaeology on the Ophel hill in Jerusalem (1923-8), by the Univ. of Chicago at Megiddo (1925-39), by Prof. Garstang at Jericho (1929-36), by the Amer. Schools of Oriental Research in Jerusalem, directed by Prof. W. F. Albright, at Tell el-Nasbeh (1926-35), at Tell Beit Mirsim (1926-32), by Prof. Elihu Grant at Beth Shemesh (1928-33), by the Brit. School of Archaeology in Jerusalem and the Amer. School of Prehistoric Research at Mt Carmel (1928-34), by Flinders Petrie at Tell el-Ajjul (anc. Gaza) (1930-4), Tell Jemmeh, and Tell el-Far'ah, by the joint Brit.-Amer.-Heb. Univ. expedition at Samaria (1931-5), by the Wellcome-Marston Expedition at Lachish (Tell ed-Duweir) (1932-8), where the famous 'Lachish Letters' were found, and numerous shorter excavations. The Jewish P. Exploration Society has excavated at Beth Shearim (modern Sheikh Abrik) (1936-40), Khirbet Kerak (= anc. Beth Yerah) (1944 onwards), and more recently at the Biblical city of Hazor and the Herodian fortress of Masada. The most important discovery which has ever been made in regard to biblical MSS. was in the summer of 1947, when a number of MSS. were found in an anc. cave in the cliffs above the Dead Sea. It is taking the scholars many years of study to exhaust all the implications of this remarkable find. See *SCROLLS OF THE LAW*. In 1953 Miss K. Kenyon made important prehistoric discoveries at Jericho going back to c. 5000 bc. Excavations continued in succeeding years.

PREHISTORY. Our historical information concerning P. before the time of the Hebrews is very limited. Indeed, the hist. of P. in the ordinary sense does not go back farther than the second millennium bc. Such information as can be gathered about the earlier times is derived almost exclusively from the discovery of excavators and the research work of geologists and archaeologists (see preceding section). It seems that in the Tertiary Age P. rose above the sea, and after much oscillation attained what were roughly its present boundaries; and less than 2,000,000 years ago the tectonic movements in the earth's crust culminated in the great cleft which is known in its modified form of to-day as the Jordan valley; at the same time upheavals of rock deposits created the hill country of W. P.

P. appears to have been inhabited at a very remote period. The earliest inhab. belonged to the Early Palaeolithic period; they lived in caves in which they left traces of their occupation. The oldest cave deposits are assigned to the Acheulian phase (perhaps 180,000 years ago). On Mt Carmel, in a Middle Palaeolithic cave deposit (belonging perhaps to 150,000 years ago), a dozen human skeletons were found, and several more were discovered in a cave S. of Nazareth. The Carmel man seems to

represent a mixed race, intermediate between Palaeanthropic man (*Homo neanderthalensis*) and Neanthropic man (*Homo sapiens*). There followed various Late Palaeolithic and Mesolithic phases, each one lasting many thousands of years.

Of Neolithic men in P. (perhaps 6000-4500 or 4000 bc) much more is known. They left behind them numerous monuments of stone such as menhirs (q.v.), dolmens (q.v.), and cromlechs (q.v.), possibly the biblical *gilgal*. Perhaps about 4500 bc copper made its first appearance in P.; gradually it became more abundant, and partly replaced stone as a material for tools. This period is known as Chalcolithic, i.e. 'copper (or bronze)—(and) stone'; it was the transitional period between the Neolithic and Bronze Ages. Whatever may be the case with the Palaeolithic inhab. of P., according to Prof. Albright, the leading Amer. orientalist, Hamito-Semitic tribes already appear during the Mesolithic period, nearly 10,000 years ago, and (although later there were many movements of non-Semitic peoples across P.) the Semitic element remained primary in the ethnic make-up of P. ever since. The true hist. of P. begins with the invasion of the Israelites in the 13th cent bc (after their exodus from Egypt), and with the invasion of the 'Sea Peoples' in the early 12th cent. bc (see below).

ANCIENT HISTORY. (For the traditional hist. of the Israelites see *under ISRAEL*.) By 1100 bc the Israelites had occupied most of the hill country in P., and they were already distinguished from the Phoenician people of the coast and the Semites of the desert beyond the Jordan by their peculiar religion. Hostile pressure, especially from the Philistines, led to the setting up of a monarchy; and under David (c. 1000-970 bc) and Solomon (c. 970-930 bc) the Israelites were effectively united, the Philistines and other enemies defeated, and the power of the new kingdom was extended over all P. But on Solomon's death a decline set in. The coastal people regained their independence; the N. tribes established a separate kingdom of Israel centred on Samaria, often at war with the kingdom of Judah, in which, principally because Solomon's temple in Jerusalem was the visible symbol of the Heb. faith, the tradition of Heb. culture was thenceforth mainly concentrated. This 'partition' of P. rendered easier its subjection to whichever should become the stronger of the neighbouring empires, Egypt or Assyria. The two Israelite kingdoms and the coast tns, however, succeeded in keeping a precarious independence for 2 centuries, but in 721 the first blow fell. The N. kingdom became merged in the Assyrian Empire, Samaria was destroyed, and the wealthier sections of the people were deported to other lands. By 586 bc Judah suffered a like fate. Jerusalem was sacked and deprived of its defences and equipment and a great part of the pop. removed to Babylon. The 'captivity,' however, did not last long, for in 538 bc Cyrus allowed the Judean exiles

to return to their country and some 40,000 returned to their homeland, rebuilt the temple, and reconstituted their life in a small inland state. Our evidence for the hist. of P. during the Persian period (538-330 BC) is both confusing and scanty. It seems, however, that there was a semi autonomous state called Yehud (Judaea). After the conquest of P. by the Seleucid rulers of Syria came the earliest persecution of the Jewish faith, but under the lead of Hasmonaeans or Maccabees the Jews revolted, and from 142 BC recovered the long-lost independence of Judaea and even extended their rule almost to the old limits of David and Solomon. Then in 63 BC Pompey stormed Jerusalem. The Jews, however, were determined not to yield without a struggle, and in AD 66-70 Titus concluded a long and difficult campaign by sacking Jerusalem and destroying the temple. After crushing a further revolt in AD 132-5 the Romans ploughed the site of Jerusalem and drove many of its people into slavery. Jewish religious life continued to develop (see MISHNA; TALMUD), and Christianity made some progress.

MEDIEVAL HISTORY. For over 500 years P. remained under Rom. or Byzantine rule, except for a short period of Persian domination; and then, in the 7th cent., the Arabs, inspired by the rise of Islam, in their great Mediterranean conquests included Syria, which also embraced P. But whatever the achievements of the golden age of Arab rule, P. played no great part, and the only outstanding work of art which has survived from the age of Arab independence is the Dome of the Rock, erected at the end of the 7th cent. But in one respect Jerusalem attained a higher place in the Arab world than Bagdad, Granada, or Cairo: Mohammed placed the scene of his ascent to heaven on the site of the Jewish temple in Jerusalem. In the course of the next 400 years the Arab empire disintegrated, and from AD 1099 P. was exposed to the series of invasions known as the crusades, which maintained a precarious kingdom of Jerusalem until the late 12th cent., after which most of P. reverted to Muslim rule. In 1291 the crusaders lost their last foothold at Acre. In 1517 P. was conquered by the Ottoman Turks, and under the rule of the Ottoman sultans at Constantinople it remained, except for a few months of Napoleon's invasion and the few years of Mohammed Ali's occupation, until the First World War.

MODERN COLONISATION. Prior to the First World War the Germans made sev. attempts at colonisation, notably at Haifa and Jaffa, and many Jewish colonies were estab. at Petah Tiqva, Rishon-le-Ziyyon, Gadera (settlements for wine and orange cultivation), lower Galilee (between the years 1901 and 1907), and mixed farming settlements under the Zionist organisation at Dagan, Tel Hai, Kinneret, and elsewhere; Circassian colonies existed (and still exist) at Jerash, Amman, and elsewhere in Transjordan (q.v.). These colonies made a beginning towards

the restoration of the land to its former flourishing condition. There was also an appreciable increase in philanthropic, educational, missionary, and monastic settlements. The Jordan valley S. of the sea of Galilee became the private property of the sultan, and some improvement took place there. After 1921 there was a wide extension of the colonisation of the Zionist organisation to large connected areas, especially in the vale of Esdraelon (q.v.).

MODERN HISTORY. *Palestine under British Mandate:* P. was taken from the Turks in 1917 by Gen. Allenby (q.v.) (see PALESTINE, OPERATIONS IN). The Brit. conquest paved the way for the Balfour Declaration offering the Jews a national home in P., and this historic declaration, far-reaching in its consequences and repercussions, was endorsed by the allied powers in the treaty of Sévres, 1920, which provided that the country should be entrusted to a mandatory power under the League of Nations. At San Remo, in 1920, the Allied Powers' Supreme Council entrusted the mandate to Great Britain. A body, then styled the Zionist Commission, and consisting of representatives of the constituent federations of the World Zionist organisation, was set up to act as a link between the Brit. administration and Zionist interests. This body was known as the P. Zionist Executive. It was financed by Jews all over the world and did valuable work in the interests of Jewish education, agriculture, and colonisation in P. The Brit. military administration (1917-20) conferred many benefits on P., including sanitation, public gardens, and chambers of commerce. Large sums were spent on road improvements, bridges were rebuilt, and a steel bridge was thrown across the Jordan. There were occasional minor disturbances early in 1920 in various parts of P. Again, in 1921, there was rioting in Jaffa, which developed into racial strife, but no serious outbreak occurred until 23 Aug. 1929, when grave disorders broke out in Jerusalem over the Walling Wall (q.v.). Similar disorders were especially grave in Hebron, but also spread to other parts of the country, order being restored, however, by the end of the month, after troops had been sent from Malta and Egypt. A commission was set up by the Brit. Gov., under the chairmanship of Sir Walter Shaw, to inquire into the causes of the outbreak and to make recommendations as to the steps necessary to avoid a recurrence. (Report, Cmd. 3530.)

From then until the outbreak of the Second World War the administration of P. was overshadowed by Muslim-Jewish hostilities, which presented formidable difficulties to the mandatory. At times the Brit. Gov. seemed to lean in favour of the Jews, and at other times to discourage the Jews in favour of the Arabs.

The immigration of Jews was always regarded with the greatest hostility, overt or otherwise, by the Arabs. In 1932 immigration rose to 9553, the first of 4 consecutive leaps which were to transform the situation by the beginning of 1936.

growth of immigration went a capital invested in the national home, especially by Amer. Jews, and in its agric. and industrial production. Meantime, however, the economic position of the Arabs continued to improve. But the Arabs began to claim that they had been displaced from lands owing to Jewish purchase, especially from absentee Arab landowners, and ordinances were passed to check this tendency, which might eventually have created a large landless Arab proletariat. There was relative tranquillity in P. between 1930 and 1933, but under the quiet surface was smouldering a fierce Arab antagonism to the whole conception of the national home. In 1933 Jews fleeing from Germany under the Nazi regime sought asylum in P., and in that year immigration jumped to 30,327, 5392 coming from Germany and 13,125 from Poland, and the national home benefited in every way materially. In 1934 there were no fewer than 42,359 'authorised' Jewish immigrants, and in 1935 61,854. The principle of 'economic absorptive capacity,' laid down over 10 years previously, was almost stultified, for the Jews now claimed that this enhanced immigration in itself actually increased that capacity, and the Arabs naturally supposed that at no great distance of time they might find themselves outnumbered. It became evident that the longer the mandate operated, the stronger and more bitter became Arab opposition. The various Arab political parties jointly demanded the estab. of a democratic gov., the prohibition of land transfer to Jews, and the cessation of Jewish immigration. The two latter demands were precluded by the mandate, unless it could be shown that land purchase and immigration were definitely injuring the rights and position of the Arabs; while as to the first demand, the gov. temporised by bringing forward a proposal (the second since the mandate) for the estab. of a legislative council. The Arabs, in a spirit of perversity, accepted the proposal only because the Jews were opposed to it, for it was clearly far removed from the Arab ideal of independence. It was, however, rejected by the Brit. House of Commons.

In such circumstances it is not surprising that in 1936 the disturbances broke out which occasioned the appointment of the Peel Commission (7 Aug. 1936). In the course of 1936 Arab work and trade were virtually at a standstill, and Arab shops were closed. An Arab 'Higher Committee' was formed which became a kind of *imperium in imperio*, and by June of that year the strike hardened throughout the country. Violence and sabotage increased. Roads were barricaded and trains derailed. Armed bands appeared in the hills, including volunteers from Syria and Iraq. Military reinforcements came from Malta and Egypt for the defence of key-points. By Aug. these bands were strengthened in numbers and arms and were joined by trained guerrilla leaders from outside P. In Sept. extensive

military operations were set on foot by the Brit. Gov. with a view to rounding up the bands, and over 20,000 Brit. troops were now in P. and martial law was authorised. Then came appeals from the Arab kings of Saudi Arabia, Transjordan, and Iraq to the Arab Higher Committee and the disturbances as an organised national movement ceased. It was then that the Peel Commission went out to P. The main recommendation of this commission, which reported in July 1937, was the partition of P., an independent Jewish state to be formed out of the predominantly Jewish-settled dists. along the coast and in the N., while the rest of P. was to become an independent Arab state. Jerusalem and Haifa were to remain under Brit. administration, and the Arabs were to get a corridor to the sea near Jaffa. The scheme was rejected by both Arabs and Jews and received such severe criticism in the House of Commons that it was in effect put back for further consideration, despite the fact that its major recommendation had already been accepted by the gov. Another commission, known as the Palestine Partition Commission, went out soon afterwards, and on their report against the practicability of partition, the Brit. Gov. came to the conclusion that the political, administrative, and financial difficulties involved in the Peel Commission's proposal to create independent states were so great that that solution of the problem was impracticable and it was dropped. Then came the Palestine Conference in London (Feb.-Mar. 1939); but as the Jewish and Arab delegations would neither meet nor agree on any compromise, the Brit. Gov. issued its own statement of policy in a White Paper pub. in May 1939. This document, which was to govern British policy in P. to the end of the Mandate, severely restricted Jewish immigration and land purchase, and envisaged the creation of an 'independent Palestinian state.' But further discussion of policy was cut short by the outbreak of the Second World War, during which Arabs and, especially, Jews seemed to lay aside their grievances in their willingness to support Britain in the fight. During the war P. was an important centre of British power and the base for the attack on the Vichy French in Syria and Lebanon in 1941.

The End of Mandatory Rule. During the war, some 6,000,000 Jews had been massacred by Hitler, and the end of the war found numerous refugees and the survivors of concentration camps anxious to immigrate to P. The White Paper regulations, however, forbade any extensive immigration. This inflamed Jewish sentiment in P. The change of gov. in Great Britain in 1945, when the Labour Party took office, had aroused hopes among the Jews, in view of the previous opposition of that Party to the White Paper and the public statements of its leaders. These hopes were soon disappointed when it was seen that British policy in P. was not to be changed. The Arabs were heartened by these developments, as well as by the growing

importance of the Arab states in the Middle East and the formation of the Arab League (q.v.).

In consequence, the Jews took over from the Arabs the rôle of rebellion against the British administration. The main Jewish military group was the *Haganah*. Originating as a defence force of the Jewish agricultural settlements against the pre-war Arab riots and rebellions, it now incorporated many of the members of the Jewish brigade which had served in Italy during the war. This body enjoyed the tacit support of official Jewish elements. Smaller, but more spectacular, groups were the *Irgun Zvai Leumi* and its

The gov. replied in various ways: by arresting the (moderate) Jewish leaders, by deporting illegal immigrants to Cyprus (and in one case to Germany), and by putting forward the 'Morrison Plan' for the future of P., a scheme for dividing the country into provinces or cantons which was unanimously rejected by Arabs and Jews alike. In Sept. a conference was held in London between the Brit. Gov. and representatives of the Arab states, but nothing useful emerged. Finally, despairing of any other solution, the gov. announced on 15 Feb. 1947 that it would submit the P. problem to the United Nations.

THE POST OFFICE, JERUSALEM

offshoot *Lechi* (Stern group), specialising in bombing attacks and assassination. They were frowned upon by the Jewish leaders, but received much popular support.

U.S. pressure on the Brit. Gov. enforced the setting up of an Anglo-American committee, which, in 1946, declared against the White Paper, urging the immediate admission of 100,000 Jews into Palestine. At the same time, the committee pronounced against the setting-up of either a Jewish or an Arab state in P. The Brit. Gov. did not accept the report, refusing to do so as long as the Jewish military forces remained in being. Meanwhile, the *Haganah* encouraged immigration into P. in defiance of the regulations and the *Irgun* increased the number and scope of its attacks. On 22 July 1946 the gov. offices in Jerusalem were blown up, with the loss of nearly a hundred lives.

In May 1947 a U.N. committee was formed and pursued inquiries in P. in the following months. The committee published its report in August, all the members agreeing that the Mandate should end and the country receive independence. The majority were in favour of the territorial division of P. into an Arab state and a Jewish state, with Jerusalem and its environs remaining a *corpus separatum* under U.N. trusteeship. The frontiers were planned partly in accordance with the distribution of the Arab and Jewish pop. and partly to secure the overriding economic unity of the country. The Jewish state, including the Negev (q.v.), would have had an area of 5500 sq. m. and the Arab State 4500 sq. m. Supported by the Jews, but opposed by the Arabs, the plan was adopted by the U.N. Assembly with the necessary two-thirds majority in Nov. 1947. The Brit. Gov.

agreed to terminate the Mandate on 15 May, 1948 and to evacuate its troops, numbering about 100,000, by 1. Aug.

The Arabs now reacted violently to these new proposals, and were soon joined by irregular forces from the neighbouring states. Civil war raged between Jews and Arabs, with occasional intervention by the British forces. The administration soon collapsed. Amidst the general chaos and confusion the Jewish Agency established control over the Jewish areas and perfected the organisation of *Haganah* as a national army. The Arabs were content to wait for the end of the Mandate and the entry of the regular armies of the neighbouring Arab states. At midnight on 14 May 1948 the High Commissioner left Palestine. Simultaneously, the Jewish state was proclaimed at Tel-Aviv, and recognised almost immediately by the U.S.A. and the U.S.S.R. Palestine had become a geographic expression. For the war of 1948, and subsequently, see ISRAEL.

GOVERNMENT AND CONSTITUTION. Under Turkish rule, part of P. was in the vilayet of Beirut and part in the independent sanjak of Jerusalem. After it was conquered in 1917-18 by Gen. Allenby, the country was placed under Brit. military administration until July 1920, when Sir Herbert Samuel was appointed High Commissioner and a civil administration was established. By the treaty of Lausanne (q.v.), 1923, Turkey renounced all right over P. The mandate given by the League of Nations to Great Britain came into force on 29 Sept. 1923, and under its terms Great Britain was responsible for carrying into effect the terms of the famous Balfour Declaration of 22 Nov. 1917. Under that declaration the Brit. Gov. projected the establishment of a national home for the Jewish people, it being understood that nothing should thereby be done to prejudice the civil and religious rights of existing non-Jewish communities in P., or the rights and political status enjoyed by Jews in any other country. A new constitution was promulgated on 1 Sept. 1922. It provided for the appointment of a High Commissioner and Commander-in-Chief, an Executive Council, and a Legislative Council. But no Legislative Council was ever elected owing to the persistent refusal of the Arabs to take part in the elections. To meet this emergency the High Commissioner, under an Order in Council of 1923, formed an Advisory Council composed of a number of the chief officials, to enact the necessary laws. Under the constitution English, Arabic, and Hebrew were the official languages of P. The country was divided into 6 dists., Jerusalem, Lydda, Haifa, Galilee and Acre, Samaria, and Gaza, administered by dist. commissioners. In 1927 regulations were made for the organisation of the Jewish pop. as a religious community, with autonomy for its internal affairs, religious, cultural, and communal. This community had a Chief Rabbinate, an Elected Assembly, and a General Council (*Va'ad Leumi*) elected by the Assembly to represent the community in its dealings

with the gov. The Brit. Gov. and the P. administration recognised the Jewish Agency as representing the Jewish people in all matters appertaining to the building up of the Jewish national home. The Muslim Supreme Council was constituted by the High Commissioner in 1921 to control Muslim affairs in P. This Council consisted of a president (Rais-ul-Ulema) and 4 elected members. It controlled the appointments of officers for the Sharia courts and for the *Waqfs* (Muslim religious endowments). There were (1948) 24 municipalities. Election to municipal councils were regulated by an ordinance of 1934. Much was done by the municipal corporations in town-planning, street construction, and drainage. In rural areas local affairs were administered by local councils. Law courts were either civil or religious, the former exercising jurisdiction in all save questions of personal status or charitable endowments, which were dealt with, amongst similar matters, by the Jewish, Muslim, and the sev. Christian courts. The Supreme Court consisted of a Brit. Chief Justice with 3 Brit. and 4 Palestinian judges. In 1937 the Ottoman code was replaced by a criminal code based on Eng. law.

See also *Report of the Joint Palestine Survey Commission*, London, 1928; *Report of the Palestine Royal Commission*, Cmd. 5479, 1937. Röhricht's *Bibliotheca Geographica Palaestinae*, Berlin, 1896, is a catalogue raisonné of the descriptions, MS. and printed, of the Holy Land written between the years 333 and 1878. Dr P. Thompson's *Die Palästina-Literatur* (of which 4 vols. have been pub. in Leipzig) is a complete bibliography of all works on P. from 1895 onwards.

Palestine, Operations in First World War. Because of the evacuation of Gallipoli and the surrender of the Brit. force under Gen. Townshend at Kut (q.v.), Brit. prestige in the Near E. had declined. But the success of the O. in P. in 1917 was a material factor in restoring confidence. Brit. troops under Sir Archibald Murray began the offensive by advancing from N. Egypt and driving the Turks before them over the Sinai Desert. A halt then ensued in order to give time for the construction of a military railway from Kantara to Rafa on the SW. border of P., from which the advance was resumed northward along the coast. But at this point the advancing force was held up by the Turkish resistance at Gaza, the chief battle for the tn being on 26 Mar. 1917. This check, however, marked the limit of Turkish success; Gen. Murray was replaced by Gen. (later F.-M.) Allenby (q.v.) who had greatly distinguished himself on the W. front. The offensive was resumed in Oct., the moment being favourable because a considerable Turkish force was occupied, E. of the Dead Sea, against the Arabs of the Hedjaz. Allenby took Beersheba in a surprise attack and then fought the second battle of Gaza on 6 Dec., the tn falling on the following day. This success heralded the beginning of his victorious advance through P., for Jerusalem was captured after the battles fought 7-9 Dec. 1917, 3 weeks after the Brit. had taken Jaffa, the latter in falling after the cutting of the Jaffa-Jerusalem railway at Ludd. Jerusalem was encircled from nearly all quarters, all the Turkish outer positions being taken by storm, and the city itself was surrendered without standing a siege. The following year Jericho was taken in the fighting of 19-21 Feb., and thereafter followed a long halt in the operations, the Brit. hold on the country being in the meantime consolidated. The culminating battle in the P. operations was that of Megiddo (19-25 Sept. 1918), which followed a brilliant outflanking operation by the cavalry under Sir Philip Chetwode. Allenby's P. campaign is a tale of almost uninterrupted success and of efficient management, and much of the success was due to his magnetic personality. He was especially successful in welding together the very various components of his force, regulars, yeomanry, and New Army, the mounted troops of Australasia, and the Indian contingent, a great part

of which contained elements previously untested in war. The Arab effort, too, under T. E. Lawrence (q.v.), was of considerable value, and it was not the least of Allenby's achievements that he should have made the best of such difficult allies. The P. operations were valuable in diverting the strength of the Turks, and to some extent even of the Gormans, from more vulnerable points of the allied fronts, and still more in their moral effect. The campaign has a special interest in the brilliant and, no doubt, spectacular work of the cavalry, an effort which marked the last great campaign of mounted troops in modern warfare. See T. E. Lawrence, *Revolt in the Desert*, 1927, and Sir G. McMunn and Sir C. Falls, *Military Operations, Egypt and Palestine, 1917-1919*, 1928.

Palestine Exploration Fund, founded in 1865. Its first important work was a complete and accurate survey, both topographical and geographical, of the country, and it has organised many archaeological excavations mainly concerned with biblical hist., full reports of their findings appearing in the Jour. of the Fund pub. twice yearly.

Palestrina, Giovanni Pierluigi da (1525-94), It. composer, b. in the town of Palestrina (whence his name, 'of P.'), became a boy chorister in the cathedral there, but at the age of 9 was taken to Rome, where he entered the choir-school of S. Maria Maggiore. He probably studied under Firmin Le Bel there. In 1544 he became choirmaster at Palestrina cathedral, but in 1551 he was summoned to Rome as *maestro di cappella* of the Julian Choir at St Peter's, and in 1555 he was transferred to a similar post at S. Giovanni in Laterano. He had by this time established himself as a composer of church music and madrigals and dedicated the *Missae Papae Marcelli* to Pope Marcellus II. He resigned his post at S. Giovanni in 1560 and became *maestro* at S. Maria Maggiore the next year, and director of the Roman Seminary in 1565. Offers from the courts of Vienna and Mantua failed to result in appointments, and he remained in Rome until his death. He was twice married, in 1547 and 1581. He d. in Rome on 2 Feb. 1594. Nearly 100 masses and nearly 300 motets of his are preserved, also a great deal of other church music, spiritual and secular madrigals, etc. P. represents the finest achievement of his period in the domain of sacred polyphonic music in Italy, the Flem., Sp., and Eng. schools being equally well represented by Lassus, Victoria, and Byrd. See life by H. Coates, 1938, and K. Jeppesen, *The Style of P.*, 1950.

Palestrina (anct Praeneste), It. tn, in Lazio (q.v.), standing on a spur of the Apennines, 1476 ft above sea-level, 22 m. ESE. of Rome (q.v.). It commands a magnificent view of Rome and the Alban Hills (q.v.). In 499 BC the anct city made an alliance with Rome, separating from the Lat. League, to which it had previously belonged, but during the Lat. war (340-338) it fought against Rome and

lost part of its ter. (see ROMAN HISTORY). Down to the time of the Social war it remained an allied city, and it then received the Rom. franchise (about 90 BC). During the civil wars of Sulla (q.v.) the tn was blockaded, and after it fell a military colony settled there. Sulla removed the city from the hillside to the lower ground at Madonna dell' Aquila and enlarged the famous temple of Fortune on the site of the anct city, making it the largest in all Italy. It was built on 5 terraces, and contained the famous mosaic with scenes from the Nile now in the Palazzo Barberini. It was also famed for its oracle, which was consulted down to the time of Constantine, who had the temple closed. The city became a favourite resort of the Romans, and Hadrian and Marcus Aurelius had villas there. In 1297 the Colonna (q.v.) family owned the city, and during a revolt against the Pope it was taken and destroyed. It was rebuilt, but in 1437 the new city shared the same fate. Stefano Colonna rebuilt it in 1448 and fortified it, and it remained in the possession of the family until purchased by the Barberini (q.v.) family in 1630. Only a few ruins of the anct city remain; but excavations have brought many interesting relics to light, among them an anct calendar which had been used in the rebuilding, and the famous Ficoroni casket found in 1738 and preserved in the Kircherian Museum in Rome. Here was found the earliest Lat. inscription. P. has a cathedral, and a ruined castle of the Colonna, as well as the Palazzo Barberini. There was some damage during the Second World War. Pop. (tn) 8400; (com.) 9200.

Paley, William (1743-1805), divine, b. Peterborough; educ. at Christ's College, Cambridge, and was senior wrangler in 1763. He was ordained, 1767, and, after holding sev. livings, was appointed prebendary (1780) and then archdeacon (1782) of Carlisle. He pub. *The Principles of Moral and Political Philosophy*, 1785; *Horae Paulinae*, 1790; *A View of the Evidences of Christianity*, 1794; and many other works. The *Evidences of Christianity* brought him into great prominence as a theological writer and was long accepted as a standard work. See life by G. W. Meadley, 1809; also L. Wainwright, *A Vindication of Dr Paley's Theory of Morals*, 1830.

Palgrave, Sir Francis (1788-1861), historian, b. London of Jewish parentage, converted to Christianity in 1823. Called to the Bar in 1827, from 1838 till his death he was deputy keeper of the records, in which capacity he arranged a great mass of hitherto inaccessible documents and ed. many of them for the Record Commission. Among the most important of these are *Parliamentary Writs*, 1827-84. Among his works are *History of England* (only vol. i pub.), *Anglo-Saxon Period*, 1831; *The Rise and Progress of the British Commonwealth*, 1832; *The History of Normandy and of England* (4 vols.), 1851-64. His works were of great contemporary value in throwing new light upon the hist. and condition of medieval

England, though they have since been largely superseded.

Palgrave, Francis Turner (1824-97), poet and anthologist, b. Great Yarmouth, Norfolk, son of Sir Francis P. (q.v.). Educ. at Charterhouse and Balliol College, Oxford, in 1846 he became private secretary to Gladstone, and 2 years later entered the Education Office, in which he rose to be assistant-secretary. He retired from the service at the age of 60. He was prof. of poetry at Oxford from 1885 until 1895. He was the author of sev. vols. of poetry and essays, but he is best remembered for his anthology, *The Golden Treasury of Songs and Lyrics*, 1861. This is still regarded as one of the best, if not the best, of the works of this kind, and to its compilation P. brought a wide knowledge of literature and a fine judgment. See life by G. F. Palgrave, 1899.

Palgrave, Sir Robert Harry Inglis (1827-1919), economist, b. Westminster, son of Sir Francis P. He ed. the *Economist* newspaper 1877-83, was knighted 1909, and received the hon. freedom of Great Yarmouth 1910. His pub. include *The Local Taxation of Great Britain and Ireland*, 1871; *Notes on Banking*, 1873; *Analysis of the Transactions of the Bank of England, 1844-72*, 1874; and *Enquiry into the Economic Condition of the Country*, 1904. He ed. the *Dictionary of Political Economy*, 1894-1906—Appendix, 1908.

Pāli. The term P. means actually the 'text,' the text *par excellence*, the text of the Hinayāna Buddhist scriptures, but it indicates also the language in which the sacred scriptures of Buddhism are recorded, and the script in which these are written. The P. scriptures contain a literature about double the size of the Bible, but if its repetitions were excised it would be somewhat smaller than the Bible. It consists of 3 Pitakas (called also Tripitaka), baskets, or collections. They are supposed to be the teachings of the Buddha, which were being handed down orally; they were committed to writing probably at the end of the 1st cent. BC (traditionally in 80 BC). The first Pitaka is the Vinaya (rules), dealing with discipline, but including the Mahāvagga, a hist. of the founding of the order of Buddhism, and the exposition of monastic rules. The second is the Sutta (Sūtra) Pitaka, the doctrine or collection of teachings. It consists mainly of dialogues between the Buddha and various interlocutors, and it contains books of meditation and devotion, sayings by the Master, poems, fairy tales and fables, stories about Buddhist saints, and so on. The third collection, the Abhidhamma (analytical exercises), or dogmatic statement of the psychologic and philosophic discriminations, contains speculations and discussions on various subjects. There are some other treatises in the P. literature. The most important historical work written in this language is the *Mahāvamsa*; other P. works are the *Dhammapadam* and the *Sutta-nipāṭa*, lofty and artistic ethical and religious verse; the highly literary Jātaka book of 547 stories of Buddha's prior incarnations in

various animal and human forms; the beautiful poetic compositions of the *Thera-gāthā* and *Theri-gāthā*, or 'Songs of the Monks' and 'Songs of the Nuns'; the *Milinda-paṭṭha*, or dialogues of the Buddhist monk Nāgaseṇa with the Gk king Menander, etc.

The language P. should be termed *palibhāṣā* or *tantibhāṣā* rather than P. It is an anct Prakrit, i.e. a 'natural uncultivated' local Middle Indian, dialect, probably originating in NW. India. The great Gautama Sakyamuni Buddha (see BUDDHA), anxious to make his spiritual teachings accessible to the common people, refused to confine them to Sanskrit (q.v.), the language of the small privileged class. His teachings thus became a potent cause of the development of the language of the people. It is uncertain, however, which of the local dialects became the P. language. According to some scholars, it was a prototype of Māgadhī, according to others it should be traced to anct W. Hindi. It is also uncertain whether the oldest works of Buddhism were actually written in what is now known as P. Two main causes made P. the great literary vehicle which it was and still is: (1) a political cause—the estab. in the 7th cent. BC of the great state of Kosala and Māgadhā in N. India, leading to a new standard speech, P., which was adopted at the court of Kosala, at Sāvattthī; and (2) a cultural-religious cause—the adoption by the Buddha (q.v.), himself apparently a native of Kosala, of P. for his teaching and propaganda vehicle. P. is nowadays used in Ceylon, Siam, and Burma as the liturgical language of Buddhism, although it had to give way to native tongues, in which the later Buddhist literature was composed.

The P. script developed from the archaic Brāhmī, and in the last centuries BC became the writing of the Buddhist scriptures; it was carried by the Buddhists to Ceylon, where it gave rise to the early Sinhalese writing. The cultural expansion of India into Burma, Cambodia, Cochín China, and Siam was also mainly due to Buddhism. The scripts of the Buddhist monks became the vehicle of culture and outward organisation: thus Buddhism played in SE. Asia a part similar to that of Rom. Christianity in W. and Central Europe in the Middle Ages. P. Buddhism, i.e. the particular form of Buddhism based on the sacred P. books, was brought over from Ceylon in the 11th–12th cent. AD. In Burma the 'square' P. script developed into a capricious, highly calligraphic character, generally employed for writing the religious Buddhist books. The letters are painted with a broad brush (generally in dark-brown lacquer, and sometimes on a plate of gilded metal) and are correspondingly very thick. The Buddhist Burmese script was adopted by various peoples (the Karens, the Taungtha, the Yao, and others), but the Siamese and the various Shan scripts, the Javanese, and other Indonesian scripts, and so forth, which are still considered by some scholars as

belonging to the P. branch, may be better termed the Further-Indian branch of scripts, because they do not descend from the P. branch, but from another script of Indian origin.

Palikao, Comte de, see COUSIN-MONTAUBAN.

Palilicium, see ALDEBARAN.

Palimpsest (Gk *palimpsestos*, scraped again), name given to a MS. on parchment, from which the original writing has been erased or washed out, and another text written over it. This practice by the Greeks and Romans was due to the scarcity and high cost of parchment, and is mentioned by Cicero, *Ad Fam.* vii, Plutarch, and other classical writers. Cicero banter his friend the lawyer Trebatius upon his economy in using P. in his correspondence, and expresses the hope that they are his own consultations and not Cicero's letters that he erases. Actually no very anct P.s have come down to us. P.s became most common between the 7th and 9th cents., but continued even down to the 16th. The old writing was scraped off with a razor or with pumice, and a mixture of cheese, milk, and lime was used to soften the vellum. However, the ink of the old writing had penetrated so deeply into the parchment that even most severe scraping could not remove all traces of the text. If the MS. is soaked in certain chemicals, the blue or red outlines of the old writing come again to the surface. Unfortunately after this treatment—primarily acid obtained from oak gall was used for restoring the P.—the MS. becomes so dim that it is impossible to read it. More recently, in place of tannic acid, other substances have been used, which bring out the old writing for a short time. While the text is thus visible, photographs are taken, and then the acids are washed out. Nowadays photographs of an old writing can be taken without any chemical treatment, by using ultra-violet rays or fluorescence. Many valuable MSS. which were lost have thus been restored. There are even P.s in which there appear 3 successive writings. Sometimes the P.s are bilingual, the old writing being Greek and the new writing being Latin, or Syriac and Arabic, or Hebrew and Latin, and so forth. Many P.s are written in capitals or uncials, in Greek or Latin. A Sinaitic Syriac P. turned out to be one of the earliest trans. of the N.T. The idea of using P. MSS. for the discovery of fragments of lost works was first taken up about the 18th cent. Dr Bruno ed. his fragments of Livy in 1773, Niebuhr's ed. appeared in 1820. Cicero's *Republic* and the *Institutiones* of Gaius were thus recovered. Mai pub. the *Codex Ambrosianus* of Plautus, 1814–15. Tischendorf discovered biblical P.s, including the *Codex Ephraemi*, 1843–5. See E. Chatelet, *Les Palimpsestes latins*, 1907.

Palindromes (Gk *palin*, again, and *dromos*, a course) is a sentence or phrase that reads the same either backwards or forwards, as, for example, the Latin verse, *Roma tibi subito motibus ibit amor*. An example in Eng. is, 'Able was I ere I

saw Elba,' supposed to have been said by Napoleon when asked whether he could have invaded England. 'Dog a devil defied, defied lived a god' is said to be the longest P. in Eng. The 'Sator-Arepe formula':

SATOR
AREPE
TENET
OPERA
ROTAS

('The sower of the acre holds the wheels at work') is, besides being a P., a quadrate, i.e. it can be read as a square. This magician's formula can be traced back to the 4th cent. AD, and appears to have originated in Asia Minor. The term P. is also used of a single word such as 'ere'.

Palinurus, helmsman of Aeneas, who was drowned off the W. coast of Italy (Lucania) on the way from Troy, having fallen overboard while asleep. Palinuro Punta (or Spartimento), above the Gulf of Policastro, was called after him. See Virgil, *Aen.* vi. 337; Strabo, vi.

Pallsander Wood, see ROSEWOOD.
Palissy, Bernard (c. 1510-c. 1590), Fr. potter and enameller, b. near Agen. His reputation is largely based on literary sources, beginning with his own fantastic writings, according to which he laboured for years in direst poverty to discover how to make fine enamels. In 1548 the Constable de Montmorency ordered several works from P. During the next 15 years P. succeeded in producing that distinctive ware called by his name, earthenware moulded in high relief with water creatures, shells, fishes, lizards, leaves, and other natural objects, and covered with coloured lead-glazes of wonderful harmonies. In 1566 Catherine de' Medici, the Queen Mother of France, summoned him to Paris to make a grotto, some fragments of which, found in 1878, are in the Louvre. Although saved from the Massacre of St Bartholomew's Day by Catherine de' Medici, he retired to Sedan until 1575, when he returned to Paris, where he lectured on natural hist. until 1584. With the renewed persecution in 1586, P. was imprisoned in the Bastille, where he d. about 4 years later. Anatole France pub. his *Oeuvres complètes*, 1880. See lives by H. Morley, 1852; F. de Lasteyrie, 1865; E. Dupuy, 1902; A. B. Hanschmann, 1903; D. Leroux, 1928; see also M. J. Ballot (Musée du Louvre: Documents d'art), *Bernard Palissy et les fabriques du XVI^e siècle*, Paris, 1924.

Palitana, state and tn of Kathiawar peninsula, Bombay, India, 78 m. NE. of Diu, now merged in Saurashtra State. The Satrunjaya Hill above the city (W.) is the most sacred of the hills of the Jains (c. 1977 ft.). It is covered with temples and shrines, some dating from the 11th cent. The larger ones are in 'tunks' or separate enclosures. Horse-breeding is largely carried on. See J. Burgess, *Notes of a Visit to Satrunjaya Hill*, 1869.

Pallurus, genus of deciduous flowering shrubs (family Rhamnaceae), with slender branches bearing spiny stipules and

clusters of small green and yellow flowers, followed by dry, hemispherical fruits. *P. spina-Christi* is Christ's thorn (q.v.).

Palk's Bay and Strait, gulf and channel of the Indian Ocean, between India and N. Ceylon, N. of the shoals called 'Adam's Bridge.' The Dutch named it after Governor Palk. At the narrowest part it measures 40 m. across.

Pall: 1. Stiffened square of linen used to cover the Eucharistic chalice, partly for reverence, partly to keep out flies.

2. Rich cloth used to cover a coffin while it stands in the church or is being borne to burial.

3. The pallium (q.v.).

Pall-mall, Pell-mell, or Mell, see MALL, THE.

'Pall Mall Gazette,' penny daily evening paper founded in 1865. The first proprietor was Thackeray's publisher, and the editor was Thackeray's assistant on the *Cornhill Magazine*, facts which, taken with the early style of the paper, have often suggested that it was based upon Thackeray's journal (also called the *P. M. G.*) written by 'gentlemen for gentlemen.' It took an independent line in politics down to 1880, when it became, under John (later Lord) Morley's editorship, a Radical paper. Later it became as strongly Conservative as it had been Radical. In 1923 it was incorporated in the *Evening Standard* (q.v.).

Palladian, see PALLADIO, ANDREA.
Palladio, Andrea (1508-80), It. architect, b. Vicenza. He studied in his native city and at Rome. He was one of the greatest It. architects of the late Renaissance, and the style which he used has received the name of Palladian. It was an attempt to revive the severity and dignity of Roman architecture, and was derived from Vitruvius and from a study of the Roman monuments that remained. Its best exponent in England was Inigo Jones. P. greatly influenced the architecture of his day by his work, *I quattro libri dell' Architettura*, 1570, which was immediately trans. into most European languages. His chief buildings were the Palazzo della Ragione and numerous private palaces at Vicenza; sev. villas in the neighbourhood; and the churches of S. Giorgio and Il Redentore at Venice. See biography by B. F. Fletcher, 1902.

Palladium, an ancient wooden image of Pallas (a surname of Athena), upon the preservation of which in its sanctuary the safety and welfare of the State depended. It had fallen from heaven as a gift from Zeus to the founder of Ilum, and was guarded in the citadel of Troy. Odysseus and Diomedes stole it during the Trojan war, thus securing victory for the Greeks. It was brought by Aeneas to Italy and kept in Vesta's temple at Rome. A P. has come to mean a 'protecting talisman.'

Palladium, chemical element, symbol Pd, atomic number 46, atomic weight 106.7; one of the 'platinum metals' found in the platinum ore which occurs in small grains and rare nuggets in alluvial deposits and riv. sand principally in Brazil, California, and the Urals. It is a lustrous white metal (melting-point about 1600° C.

and sp. gr. 11.8) which is not acted on by the air at ordinary temps. P. forms the exception in the platinum group of metals by dissolving in hot nitric acid. The oxides PdO, PdO, and PdO₂ are known, and the metal forms palladous salts corresponding to the monoxide as well as a palladic chloride, PdCl₂. The metal has the special property of occluding large volumes of hydrogen to form a substance of metallic appearance which is not a true compound, though it approximates to the composition PdH. Absorption takes place most rapidly at 100° C., and with finely divided metal, about 900 vols. of hydrogen being absorbed by 1 vol. of metal. P. is used in dentistry, jewellery, scientific instruments, aeroplanes, etc.

Palladius, Rutilius Taurus Aemilianus, Rom. author of the 4th cent. AD, who lived about the time of Valentinian or Theodosius. His *Opus Agriculturae* was mainly compiled from Columella and earlier writers. A Middle English verse trans. from an Eng. MS. (c. 1420) was pub. for the Early English Text Society under the title *Palladius on Husbandrie*. See J. C. Schmitt's Ger. ed., 1898, and J. G. Schneider, *Scriptores Rei Rusticae*, iii, 1795.

Pallantia, see PALENCIA.

Pallanza, It. tn, in Piedmont (q.v.), on the central basin of Lake Maggiore (q.v.). It commands a fine view of the Alps and is a popular tourist resort. Pop. 5500.

Pallas: 1. Appellation of the Gk goddess Athena (q.v.), perhaps meaning virgin.

2. Freedman of and secretary *a rationibus* to the emperor Claudius (q.v.). It was at his instigation that Claudius married Agrippina the younger, adopted her son (the future emperor Nero), and was afterwards murdered. See Suetonius, *Claudius*; Tacitus, *Annals*, xlii; Juvenal, i. 107.

Pallas, Peter Simon (1741-1811), Ger. traveller and naturalist, b. Berlin. He studied medicine and natural hist. at the univs. of Berlin, Göttingen, and Leyden. In 1766 P. pub. *Elenchus Zoophytorum* and *Miscellanea Zoologica*. With these works he gained a high reputation, and in 1768 he was appointed naturalist to a scientific expedition bound for Siberia, there to observe the transit of Venus. P. returned to St Petersburg in 1774 with extraordinary specimens in natural hist., which formed the nucleus of the museum of the Academy of St Petersburg. His other works include *Reisen durch verschiedene Provinzen des russischen Reichs* (3 vols., 1771-6; supplement, 1779-1801); *Sammlungen historischer Nachrichten über die mongolischen Völkerschaften* (2 vols.), 1776-1802; *Flora Rossica*; and *Icones insectorum, praesertim Rossiae Siberiaeque peculiarium*, 1781-1806.

Pallas, hamlet of Longford co., Rep. of I., 2 m. SE. of Ballymahon. Oliver Goldsmith was b. here (1728).

Pallas, second asteroid (q.v.) in order of discovery (Ceres being the first) and farthest from the sun, revolving between

the orbits of Mars and Jupiter. It was discovered by Olbers at Bremen (1802). Its magnitude remains uncertain, while its period of revolution is about 4.61 years.

Pallavicino, Pietro Sforza (1607-67), It. historian and cardinal, son of Alessandro P. of Parma, b. Rome. P. took priest's orders and held important eccles. appointments during the pontificate of Urban VIII. He entered the Society of Jesus in 1637, and was created cardinal by Pope Alexander VII in 1657. P. was the author of many fine works, but the best known is his *Istoria del Concilio de Trento*, 1656-7, intended as a reply to the still more celebrated work of Paul Sarpi. His collected works were pub. 1844-8.

Palliser, La, see ROCHELLE, LA.
Palliser, Sir Hugh (1723-96), adm., son of Hugh P., an army officer, b. York-shire. In 1759, in his ship *Shrewsbury*, in which he had fought under Anson off Ushant and captured many prizes, he took part in the operations in the St Lawrence leading up to the capture of Quebec. In 1764 he was governor and commander-in-chief of Newfoundland. In 1778 he was promoted to be vice-adm. of the blue. After the action off Ushant in July 1778, in which the Fr. fleet escaped, a court-martial was held on Keppel (q.v.). P.'s superior officer, whose charges of neglect of duty against P. were pronounced malicious and false. P., whose supporters, adversaries of Keppel, had instigated the inquiry, consequently resigned and applied for a court-martial on himself, the result being that he was censured for his conduct in the action. It seems probable that a fair and independent court would have reached a very different conclusion. P. was a brave and capable officer, though his conduct in the action remains a mystery, the more difficult to solve because his character was differently estimated by the factions of the day. In the year after the court-martial he was appointed governor of Greenwich Hospital, and he became an adm. in 1787. See Southey's *Life of Nelson*, 1813.

Palliser, John (1817-87), Canadian geographer and explorer, b. Ireland, brother of Sir Wm P. (q.v.). He travelled over N. America, in the then uncharted regions of the far W., between 1847 and 1861. He made a topographical delimitation of the boundary between Canada and the U.S.A. from Lake Superior to the Pacific coast.

Palliser, Sir William (1830-82), soldier, b. Dublin, entered the Army as a cavalry officer. He invented the method of chilled shot that bears his name and the method of converting smooth bore into rifled guns (1862-3).

Pallium, narrow circular strip of cloth, about 2 in. wide, with two pendants about 12 in. in length which hang down, one over the breast, the other at the back, worn by the Pope and by archbishops about the neck, breast, and shoulders. The pendant strips are weighted with small pieces of lead enclosed in black silk. The P. is made of white wool taken from 2 lambs provided by the Lateran canons of St John and blessed by the Pope on the

feast of St Agnes. The Pope may wear the P. on all occasions, but the times of its use by archbishops are strictly regulated. The P. is granted only by the Pope, and each newly consecrated metropolitan must apply to him for it within a year after consecration. The P. symbolises the supreme pastoral power. It came into use in the 5th cent., being simply the old 'scarf of office' worn by the emperor and consuls and granted to other officials during the 4th cent. This scarf also developed into the stole (q.v.). Originally pallia, lay and clerical alike, were of coloured silk. Celestine I (AD 425) protested violently against its adoption. See G. Dix, *The Shape of the Liturgy*, 1945.

Palm, common name of members of the Palmaceae, a monocotyledonous family of woody perennials, containing about 1100 species, natives of the tropics and subtropics, with the exception of *Chamaerops humilis*, a pretty, small fan-palm, native to the Mediterranean, and hardy enough for mild districts in the SW. of Britain. The P.s grow usually with unbranched stems and by the terminal bud, except in *Hyphaene* (q.v.), forming a crown of leaves at the apex, which are usually fan-shaped, and radiate- or pinnate-veined, varying in size according to species, from inches long in *Reinhardtia* to several feet in *Manicaria*, and having a thick, glossy cuticle which restricts transpiration and moisture loss under hot sun. The inflorescence is usually large and branched, usually axillary, sometimes terminal, with flowers borne on a spadix, and enclosed in a spathe of several leaves, emerging when the flowers are ready. Each flower is sessile, with 3 sepals and 3 petals, which are alike and form a greenish or yellowish perianth, with 6 stamens, a pistil, and usually 3 carpels. The fruit varies greatly in size and structure, and may be a drupe or a berry, the seeds having a large endosperm. Many P.s are monococious, others dioecious. As monocotyledons P.s have no tap-root, and in some species the cotyledon is lengthened

downward considerably to give anchorage and stability to a tall stem.

Economically the P.s are important, and have many uses. They provide building materials, the timber of *Sabal palmetto* being valued commercially for its durability; food products include the coconut (*Cocos nucifera*), date (*Phoenix dactylifera*), P. honey (*Jubaea spectabilis*), P. sugar and P. wine from various P.s, and sago and similar foods obtained from the pith of *Arenga pinnata*, *Caryota*, and other P.s. Other products include P. oil from the fruits of *Elaeis guineensis*, carnauba wax from the leaves of *Copernicia cerifera*, vegetable ivory from the seeds of *Phytelephas macrocarpa*, and betel nuts from *Areca catechu*. The leaves of many P.s are used for thatching and native building materials; those of the Palmyra P. (*Borassus flabellifer*) for paper and records; others for straw-hat making; and the leaf mid-ribs of *Metroxylon* may be split for use as flooring or panel boards. Rattan canes are provided by *Calamus rotang* and *C. tenuis*, and Malacca canes by *C. scipionum*.

Many P.s are grown for their decorative foliage indoors or in greenhouses in Britain, and they may usually be propagated from seeds, under glass, with bottom heat, though germination is slow. They are the better for restricted root room, and seedlings should be potted when 2- or 3-leaved. Spring is sowing and re-potting time, and given proper watering, with occasional sponging of the leaves, and shade from hot sun, the plants are quite long-lived, tolerating winter temps. down to 50° F. Important genera include *Acanthophoenix*, *Alphanea*, *Areca*, *Arenga*, *Bactris*, *Borassus*, *Calamus*, *Caryota*, *Chamaerops*, *Cocos*, *Copernicia*, *Corypha*, *Elaeis*, *Howea*, *Jubaea*, *Livistonia*, *Manicaria*, *Mauritia*, *Metroxylon*, *Neanthe*, *Phoenix*, *Raphia*, *Reinhardtia*, *Rhapis*, *Sabal*, *Syagrus*, *Trachycarpus*, *Versaffeltia*, *Wallichia*, *Washingtonia*, *Welfia*, and *Zalacca*.

Palm Beach, tn, P.B. co., Florida, U.S.A., situated on a narrow piece of land between Lake Worth and the Atlantic Ocean, 65 m. N. of Miami. It is a fashionable resort. Its nearest railway station is West P. B., on the opposite side of Lake Worth and connected with it by a bridge and ferry. Pop. 3886.

Palm Beach, West, see **WEST**.

Palm Fruit, from numerous varieties of the oil palm *Elaeis guineensis*, native to the tropical regions of W. Africa, where it is confined mainly to a 300-m.-wide coastal belt extending from the Gambia to Angola, and also cultivated on plantations on a very wide scale in Indonesia and Malaya. In W. Africa the trees grow principally in the wild state, but an increasing number is being cultivated there on plantations. The uncultivated palm starts to fruit when 15-17 years old, by which time it has attained a height at which it must be climbed in order to cut down the large bunches or 'heads' of fruit from amongst the fronds at the top, whereas the cultivated dwarf palm starts to fruit 6 years after planting, and the

fruit may be harvested from ground level until the tree is about 12 years old. Each tree bears about 5 bunches of fruit each year at maturity, each bunch weighing 35-40 lb. and containing up to 1000 P. F., which are oval and pointed at the apex and about 1½ in. in length by 1 in. in diameter. The mature fruit may be yellow, orange, reddish brown, or nearly black, depending upon the variety, and consists of an outer pulpy, fibrous layer (pericarp) enclosing a nut, which contains the brown to black palm kernel. P. F. produces 2 different varieties of oil, palm oil from the pericarp and palm-kernel oil from the seed kernel. The relative proportions of palm and palm-kernel oil in a fruit vary considerably, as the fruits of the different varieties differ much in thickness of pericarp and shell, and size of kernel. The main varieties of the palm *E. guineensis* are: *Macrocarpa*, which yields a fruit with a relatively large nut and correspondingly thin pericarp; *Dura*, which produces a fruit with a thicker pericarp and thick shell but smaller proportion of kernel; and *Tenera*, which produces a fruit with a much thicker pericarp and small thin-shelled kernel. The variety *Macrocarpa* is found widely distributed in W. Africa, and is always self-sown. *Dura* is the most common in natural palmeries, and a type of *Dura*, known as *Deli*, has been extensively cultivated on plantations in SE. Asia, chiefly for palm oil. *Tenera*, also common to W. Africa, is particularly attractive for plantations in W. Africa and SE. Asia, and has been chosen for cultivation for palm-oil production, the kernels being a by-product. The pericarp and palm kernel each contain up to 50 per cent of oil.

Palm-kernel Oil is obtained from the hard kernel of the oil-palm fruit, and is very similar in almost every respect to coconut oil. By far the bulk of world production of palm kernels is exported to W. European countries, chiefly to the U.K., for processing by high-pressure 'expellers' (continuous-screw presses) and, to a small extent, by low-pressure expellers followed by solvent extraction, but a small quantity has been crushed in recent years in the producing regions by modern mills erected and operated by W. European companies. None is crushed by the W. African natives, whose main purpose is the comparatively easy expression of palm oil from the pericarp of the palm fruit. Nigeria has been for many years the prin. source of palm kernels, and in 1934 exported some 57 per cent of the world total export of 820,000 tons; W. Africa as a whole exported about 750,000 tons, while Indonesia and Malaya together exported 56,000 tons. The oil expressed or solvent extracted from the white 'meat' of the kernel is screened and filtered to remove all traces of fine meal ('foots'), and may then be transferred to the soap manufacturer as crude oil or, if required for edible purposes, is passed through a refining process for removal of all free fatty acids, colour, and those substances which give rise to flavour and odour.

Refined P.-k. O., which sets to a white fat when cooled below 26°C., is used in margarine manuf., or is 'hardened' by hydrogenation for use in confectionery, chocolate, synthetic cream, ice-cream, etc. It is also separated into 2 fractions, a hard stearine and liquid oleine, by hydraulic pressing, for the production of special fats for confectionery, etc. Main fatty acid components of the oil are: saturated—lauric (46-52 per cent), myristic (14-18 per cent), palmitic (6-9 per cent); and unsaturated—oleic (10-19 per cent). The expelled cake and solvent-extracted meal, containing about 6 per cent and 1 per cent of oil respectively, are used in animal compound feeding-stuffs. See PALM FRUIT and OILSEEDS, PROCESSING OF.

Palm Oil, fat extracted, by boiling and skimming, from the pulp of the fruit of various palms. It has a butter-like consistency, a dark orange colour, and, when fresh, a pleasant odour. It mixes with turpentine and ether, and melts at 27°C. Both P. O. and palm kernels are derived from the fruit of the oil-palm. A fibrous pericarp contains the oil and covers the shell, which is cracked to obtain the kernel of commerce. In W. Africa the edible pericarp oil is extracted by crude methods and the nuts are cracked by women and children. Kernels are not used by the Africans, but are exported to Europe for crushing. P. O. is employed largely in the manuf. of margarine and soap, and also candles and railway grease. Brit. W. Africa is the largest producer in the world and, except for a few European plantations, production is in the hands of Africans. Nigeria has exported as much as 210,000 tons annually, and the old name, 'Oil Rivs.', was once applied to the Niger delta because, in the early hist. of the country, P. O. and kernels were brought down the waterways for trading at the ports. In 1922 the W. African trade began to encounter keen competition from the Dutch E. Indies and Malaya, which exported an oil superior in quality and with a lower percentage of free fatty acid. The Nigerian Gov. has taken steps to improve the existing palm groves and to induce the natives to use hand-presses; but progress is slow because it is difficult to persuade the natives to give up old methods. In Ghana oil-palm products were the staple agric. export before the development of cacao. The oil-palm is also grown in Sierra Leone, and there is a large consumption of P. O. for food purposes; but the fruit of the indigenous palm of that colony yields relatively little oil, and breeding is confined to imported varieties. In Fr. Togoland the oil-palm is an important source of revenue, and in parts of the Belgian Congo the oil-palm has always been important in native economy as a source of food and other products, but large areas have been planted at different times and then abandoned. Progress in P. O. extraction methods in recent years has been such that

Palm Sunday, last Sunday in Lent, the Sunday before Easter (q.v.), obtains its name from Christ's triumphal entry into Jerusalem (Matt. xxi). In the Rom. Catholic Church and the oriental Churches an elaborate ceremonial, including a procession of palms, takes place on this day. Palms are also blessed and distributed to the faithful to be taken home. Some of these ceremonies have been revived in many Anglican parishes. In Wales, a vestige of the old ceremonies may perhaps be seen in the custom of decking graves with flowers on P. S.

Palma, Sp. tn, cap. of the Balearic Isles (q.v.), standing on a wide bay of the SW. coast of Majorca (q.v.). There is a vast, and very fine, Gothic cathedral, begun in 1230, and near to it is the Almudaina, a former royal palace, which dates from the 14th cent. Many fine mansions and a 14th-cent. Gothic bourse testify to P.'s ancient prosperity as one of the great Mediterranean ports. Other buildings of note include the 13th-cent. church of St Francis of Assisi, which contains the tomb of Raimon Lull (q.v.), and the circular royal castle of Bellver. A printing office in the tn, founded by Jaime Guasp in 1578, is still in operation. P. has a busy harbour, a trade in grain, wine, silk, and fruits, and manufs. of glass, textiles, shoes, and liqueurs. Pop. 143,100. See R. A. Cram, *The Cathedral of Palma de Mallorca*, 1932.

Palma, La (San Miguel de la Palma), most westerly of the Canary Is., in the prov. of Santa Cruz de Tenerife (q.v.). It is mountainous (Pico de la Cruz, 7760 ft), with deep gorges, is well wooded, and is very fertile. Wine, sugar, honey, fruits, wax, and silk are produced. The cap. is Santa Cruz de la P., on the E. coast. Area 281 sq. m. Pop. 70,000.

Palma del Condado, La, Sp. tn in the prov. of Huelva, well known for its wines. Pop. 8500.

Palma di Cesnola, see CESNOLA.

Palma di Montechiaro, tn in Sicily (q.v.), 12 m. SE. of Agrigento (q.v.). It has a trade in fruit, sulphur, soda, and almonds. Pop. 17,000.

Palma Giovane ('The Younger'), Jacopo (Giacomo) (c. 1544-1628), It. painter. He was the grand-nephew of P. Vecchio (q.v.). He imitated Titian, Tintoretto, and Paolo Veronese, and studied the antique at Rome (1559-67). The architect A. Vittorino became his patron and obtained innumerable commissions for him. Among his works are 'St Catherine rescued from the Wheel,' 'Madonna with Saints,' 'The Brazen Serpent,' 'Resurrection of Lazarus.' See G. Morelli, *Italian Masters in the German Galleries*, 1883; and P. Locatelli, *Notizie intorno a G. Palma*, 1890.

Palma Vecchio ('The Elder'), Jacopo (Giacomo) d'Antonio de Negreti (c. 1480-c. 1528), It. painter of the Venetian school, b. Serinalta, near Bergamo. He studied under Bellini and others. Among his best works were 'Santa Barbara' (Venice); 'A Holy Conversation' (Naples and St Petersburg); 'St Jerome,' 'The Virgin Enthroned' (Vicenza); 'Adoration

of the Magi,' and various portraits. See J. A. Crowe and G. B. Cavalcaselle, *History of Painting in North Italy*, 1871; M. von Boeln, *Giorgione und Palma Vecchio*, 1908; and life by A. Spahn, 1932.

Palmas, Las, see LAS PALMAS.

Palmer, Herbert Edward (1880-), poet and critic, b. Market Rasen, Lincs. Educ. at Woodhouse Grove School, Birmingham Univ., and Bonn, he became a schoolmaster, but in 1921 gave up teaching for writing. After sev. vols of poetry he pub. *Collected Poems* in 1932, and followed this with *Sword and Chasm*, 1934, *The Vampire*, 1936, *A Sword in the Desert*, 1946, and *The Old Knight*, 1949. *Post Victorian Poetry*, 1938, is a book of criticism, and *The Mistletoe Child*, 1935, a vol. of early reminiscences.

Palmer, John (1742-1818), projector of mail-coaches in England, b. Bath. He put forward a scheme to Pitt for running mail-coaches, and the first started from Bristol in 1784. The idea was promptly taken up, and services multiplied rapidly throughout the country. P. became comptroller-general of the post office in 1786, but was dismissed (1793) because of his frequent quarrels with Lord Walsingham, the postmaster-general. He was granted £50,000 as compensation in 1813.

Palmer, Sir Roundell, see SELBORNE.

Palmer, Samuel (1805-51), landscape painter and etcher, son of a small bookseller at Newington, Surrey. He was sent to the Merchant Taylors' School; he discovered his powers there, and as early as 1819 showed 3 pictures at the Royal Academy, a remarkable record for a boy of 14. At this same exhibition he was excited by Turner's 'Orange Merchantman,' but his great experience in youth was his meeting with the aged William Blake, whose character and art deeply impressed him. He and other worshippers of Blake formed a group at Shoreham, Kent, called 'the Ancients,' between 1826 and 1833, and in this period P. excelled, mainly in sepia and water-colour. His best works show a genuine, if limited, imagination, and express a personal and emotional vision of nature. See G. Grigson, *Samuel Palmer: the Visionary Years*, 1947.

Palmer, Vance, see AUSTRALIAN LITERATURE.

Palmer, William Waldegrave, see SELBORNE, SECOND EARL OF.

Palmer (medieval Lat. *palmarius*, from *palma*, a palm), one who, having made a pilgrimage to the Holy Land, returned carrying a palm-leaf as a sign of his accomplished pilgrimage. The title was later applied to itinerant religious men who spent their whole time in such pilgrimages, subsisting on charity. It is also frequently used merely as an equivalent to 'pilgrim.'

Palmerston, Henry John Temple, third Viscount (1784-1865), statesman, b. Broadlands, near Romsey, Hants, and educ. at Harrow and St. John's College, Cambridge. He succeeded in 1802 to the Irish peerage, and 5 years later entered the House of Commons. Within 12

months, he became lord of the admiralty under the Duke of Portland, and in 1809 accepted the secretaryship of war, which, under various Prime Ministers, he held until 1828. He became foreign minister under Grey (1830), and remained in that office (except during Peel's brief administration) until 1841. In this great position he maintained and even increased the prestige of England, which was never higher in the 19th cent. than when he was at the Foreign Office. In opposition until 1846, in that year he became foreign secretary under Russell, and in 1850 made his famous *civis Romanus* speech, in which he estab. his reputation as an orator and won the hearts of his countrymen. When in 1851 he expressed his approval of Napoleon's *coup d'Etat*, without having consulted the queen or his colleagues, he was, at the demand of her majesty, dismissed from office by Lord John Russell. He became home secretary under Aberdeen in 1852, and strongly advocated a firm attitude against Russia. The Crimean war broke out in 1854, mismanagement was rampant, and Aberdeen (q.v.) resigned in the following year. By general consent, P. became Prime Minister, and his vigorous action soon brought about a more satisfactory condition of affairs. He was defeated in 1857 on the China war question, whereupon he dissolved Parliament and appealed to the nation, and was promptly returned to power. He was defeated again the following year on the Conspiracy to Murder Bill. In the meantime, however, he had suppressed the Indian Mutiny, 1857-8. In 1859 he again formed a gov., and so strongly was he supported that it was said that he was 'Prime Minister for life,' his following being almost entirely personal. Gladstone was chancellor of the exchequer in this administration, and he and P. were men of widely differing temperaments and ideals. In this, his second administration, P. furthered the cause of free trade, but made the mistake of allowing the *Alabama* (q.v.) to leave Birkenhead. He d. in office and was buried in Westminster Abbey.

P. was to many of his contemporaries the ideal Eng. minister, firm, tactful, humorous, and blessed with great common sense that enabled him to extricate the country and himself from awkward places. He was the most popular Prime Minister of the day, and, except in connection with the Conspiracy to Murder Bill, could always rely upon being supported. P. was, after 1832, uninterested in further parl. reform, and his autocratic character meant that his party shelved its proposed measures on this subject until after his death. Home affairs, in fact, never really interested him, and for the last 30 years of his life his views on most domestic subjects were far more conservative than those of the majority of his party. In character and policy he expressed the self-confidence of the ruling classes of his era; his high-handed attitude to the great powers of Europe and his support for the weaker nations (he was largely responsible for the creation

of an independent Belgium, and his actions did much to further it, unity—though throughout he was, of course, motivated by Brit. interests, and not by philanthropy) gained him a reputation far beyond his own country. But at the end of his life Bismarck (q.v.) called P.'s bluff on the Schleswig-Holstein question, and it is open to doubt whether P.'s methods of blustering bellicosity would have been so successful had a Bismarck arisen to challenge him 30 years earlier. See A. E. M. Ashley, *The Life and Correspondence of Henry John Temple, Viscount Palmerston*, 1878; F. Guedalla (ed.), *The Palmerston Papers: Gladstone and Palmerston*, 1928; and H. C. F. Bell, *Lord Palmerston*, 1936.

Palmerston, one of the N. Cook Is. It is 1 sq. m. in area, and inhabited by about 90 of the descendants of the late Wm. Marsters, an Englishman who in 1862 settled there with 2 native women, his wife and her sister, both from Penrhyn Is.; later a third Penrhyn woman joined them. He forbade the use of the native tongue, and to this day a form of Eng. is spoken. Copra is the main product, collected by schooner twice a year.

Palmerston North, city in Manawatu dist., Wellington Prov., N. Island, New Zealand, 87 m. N. of Wellington. The centre of a thriving dairy and sheep-raising country, it was proclaimed a city in Aug. 1930. There is an agric. college. Pop. of urban area 37,750.

Palmetto Leaves, leaves of *Sabal palmetto*, a fan-palm, native of Central America, which are used in making hats and mats.

Palmetto State, see under SOUTH CAROLINA.

Palmgren, Selim (1878-1951), Finnish pianist, conductor, and composer, b. Hörneborg. He studied at the Helsinki Conservatory, in Germany and Italy. He married the singer Maikki Järnefelt, toured Europe and the U.S.A. with her, in 1923 became prof. of composition at the Eastman School of Music at Rochester, New York, and in 1936 at the Sibelius Academy in Helsinki, where he d. His works include operas, incidental music, choral works; two pianoforte concertos, *Metamorphoses* and *The River*; and numerous pianoforte pieces, etc.

Palmiet, see PALMITE RUSH.

Palмира, tn of Colombia, in the dept of Valle, and 15 m. E. of Cali. It is situated on the Llanos de Malajana at an altitude of 3500 ft. Grows tobacco, coffee, cacao, sugar, and rice, and has an experimental agric. station. It is reached by rail from Buenaventura 144 m.). Pop. 21,250.

Palmistry, or Cheiromancy (Gk *cheir*, hand, *mantikē*, divination or prophecy), the art of reading a person's character and the chief events of his life from the general contours of his hand, and, in particular, from the lines upon the palm. Though in modern times it has fallen into disrepute through being exploited for gain by more or less ignorant fortune-tellers, it was in early times highly esteemed, and is mentioned with respect

by Pliny, Aristotle, and other ancient writers. The different parts of the hand are named after the planets, the thumb belonging to Venus (♀), the first finger to Jupiter (♃), the second to Saturn (♄), the third to Apollo or the Sun (☉), and the fourth to Mercury (☿), while there are also the 'mounts' of the Moon (☾) and of Mars (♂). The chief lines are those of heart, head, and life (1, 2, and 3 in diagram), but all small markings, crosses, etc. must be taken into consideration, the rules upon which an adequate judgment is based being extremely complex. It is claimed that the lines are continually altering in accordance with the development of a person's tastes and character; also that markings signifying particular events appear temporarily and

vanish when the event has taken place. See S. D'Arpentigny, *La Chirologie*, 1843; A. Desbarrolles, *Les Mystères de la main*, 1859; E. Beemish, *The Psychonomy of the Hand*, 1865; A. Raphael, *Chiroscopy*, 1901; W. G. Benham, *The Laws of Scientific Hand Reading*, 1901, and *How to Choose Vocations from the Hands*, 1932; and Cheiro, *The Language of the Hand*, 1911.

Palmite Rush, or **Palmiet** (*Prionium palmita*), evergreen perennial plant (family Juncaceae), native of S. Africa, with broad, linear leaves, which are deeply channelled and finely serrated, and small greenish-golden flowers. The leaves are used in thatching, and the fibre in the leaf sheaths is sometimes employed in brush making.

Palmitic Acid (Hexadecanoic, $C_{16}H_{32}COOH$ or $CH_3(CH_2)_{14}COOH$), most important and most abundant of the saturated fatty acids, found widely distributed as mixed glycerides in animal, vegetable, and marine fats and oils. It is a major constituent of lard, tallow, palm oil, and cocoa butter, and is a tasteless, odourless, and hard crystalline substance, melting to a colourless liquid at $63^\circ C$. Commercial P. A. derived from natural fats usually contains stearic acid, and is converted into mono- and di-glycerides, water-soluble alkali-metal soaps or salts, and oil-soluble, water-insoluble 'metallic' soaps. Prin. uses of the derivatives are—

as emulsifying agents in edible products, cosmetics, shaving-soaps and creams, high-temp. washing soaps, etc., as 'driers' or thickening and levelling agents in paints, enamels, varnishes, and other protective coatings; as thickening or gelling agents in lubricants, and as components of waxes and polishes. See **FATTY ACIDS**.

Palmyra, ancient city standing in an oasis of the Syrian desert, 150 m. N.E. of Damascus. It is now a mere collection of Arab huts, but wonderful ruins exist. It is called by the Arabs Tadmor, and is supposed by some to have been founded by Solomon (2 Chron. viii. 4). This can scarcely be the case, P. having been a flourishing city some considerable time before that given for Solomon's birth. It formed a halting-place for the caravans between Syria and Mesopotamia, and hence grew into a rich, commercial city. The bulk of the pop. was of Arab blood. The city reached its greatest period of wealth and splendour under Hadrian and the Antonines. (For the revolt of the Palmyrenes against the Romans see ZENOBIAS.) P. was destroyed by Aurelian, AD 273, and the inhab. massacred. It never recovered its former glory. Remains include a temple of the sun, walls, and a colonnaded street with a triumphal arch. See M. I. Rostovtzev, *Caravan Cities*, 1932; D. M. Robinson, *Babylonia; Palmyra*, 1946.

Palni Hills, ranges of mts in the W. of the Madras dist., Madras, India, consisting of an E. and W. range, and reaching a height of 7000 ft. On the lower slopes are many plantations of tea, coffee, and cardamoms.

Palo Alto: 1. Banking tn of Santa Clara co., California, U.S.A., 30 m. SE. of San Francisco. It produces canned fruits, dairy products, Roentgen-ray tubes, and insecticides. Stanford Univ. (opened 1891) is 1 m. away, and there is a Rom. Catholic theological seminary. Pop. 25,473.

2. Battlefield of Cameron co., S. Texas, U.S.A., between Point Isabel and Matamoros, The Americans, under Taylor, defeated the Mexicans here (1846).

Palo Worm (*Leotie viridis*), annelid which is widely distributed around the S. Pacific Is. It makes its appearance once a year at the full Oct. moon on the surface of the seas around Samoa and the Fiji Is. It occurs in vast numbers, and the natives value it highly as a food, eaten raw.

Palomar, mt in California, U.S.A., 35 m. inland from the coast, and 66 m. N. of San Diego, a peak of the Santa Anna Mts. There is an observatory with a 200-in. reflector, the largest in the world (see **MOUNT PALOMAR OBSERVATORY**).

Palomides, Sir, see **PALAMEDES**.

Palomino de Castro y Velasco, Don Acisolo Antonio (1643-1726), Sp. painter and writer on art, sometimes called the 'Sp. Vasari,' b. Bujalance, Cordova. He assisted Coello with the frescoes of the queen's gallery in the Alcázar (1686), and was appointed court painter to Charles II (1688). On his wife's death in 1725 he took priest's orders. His oil-paintings

were better than his frescoes, but he is chiefly remembered for his *El Museo pictórico y escala óptica*, 1715-24, of which the third part, with the sub-title, *El Parnaso español pintoresco laureado*, contained biographies of Sp. painters. Abridgements appeared in England (1739) Spain (1742, 1744), France (1749), and Germany (1781), and a reprint of the whole work in Spain in 1797. See J. A. Cuan-Bermudez, *Diccionario de los mas illustres profesores de las bellas artes en España*, 1800; and Sir W. Stirling-Maxwell, *Annals of the Artists of Spain*, 1848.

Pálsson, Bjarni (1719-79), Icelandic naturalist and physician, with Eggert Ólafsson (q.v.) explorer of Iceland and joint author of their famous *Reise gjennem Island* (Sorðe), 1772, which did more than any other work to disseminate factual knowledge of that country. P. did much to effect sanitary reform in the country.

Palsy, see PARALYSIS.

Paludan-Müller, Frederik (1809-76), Dan. poet. b. Kerteminde. He studied law at Copenhagen Univ., but never practised. Whilst there he pub. 4 little romances, and inspired by his study of Shakespeare and Gozzi produced the romantic drama *Love at Court* in 1831, and gained thereby his passport into the society of belles-lettres of the cap. His successful *Dandserinden*, which shows traces of Byron's influence, appeared in 1832. *Amor and Psyche*, probably his most finished work, was pub. in 1834. He settled down to a quiet and studious life in a cottage on the royal estate at Fredensborg. *Zuleima's Flight* and *Beatrice* were written in 1835-8, *Venus* in 1841. During 1841-8 he was engaged upon his greatest work, which has become a Dan. classic, *Adam Homo*. This was followed in 1844 by the 3 graceful idylls, *The Dryad's Wedding*, *Tithon*, and *The Death of Abel*. Excepting the drama of *Kalanus* in 1854, P. afterwards produced nothing of particular merit for some years, until he composed with all his former charm and power what was to prove his 'swan-song,' the beautiful poem *Adonis*, 1874. See V. Andersen, F. Paludan-Müller (2 vols.), 1910; M. Martensen-Larsen, *Den virkelige F. Paludan-Müller*, 1924.

Paludi Pontine, see PONTINE MARSHES.

Paludrine or Proguanil Hydrochloride, $C_{11}H_{12}N_4Cl$, antimalarial drug first synthesised in 1944. Up to that time the chief drug used to fight malaria was quinine. P. not only destroys the malaria parasites in the blood, but when administered at the correct time prevents the infection from developing. It is well tolerated in man; doses up to 1.5 grams a day have been given, while as little as 10 milligrams a day gives an action in the clinical phase of malaria. See MALARIA.

Palyngology, the science of pollen-analysis. Besides its use in honey and hay-fever investigations, the analysis of fossil spores and pollen is important in palaeobotany (q.v.). Pollen grains extracted from Quaternary peats, Tertiary

brown coals, and other deposits can not only be used as index fossils enabling regional correlations to be made, but also allow the composition and migration of aet forests, and fluctuations in past climates to be worked out. See K. Faegri and J. Iversen, *Textbook of Modern Pollen Analysis*, 1950; and G. Erdtman, *An Introduction to Pollen Analysis*, 1954.

Pamaquin, $C_{10}H_{14}O_4N_2$, synthetic drug used against malaria. It occurs as a granular, pale-yellow powder, and may be used either alone or alternating with mepacrine or quinine. P. is a toxic drug, and the margin between the therapeutic and the toxic dose is small. For this reason it is used in very small doses in combination with quinine or alternated with mepacrine. P. is too toxic for use as a prophylactic. See MALARIA.

Pamfil, Giovanni Battista, see INNOCENT (popes), Innocent X.

Pamiers, Fr. tn, cap. of an arron., in the dept of Ariège, on the Ariège. It is the seat of a bishopric, and has an iron industry and a trade in garden produce. Pop. 12,000.

Pamirs, mountainous region forming the nucleus of the central Asiatic highland system. They connect the highlands of the Hindu Kush and Karakoram with those of the Tien Shan and Kunlun, whilst the depressions of the Amu and of E. Turkestan border the region, which is termed by natives the 'Roof of the World' (*Bam-i-Dunya*); the word *pamir* (meaning an upland plain or valley) being a name there applied to the riv. valleys. On 2 sides the plateau is bordered by high mts; on the SW. there is no such mt wall, but an abrupt descent to the valley of the Panj. The length of the P. is about 280 m., and breadth from 120 to 150 m., the area being about 30,000 sq. m.

The chief peaks in the N. are Stalin Peak (24,590 ft) and Lenin Peak (23,383 ft), in the E. Muztagh Ata (24,388 ft). Across the plateau ridges run in various directions, principally from E. to W., enclosing the P., or flat, broad riv. plains. The chief rivs. of the P. are the Wakhan (afterwards the Panj) and the Murgab R., both rising in Lake Oikul, and descending to the Aralo-Caspian depression. The ridges running across the P. are crossed by passes, notably the Andamin Pass (15,500 ft), from the Great to the Little P., and the Kharosh Pass (14,550 ft) from the Great Pamir to the Tareh Pamir. Many lakes are found on the P. The prin. P. are the Kharoshy Pamir, round Great Karakul Lake, Rang-Kul, and Alichor; the Great Pamir, round Lake Zorkul; the Little Pamir, round Lake Oikul; and the Taghdumbash Pamir. The theory of Younghusband is that these elevated plains were originally deep riv. gorges, which have gradually been filled up because the debris falling from the mts on either side has accumulated too rapidly to be washed away by the streams. The culminating point of the P. region is reached in the Kunlun Mts. and between the Muztagh Ata and the Tien Shan the mean altitude is about 20,000 ft, whilst the average

height of the P. as a whole is over 12,000 ft. The climate is colder in the centre of the plateau, and the snowfall less than in other parts. The whole region is destitute of trees or shrubs; along the banks of the streams fine pasture is found, to which the Kara-Kirghiz nomads bring their flocks in summer. These are practically the only inhab. of the P., though the peripheral dists. are inhabited by Tajiks. The Russian surveys of Grombchevsky, Bogdanov, Featschenko, Muschketov, and Severzov, and the journeys of Mr and Mrs Littledale, M. Dauvergne, Dr G. Capus, Sir Francis Younghusband, Svon Hedin, Sir Aurel Stein, etc., have much increased the knowledge of the geography of the region. The P. are for the most part in the Tajik S.S.R. See Lord Dunmore, *The Pamirs*, 1893; Report of the Boundary Commission, 1897; Svon Hedin, *Through Asia*, 1898; E. E. Shipton, *Mountains of Tartary*, 1951.

Pampa, La, see LA PAMPA.

Pampas (*Quichuo*, 'plains') are wide, treeless plains found in the Argentine Rep., stretching from Rio Colorado N. to Gran Chaco, and from the foothills of the Andes E. to Paraná and the Atlantic coast. They rise gradually from the ocean, and the E. portion is covered with grass, and supports large herds of cattle, sheep, and horses, whilst the W. is more sterile. The soil of the P. consists of sands and clays. The characteristic vegetation is the 'pampas' grass (q.v.), which grows to a height of 8 or 9 ft. Birds are more numerous than other species of fauna. Area about 250,000 sq. m. The name P. is also applied to other similar plains on the Atlantic coast.

Pampas Grass, genus of beautiful and almost hardy S. Amer. perennial grasses. *Cortaderia argentea* and varieties are the best known in gardens, and on light, deeply worked soils and in sheltered positions will survive sev. degrees of frost. The large, upright, plume-like, white or silvery panicles of flowers appear in Sept. and Oct. *C. quila*, a less hardy species, bears taller rose-coloured panicles.

Pampas Hare, see VISCACHA.

Pampas River, S. central Peru, 200 m. long, rises in Andean lakes in Cordillera Occidental.

Pampeluna, see PAMPLONA.

Pamphlet (from medieval poem entitled *Pamphilus*, taken as type of small book), in a general sense signifies a small treatise occupying fewer pages than a book, on some question or subject of current or temporary importance of a social, personal, political, or eccles. nature, controversial or otherwise, in which the writer endeavours to appeal to the public. Speaking technically, it implies 8 or more pages of printed matter not exceeding 5 sheets, stitched together, with or without a thin paper cover. It is first found in the Lat. form *pamphletus* in Richard de Bury's *Philobiblon*, 1344, and early made its appearance in Eng. literature, Oocleve using the words 'though that this pamphlet' in *De Regimine Principum*, 1412. Lydgate relates in *Minor Poems*, 'which

in a paunflet I redde,' 1430, and in Caxton's 1490 ed. of *Eneydos* we find 'dyverse paunflettis and bookys.' An immense impetus was given to P. writing by the Marprelate controversy in 1589, as instanced by the writings of Nashe, Thomas Cooper, the Harveys, and others. The various witch controversies of the period, especially in the case of the Lancashire trials of 1612 recorded by Thomas Potter, helped to increase the output. Richard Greene likewise caused diversion by his social P.s exposing the rogues of Elizabethan London, the most famous being *A Notable Discovery of Coosnage*, 1591, and *A Defence of Coney-Catching*, 1592. Contemporary with these are those quaint literary productions, the tobacco P.s, and political P.s and news-sheets (the germ of the modern newspaper) began to appear. Political P.s were to multiply quickly during the Caroline reigns, helped by the intervening period of rabid Puritanism, culminating in Anne's time in what Dr Johnson designated the age of P.s, enlisting such able pens as those of Addison, Steele, and Swift. In England such matters as the Corn Laws, Home Rule, the S. African war, Imperial Federation, and in France the Dreyfus case may be cited as having brought forth their full share of this class of literature. A series of well-informed P.s was issued during the Second World War by the Oxford Univ. Press, entitled 'Oxford Pamphlets on World Affairs,' and dealing with the foreign policies of different countries, the economics of the war, racial questions, and special problems. See *British Pamphleteers from the 16th to the 20th centuries*, vol. I, ed. G. Orwell and R. Reynolds, 1948, vol. II, ed. R. Reynolds and A. J. P. Taylor, 1951.

Pamphylia, anct country on the S. coast of Asia Minor, bounded by Lycia and Cilicia. The chief tns were Aspendus, Perga, Attalia, and Olbia. This country formed at first part of the Persian Empire, but afterwards passed successively to Macedonia, Syria, and Rome.

Pamplona: 1. (or Pampeluna; Basque Iruña) Sp. tn, cap. of the prov. of Navarra, on a hill by the Arga. Once cap. of the kingdom of Navarre (q.v.), it has often been besieged. There are a beautiful Gothic cathedral, with an 18th-cent. façade, other anct churches, fine old houses, and remains of the medieval walls. Pop. 75,450.

2. Tn of Colombia, in the dept of Norte de Santander, 210 m. NE of Bogotá, at an altitude of 7670 ft. It is connected by rail with Cucuta and Encencontrados. It is an episcopal see, and is in the vicinity of abandoned gold and silver mines. Other minerals, including iron, coal, lead, and copper, are found in the neighbourhood. Its chief products include dye-woods, gums, coffee, cacao, coal, and gold. There are breweries and distilleries, and also textile factories. Pop. 13,100.

Pan, Arcadian god of flocks and shepherds, son of Hermes, a god of Arcadia, which originally was always the prin. seat of his worship. His name and worship spread over Greece, but at Athens

were not introduced till the time of the battle of Marathon (490 BC), before which he was believed to have appeared to the runner Pheidippides. He is described as wandering among the mts and valleys of Arcadia, amusing himself with the chase, or leading the dances of the nymphs. He loved music, and invented the syrinx or shepherd's flute. P., like other gods of the forests, was dreaded by travellers, to whom he sometimes appeared, and whom he startled with sudden inexplicable terror, a *Panic* fear. The Romans identified their god Faunus with P. P. is represented as a sensual being, with horns and goat's feet, sometimes dancing and sometimes playing on the syrinx. See J. C. Lawson, *Modern Greek Folklore and Ancient Greek Religion*, 1910.

Pan-American Conference, or Congress. The first P.-A. C. was convened at Panama in 1826 by Simon Bolivar, the Venezuelan patriot, representatives from Colombia, Peru, Mexico, and Guatemala attending. An attempt was made to effect a treaty of federation, but the congress failed to do so, though it had far-reaching results in the direction of fusing Lat.-Amer. aspirations for their own corporate protection. This aim was definitely stated at the congress in 1856, when Peru, Chile, and Ecuador signed a continental treaty. The movement was hostile to the U.S.A., and in 1889 the U.S. Gov. invited Lat.-Amer. republics to a conference to discuss such questions as peace, customs, and communications. All the republics attended, and recommendations regarding port duties, sanitation, freedom of rivers, common weights and measures standards, extradition of criminals, and intercontinental railways were considered. At further conferences in 1901, when President McKinley attended, and 1906 and 1910, agreement was reached on arbitration in disputes, adherence to The Hague Convention of 1899 was agreed to, money claims adjusted, and the formal dedication of the Pan-Amer. Union (q.v.) was made. At the conference in 1923 Peru, Bolivia, and Mexico refused to attend. Three conventions were adopted, as follows: international disputes were to be examined by a commission, trade-marks were protected, and customs documents were to be pub. The sixth congress, held in 1928, was attended by President Coolidge, when public and private international law was coded, and the subject of aerial navigation reviewed. Various Pan-Amer. scientific congresses have taken place. In 1915 President Wilson attended one, when discussions took place respecting improvement of cable services, telegraph and railway co-ordination. The seventh conference, held at Montevideo in 1933, was attended by all the Amer. republics except the Argentine, and the U.S.A. and 9 other states sent their foreign ministers. This important conference gave Franklin Roosevelt's administration its first opportunity to expound the 'good neighbour policy' (see further under **MONROE DOCTRINE**). A declaration that 'no

state has the right to intervene in the internal or external affairs of another' was strongly supported by Mr Cordell Hull (q.v.) and unanimously adopted. This conference adopted over 100 recommendations for the promotion of inter-Amer. amity. Noteworthy, too, was a resolution for the removal of trade barriers, including high tariffs, a welcome reaction from the scandal of the Hawley-Smoot tariffs. President Roosevelt followed up this conference by proposing a special conference on the maintenance of peace, which met in Buenos Aires at the close of 1936, the opening session being addressed by him in person. Its most important result was a convention for the maintenance, preservation, and re-establishment of peace, which provided for general inter-Amer. consultation if any threat of war touched the New World, whether with an Old World nation or war between 2 Amer. nations. A treaty on the prevention of controversies set up a number of mixed commissions between Amer. states to devise means of avoiding future conflicts, and a new protocol raised still higher the barrier against intervention by any one of the signatories 'for whatever reason in the internal or external affairs of any of the other parties.' The U.S. Senate ratified the peace convention or consultative pact. The eighth conference, held in Lima in 1938, met under the shadow of a second world war. Mr Hull, apprehensive of Ger. penetration of S. America, wished to form a united front against international aggressors; but Argentina was opposed to drastic action, and late in the war was the one Amer. republic to maintain an equivocal attitude towards the belligerents, even after Brazil, Mexico, and others had actually declared war on the Axis. However, the Declaration of Lima, adopted unanimously, affirmed the faith of the 21 Amer. republics in democracy and pledged them to consultation and, at least, to a measure of common action if any were menaced. Thus, under the impulse of common danger, Pan-America did at length achieve something for concord and security in the W. hemisphere, besides fostering closer commercial and cultural relations. In accordance with the Declaration of Lima, the foreign ministers of all the republics met for consultation at Panama city soon after the Second World War began. They adopted a statement of co-operative neutrality, defining their rights and privileges in a world at war. The Declaration of Panama asserted, though rather unrealistically, their inherent right to keep the waters used for normal inter-Amer. maritime communications 'free from the commission of any hostile act by any non-Amer. belligerent,' and to that end they adopted a neutrality zone (q.v.), which, however, never came into effect. The collapse of France led to a new meeting at Havana in July 1940, which resulted in the Act of Havana, an act which went far towards extending the Monroe Doctrine. This was an effort to safeguard Brit., Fr., and Dutch possessions in the

W. hemisphere from Ger. seizure. The delegates also adopted a declaration to the effect that any attempt by a non-European state against the integrity of the ter. or political independence of an Amer. state should be considered an act of aggression against all the New World republics. In fact, the Monroe Doctrine had now become a multilateral doctrine. After the Japanese had attacked the Amer. fleet at Pearl Harbour it is obvious that all the S. Amer. republics should have given practical expression to this joint declaration by breaking with the Axis, and but for the resistance of Argentina this step would never have been delayed. The foreign ministers of all the republics again met, this time at Rio de Janeiro in Jan. 1942, and a declaration recommending severance of diplomatic relations was adopted, with Argentine and Chilean reservations; indeed, Argentina's ambiguity was the great obstacle to a united Pan-Amer. front. Soon after this conference Brazil, Bolivia, Ecuador, Paraguay, Peru, and Uruguay broke off relations with the Axis. Mexico had done so before the conference, at the end of 1941. Other congresses have met since (Bogotá, 1948; Caracas, 1954; Buenos Aires, 1957), but regional disputes and fears of U.S. preponderance have vitiated their effectiveness. *See also* PAN-AMERICANISM.

Pan-American Highway, planned in 1924 to connect N. America with the Central and S. Amer. reps. Funds are being supplemented by U.S. and World Bank assistance. Short stretches of exceptionally mountainous terrain remain to be completed, notably in the Central Amer. states and S. Ecuador.

Pan-American Union. In 1890 an International Union of Amer. Republics was convened to organise the pub. of comprehensive commercial data in a bulletin issued monthly in the 4 languages of England, Spain, Portugal, and France. From this beginning there grew the P.-A. U. in 1911 at a congress in Buenos Aires. The stated objects of the union are to develop inter-republic commercial and diplomatic relations and to organise co-operation in communications, customs, etc. A library was developed, called the Columbus Memorial Library. The widening scope of the work of P.-A. U., and the creation of specialised inter-Amer. agencies, made it clear that greater integration was required, and accordingly the ninth international conference of Amer. states, held in 1948, adopted a charter for the organisation of Amer. states. Membership comprises the 21 Amer. republics on a basis of equality, and its aims are accomplished by sev. bodies, as follows. An inter-Amer. conference meets every 5 years. The ministers of foreign affairs meet to consider urgent or common problems, assisted by an advisory defence committee. The council of the organisation, with one representative of ambassadorial rank, supervises progress either directly or through technical organs, i.e. the Inter-Amer. Economic and Social Council, the Inter-Amer.

Council of Jurists. The permanent and central organ of the organisation, housed in Washington, is the P.-A. U., which acts as a permanent secretariat and as a clearing-house for information about the member countries. Specialised conferences deal with technical matters or specific questions of co-operation, and specialised organisations are estab. to fulfil specific functions in agriculture, education, or sciences.

THE PAN-AMERICAN HIGHWAY IN MEXICO

From this point the road begins to climb to an elevation of almost 9000 feet.

Pan-Americanism, movement intended to bring the Amer. republics into closer association for the promotion of trade, cultural interests, peace, and security. Its fundamental object has no necessary connection with the Monroe Doctrine, but in effect the decisions reached at various Pan-Amer. conferences involve the application of that doctrine in its wider, modern interpretation (*see further* MONROE DOCTRINE). In more recent years U.S. leaders have favoured the inclusion of Canada in the Pan-Amer. system, and the formation during the Second World War of the Canadian-Amer. Defence Board marks the inevitable development of this tendency. The ideal of P.-A. has its origin in the time of Henry Clay (q.v.), but for a number of reasons it made only very slow progress. A serious obstacle is or was the fact that Latin America (q.v.)

has always had much stronger ties, cultural, moral, and economic, with continental Europe, especially with Spain and Portugal, than with the U.S.A. Secondly, the S. Amer. republics for long regarded U.S. foreign policy with deep suspicion. Thirdly, there is, even to-day, a difference in governmental ideals; for, whereas the people of the U.S.A. abhor dictatorships, many S. Amer. states have found them apparently well suited to their stage of political progress. Hence in most Pan-Amer. conferences it has been difficult to discuss political aims from a common standpoint. Fourthly, there is a radical difference between the outlook and temperament of the Latin Americans and the Eng.-speaking Americans: the latter seem to regard the former as indolent, changeable, and unprogressive, while the former, especially the Argentines and Chileans, are prone to regard the N. Americans as aggressive, materialistic, and irreligious (Allan Nevins, *America in World Affairs*, 1941). See PAN-AMERICAN CONFERENCE. See also J. A. Houston, *Latin America in the United Nations*, 1950.

Pan-Arabic Movement, or the movement for an Arab union or federation. Arabia proper forms only a small part of the Arab world, and not even the most comprehensive programme for an Arab union or federation could look to the political unification of this whole area as a practical proposition (see also ISLAM). Moreover, the Arabic-speaking countries in N. Africa to the W. of Egypt (Libya, Tunisia, Algeria, and Morocco) down to 1944 held aloof from the current movement for union. But within the E. half of the Arab world, a smaller and more compact group of ters., the peoples of which are not exclusively or even predominantly of Arab origin, have in the course of centuries become thoroughly Arabised, speak Arabic, and consider themselves Arabs. Yet hitherto they have been kept apart by mutual jealousies and suspicions, and by the centrifugal force which the geographical peculiarities of the Arabian peninsula have always exerted. Hence the Nejd has never been the nucleus of an Arab state extending beyond the limits of Arabia proper, and only the Umayyad caliphs of Damascus (661-750) succeeded in holding the Arab countries together during the period of their sway, and from 868 their successors had to submit to the existence of virtually independent dynasties in Syria and Egypt. In Arabian hist. it was exceptional for the majority of the Arab countries, which owed formal allegiance to the caliph of Bagdad, to be united under a single ruler. Egypt and Syria formed a unit of this kind for some centuries, and the Ottoman Turks, early in the 16th cent., united the whole region into a single state, though one of Turkish character with its cap. at Constantinople. The scheme of Mehmet Ali (q.v.) to rival the Ottoman caliph was thwarted by the great powers, but, in any case, there existed then no Arab nationalist consciousness such as exists to-day. The origin of the Arab union movement of recent years may be

traced back to about 1906, in the growing aversion of the Arabs to Turkish hegemony. Although the positive side of this movement was vague, the existence of a common national feeling in the Arab provs. of the Ottoman Empire was an undoubted fact by 1913, and it had been influenced by the increasing tempo of European nationalism. The experiences of the Arabs during the First World War contributed greatly to strengthening the bonds between them, while the Brit. Gov.'s pledge of 1918 to give the Arabs full opportunities of becoming a nation again should have operated in the same direction; but in the result only Syria and Iraq really aspired to unity and, in the Arabian peninsula, there can, even to-day, be no question of nationalism in the W. sense, while, again, Egypt's independence was founded on local patriotism. The great differences in the standards of civilisation and in economic resources, as well as among the various classes of society in each, formed, and still form, the main obstacle to union. At the Paris Peace Conference after the First World War the idea of an Arab union was voiced by the Hejaz delegation against a Syrian movement for local independence. The settlement of the Arab question after 1918 resulted eventually in the independence of Arabia proper (Saudi Arabia and the Yemen) and, later, of Iraq, Egypt, Syria, and the Lebanon. But many years passed before superficial disagreements, both inside and outside the Arab peninsula, were overcome, or even before the mutual estab. of diplomatic relations. King Faisal (q.v.) of Iraq fostered union between Iraq and Syria, and, since his regime, the desire for Arab unity has been strong in Iraq. The Syrian National party in 1936 embodied in their national pact the same aspiration, to be achieved by a federation of the Arab states. Arab solidarity was also manifested by the general sympathy and support given by the Arab states to the cause of the Palestine Arabs from 1936 onwards. A general Arab conference was held in Alexandria in 1944, attended by gov. representatives of Egypt, Iraq, Lebanon, Saudi Arabia, Syria, Jordan, and the Yemen, and a representative of the Palestinian Arabs. From this resulted the Alexandria Protocol, which suggested an Arab league, a covenant establishing this body being signed in Mar. 1945 (see ARAB LEAGUE).

Pan-Germanism (Ger. *Pangermanismus*), movement in Germany during the latter half of the 19th cent. to encourage unity between the Ger.-speaking peoples and countries under Ger. influence, i.e. Austria-Hungary, Holland, Luxembourg, Flem. Belgium, and Switzerland. An impetus to P. was given by the success of Ger. arms in the Franco-Prussian war of 1870, and from this derived 2 movements, *Einiges Deutschland* and *Grossdeutschland*. Later these were welded into one society, the *Alldentscher Verband* (1890). The First World War was an expression of P. The alliance with Turkey aimed at the extension of *Mittleuropa* to include

Constantinople. The so-called Flem. movement during the Ger. occupation of Belgium, which aimed at dissociating Flem. Belgium from the remainder and bringing it under closer Ger. influence, was also in accordance with P. So was the Ger. policy in Poland: it was proposed to give that country autonomy, but only under Ger. supervision. With Germany's defeat in the war and the dissolution of the empire into federated states, the scheme of *Mitteleuropa* collapsed and the disintegration of the Austro-Hungarian Empire seemed to have given P. its death blow. But it was revived in all its worst features under Hitler, who was brought up in the atmosphere of Austrian P. and permanently influenced by it. Hitler, however, discarded the limitations on P., and, from one annexation after another, proceeded to engulf most of Europe. See NEW ORDER.

Pan-Islam, an idea and a movement which became prominent in the second half of the 19th cent. In Islam all believers are equal, human inequalities shrinking to nothing in the presence of God; His law governs their lives. The first principle is more or less a fact; the second is an ideal. As long as Muslim states had little contact with Europe, the second idea was latent, expressing itself at times in protests against taxes which were not sanctioned by God's law. But when Muslims had often to deal with a more powerful Christian state or were even subject to it, the gap between the actual and the ideal shocked them into consciousness of their position. Later, speedy travel and the press brought them nearer together and they felt the subjection of their brethren to 'infidels' as their own. Jamal al-din al-Afghani was one of the first to preach resistance to Europe. Feeling was so strong that at times it broke through the age-long enmity between Sunnite and Shiite. One manifestation was the cult of classical Arabic, the sacred tongue of all Muslims. Turkey, the most powerful Muslim state, exploited this spirit, making connections with Muslims in all countries, encouraging the pilgrimage (see HADJ) by building the Hedjaz railway (largely paid for by the gifts of the faithful), and exhibiting the sultan as caliph, the commander of all believers. In the middle of the 20th cent. it looks as if nationalism and the ambitions of individual rulers will defeat the internationalism of religion, and instead of P.-I. there will be Pan-Arabism. See C. H. Becker, *Islamstudien* 2, 231.

Pan-Slavism, movement for the union in policy and culture of all the Slav races, in which Russia has taken the lead as the great political representative of these races. The movement began about 1830, and the spread of the national spirit in Europe considerably strengthened it. A congress was held at Prague in 1848, to which most of the Slav races sent representatives. In the sixties Russia used P. as an instrument of tsarist imperialism, for strengthening the Russian hold on Poland and the Ukraine, and for furthering Russian aspirations in the Balkans and in the Austrian

empire. The congress held at Moscow in 1867 was, however, less successful than the Prague Congress, for the fear had grown that the movement was becoming no more than an instrument for the aggrandisement of Russia. In the old tsarist days Russia's pan-Slavist policy was directed mainly against the Hapsburg monarchy. The Czechs were chief adherents of P. among the W. Slavs, while the Poles, oppressed by tsardom, were its prin. opponents. The movement also affected the Russo-Turkish war of 1877 and the Balkan wars of 1912-13. Slavophil writers believed it right for the Slav people to leave the task of governing to their rulers, while retaining intellectual freedom to disapprove of what was done amiss. This justification of the existing order was obviously out of sympathy with the increasing revolutionary theories, and, with the downfall of the tsarist regime and the triumph of the revolution, P. for a time ceased to be a practical force. Mutual inter-Slav sympathies have frequently been invoked since then, but in practice they have been of little avail in face of dissensions among the Slav peoples, such as the Polish-Russian and Serbo-Bulgarian conflicts. Following the Second World War Russian foreign policy was concentrated on a deepening *cordon sanitaire* of sovietised states on her W. border as a counterpoise to the 'Western democratic bloc.' This was P. used as an instrument of Soviet imperialism.

Panama, republic of Central America, which prior to 1903, when it asserted its independence, was a dept. of Colombia. Its area is 28,576 sq. m., its length 480 m.; coast-line, 426 m. on the Atlantic and 767 m. on the Pacific; breadth from 37 to 110 m. It is a strip of mountainous land branching out westward from Colombia and co-extensive with the Isthmus of P. The U.S.A. recognised its independence in 1903 and, shortly afterwards, the remaining powers did so. (For the terms of the treaty with the U.S.A. relative to the P. Canal Zone see PANAMA CANAL ZONE.) But it was not until 1914 that Colombia agreed, under the treaty of Bogota, to recognise the independent status of P. This treaty was ratified by the two govs. in 1921, and in 1924 a protocol was signed by the plenipotentiaries of P. and Colombia establishing diplomatic relations between their respective countries. The W. or Costa Rican boundary was determined in 1910, but, after ratification, the question of the true demarcation was referred to the chief justice of the U.S.A., whose award, delivered in 1914, was rejected by P. The U.S. Gov. insisted on the award being upheld, with the result that the ter. in question was occupied by Costa Rica. On 2 March 1936 a new treaty between P. and the U.S.A., ratified by the U.S. Senate on 25 July 1939, annulled the former provision by which the U.S.A. 'guaranteed the independence of P.' but permitted the U.S.A., in the event of war, to defend the canal in any way necessary. The U.S. Gov. paid P. \$10m. for the Canal Zone rights and, from 1913, \$250,000

yearly. A later treaty, ratified by P. in 1930, and by the U.S.A. in 1939, increased the ann. payment to P. to \$430,000. In Sept. 1939 the president of the U.S.A. placed both the canal and the zone under the control of the U.S. Army, and in Jan. 1942 he estab. Amer. naval control over the Gulf of P. and the maritime approaches to Cristóbal. This ceased in 1947.

Provinces and Population. There are 8 provs., with pops. for 1950 (caps. in brackets): Bocas del Toro (Bocas del Toro), 22,392; Chiriquí (David), 138,136; Coclé (Penonomé), 73,103; Colón (Colón), 90,144; Los Santos (Las Tablas), 61,422; P. (P. city), 248,335; Herrera (Chitró), 50,095; Veraguas (Santiago), 107,000. The pop. of P. city in 1950 was 127,874, and of Colón 52,204. There are about 23,000 Brit. subjects on the isthmus, chiefly coloured people from the W. Indies. The census pop. in 1950 was 805,890, including 48,650 tribal Indians. Under the constitution the immigration of the following is prohibited: Negroes whose original language was not Sp., yellow races and original races of India, Asia Minor, or N. Africa. The official language is Sp. Some 93 per cent of the pop. is Catholic and 6 per cent Protestant. Freedom of worship is allowed.

Constitution and Justice. The new constitution promulgated in 1946 continued the pre-existing provisions for a National Assembly of 32 members. This was amended to 53 to meet needs of representation of an increased population, 1950. Deputies are elected by universal suffrage for 4 years. The assembly meets biennially on 2 Jan. The term of the president of the republic, elected by direct vote, is also 4 years, and he is not re-eligible for 2 more terms. The supreme court consists of 5 justices appointed by the executive.

Education is obligatory for all children between 7 and 15 years of age and co-education has been adopted. The gov. maintains 1004 primary schools (16 for native Indians), attended by 132,750 children in 1954, and 19 post-primary schools, with 5400 students. Illiteracy is down to 28 per cent (1950). There is a univ. and a school of arts and crafts; but a number of students are sent at the gov.'s expense to the U.S.A. and Europe for their education. The Rolivarian univ., founded at P. city in 1926, is supported by a number of other S. Amer. republics as a pledge of Pan-Amer. solidarity. A new normal school, opened at Santiago in 1938, is attended by 1160 students of both sexes. There is also a professional school for young women.

Production. The soil is very fertile, but not by any means fully cultivated. The chief exports are bananas (5,700,000 stems in 1954, mostly to the U.S.A.), coconuts, coconuts, hides, ahacá fibre, tortoiseshell, and rubber. Coffee is cultivated in Chiriquí prov. near the Costa Rican border, while timber, sugar, copaiha, sarsaparilla, iperacuanha, and rice (a very large crop, for home consumption) are also produced. Caout-

chouc is grown near the coast by European planters, but rubber exports have been small in the past three or four decades. Beer production is a national monopoly. Whisky, gin, and rum are also produced. Tobacco is exported; cattle are reared and hides exported to some extent; pearls from the Pearl Is. and Coliba Is. and turtle-shell are also exported. P. has nearly every valuable mineral except coal, but the mines are not much exploited. The rep., possessing few industries, subsists largely on the P. Canal (in services to its employees) and on tourist and transit traffic. Exports are far below imports, the approximate figures for the 5 years before the Second World War being between 3,500,000 and 4,250,000 balboas for exports and between 18,000,000 and 23,000,000 balboas for imports; between 1940 and 1945 exports ranged between 2,000,000 and 4,500,000 balboas and imports between 24,000,000 and 40,000,000 balboas. In 1954 exports were 19,400,000 balboas and imports 72,600,000. This heavy adverse balance is met by invisible exports such as the expenditure of Canal Zone employees, U.S. Army and Navy personnel, and tourists. The greater part of the country's trade is with the U.S.A., with the U.K. in the second place, chiefly in imports from the latter.

Communications, etc. The P. railroad is 47 m. long and links P. city with Colón. It passes through the Canal Zone, and the bulk of the goods consigned to P. passes over it, there being no road over the isthmus. Most ships unload at Cristóbal at the entrance to the canal. There is a narrow-gauge railway between Pedregal and David and a line between David and Concepción. There is at present a road from P. city westward as far as David. Work on its extension to the Costa Rican border was expedited by Amer. engineers as a war measure so as to complete the Panamanian link in the highway from the U.S.A. to the P. Canal. Commercial aviation has developed rapidly in P. Daily air services, in both directions, connect P. city and David. Daily air-mail and passenger services operate between P. and New York. There are telegraph cables from P. to N. and S. Amer. ports, from Colón to the U.S.A. and Europe. The Pacific ports are Puerto Mutil, Pedregal, Dulce, Montijo, and Puerto Armuelles; the Atlantic ports are Puerto Bello, Bocas del Toro, and Colón. There are 60 radio stations.

Defence. P. supports no army or navy, but during the Second World War a militia force was formed with the assistance of U.S. officers. In 1941 P. granted air and anti-aircraft bases to the U.S.A. for the defence of the Canal Zone.

See W. R. Scott, *The Americans in Panama*, 1912; A. Edwards, *Panama: the Canal, the Country, and the People* (revised ed.), 1914; A. H. Verrill, *Panama Past and Present*, 1921; C. H. Forbes-Lindsay, *Panama and the Canal To-day*, 1926; H. G. Miller, *The Isthmian Highway: a Review of the Problems of the Caribbean*, 1929; W. D. McCain, *The United States and the Republic of*

Panama, 1937; L. O. Ealy, *The Republic of Panama in World Affairs*, 1951; J. and U. Biesanz, *The People of Panama*, 1955.

Panama, cap. of the rep. of P. The original town was founded by the Spaniard, Pedrarias de Avila, who in 1514 amalgamated the sev. Sp. colonies in Central America under the name of Tierra Firme and about 5 years later founded P. city. This city was sacked and burnt by the famous Eng. buccaneer, Henry Morgan (q.v.), in 1671 and rebuilt in 1673 during the governorship of Fernández de Córdoba on a site 4 m. WSW. of the previous site. The modern city is thus to the E. of Ancón, and has developed new suburbs to its S. and N. According to Esquemeling, the original P. was a city of wealth and luxury of 30,000 inhab. with some 5000 stone houses and thousands of large houses of cedar. P. city stands on a rocky peninsula at the foot of an extinct volcano known as Ancón Hill and is on the S. side of the Isthmus at the head of the Gulf or Bay of P. Since the rep. gained her independence the cap. has undergone many improvements, and the \$10,000,000 paid by America for the lease of the canal has enabled the Panamanian Gov. to erect a number of handsome buildings, which have much altered the aspect of the old city. The main thoroughfare is the Avenida Central. The weather-worn cathedral (founded in 1760) took nearly 90 years to complete. It was erected at the expense of a Negro, who from lowly origin rose to be Bishop of P. Its chief features are the twin towers, the domes of which are encased in mother-of-pearl, said to have been brought from the pearl fisheries of Margarita. Among the other churches are San Felipe Neri, with an arch dated 1888, and San Francisco, built in 1740. Facing the cathedral are the episcopal palace and old Gov. Palace. Among the new buildings one of the most noteworthy is the handsome Palacio Municipal or city hall. At the lower end of the Avenida is the group of gov. buildings, at the back of which is the handsome National Theatre, one of the finest buildings of the kind in this part of the world. The Malecón, or sea-wall, is a popular promenade; to the W. of it is another sea-wall, that of Las Bóvedas, under which are the old prisons. At the foot of Ancón Hill is the Instituto Nacional, P.'s first univ., which was opened in 1911. Pop. 127,874. See J. Esquemeling. *Buccaners of America*, trans. from the Dutch by Wm Crooke (London), 1684 (Esquemeling or Ooxmalin was a buccaneer with Morgan, and his book is the only first-hand source of all the facts pub. in the Calendar State Papers and used by biographers since); A. H. Verrill, *Panama Past and Present*, 1921.

Panama, Gulf of, inlet of the Pacific Ocean, formed by a curve of the Isthmus, contains the Pearl Is. with their fisheries. Width 120 m., from Point Caracoles on E. to Point Mala on W.

Panama, Isthmus of, joins N. and S. America. Lat. 9° N., long. 79° 30' W.; length, 480 m.; breadth, 37-110 m. Its

E. end separates the gulfs of P. (Pacific) and Darién (Atlantic).

Panama Canal, designed in 1879 by Ferdinand de Lesseps (q.v.), who constructed the Suez Canal, as a tide-level canal. Gomera (1510-60) advocated a canal; in the 16th cent. the Panama, Nicaragua, and Tehuantepec routes were discussed. A Colombian concession granted to Lt. Wyse was sold to the Panama Canal Company, and work of survey, etc., was commenced in 1881. The estimate of cost was about £33m. reduced by de Lesseps to £24m., and the work was to be completed in 1888. With less than one-quarter the work done and £74m. estimated debt, the company was forced into liquidation in 1889. In 1892-3 occurred the Panama scandals in France, leading to the imprisonment of de Lesseps, his son Charles, and others; mismanagement, bribery, corruption, and fever had ruined the scheme. Up to 1902 £60m. had been expended, only £12m. effectively. The chiefs of the Fr. canal company, convinced that they were unable to complete the work, commenced negotiations with the U.S. and Colombian Govs. The U.S. offer of £8m. for the company's rights and assets was accepted by the Herrán-Hay Treaty (1903). This treaty was strongly opposed by Colombia, and its ultimate rejection led to Panama proclaiming her independence in 1903, and signing the Canal Treaty in Nov. of the same year (see PANAMA CANAL ZONE), under which the work progressed. The necessity of the work was brought home to the U.S.A. by the voyage of the S.S. *Oregon* from San Francisco to Cuba in the Sp.-Amer. war, the ship having to sail round Cape Horn. When the U.S.A. eventually made arrangements to dig the canal, it paid the rep. of Panama a bonus of \$10m., the Fr. canal company \$40m. In 1925, mainly to obtain the goodwill of the S. Amer. republics, it paid Colombia \$25m. Work on the canal was finally started by the Americans in 1905, and in 1920 President Wilson declared it formally completed. The digging of the canal was made possible by the work of Wm C. Gorgas, then a surgeon in the U.S. Army, who, with 2000 assistants, removed the sources of yellow fever and malaria, and made the Canal Zone as healthy as any place in the U.S.A. The engineering work was entrusted to George W. Goethals (q.v.), then a colonel in the engineering corps of the U.S. Army. Actual excavation work was begun in 1906, with a force of 45,000 men. The clerks, foremen, and officials were Americans, but the manual labour was mainly performed by Spaniards, Italians, and Negroes. Huge steam shovels were employed, the soil being hauled off by about 800 trains of 23 cars each. A total of 240,000,000 cub. yds of earth was removed. The canal cost \$366,650,000, exclusive of appropriations for its defence.

It lies between the 8th and 10th parallels of N. lat. and the 79th and 80th meridians W. long. It connects the Caribbean Sea with the Pacific Ocean. It runs from NW. to SE. almost at right

angles to the axis of the isthmus. The Canal Zone, which belongs to the U.S.A., includes all land extending 5 m. on either side of the centre line of the canal channels. By the terms of the treaty the cities of Colón on the Atlantic side and Panama on the Pacific are retained by the rep. of Panama, but the U.S.A. makes itself responsible for their hygienic condition. The total area of the Canal Zone is 558.56 sq. m., including Gatun Lake, with 163.38 sq. m., and Miraflores Lake, with 1.90 sq. m. In passing through the canal from the Atlantic to the Pacific a vessel goes through a dredged channel at least 300 ft wide, 41 ft deep at mean low water, and 5.77 m. long, leading to the Gatun locks, the first of a series of 3 locks. The Gatun locks, which consist of 3 flights of chambers, raise the vessel from sea-level to Gatun Lake, a lift of 85 ft. The locks are double, being 1.04 m. long and 110 ft wide. Each chamber is 1000 ft long, with intermediary gates which can shorten the length for smaller vessels and thus conserve water. All lift operations are controlled from a central station. The ship is attached to electrically operated mules which run on tracks on both sides, pulling the ship through and keeping it in position, so that it will not damage itself or the mechanism of the locks. Once out of the locks, the vessel proceeds under its own steam through a fixed channel in Gatun Lake. This varies from 500 to 1000 ft wide and from 45 to 85 ft deep. It does not follow a straight line through the lake, but goes through the former valley of the Chagres R., whose waters were used to form the lake. Once out of the lake, the vessel enters Culebra Cut (now Gaillard Cut), a distance of 20.55 m. from Gatun locks. This cut is 300 ft wide, 45 ft deep, and 6.97 m. long. At the Pacific end of this cut the ship passes through Pedro Miguel locks, a single flight of double chambers. This flight of locks is 0.75 m. long with a drop of 31 ft to the level of Miraflores Lake. Passing through this lake is a fixed channel 500 ft wide, 45 ft deep, and 0.86 m. long. The ship then enters Miraflores locks, consisting of 2 flights of double locks 0.91 m. long with a drop of 54 ft more or less, depending on the state of the tide, and thus reaches the level of the Pacific Ocean. The channel from Miraflores locks to the Pacific is 500 ft wide, 35 ft deep, and 6.99 m. long. In 1940 construction was begun on a new set of locks located approximately parallel to those at Gatun, Pedro Miguel, and Miraflores. A concrete dam, 974 ft long and 223 ft high, across the Chagres R. at Alajuela was completed in 1935, creating Madden Lake, thus providing a reserve of 22 milliard cub. ft of water for maintaining the level of Gatun Lake in dry seasons. The average time of passage through the canal is from 7 to 8 hrs; the record passage is 4 hrs 10 min. The total length of the canal from entrance to entrance is 43.85 nautical m. The ports of entry for the Canal Zone are Cristóbal on the Atlantic side and Balboa on the Pacific. The maximum traffic capacity of the canal is

estimated at 48 ships of usual size in a day, or about 17,000 in a year. By a treaty of 1955 between the U.S.A. and Panama, the U.S.A. increased its ann. annuity for the use of Panamanian ter. to \$1,930,000. and agreed to return to Panama some \$24,000,000 worth of land no longer needed for operating the canal; certain other concessions were arranged between the signatories. In the fiscal year 1956 some 8200 ocean-going vessels passed through the P. C. (net tonnage over 41,000,000). All ships passing through the canal have to pay the tolls except the gov. ships of the reps. of U.S.A., Panama, and Colombia. See P. Bunau-Varilla, *Panama: its Creation, Destruction, and Resurrection*, 1913, and *The Great Adventure of Panama*, 1920; F. J. Haskin, *The Panama Canal*, 1914; D. H. Smith, *The Panama Canal*, 1927; D. C. Miner, *The Fight for the Panama Route: the Story of the Spooner Act and the Hay-Herrán Treaty*, 1940; N. J. Padelford, *The Panama Canal in Peace and War*, 1942; and G. Mark, *The Land Divided: a History of the Panama Canal*, 1944.

Panama Canal Zone, strip of land some 5 m. wide, on both sides of the centre line of the Panama Canal, granted to the U.S.A. by the treaty of 18 Nov. 1903 with Panama. In the treaty Panama granted to the U.S.A. the use in perpetuity of the zone and, within its ambit, the exclusive control for police, judicial, and sanitary purposes. A new treaty, ratified by Panama and the U.S.A. in 1955 (see PANAMA CANAL), altered arrangements made under previous treaties. The zone is 558.56 sq. m. in area, and of this area 163.38 sq. m. are occupied by Gatun Lake. The zone also includes about 20 sq. m. in the Chagres R. valley above Alajuela, assigned to the U.S.A. in 1924, with the view of constructing Madden Dam at Alajuela. The pop. of the zone is 52,822. There is no privately owned land in the zone, the zone being gov. property, dedicated to the purpose of protecting, operating, and maintaining the canal; but steamship companies may obtain building sites on licence, and agric. land can be licensed in limited tracts. The cities of Panama and Colón remain within the jurisdiction of Panama, but the U.S. Gov. is by the treaty given the control over both cities and over their harbours in matters relating to sanitation and quarantine. The status of the zone is that of a military reservation under the governor of the Panama Canal, who is appointed by the U.S. Gov. In Sept. 1939 the President of the U.S.A. placed the canal and zone under the control of the U.S. Army, and in Jan. 1942 he estab. Amer. naval control over the Gulf of Panama and the approaches to Cristóbal. Control over the Trans-Isthmian Highway was transferred to Panama in 1950.

Panarea, see LIPARI ISLANDS.

Panathenaea, most famous of Athenian festivals, celebrated in honour of Athena, the patron deity of Athens. Originally the Athenaea, it was said to have been called P. when Theseus united the inhab. of Attica into one body. Supposed to

have been founded by Erechtheus as a religious ceremony, it afterwards included horse races, chariot races, and gymnastic sports, as well as torch races and musical contests (introduced by Pericles). It consisted of 2 feasts, the lesser P. and the greater P., the former celebrated every year and the latter every fourth year. The great P. occupied some days, culminating on the twenty-eighth day of August, the birthday of the goddess, when the grand procession carried through the city the costly embroidered peplos or state robe of Athena. This procession is vividly represented in the frieze of the Parthenon which is now in the Brit. Museum.

Panax, genus of shrubs and trees (family Araliaceae) with ornamental pinnate or digitate leaves, and umbels of cream, green, or white flowers. *P. quinquefolius* is Ginseng (q.v.).

Panay, is. of the Philippines, bounded on the W. by the Cuyo East Pass and on the E. by the Visayan Sea. It has an area of 4446 sq. m., and is mountainous and well watered. The chief industry is agriculture, coconuts, citrus fruits, rice, sugar, and tobacco being the chief crops. Copper is mined, and horses raised. Jap. forces occupied P. from May 1942 until March 1945. Iloilo (pop. 110,122) is the largest tn. Pop. of is. 1,291,548.

Pancha Tantra, or **Panchatantra**, anct collection of Indian fables going back to the 4th cent. See also **BIDPAI**.

Panchayat, traditionally, in India, the court or committee of vil. elders which managed vil. affairs. Under Brit. rule it became the lowest centre of authority, with very limited powers and functions and even more limited finance. It remains the source of authority in many vil. social affairs.

Panchen Lama, see **LAMAISM**.

Panchromatic, see **PHOTOGRAPHY**.

Panoras, Saint, Phrygian Christian who was martyred in Rome at the age of 14. The date of his martyrdom is uncertain. He was buried in the cemetery of Calpodius in Rome, and his head is preserved in the Lateran Basilica. His cultus was very widespread in Europe in the Middle Ages. Pope St Vitalian in the 7th cent. sent relics of the saint to one of the A.-S. kings, and thenceforward St P. became very popular in England. His feast is kept on 12 May.

Pancratium, see **BOXING**.

Pancreas, long, narrow, racemose gland composed of 2 kinds of tissue. In man the P. lies behind the stomach, the larger end lying within the bend of the duodenum, and the narrow end in contact with the spleen. The cells of one kind of tissue are similar to those of the parotid gland and secrete the pancreatic juice containing trypsin, which converts proteids into amino-acids such as leucine and tyrosine; a ferment amylase, similar to ptyalin, which converts starch into sugar, chiefly maltose, but partly dextrose (glucose); and a ferment lipase, which saponifies and emulsifies the fats. These digestive juices are poured into the duodenum at the middle bend, together

with the bile; they are viscid and alkaline, due to the presence of sodium carbonate. The cells of the second kind of tissue form the is. of Langerhans, and their secretion contains insulin (from Lat. *insula*, an is.) which is important in carbohydrate metabolism (see also **DIABETES**). If the P. be removed, the amount of sugar in the blood increases, and some is excreted in the urine, as in diabetes mellitus, a disease in which the carbohydrate metabolism is disturbed. If the pancreatic duct be severed from the duodenum and exposed so that pancreatic juice is liberated, external to the body, carbohydrate metabolism remains normal. This is evidence of the control of this metabolism by an internal secretion of the P., which thus functions as an endocrine organ as well as a digestive gland. The function of the cells of the is. of Langerhans may be impaired or even destroyed by lesions, fibrosis, and degeneration, but in some cases of diabetes mellitus no visible change in these cells takes place (see **DIABETES**; **GLAND**; **INSULIN**).

Pancreatitis. Inflammation of the P. usually proceeds from the ducts, and is sometimes associated with catarrh of the stomach, bile ducts, and duodenum, and with the formation of gall stones. The chronic form is accompanied by fever, loss of weight, anaemia, abdominal pains, jaundice, large pale stools, sugar in the urine, and the pancreatic reaction. It is characterised by glandular atrophy and growth of connective tissue. Acute pancreatitis shows much more violent symptoms; with collapse, nausea, and vomiting, sudden acute colic in the upper abdomen, and a tense and swollen condition of that part, and fever. It is of 3 types: (1) haemorrhagic, (2) gangrenous, (3) suppurative, with abscess formation; fat necrosis is observed in the substance and surface of the gland. The gangrenous form is regarded as an advanced stage of the haemorrhagic form and results from the infection of the P. by bacteria which disintegrate the tissues.

Panda, or **Bear-cat** (*Ailuropus fulgens*), mammal of the family Ailuridae and almost exclusively vegetarian. It is found only at a height of about 10,000 ft in the SH. Himalayas. Its total length is about 30 in. The thick fur is rich chestnut or rusty red on the upper parts and black on the limbs and under part. The face has white markings, and the long, bushy tail bears a series of indistinct reddish-brown rings. The feet have large semi-retractile claws, and the animal applies nearly the whole of the sole of the foot to the ground in progression. The Giant P. (*Ailuropus melanoleuca*, is allied to the bears; it is a rare animal of E. Tibet, where it was discovered by Père David. Five Giant P.s brought to England from W. China by Mr Floyd Smith in 1938 were the first P.s ever to reach England alive. One went to the Continent, another to New York, and 3 to the London Zoo. Ming, the sole survivor in 1944 of the 5, d. in the London Zoo on 25 December, 1944. Valued at £2000, she was the rarest and most

valuable animal in the gardens. Little is known about the giant P. in its natural state, beyond the fact that bamboo leaves are its natural food.

Zoological Society of London
GIANT PANDA

Pandanus, genus of evergreen tropical shrubs and trees, with simple, narrow, strap-like leaves which are often variegated, and dioecious flowers, followed by globular or oblong fruits. *P. candelabrum*, the Candelabrum or Chandelier Tree, *P. tectorius* (synonym *odoratissimus*) with strongly scented inflorescence, *P. lindenii*, and others are grown as pot plants or under stove-house conditions in Britain, and are known as Screw-pines.

Pandects, see JUSTINIANUS, FLAVIUS ANICIUS.

Pandemic, see EPIDEMIC.

Pandharpur, tn of Bombay state, India, on the Bhima, 38 m. from Sholapur. It is a popular pilgrims' resort, containing a famous temple to Vishnu.

Pando, dept of NW. Bolivia, adjoining Brazil, a low-lying area between the Abuná and Acre R.s. Cobiá is the cap. P. is noted for rubber and other tropical products. Area 23,876 sq. m.; pop. 19,800.

Pandora, in Gk mythology, name of the first woman. Zeus, in vengeance upon Prometheus, who had stolen fire from heaven, caused a woman to be made, who, by her charms and beauty, should bring misery upon the human race. The gods blessed her and called her P. or 'All-gifted.' She brought from heaven a box containing every human ill which she was forbidden to open. Curiosity made her do so, whereupon they all escaped and spread over the earth. Hope alone remaining. Later the box was said to have contained blessings which flew away when it was opened. See Hesiod, *Works and Days*, lxxxi, seq.; Milton, *Paradise Lost*, iv, 716 ff.

Pandulf (d. 1226), Bishop of Norwich, b. Rome. He was sent as papal legate to England in 1211 and 1213 to negotiate with King John, and was also present at the conference of Runnymede in 1215. He received the see of Norwich in 1218, and until 1221 had almost regal authority.

Panæas, see BANTAS and CAESAREA.

Panegyric (Gk *pan*, all; *agora*, assembly) originally meant a 'festival speech,' such as that in which Isocrates urged the Greeks to unite against Persia. The term then came to mean a public eulogy, such as the earlier funeral oration of Pericles (q.v.) over the Athenians who fell in the Peloponnesian War. A famous panegyric of Roman times, that of Pliny the Younger on the Emperor Trajan, was the first of a series of adulatory speeches addressed to reigning emperors and collected as the *Panegyrici Latini*. In modern times the term is used for a formal or elaborate eulogy in a public speech or public writing. A notable example is the tribute paid to England by John of Gaunt in his great speech in Shakespeare's *Richard II*.

Panel Beating, process used in sheet-metal work, to shape the sheet metal for duct work and trunking. Accuracy is essential, especially in the assembly processes, such as welding, when heat tends to distort the lines. Machine fabrication is rapidly taking the place of hand-work.

Panel Heating, system of low-temp. heating in which small pipes are placed below the surface of walls and ceilings, or beneath flooring, and hot water circulates through them at a temp. of from 70° to 130° F. For complete safety, P. H. should be thermostatically controlled. The term is used also to describe a similar form of low-temp. heating by electricity. See also HEATING.

Panel Walls fill the spaces between the vertical and horizontal framing members of a structure. They need to possess all the qualities of other types of external walls (q.v.), except that they do not have to carry imposed vertical loads. They may therefore be light in weight, and are usually of sandwich or cavity construction.

Panelling, covering of a surface in a building, such as a door, ceiling, or wall, with panels, i.e. sunken or raised compartments, usually framed at the edges. They may be of stone, plaster, or wood. Ceiling plaster panels, often most ornately moulded, were a common form of interior decoration from the 16th to the 19th cents., while Wren popularised for a time the use of stone and marble P., much favoured by It. Renaissance craftsmen. Wood has been a favourite material for P. since the late Middle Ages. As a type of mural decoration, wood-P. was first used in England in the 15th cent., solid wood being used. The joiner working in solid wood had always to allow for the limitations placed upon his work by his material. Both the design and construction of P. were determined by the nature of the wood. In Tudor times panels were small and unjointed, set in a close framework of stiles and rails, which were all grooved. The panels were set in dry, to minimise subsequent shrinkage. In the 17th cent., when soft woods and scantlings appeared, the design changed to allow for the introduction of large panels, developing into the long Palladian oblong, bolder and simpler mouldings replacing

the elaborate detail of earlier times. The influence of Robert Adam reduced the 18th-cent. P. to more modest proportions; plain white or cream paint became the chief decoration on P., and the moulding was even simpler. But throughout the method of construction remained essentially the same: that of a framework grooved and rabbeted to conceal the unavoidable movement in the panels, so that, at worst, it was only necessary to paint or polish the margin that shrinkage would expose along the arris on the stile or rail framing the panel. In modern times, however, the development of plywood (q.v.) has led to entirely new methods of construction, and, because of its lower costs, to a much wider use of P. Plywood boards in Gaboon mahogany are now mass-produced at a size of 65 in. by 183 in., so that very large plywood panels are frequently used. The shrinkage in plywood is negligible: the designer's chief concern is therefore the concealment of butt and heading joints, since the minutest crack produced by such joints would otherwise be visible on the polished surface given by modern veneering (q.v.), which is the most popular form of panel finishing to-day.

Pangani, tn, dist., and riv. of Tanganyika on the Indian Ocean. The tn, 32 m. S. of Tanga, is on the riv. (which is called Ruvu near the mouth). Much of its former importance has been lost. Sisal, coconuts, and sugar are grown in the dist.

Pange Lingua, opening words, used as the name of famous hymns. The earlier, *Pange lingua gloriosi proelium certaminis*, treats of the Passion of Christ, and is ascribed to Venantius Fortunatus, and by some to Claudian Mamertus (5th cent.). It is in the accented unrhymed verse of the period. The other and more popular hymn, *Pange lingua gloriosi corporis mysterium*, treats of the Eucharist and was written by St Thomas Aquinas (13th cent.). It is in rhymed verse and is notable for its theological precision as well as its triumphant swing, which is imitated from the earlier hymn. There are also lesser-known hymns beginning P. L.

Pangensis, see HEREDITRY.

Pangim, see (61).

Pangkor, or **Pankur**, see DINDING.

Pangolin, or **Scaly Ant-eater**, order of (toothless) mammals, (Pholidota) found in Africa, India, Ceylon, Java, Borneo, China, and Formosa. There are about 7 species. They are lizard-like in appearance, and, with the exception of the muzzle, sides of the head, throat, chest, and belly, are covered with scales, these being formed of consolidated bairs. They vary in length, according to species, from 1 to 3 ft, exclusive of the prehensile tail, which is about twice as long as the body. The head is small, with a tapering muzzle. The lower gums of the mouth form 2 thickened horny ridges separated by a groove along which the cylindrical worm-like tongue slips in and out. The feet are strongly clawed, especially on the third toe of the forefoot, which is used in burrowing and in climbing. The extreme

tip of the tail is free from scales and padded with thick skin. The protection afforded these animals by their scales is supplemented by a powerful stench emitted by the entire surface of the skin. The single family (Manidae), may be divided into 2 groups, distinguished both by geographical distribution and certain convenient but not very important external characteristics. In the first or Asiatic group are 3 species: *Manis javanica*, ranging from Burma through Java to Borneo; *M. aurita*, found in China, Formosa, and Nepal; and *M. crassicaudata* or the common Indian P. found over the whole of India and Ceylon. In the African group are the long-tailed P. (*Phataginus macrura*), which has a tail nearly as long as its body; the white-bellied P. (*P. tricuspis*), the short-tailed

P. (*Smutsia temminckii*), and the giant P. (*S. gigantea*)—both the last 2 species have their tails covered entirely with scales. Two specimens of Temminck's (named from Konrad Jacob Temminck, 1778-1857, one-time keeper of the Leyden museum of natural hist.) P., which is confined to the savannah regions of E. Africa, were received by the Zoological Gardens in July 1949. Temminck's P. is a terrestrial species, as is also the giant P., unlike the 2 W. African species *P. macrura* and *P. tricuspis*, which are arboreal. It grows about as big as a medium-sized pig and has a much broader and shorter tail than the other species. With its bony overlapping scales, which protect it against carnivorous animals, the P. is probably quite safe from them when it rolls up into a ball. Its natural food consists of ants and termites; but the terrestrial species is much easier to feed than is the arboreal, which seem almost impossible to keep in captivity. The young P.s are carried about on the mother's tail.

'Panhandle State,' see WEST VIRGINIA. **Panicum**, genus of grasses which includes 2 Brit. species and a large number of tropical ones, the most important of which is *P. miliaceum*, millet (q.v.).

Panipat, tn of E. Punjab State, India, 85 m. N. of Delhi. P. is best known as the scene of 3 important battles. The first was in 1526, when Babur defeated Ibrahim Lodi and became master of Delhi. The second was in 1556, when Akbar defeated the Pathan Sur army. The third was in 1761, when Ahmad Shah Durani of Afghanistan inflicted a crushing defeat upon the main Mahratta army.

Panizzi, Sir Anthony (Antonio) (1797-1879), prin. librarian of the Brit. Museum (q.v.), b. Brescello, Italy. In 1822, having conspired against the gov., he fled to England. Here he made many acquaintances, including Brougham, who secured him, in 1831, an assistant-librarianship at the Brit. Museum. He became keeper of printed books in 1837 and prin. librarian in 1857. He was in the first place responsible for the catalogue of books, and was the originator of the great domed reading-room. He was created K.C.B. in 1869. The services he rendered to students in connection with the organisation of the library have been universally recognised. The library, however, was not his only interest, for he was a keen politician, and used all his influence to further the cause of the liberation of Italy. See C. Brooks, *Antonio Panizzi, Scholar and Patriot*, 1931.

Pankhurst, Emmeline (1858-1928), feminist leader, b. Manchester, daughter of Robert Goulden, calico-printer and early advocate of woman-suffrage. At 13 she went to school in Paris, and made friends with the daughter of Henri Rochfort. In 1879 she married Richard Marsden P., lawyer, and they served on the committee that promoted the Married Women's Property Act. Five years a Manchester Poor Law Guardian, in 1892 she left the Liberals and joined the Independent Labour party. Widowed in 1898, she became registrar of births and deaths at Chorlton-on-Medlock, forming the Women's Social and Political Union in 1903. From 1906, as a 'militant,' she was frequently arrested, and in 1913 sentenced, in connection with the blowing-up of Lloyd George's house at Walton, to 3 years' penal servitude. When the First World War broke out Mrs P. went recruiting in the U.S.A. and visited Russia in 1917. She joined the Conservative party in 1918. Her statue was erected in Victoria Tower Gardens, London. She pub. *My Own Story*, 1914. See Sylvia Pankhurst, *The Life of Emmeline Pankhurst*, 1935.

Her daughter Sylvia Estelle P. (b. 1882) was also a member of the suffrage movement, and in 1921 received 6 months' imprisonment for seditious pubs. She also worked for Abyssinian independence. Her works include *The Suffragette Movement*, 1931, and a life of her mother, 1935. Another daughter, Christabel (1880-1958), was a worker in her mother's cause, after 1918 devoting herself to a religious movement; in 1936 she was created D.B.E.

Panmunjon, vil. of the rep. of Korea (q.v.), 6 m. E. of Kaesong (in N. Korea). During 1951-2 truce negotiations took

place at P. between the U.N. and the 'communists' (see KOREAN WAR).

Pannel is the term used in Scots Criminal Law equivalent to the English 'prisoner at the bar.'

Pannonia, Rom. prov. From 11 BC until AD 9 it was part of Illyricum, but was then made a separate prov. Trajan formed it into 2, P. Superior and P. Inferior, which were in turn subdivided by Diocletian. By the beginning of the 5th cent. the whole area had been virtually abandoned in face of barbarian invasion.

Panorama, originally constructed by Robert Barker, an Irish artist (1739-1806) living in Edinburgh, who exhibited a water-colour picture of Edinburgh (1788) on a cylindrical canvas 25 ft in diameter. The name applies to such pictures and to those revolving on cylinders. The *diorama* is a variation invented by Daguerre and Bouton, viewed by direct and reflected light, and giving a more glowing effect. Barker showed a P. of 90 ft in diameter in a specially built room in London (1793). Thomas Girtin's last work was a panorama of London (1802). Robert Fulton in 1797 carried the idea to Paris, and P.s became popular on the Continent. Prévost painted 'Tilsit,' viewed at Montmartre by Napoleon (1810). Battle pictures by Langlois of 'Navarino,' 'Moscow,' 'Pyramids,' and 'Malakoff' were exhibited at the Champs Elysées. The 'Siege of Paris' and P.s of the Franco-Ger. war were shown in the 2 countries. Scenes of the civil war in the U.S.A., Niagara (1890), and Jerusalem (1891) were exhibited in London.

Panormus, see PALERMO.

PANDEAN PIPES

Panpipes, **Pandean Pipes**, or **Syrinx**, early form of musical instrument, consisting of a series of reeds or pipes of graduated length fastened together, which when blown across produced the different notes of the scale. It still survives in some countries, but is of no artistic value in composition, the nearest approach being Mozart's use of an instrument of the type playing 5 notes from G to D in *The Magic Flute*.

Pansy, or **Heart's-ease** (*Viola tricolor*), dainty Brit. plant, common on arable land, and wholly or in part the origin of the numerous and beautiful garden varieties which have all been introduced since the beginning of the 19th cent. Violas or tufted P.s are partly derived from *V. cornuta* of the Pyrenees. The production of flowers is encouraged by

removing faded flower heads. Propagation is usually by cuttings or division of plants. See VIOLA.

Pantagraph, see PANTOGRAPH.

Pantagruel, see RABELAIS.

Pantaleón, Jacques, see URBAN (popes), *Urban IV.*

Pantelleria (anc. Kossyra), volcanic is., belonging to Italy, lying in the Mediterranean, 60 m. SW. of Sicily (q.v.). The mt slopes are forested, and vines, olives, and sub-tropical fruits are grown. Sheep are reared in the valleys. The cap. is P. (pop. 10,700) on the NW. coast. Area 32 sq. m. During the Second World War, P., though strongly fortified, did not long hold out against allied attacks delivered in 1943 simultaneously with the final conquest of Tunisia. Initial attacks were by forces of fighters and light and medium bombers (May). On 7 June Wellingtons and Flying Fortresses reinforced a daylight assault and a naval blockade. Cruisers and destroyers bombarded the is. sev. times between 30 May and 8 June. Though isolated by that time, the exhausted garrison refused to surrender. Air attack was then redoubled, and on 10 June there were over 1500 sorties of planes which dropped the same number of tons of bombs. Next day a powerful force of cruisers and destroyers began a bombardment, quickly followed by another great air raid, while at midday the troops put off in assault craft towards the shore. The It. commander then surrendered. Under the 1947 peace treaty P. was to be demilitarised.

Panter-Downes, Mollie Patricia (1906–), novelist, b. London. She was educ. at Heathfield House, Horsham, and when she was 17 had her first novel, *A Shoreless Sea*, pub. In 1927 she married Clare Robinson. Among her other novels are *The Chase*, 1925, *Storm Bird*, 1929, *My Husband Simon*, 1931, *Nothing in Common but Sex*, 1932, and *One Fine Day*, 1947. During and after the Second World War she wrote a weekly 'Letter from England' for the *New Yorker*.

Pantheism (Gk *pan*, all, and *theos*, God), name given to that system of speculation which, in its spiritual form, identifies the universe with God (and therefore may be called *akosmism*) and, in its more material form, God with the universe. It is only the latter kind of P. that is logically open to the accusation of atheism; the former has often been the expression of a profound and mystic religion. The antiquity of P. is undoubtedly great, for it is prevalent in the Hindu civilisation, the oldest known. Yet it is a later development of thought than Polytheism, the natural instinctive creed of primitive races; and most probably it originated in the attempt to divest the popular system of its grosser features, and to give it a form that would satisfy the requirements of philosophical speculation. Hindu P. or *akosmism* is taught especially by the Upanishads, by the Vedānta and Yoga philosophies, and by those poetical works which embody the doctrines of these systems, for instance, the Bhagavad Gītā, which follows the Yoga doctrine. Hindu

P. is purely spiritual in its character; matter and (finite) mind are both alike absorbed in the fathomless abysses of illimitable and absolute being. Gk P. originated in the same way as that of India. The philosophy of Anaximander the Milesian (610–c. 546 bc) may be described as a system of atheistic physics or of materialistic P. Its leading idea is, that from the infinite or indeterminate, which is 'one yet all,' proceed the entire phenomena of the universe, and to it they return. Xenophanes of Colophon (fl. 520 bc) is the first classical thinker who promulgated the higher or idealistic form of P.—casting his eyes wistfully upon the whole heaven, he pronounced that unity be to God. It is often extremely difficult, if not impossible, to draw or to see the distinction between the P. of the earlier Gk philosophers and sheer atheism. But the most decided and the most spiritual representatives of this philosophy were the 'Alexandrian' Neoplatonists, in whom we see clearly, for the first time, the influence of the E. upon Gk thought. The doctrines of Emanation, of Ecstasy, expounded by Plotinus (AD 204–70) and Proclus (410–85), no less than the fantastic Daemonism of Iamblichus (d. c. 330), point to Persia and India as their bp. During the Middle Ages speculation was guided by the Church, and we hear little of P. The scholastic system, culminating in the synthesis of St Thomas Aquinas, necessarily excluded P. as repugnant to the simplicity and transcendence of God. Almost the only philosopher of this period who tended towards pantheistic views is John Scotus Erigena (c. 817–c. 877), who is regarded as the only link between ant. and modern P. Modern P. first shows itself in Giordano Bruno, burned at Rome for his opinions in 1600. The universe in his eyes is, properly speaking, not a creation, but only an emanation of the infinite mind. Spinoza comes next among pantheists; his system is based, like the geometry of Euclid, on certain definitions and axioms, and he claims to have given it as conclusive and mathematical a demonstration as the latter. The prin. result at which, after a long, firm-linked chain of reasoning, Spinoza arrives is that there is but one substance, infinite, self-existent, eternal, necessary, simple, and indivisible, of which all elements are but modes. This substance is the self-existent God. In Germany, with the exception of Kant, the 3 greatest philosophers of recent times—Fichte, Schelling, and Hegel—have all promulgated systems of a thoroughly pantheistic and ideal character. Neither England, France, nor America has produced a single great pantheistic philosopher, but there is an immense amount of vague pantheistic sentiment in the poetry, criticism, theology, and even in the speculative thinking, in these and all European countries in the present age. This is attributable to the ravages made by a now discredited biblical criticism, and the impact of the physical sciences on religious beliefs. In fact, however, there is no real conflict

between natural science and supernatural religion; and P. in any shape or form is contrary to Christian faith. See also METAPHYSICS; MONISM. See G. Weisenborn, *Vorlesung über Pantheismus und Theismus*, 1859; C. E. Plumptre, *The History of Pantheism*, 1878; F. Paulsen, *Der moderne Pantheismus und die christliche Weltanschauung*, 1906; and J. A. Picton, *Pantheism*, 1914.

Pantheon (from Gk *pantheon*, temple to all the gods), temple erected at Rome in c. AD 120 by Hadrian to replace the previous P. of Agrippa (erected 27 BC), which had been destroyed by lightning. It is the best preserved and noblest specimen of Rom. architecture (q.v.). It is now used as a Christian church. See also PARIS.

Panther, see LEOPARD and PUMA.

Panther-cat, see OCKLOT.

Pantholops, see CHIRU.

Panticapaeum, anct name of Kerch (q.v.).

Pantin, Fr tn in the dept of Seine, a NE. suburb of Paris, on the Ourcq canal. It has chemical and glass manufs., and sugar refineries. Pop. 36,000.

Pantograph, instrument used for making exact copies of a plan or drawing on a larger or smaller scale. The commonest form is made as follows. Four rods are joined together as in figure at points A, B, C, and D, so that ABCD forms a parallelogram, and so that OD = DC and OB = BP. The instrument is pivoted at O, there is a tracing point at P, and a pencil

PANTOGRAPH

at C. The tracing point is then moved over the drawing to be copied, and by the pencil at C a smaller reproduction of the drawing is made at the same time. If the drawing is to be enlarged, the tracing point is placed at C and the pencil at P. Since the points D and B can be moved up and down the rods at pleasure, all positions can be arranged for.

Pantomime, among the anct Romans, denoted not a spectacle but a person. The P.s were a class of actors who acted their parts only in dumb show. The date of their first appearance in Rome cannot be ascertained; probably the *histriones* brought from Etruria to Rome in 364 BC were P.s, but the name does not once occur during the rep., though it is common enough from the very dawn of the empire. Augustus showed great favour

to this class of performers, and is consequently supposed by some writers to have been himself the inventor of the art of dumb acting. The class soon spread over all Italy and the provs., and became so popular with the Rom. nobles and knights that Tiberius reckoned it necessary to administer a check to their vanity by issuing a decree forbidding the aristocracy to frequent their houses, or to be seen walking with them in the streets. Under Caligula they were again received into the imperial favour, and Nero himself acted as a P. From this period they enjoyed uninterrupted popularity as long as paganism held sway in the empire. As the P.s wore masks, no facial mimicry was possible; everything depended on the movements of the body, and it was the hands and fingers chiefly that spoke. The subjects thus represented in dumb show were always mythological, and consequently fairly well known to the spectators. The dress of the actors was made to reveal, and not to conceal, the beauties of their person, and as, after the 2nd cent., women began to appear in public as P.s, the effect of the aesthetical costume was conducive to humorality; sometimes these pantomimic actresses appeared quite naked before an audience. It was natural, therefore, that pantomimic exhibitions should have been denounced by the early Christian writers, as they were even by pagan moralists like Juvenal.

Modern P. denotes not the performer but the piece performed, the character of which is, strictly speaking, that of a harlequinade. The Christmas P. or harlequinade has now become an essentially Brit. entertainment founded on a version of the *Commedia dell'Arte*, introduced here by one Arlecchino in the reign of James I. It became popular and was adapted by the Eng. stage, finding a concrete form in *The Taverne Bilkers*, written by a dancing master of Shrewsbury named Weaver, and produced at Drury Lane in 1702. One of his P.s, entitled *The Loves of Mars and Venus*, met with great success. The arrival in London, in 1717, of a troupe of Fr. pantomimists with performing dogs gave an impetus to this kind of drama, which was further developed in 1758 by the arrival of the Grimaldi family, the head of which was a posture-master and dentist, Joseph Grimaldi, the son of the dentist, was clever at inventing tricks and devising machinery, and *Mother Goose* and others of his harlequinades had an extended run. For many years, P. consisted of a short farce or operette, known as 'The Opening,' at the end of which Harlequin transformed the characters into those of the Harlequinade—hence the transformation scene, so long a feature of P. By degrees the 'openings' became longer and longer, and the Harlequinade shorter and shorter, until it eventually vanished altogether. As this happened, the wit of the clown became a less important factor, and greater emphasis was laid on scenic effects. The chief characteristic of P. is that it must be

completely topsy-turvy. Kings and queens must be hard up and afraid of their servants and of the broker's men. The 'Principal Boy' must be played by a woman, and the prin. female role, known as the 'Dame,' by a man. These characteristics are probably based on the ant. Rom. feast of Saturnalia, which took place as a pagan festival at what is now Christmas-time (when P. flourishes).

At one time almost every theatre in the country ran a Christmas P. Those produced by Sir Augustus Harris, and later by Arthur Collins, at Drury Lane became traditional, and the late Julian Wylie kept this tradition alive for years. It was understood that P.s must have local appeal, and must also be topical, full of spectacular scenes, and with plenty of music, singing, dancing, and magic. Naturally, broad comedy was a main-spring as well. For the past 60 or 70 years the usual topics have been the familiar fairy stories, but prior to that the plots were original. True Brit. P. fulfilled the difficult task of pleasing people of all ages. Much of the romance and all the magic of P. were lost with the departure of the Harlequinade, and the modern P. is a swift-moving entertainment, part revue and part music-hall or variety performance. Since the old tradition was abandoned its popularity has decreased considerably, especially in London.

Papacy (Medieval Lat. *Papatus*, from Lat. *papa*), position of the Pope or Bishop of Rome, with reference to his claim to be the head and centre of unity of the whole Christian Church. W. Christendom is broadly divided into 2 sections, of which one admits the claims of the P., while the other emphatically denies them. According to the Rom. Catholic belief, the P. owes its origin to Christ Himself, who gave to St Peter the primacy of the Church (see especially Matt. xvi. 18-19; Luke xlii. 31, 32), and it is claimed that at the Council of Jerusalem he occupied this position (Acts xv). St Peter ultimately came to Rome, where he lived and died as bishop of the Church in this place. His powers and office as primate of the Church were handed on to his successor, and so the office has been handed down to the present day. It is, however, important to notice that the powers are attached to the office itself. The Bishop of Rome is elected, and the peculiar papal powers are his in virtue of his being the successor of St Peter in the see of Rome. By the end of the 4th cent. the papal supremacy was generally recognised, in a theological but not in a political sense, and Leo I (440-61) may be considered as the

first of the popes to exercise his jurisdiction on a large scale. The acceptance of his famous *Letter or Tome* at the Council of Chalcedon (451) was in itself a great step. Gregory the Great (590-604) shows the political and economic side of the Rom. administration. He was responsible for sending Augustine and 40 monks to convert the A.-S. (597) and for the planning of 2 archiepiscopal sees in England, viz. Canterbury and York. He kept in close touch with the Frankish kings, whose help was continuously sought, in the centuries that followed, as a defence against the Lombards. The temporal sovereignty of the Rom. see estab. itself gradually as the Rom. emperor's authority, represented at this period by an Exarch living in Ravenna, grew weaker and weaker, and civil administration at Rome devolved more and more on the bishop. The grant of the papal states was made by Pepin in 753 to Pope Stephen II, Pepin having himself conquered them from the Lombards. A fresh epoch in the hist. of the P. is marked by the coronation of Charlemagne as emperor by Leo III (800), when the imperial name was revived. During the 9th and 10th cents. the condition of affairs at Rome deteriorated. The Pope became the mere puppet of conflicting political parties, and the papal prestige reached its lowest point. Reform, largely urged on by the great monastic orders, began in the 11th cent. under Leo IX, acting under the guidance of Hildebrand. Hildebrand himself came to the papal throne as Gregory VII (1073-85), and his vigorous campaign on behalf of the freedom of the Church was eminently successful, accompanied as it was by a moral reformation. The only Englishman to become pope, Nicholas Breakspear, reigned as Adrian IV (1154-9). For a time the papal power continued to increase and expand until it reached its culminating point in the pontificate of Innocent III (1198-1216), whose actions and success against King John of England are alone sufficient to demonstrate this. After this comes a decline. The conflict between Pope Boniface VIII (1294-1303) and Philip IV of France as to the power of the State to tax the Church ended in the victory of the Fr. monarch. About this period the popes lived relatively little in their own city, but travelled much in their states. The influence of the Fr. king was seen in the election of a Frenchman as Pope Clement V in 1305. Partly owing to this influence and the disturbed state of Italy, he took up his residence in the little state of Avignon. Here he and his successors, who were Frenchmen, were subject to the strong influence of the Fr. king, and as this period lasted over 70 years (1309-76), it has come to be known as the 'Babylonian captivity.' It did much to lower the prestige of the P. in N. Europe, and as the P. also fell heavily into debt through the extravagance of Peter Roger, Clement VI, subsequent papal policy was marked by heavy and correspondingly unpopular taxation. In 1377 Gregory XI returned

felt-covered roll running on the top side of the P., which helps to press the fibres closely together and press the water out. At this stage the sheet of P. is strong enough to be taken from the wire cloth, which returns underneath, and is conveyed by a felt through press rolls, which still further remove water and help to close up the sheet by pressing the fibres closer together. From the press part of the machine the P. now passes to a series of steam-heated cylinders, which dry it to the required degree. If the P. is required to be rough it is placed, directly after the drying process, on to a spindle and reeled up in a continuous length; if it has to be glazed it is fed through a series of highly polished rollers which impart a high gloss to the P. This describes the

usually called 'Pulp board.' To get a greater thickness of board it is necessary to build up the thickness by sticking together various numbers of sheets until the required thickness is obtained, and such boards would be described as Duplex or Triplex boards. The manuf. of much thicker boards is done on a machine where sev. layers of pulp are made in a series of vats and the resultant plies brought together and rolled up around a large-diameter roll, until the required thickness is reached, when it is cut off and fed in a flat state through special hydraulic presses and dryers, and finally rolled between two highly polished rollers. This machine is known as an intermittent board machine, and is used for the very heaviest types of boards.

Ryburndale Paper Mills

PAPER MACHINE: WET END

Bulford Paper Mills

FINISHED PAPER END

process of which is known as M.F. or Machine Finished P. P.s of this sort, however, are not always suitable for certain printing processes, and for 'art paper' it is necessary to coat the surface of the P. with China clay. This is done in modern practice actually on the P. machine itself, but in the more superfine qualities the P. is taken from the P. machine and put through an entirely separate coating and drying process. Sometimes it is necessary to impart a high degree of gloss where coating with China clay is not desirable, and this is done after the P. is made by damping it and running it through a large machine known as a super calender, which gives a finish rather better than that obtainable on the P. machine itself.

By this stage the P. is made and almost ready to be either cut into sheets or slit and reeled for use on continuous printing machines, e.g. for newspaper production. When P. is cut into sheets it is usually sorted and any substandard sheets removed, after which it is counted into reams of 480, 500, or 516 sheets. Nowadays the ream is usually standardised at 500 sheets.

The production of P. board can be done on the P. machine, provided that the thickness required is not very great, and board made on a normal P. machine is

Production of P. and board in the U.K. was 3,275,134 tons in 1956.

PAPER QUALITIES. There are many varieties of P.s manuf. for special duties, a few of the more common ones being listed below:

Antique. Usually a rough, bulky P. made to imitate the old hand-made or early machine-made P.s, as the name implies.

Art. P.s first manuf. and then afterwards coated with a mixture of China clay and adhesive, giving a very smooth surface; used for finer forms of printing, where a high definition of outline is required. Imitation Art P. is also made by putting a large amount of China clay on to the P. while it is being made, but is inferior to the genuine article.

Bank. A strongish P. of thin substance, used for letter copies, air-mail letters, etc., not to be confused with tissue (see below).

Bible. A very thin, opaque P. used when it is desired to get the maximum number of pages in a small-sized book.

Bond. A strong, thinish P. used principally for commercial stationery, usually watermarked and designed for the good appearance demanded in stationery of quality.

Book. A term covering the range of

papers including antique, art, bible, featherweight, M. F. printing and S. C. printing, used for the printing of books.

Cartridge. A strong, thickish P. originally used, as its name implies, for the packing of gunpowder in anet muzzle-loading guns; now a hard drawing P. or a semi-smoothed surface printing P., developed mainly for printing by photo-offset lithography.

Cigarette. As the name implies, paper made for the purpose of the outer covering of a cigarette usually made from hemp as this material smoulders without making a smell or taste. The cheaper grades however are made from wood pulp.

Cover. A thick semi-board, usually in a variety of colours, used, as its name implies, for covers of pamphlets and brochures, menu cards, etc.

Duplicating. Absorbent P.s, manuf. for use on duplicating machines.

Featherweight. A very thick, light, loosely knit P., chiefly used when it is desired to make a big book with few pages, such as children's picture books, etc.

Glazed Imitation Parchment, known as G.I.P. A thin highly glazed P., used for wrapping sweets, toffees, etc.

India. A paper very similar to bible paper.

Insulation. P.s specially manuf. to be free from all ferrous and non-ferrous particles, and used for cable making and other purposes, where a high resistance to the passage of electric current is required.

Kraft. A P. used principally for wrapping, where great strength is required, e.g. cement sacks.

Machine Glazed, known as M.G. Made on a special machine with one large drying cylinder, this imparts a high glaze to one side of the P. only; it is used for some forms of wrapping P. and for work where it is only necessary to print on one side, e.g. posters, envelopes, etc.

M.F. Printing. A paper in which the finish is given on the paper machine.

Newsprint. As its name implies, paper used for printing newspapers and cheap books, pamphlets, etc. It is made entirely from wood pulp, mostly mechanical with a little chemical pulp added to give it strength. There are various grades of newsprints made by varying quantities of the two pulps.

Parchment. A name given to P. designed to imitate animal parchment; many P.s are called parchment, however, which bear no resemblance at all to the original article. The term usually describes a rough writing P.

Printing. A term covering a large range of papers from art paper to newsprint used for printing as opposed to wrapping, etc.

Rice. A misused term sometimes in reference to cigarette papers. Rice paper is an edible paper made by breaking down rice and forming it into sheets upon which certain pastries are formed and cooked.

Super Calendered. A printing paper in which the finish is given by putting through a large calender after it comes off the paper-making machine.

Tissue. A thin, soft P. used in the clothing trade, and specially made to be free from acid for use by silversmiths, jewellers, etc.

Wet Strength. Where P. has to be used for wrapping damp articles, such as fish, etc., or for handkerchiefs or towels, materials are incorporated in its manuf. which improve its strength when dampened.

Writings. A general term covering all P.s used for writing; these are usually softer and rather more bulky than Bonds and Banks, and cover a wide range from white P.s to the decorative P.s used in some forms of fancy stationery.

BOARD QUALITIES. There are many varieties of board, the following being among the more common:

Pulp Boards are made in the same way as P. and are usually single ply.

Duplex or Triplex, as the name implies, can be 2 or 3 ply, and are usually thicker than pulp boards. Made either by running 3 sheets together on the P. machine or by pasting together after manuf., these are sometimes referred to as Pasteboards.

Cloth Lined are boards where great strength and resistance to wear is required, and a form of mutton cloth is embodied in their manuf.

Manillas are very strong, light or heavyweight boards, used where great resistance to wear is required, such as in labels, folders, etc.

Surface Boards are coated in the same way as Art P., after manuf., for a similar reason.

PAPER SIZES. *British.*

<i>Size</i>	<i>Writings and Drawings (in.)</i>	<i>Printing and Cartridges (in.)</i>

The above sizes can be doubled or quadrupled, for example, Crown 20 × 15, Double Crown 30 × 20, Quad Crown 40 × 30. These sizes can also be subdivided.

complaints were not all justified; in 1834 he and his followers had drawn up an extraordinary document, known as *Ninety-two Resolutions*; some of its protests were fully justified, but generally speaking the document was bitter and unreasonable, and its approving references to the Amer. revolution were unwise. P. lost the sympathy of moderate Fr.-Canadians, and especially of the leaders of the Church, who had no wish to foment rebellion. A warrant was issued against him for high treason. He escaped to Paris, but after a general amnesty returned in 1847 to sit in the United Canadian Legislature till 1894.

Papini, Giovanni (1881-1956), It. author (pseudonym, Gian Falco), b. Florence, and largely self-taught. He helped to found the reviews *Leonardo*, 1903, and *Lacerba*, 1913. Among his vols. of essays and criticism are *Il Crepuscolo dei Filosofi*, 1906; *La Paga del Sabato*, 1915; *L'Uomo Carducci*, 1918; *Le Più Belle Pagine di A. Manzoni*, 1923; *Dante vivo*, 1933; *Italia mia*, 1939; *Figure umane*, 1940. His poetry includes *Cento Pagine di Poesia*, 1915; *Opera Prima*, 1917; *Pane Vino*, 1926. Novels: *Parole e sangue*, 1912; *Un Uomo finito*, 1912 (autobiography; Eng. trans. 1924). Formerly a sceptic, specially famous through his *Strocnature*, 1916, he accepted the Catholic faith while writing his famous *Storia di Cristo*, 1921, which has been trans. into many tongues (Eng. trans. 1923). Later works include *Dante vivo*, 1933, and *Storia della letteratura italiana*, 1937. See studies by E. Palmieri, 1927; A. Viviani, 1934; and M. Apollonio, 1944.

Papinianus, Aemilius Paulus, most celebrated of Rom. jurists, was b. towards the middle of the 2nd cent. During the reign of the Emperor Severus he held the office of Libellorum Magister, and afterwards that of Praetorius Praetorio. After the death of Severus, Caracalla dismissed P. from office and caused him to be put to death (212). P.'s works consist of 37 books of *Quaestiones*, 19 of *Responsa*, 2 of *Definitiones*, and 2 works, *De Adulteris* and a Gk fragment. P.'s immense reputation is illustrated by the Law of Citations (426), which gave his opinion the force of law in any dispute where there was no majority of jurists on either side.

Papinius Statius, see STATIUS.

Papio, or Cynoccephalus, see BABOON.

Papirus Carbo, see CARBO.

Pappus, see COMPOSITAE.

Pappus Alexandrinus, eminent mathematician of Alexandria, who flourished about the end of the 6th cent. AD. He was the author of commentaries on the *Elements* of Euclid, of which fragments have been preserved by Proclus and others, and of which the section on book 10 has survived in Arabic; also on Ptolemy's *Synaxis*, of which books 5 and 6 survive (ed. A. Rome, *Bibliotheca Apostolica Vaticana*, 1931), and on the *Planisphaerium* of Ptolemy and the *Analemma* of Diodorus. P.'s greatest work, however, is the *Synagoge*, an invaluable collection of mathematical writings and commentaries.

This has come down to us complete (ed. F. O. Hultsch, 1876-8). See Pappus' rule under CUBATURE.

Papua, or British New Guinea, is the SE. part of the is. of New Guinea with the d'Entrecasteaux Is., Louisiade Archipelago, and the small is. between 8° and 12° S. lat. and 141° and 155° E. long. Area 90,540 sq. m. Pop. 375,000. P. lies wholly within the tropics, and has a very irregular and indented coast-line. The SE. rises to a series of mt. ranges, the highest point of which, Mt. Victoria, attains 13,120 ft. The chief rvs. are the Fly, Turama, and Bamo. The rainfall is heavy and evenly distributed, except in one belt of land which has a dry season and produces tobacco and cotton. The wetter parts produce a variety of crops, sugar-cane, coconuts, sago palm, bread fruit, dyewoods, spices, ginger, and bananas and other fruits. Many minerals occur, gold, copper, tin, lead, zinc, and cinnabar, also brown coal and petroleum; gold, silver, and osmiridium are the only minerals exported. Topaz and beryl are the only precious stones. There are wireless telegraph stations at Port Moresby and Samarai. The races vary in colour, mode of living, and language, and most of the coastal people are not of Papuan origin but are descended from races of more distant parts of the Pacific. Capital Port Moresby (q.v.). In 1901 occurred the massacre of the Rev. James Chalmers and his party by the Goaribari tribe, followed by the Le Hunte punitive expedition, which burned down dozens of *dubes* or native vils. But tribes have in large areas settled down to peaceful habits, while hundreds of the natives are being taught by the many missionary bodies in P.

In order to prevent that portion of New Guinea not claimed by the Dutch from passing into Ger. hands, the Queensland Gov. annexed it in 1883, a step not sanctioned by the Imperial gov. In 1884, however, a Brit. protectorate was proclaimed over the S. portion of the E. half of New Guinea, and in 1887 Queensland, New S. Wales, and Victoria agreed to share the cost of administration. The ter. was annexed to the Crown the following year. The Federal Gov. of Australia assumed the control in 1901; the political transfer was completed by the Papua Act of 1905, passed by the Federal Gov., and in 1906 a proclamation declared that New Guinea would be known as the ter. of P. Occupied by Japanese during Second World War. See also MELANESIA. See A. F. R. Wollaston, *Pigmies and Papuans*, 1912; Sir H. Murray, *Papua of To-day*, 1925; I. F. Champion, *Across New Guinea from the Fly to the Sepik*, 1932; E. Cheesman, *The Two Roads of Papua*, 1935; J. G. Hides, *Through Wildest Papua*, 1935; and L. Lett, *The Papuan Achievement*, 1942.

Papule (Lat. *papula*, pimple), small, round, solid elevation of the skin. See RASH.

Papworth Village Settlement, vil. settlement, founded by Sir Pendrill Varrier Jones (a tuberculosis officer in Cambs)

for the rehabilitation of tubercular cases, the largest of its kind in the world. Begun in 1917 on a nucleus of a few shelters and an old house, it is now a community of some 2000 people who have been helped to health and enabled to support themselves by their own efforts. In addition to 3 hospitals, 5 hostels, and nurses' homes, there are now some 200 houses and 5 large modern factories employing 700 men and women making, for home and export, prefabricated buildings, coach-building and joinery products, cabinet furniture, and travel and upholstery goods; printing and bookbinding are also carried on. Although the hospital section has now been absorbed into the national health scheme, the hostels, factories, and vil. retain their individual identity.

Papyrology, in the widest sense, is that branch of learning which seeks to decipher and determine the date and place of anything written on papyrus. The oldest books known are written on rolls of papyrus, and the earliest preserved written papyri go back to the 5th Egyptian dynasty (about 2750-2625 BC); they are couched in Egyptian language and hieratic writing (see under HIEROGLYPHIC AND HIERATIC WRITINGS). Other papyri are written in Egyptian demotic or Coptic scripts, in Aramaic, in Greek, Latin, Persian, or Arabic.

Use of papyrus lasted through Gk and Rom. times to the early Middle Ages. The middle of the 10th cent. seems to be the period when its manu. (in Egypt) ceased, but already since the 4th cent. AD in S. Europe, under Christian, Rom., and Byzantine influence, papyrus was gradually displaced for writing books by parchment and vellum.

In the strictest sense of the term, P. indicates Gk P., and particularly deals with the period in which Egypt was more or less completely under Hellenic influence and Greek was one of its main languages. The upper limit of this period may be fixed at 332 BC, corresponding with the conquest of Egypt by Alexander the Great, and the lower limit about 2 centuries after the Arabic conquest of AD 641, when Arabic had definitely triumphed. The reason of this restricted use of the term P. lies in the following facts: (1) The manu. of papyrus was confined to Egypt, and it is most probable that the estab. of the great Alexandrian library led to improvements in its manu., and stimulated production. (2) Although, in the countries bordering on the Mediterranean, papyrus was until the 4th cent. AD the most common writing material, on account of climatic circumstances and because of the damp soil no papyrus could long survive except beneath the splendid protective covering of the sands of Upper Egypt (some charred papyri have been found in Lower Egypt and in Herculaneum, Italy; a few fragments have been discovered in Palestine and in Dura Europos in N. Mesopotamia). (3) The number of the preserved Gk papyri is estimated at about 30,000. Thanks to them we have at our

disposal so many data of so great a variety that there is no region in antiquity of which we know the legal, social, religious, cultural, economic, and domestic life so well as Graeco-Rom. Egypt.

P. is a new branch of knowledge; although the first papyrus brought in modern times from Egypt to Europe (the 'Papyrus Schow' or *charta Borgiana*, now in Naples) reached Europe in 1778, and in the 19th cent. considerable finds were made in various places in the Fayûm, only in the last decade of that century were systematic excavations and research for papyri organised (W. M. Flinders Petrie on behalf of the Egyptian Exploration Fund, 1890; B. P. Grenfell and A. S. Hunt, of Oxford, 1896). P. is of paramount importance for the study of the Gk civilisation of Egypt in the following fields: writing, language, public and administrative law, social, economic, and religious life.

See W. M. Flinders Petrie, *Ten Years Digging in Egypt*, 1892; L. Mittels and U. Wilcken, *Grundzüge und Chrestomathie der Papyrskunde*, 1912; W. Schubart, *Einführung in die Papyrskunde*, 1918; P. Collomp, *La Papyrologie*, 1927; F. G. Kenyon, *Fifty Years of Papyrology*, *Actes du V^e Congr. intern. de papyrol.*, 1938; A. Calderini, *Manuale di papirologia antica greca e moderna*, 1938; W. Peremans and J. Vergote, *Papyrologisch Handboek*, 1942; and M. David and B. A. van Groningen, *Papyrological Primer*, 1946.

Papyrus, whence Eng. 'paper,' Gk *papuros* (also *bublos*, *biblos*, hence Bible). The term P. is of Egyptian origin, meaning 'the growth of the River (Nile).' It is a straight, stout, tall, reed-like, aquatic plant, called in Latin *P. antiquorum* or *Cyperus papyrus* (q.v.), which in ancient times grew in profusion in Egypt on the R. Nile. It also grew, but in small quantities, in N. Palestine. Nowadays it grows only in Abyssinia and in Sicily, but it is reared as a curiosity in many botanical gardens (also in England, where, however, it needs to be removed under cover in the autumn). Its leafless stems rise from 4 to 15 ft above the water, and have umbrella-like tops of delicate green rays. The ancient Egyptians used the stems of this plant to make ropes, mats, sandals, framework of light rowing boats, and for other purposes, but the prin. importance, at least in modern eyes, was the use of P. as writing material. A detailed account of the way in which the P. was treated in the Egyptian 'paper factories' is given by Pliny the Elder (*Naturalis historia*, xiii. 74 ff.), the great Rom. naturalist (AD 23-79). A section from the lower part of the stem, the pith, was cut vertically into thin strips; these were laid some vertically and others transversely, pressed together, and dried in the sun. Uneven patches were smoothed or pressed away, and the surface was polished more or less carefully according to the quality to be produced. The sheets were then glued together into a roll. The length of the rolls varied; some were 30 or 40 ft long, but we are told of some

that were 150 ft long, and would contain the whole *Iliad* or *Odyssey*.

The oldest books known are written on rolls of P., and the earliest preserved written papyri go back to the first half of the 3rd millennium B.C. P. was not only employed for literary purposes. In Egypt, Greece, Rome, Syria, etc., it was for many centuries the chief material used for writing for all ordinary purposes, such as legal documents, receipts, petitions, notices of birth, and official and private letters. Its employment for these purposes continued until the middle 11th cent., while as writing material for books it was gradually displaced by parchment or vellum, which had superseded it in the 4th cent. A.D. See PAPER; Papyrology; PARCHMENT; VELLUM; MANUSCRIPTS.

Par, or Parr, see SALMON.

Pará, original name for the R. Amazon. The name is now applied to the estuary in the P. state of Brazil, popularly described as a mouth of the Amazon. It really belongs to the Tocantins and Amapá R.s. and is only connected with the Amazon by a tidal 'furo' (bore).

Pará, or Grão Pará, maritime and third largest state of Brazil, bounded on the N. by the Guianas and on the NE. by the Atlantic. Area 469,778 sq. m., including the large delta ls. of Marajó (q.v.). It lies almost entirely in the Amazon basin, and is copiously watered by the Amazon, P., Tocantins, Xingú, Tapajós, and smaller rvs. The higher ground is almost desert. The great part is still dense forest, but settlements have been made along the rvs., and cacao, sugar, cotton, caoutchouc, Brazil nuts, plumbago, rice, manioc, millet, vanilla, etc., are produced; also some gold and diamonds are found. P. produces some of the world's finest rubber, but despite the Fordlândia experiment, production has greatly declined. For its cap., see BELEM; other cities are Obidos, Santarém, Gurupá, Concoção, Bragança (qq.v.). Pop. 1,142,846.

Parable, originally the name given by the Gk rhetoricians to an illustration avowedly introduced as such. In Hellenistic and N.T. Greek it came to signify an independent fictitious narrative, employed for the illustration of a moral rule or principle. This kind of illustration is found in the O.T. and N.T., particularly in the discourses of our Lord. Much of Christ's parabolic imagery is also to be found in the writings of Hillel, Shammai, and other great rabbis, as, for example, the Pearl of Great Price, the Labourers, the Lost Piece of Money, the Wise and Foolish Virgins, etc. The P. differs from the fable in the probability or verisimilitude of the story itself, and agrees with it in the essential requisites of simplicity and brevity. It differs from the allegory (though some of Christ's P.s. come very close to allegory) in that it illustrates as a rule one point only, whereas in an allegory almost every detail of the story has another meaning.

Parabola, locus of a point P whose distance from a fixed point S, the focus,

is equal to its distance from a fixed line ZZ' , the directrix (see figure, where $SP = PM$). The figure also shows a simple method of construction; SPQ is a string attached at S and Q and equal to MQ ; the T-square MQ is moved along the ruler ZZ' , while a pencil keeping the string tight and against the T-square traces the curve. A line XX' through S perpendicular to the directrix ZZ' is called the axis; it meets ZZ' at the foot of the directrix. The curve is symmetrical to the axis, which cuts it at the vertex V, and extends to infinity, always receding from the axis. The *latus rectum* or focal width is the chord of curve through the

focus S and perpendicular to the axis. The angle SPM is bisected by the tangent at P, hence the parallel beams from the light in the focus of a parabolic reflector. The curve is a conic section made by a plane cutting a cone in a direction parallel to the generating line and is a special case of the conics governed by the relation $SP = ePM$, e being called the eccentricity of the curve. For the P., $e = 1$ (see GEOMETRY, Higher Pure G.). The path of a projectile when not truly vertical is practically a P. except for interference of air and other irregularities, the recognition of which fact has been of enormous utility in military matters. In co-ordinate (Cartesian) geometry the equation for a P. in the simplest form, taking the origin at the vertex, is $y^2 = 4px$, where $2p = sz^2$. All curves of the form $y^n = px^m$ are classed as P.s.; $y^2 = px$ is the cubical P., $y^3 = px^2$ is the semi-cubical P.—the evolute of the P. of the second degree.

Paraboloid, figure traced by a parabola moving with its vertex always on another parabola, the planes of the two being constantly at right angles to each other. The elliptic parabola is traced when the concavities are kept in the same direction; its plane sections are either parabolas or ellipses. The hyperbolic paraboloid is traced when the concavities are kept in

opposite directions; its plane sections are parabolas or hyperbolas. See GEOMETRY, *Higher Pure G.*

Paracatú, tn of Brazil, in the state of Minas Gerais, 300 m. W. of Ouro Preto, a former gold mining centre. Pop. 5000.

Paracelsus, or **Theophrastus Bombastus von Hohenheim** (1493-1541), Swiss physician, b. near Einsiedeln, the son of a physician. After a period at Basle Univ. he studied chemistry under Trithemius, abbot of Sponheim. He then spent some while in the Tyrol studying the mechanics of mining, mineralogy, and the diseases of miners. Returning to Basle in 1526, he was appointed to physician and a lecturer at the univ. But many of P.'s views were opposed to the best contemporary teaching, and he himself was of an arrogant and quarrelsome nature; he was driven from Basle, 1529, and for the next 12 years practised as a wandering physician in various Ger. and Swiss tns. In 1541 he settled at Salzburg, where he d. soon afterwards. The first ed. of his complete works was that by J. Huser (1589-91); the best modern eds. are those by K. Sudhoff and W. Mathieson (14 vols., 1922-33), and J. Stoebel (abridged, 3 vols., 1916). See A. M. Stoddart, *The Life of Paracelsus*, 1911; W. P. Swainson, *Theophrastus Paracelsus*, 1939; J. Hargrave, *The Life and Soul of Paracelsus*, 1951.

Paracentric Motion, term used by Leibnitz to express the motion which, together with harmonic circulation, made up the entire motion of a planet.

Parachor, in chem., a function used by Sngden and others in the investigation of the constitution of various compounds. The P. of a liquid is given by the expression

$P = \frac{M\gamma^{\frac{1}{3}}}{D}$, where M = molecular weight, D = density, and γ = surface tension of the liquid.

Parachute. The P. probably derives from both the umbrella and the ship's sail, and there are even Chinese legends of large hats being used when men jumped from high places. Leonardo da Vinci (c. 1500) may fairly be said to have invented the modern P., but his tent-shaped design was not known until late in the 19th cent., and so had nothing to do with the practical invention. Veranzio (c. 1595) also suggested a sail-like P., but this did not lead to any practical developments. Small P.s were in use during the early years of ballooning (1783 onwards) for sending down dogs and cats from the air. The first human P. drop (from a balloon) was by the Frenchman A. J. Garnerin at Paris in 1797. After that date parachuting was a common showman's 'turn' throughout the 19th cent., the parachutist sometimes being taken up by a hot-air balloon. Both men and women made these drops.

The first jump from an aeroplane was by Berry at St Louis (U.S.A.), after which exhibition jumps were common. The first lives to be saved by jumps from aeroplanes were those of 2 Ger. aviators in

1918. The First World War also saw P.s used extensively for escaping from observation balloons, but aeroplane P.s were not used by the Allies, and only at the end of the war by the Germans. The automatic P. (see below) owes much to Leslie Irvin, who developed his P. in the U.S.A. after the First World War.

P.s to-day are used not only for dropping from aircraft, but for sending down supplies, and for acting as auxiliary brakes for high-speed aircraft when landing. Supplies may be dropped using either one P., often a giant one, or clusters supporting one heavy item, such as a gun or truck.

Central Press Photos Ltd
PARACHUTE

The conventional aircrew P. of to-day is fully automatic; it is either released manually by a pull from the airman, or, in the case of high-altitude aircraft, where delayed action is required, operated by a barometric aneroid device at a given height. Once put into operation, a small P. is ejected first from the pack, which then draws out the main P., the latter being kept steady by a hole in the crown through which a column of air is forced as the P. descends. Some P.s to-day are constructed of concentric 'ribbons' with space between each, instead of a 'solid' canopy with the crown aperture; others with the canopy 'broken open' at intervals. There are also certain P.s operated on the helicopter principle, which consist of freely turning rotor blades; but these are not used for human drops.

Apart from their human and supply-dropping functions, P.s are now in common use to bring down valuable instruments sent up beneath meteorological

balloons, which are allowed to burst at their maximum altitude, and for similar descents on occasion from research rockets.

Parachute and Airborne Troops. The first expression is sometimes loosely used to cover the meaning of the second. A. T. are of all arms and are specially trained and equipped to arrive at the scene of action by air, usually in ter. held by the enemy. They may be transported in gliders or powered aircraft which land and disembark small units complete in the assembly area, or, as P. T. proper, they may drop by parachute from aircraft, together with the greater part of their weapons and equipment. All the infantry and a proportion of other arms of a modern airborne div. are trained as P. T. Training of P. T. is strenuous, both physically and mentally, and consists in exercises of endurance and agility similar to those performed by commandos, together with jumping from towers, moving vehicles, captive balloons, and finally aircraft.

The employment of parachutists as an integral part of military organisation was first demonstrated by Russia in 1936. Although in the Second World War Russian A. T. confined themselves to the role of organising and leading partisans in the Ger. back areas, in the W. this war saw a rapid development in the use of A. T. Parachutists were extensively employed by both sides for purposes of espionage and sabotage, but A. T. were first employed on a large scale by the Germans in the Low Countries in the spring of 1940, notably in the capture of Dutch airfields by parachutists, and of the fortress of Eben Emael on the Albert Canal by glider-borne troops. The invasion of Crete in 1941 may be taken as the culminating point of the Ger. airborne effort. After this, though the number of Ger. parachute divs. rose considerably, they were never used in their proper role, owing to the lack of transport aircraft to land and supply them. Ger. airborne divs. formed part of the Luftwaffe.

Brit. P. T. began their operations with harassing and reconnaissance operations such as the raids on Lofoten and Brunel and in support of the Canadian sortie against Dieppe. Parachutists were used in the allied landings in N. Africa in 1942, and A. T. in gliders flown by sergeant-pilots of the Glider Pilot Regiment took part in the invasion of Sicily, especially in the fighting round the Gornalunga Bridge, where they came face to face with Ger. parachutists. The Brit. 2nd Parachute Brigade occupied strong points in Catania to prepare the Eighth Army's landing there, and the same brigade was used in a sea-landing role at Taranto, and operated around Gioia del Colle between there and Bari. It also took part in the Sangro battle late in 1943, but not in an airborne role.

On the W. front the allied landings in Normandy were preceded by heavy droppings of parachutists, especially on the left bank of the bridgehead. In the autumn of 1944 an attempt was made to

seize the crossings of the Lower Rhine by dropping elements of the Brit. 1st and 6th Airborne Divs. and a Polish parachute brigade at Arnhem and Amer. P. T. at Nijmegen. Owing to unfavourable weather, the quickness and violence of the Ger. reaction, and the failure of the Brit. Second Army to break through the Ger. troops encircling the Arnhem bridgehead, the Brit. and Polish P. T. had to be withdrawn. In support of the crossing of the Rhine by the allied 21st Army Group large forces of the 1st Allied Airborne Army were dropped a short distance

Central Press Photos Ltd

BRITISH PARATROOPS

behind the Ger. defences on the right bank of the riv. This operation may be taken to demonstrate the diminishing margin of profit accruing from the use of A. T. They were first employed to achieve surprise and attack in depth. As their use became more frequent so the element of absolute surprise diminished. As the reaction of the defence became more rapid and determined, so the time permissible in which they might effect a junction with their own ground forces was reduced and their range of action, the depth to which they could attack, was shortened. The Arnhem operation showed how short was the time during which a large airborne force could be supported and supplied from the air except under the most favourable weather conditions. At this stage of the war it may be noted that 2 Ger. parachute divs. were fighting as ground troops in Italy, and the remaining 7 in a similar role on the Lower Rhine. Yet such was the allied air superiority that none of these Luftwaffe troops could be dropped from the air, and the Ardennes offensive of Dec. 1945 was deliberately mounted in weather conditions which it was hoped would preclude air activity. Typical Ger. airborne operations of the second half of the war are the rescue of Mussolini from his prison on the Gran Sasso d'Italia by A. T. under the Waaffen

S.S. Maj. Skornzeny in 1943 and the attempt to kidnap Tito at his headquarters in 1944. Both are good examples of the kind of *coup-de-main* to which the airborne arm lends itself.

In the last stages of the It. campaign allied P. T., including elements of the It. Nembo and Folgore divs., were dropped to secure crossings of the Po and the Adige. P. T. were used by the Brit. and Fr. armies when they intervened in Egypt in 1956.

P. T. in general are armed with ordinary hand weapons as carried by infantry, but some have been modified so as to reduce weight and bulk, as have some infantry support weapons such as the Brit. 3-in. mt howitzer and 6-pounder anti-tank gun. Airborne engineer equipment consists mainly of explosives for demolition, prepared charges of all kinds, and light-weight anti-tank and anti-personnel mines. Special parachutist weapons and equipment have included the Ger. *Fallschirmgewehr* (an automatic rifle) and recoilless infantry gun, and the Brit. 'Corgi'-type collapsible motor-cycle. Special types of tank have also been modified for airborne use. The parachute and airborne units now forming part of the Brit. Army are the Glider Pilot Regiment and the Parachute Regiment, which together form the Glider and Parachute Corps and the Special Air Service Regiment. See F. O. Miksche, *Paratroops*, 1943, and H. St George Saunders, *The Red Beret*, 1949.

Paraclete (Greek for advocate), name given to the Holy Ghost by Christ, who promised his disciples the P. would take His place as their teacher and guide after He left them. The name was given to the monastery founded by Abélard near Nogent-sur-Seine, of which Héloïse was abbess. See also HOLY SPIRIT.

'Parada,' see ARMY NEWS SERVICES.

Para-dihydrobenzene, see HYDRO-QUINONE.

Paradise (from Gk *paradeisos*, a park or enclosure), word first used in Greek by Xenophon for a Persian enclosed park or pleasure ground. It occurs sev. times in the O.T., notably in Neh. ii. 8, where it is trans. 'forest.' In Christian literature it is used sometimes for the earthly P., the garden of Eden, and sometimes as equivalent to heaven. Sometimes the word means an intermediate state lower than that of heaven, as in Luke xxii. 43 and in Dante's *Purgatorio*.

Paradise, Bird of, see BIRD OF PARADISE.

Paradise Fish, or *Macropodus opercularis*, a species of spiny-finned fishes of the family Anabantidae found in Asia. As in the related fighting-fishes (*Betta*), the males when in breeding colours are very pugnacious.

Paradise Wood, see ALOES WOOD.

Paradox (Gk *para*, against, *doxa*, opinion) may be described as an epigram (q.v.) containing an apparent contradiction which on closer examination reveals a substratum of truth, as in Shakespeare's line, 'Cowards die many times before their deaths,' or Wordsworth's 'The child

is father of the man.' See also FIGURE OF SPEECH.

Paradoxure (Gk *paradoxos*, i.e. adj.: 'contrary to received opinion,' + *oura*, 'tail'), animal of the genus *Paradoxurus*, family Viverridae, or of an allied genus; so called because of its remarkably long curving tail. Also called palm-cut, -marten, or -civet.

Paraffin, important branch of organic compounds called the methane series. The name (from Lat. *parum affinis*, small affinity) was given to it because P. wax (see below), which consists almost entirely of paraffin hydrocarbons, is not susceptible to the action of strong acids, alkalis, etc. The more important members of this series are the following: Methane (CH_4) boils at -11°C . under 180 atmospheres. This gas is frequently present in decomposing matter and is alternatively known as marsh gas. Ethane (C_2H_6) boils at $+4^\circ \text{C}$. under 46 atmospheres; propane (C_3H_8) boils at -42°C . under 1 atmosphere; butane (C_4H_{10}), boiling point 0°C . under 1 atmosphere; isobutane (C_4H_{10}), boiling point 17°C . under 1 atmosphere. It will be noticed that there is a constant difference of CH_2 in their composition, while they have similar chemical properties. Such a series is called a *homologous series*, this series having the general formula $\text{C}_n\text{H}_{2n+2}$ where n stands for any positive integer. The fourth member, butane, presents a peculiarity in that there are 2 distinct bodies possessing the same composition, while they differ in properties. They are distinguished by the 2 names given, and are represented constitutionally by $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_3$ and $(\text{CH}_3)_2\text{CHCH}_3$. Such compounds are said to be *isomeric* (equal measure), the second being called an *isomer* of the other. The number of isomers rapidly increases with the number of carbon atoms in the compound. There are 3 main types of P.s. known respectively as Normal, Iso, and Neo, according to the manner of grouping of the carbon atoms.

Normal Type >CH_2

Iso: Type >CH

Neo: Type >>C

The boiling points of the isomers are always slower than those of the unbranched series. The P.s. are found in nature as a main constituent of petroleum in the U.S.A., U.S.S.R., Middle E., Borneo, Venezuela, Burma, etc. Some of the lower P.s. occur as natural gas, e.g. in U.S.A., and some are found in the intestinal gases of animals and in the gases

given off during the putrefaction of vegetable and animal matter. The *cyclo-P.s* are ring compounds, e.g. *cyclo-butane* is

P. wax is a substance derived as a distillate from crude petroleum. The wax corresponds in boiling range to the lubricating oil fraction, from which it must be removed after primary distillation, since it seriously interferes with the lubricating properties of the oil. The removal is effected by chilling the distillate and filtering off the wax crystals which form at low temps. The wax obtained is chiefly used for the manuf. of candles, but it is also used in the waxing of paper and for certain water-proofing purposes, as well as in polishes of various kinds. See also WAX.

Liquid P. is the name given to a highly refined fraction of petroleum in the lubricating oil range, which is used for medical purposes as an internal lubricant and aperient. The same product is also used as an emulsifier or solvent in medical sprays, etc. Large quantities of fuming sulphuric acid or oleum, that is, sulphuric acid containing excess of sulphur trioxide, are used in refining liquid P., as it is essential that any tendency to form sludge is removed and that no reactive constituents should remain in the final product. The use of these large quantities of sulphuric acid gives rise to the formation of sulphonic acids, and these are removed by neutralisation with a strong alkaline solution containing alcohol. After neutralisation the oil is treated with decolorising earth and filtered to produce the water-white, odourless, tasteless liquid P.

In the U.K. the term P. or P. oil is popularly but inaccurately applied to kerosene (q.v.), especially when used domestically as a fuel for heating and lighting. This is the product also used as a fuel for tractors (vaporising oil) and jet aircraft (aviation kerosene).

Paragus, see PALAWAN.

Paraguari, tn of Paraguay, S. America, cap. of the dept of P., 45 m. by rail from Asunción. It produces tobacco, cotton, and cattle, and there are potteries, tanneries, and distilleries. Pop. 12,700.

Paraguay, republic of S. America, with no sea-board, bounded N. by Bolivia, NE. and E. by Brazil, and S. and W. by Argentina. Topographically P. forms part of the great depression known as the basin of Paraná, whose W. edge is formed by the Andes, and on the E. is bounded by the Brazilian highlands. To the N. rises the sheer edge of the Mato Grosso table-lands of Brazil, and to the SW. is the Gran Chaco, part of whose vast and partly unexplored ter. forms the W. portion of P. P. has been the 'subject of exaggerated descriptions: on the one hand, it has been condemned as a pest-ridden and poverty-stricken land of unbearable tropical climate, and on the other, lauded as full of great possibilities and pleasing

features. In reality it is a country of contrasts, affording compensating circumstances and varied conditions both of nature and people . . . much of the country merits the description of a natural garden, where flowers and fruit run riot, even around the thatched, mud-walled huts of the squatters, in certain districts' (C. R. Knock). The area of P. proper (i.e. excluding the Chaco or 'occidental section') or 'oriental section' is officially given as 61,600 sq. m. The Chaco formed the subject of a long-standing dispute with Bolivia and led to war in Sept. 1932, which ended with an armistice only on 12 June 1935, followed by a peace treaty signed in July 1938, the boundary being fixed by arbitration (Oct. 1938). The consequent increased area of P.'s occidental section is officially estimated at 95,447 sq. m., making the total area of the republic approximately 157,047 sq. m. Pop. (1950 census) 1,400,000, of whom Indians number 8000. The people of P. are of mixed blood, namely Spanish, Indian, or Guarani, and mestizo (mixed European and Indian), the most predominant being the Guarani. There are practically no Negroes in P., and the admixture of foreign blood is less than in any of the other S. Amer. republics. The white element, as always, forms the governing class, and the official language is Spanish, although the common speech is Guarani. The Paraguayans are a far less ambitious people than their neighbours of the Argentine, but modern civilisation slowly progresses.

P. is bisected by the riv. of its own name. The Paraná flows along its E. border, while the Pilcomayo forms its W. boundary till it joins the P. near Asunción. In the angle formed by the Paraná-P. confluence are extensive marshes, one of which, called Neembucú, i.e. 'endless,' is drained by Lake Ypoá, a large lagoon SE. of Asunción. E. of the Paraná R. the country has always been known as P. proper, while on the W. and SW. lies the region of El Gran Chaco. The portion lying within the P. ter. (prior to the treaty of 1938) consists largely of swamp, forest, and jungle, inhabited by semi-civilised Indian tribes, among whom the S. Amer. Missionary Society has long been doing good work. This region is also the haunt of the jaguar and numerous reptiles. There are large areas of good grazing ground, which support many cattle. The N. portion of P. is mountainous, but the S. portion is one of the most fertile districts in S. America, consisting of hills and gentle slopes, richly wooded, wild savannahs, and rich alluvial plains, some of which, however, are marshy. Much valuable timber is found in the forests, including hard, soft, and dye woods. The rainfall of P. is sufficient for agric. production, and the climate, though sub-tropical, is agreeable and healthy.

Production. The whole area of the oriental section of P. is cultivable, the soil affording facilities for meadows and pastures which are capable of a varying agriculture, such as might render the country the orchard and garden of that

part of the S. Amer. continent. Only a small part, however, has as yet been brought under cultivation. Stock-raising is one of the prin. industries, the country being well adapted to it. About one-third of the whole area is devoted mainly to the raising of horses, cattle, swine, and sheep. The cattle number about 4,500,000, and those not used for home consumption are exported in the form of meat extract, preserved meat, and jerked meat, over 100,000 head of cattle being slaughtered annually for this trade. Herds are to be found in most parts of the country, but it is in Misiones, the area N. of Concepción, and in the Chaco that the greater part exist. Agric. methods are primitive. The inadequacy of labour and the backwardness of communications render scientific agriculture difficult. Tractors, modern ploughs, and agric. implements in general are being introduced upon a large scale. Two botanical schools have been opened by the gov. The country is especially noted for yerba maté (strong flavoured Paraguayan 'tea'), a plantation product as well as a natural product of the forests. The leaves of the shrub (*Ilex paraguayensis*) are stripped, dried in the sun, packed in sacks, and exported. The cost of production is small and the article is sold at less than the price of tea and coffee. During the war with P. the Brazilian soldiers marched and fought day after day without any other sustenance. It is consumed all over S. America, and the output is from 12,000 to 20,000 metric tons, exports ranging from 4000 to 8000 metric tons. Yerba maté wild trees cover nearly 1,500,000 ac.; the acreage under cultivated trees is less than 30,000. Among other industries are timber cutting, fruit growing (tangerines, grapefruit, etc.), petit-grain essence (an essential oil distilled from the leaves of bitter oranges and used for perfumes and flavourings), and tobacco, while maize (135,000 ac.), manioc, beans, and various cereals are cultivated. Many rare woods are still largely unknown in foreign markets. Among the more abundant woods are cedar, curupay, and lepacho. Cedars and hardwoods are a valuable article of export, much timber being exported to the Argentine and Uruguay for girders and railway sleepers. In the Chaco the production of quebracho logs is a growing industry (about 40,000 metric tons per annum). The chief product is quebracho extract (tannin), of which as much as 40,000 metric tons are exported annually. Some 25,000 ac. are under sugar cultivation, mainly for the manuf. of spirit. There are 10 sugar-mills, the most important of which are the Tobicuari and Azucarera Paraguaya. Other products are bananas, rice, and peanuts, while another crop which is gaining ground is cotton, now about 170,000 ac. Cotton is commonly sold as Argentine cotton, chiefly to the U.K. Cotton-seed oil is also a thriving industry. Iron, manganese, copper, and other minerals occur plentifully. Sev. iron-ore mines exist (e.g. Ibicuí) which were exploited in the time of López, whose foundries made cannon, cart-axes, and

tyres. The Quilicó manganese mines contain ore deposits estimated at 60,000,000 tons. Copper has been found at San Miguel, Concepción, and Quilicó. Other minerals include granite, marble, serpentine, and kaolin. Large deposits of lithographic stone of good quality were discovered a few years ago. The few secondary industries of P. produce only for the home market, the exceptions being the meat-canning factories, quebracho-extracting plants, and saw-mills. Cheap-quality textiles are made from home-grown cotton, which is both ginned and spun in P. In 1954, total exports were *guaraníes* 813,000,000 and imports *guaraníes* 992,400,000. The chief exports are cotton, quebracho extract, timber, hides, meats, petit-grain, and tobacco. The chief imports are articles of food and drink, agric. machinery, cotton goods, and vehicles. In 1947 imports from the U.K. were valued at £308,534 and exports to the U.K. were £1,784,235; in 1957 they stood at £1,153,106 and £2,414,746 respectively.

Government. The present constitution was promulgated on 10 July 1940. Under it wider powers are vested in the president than were given by the constitution of 1870. Though basically democratic, there are authoritarian and corporative features in the new constitution. The executive power is exercised by the president, who is elected for 5 years and appoints the Cabinet. The Senate was abolished in 1940 and replaced by a council of state as the legislature. This council is nominated by the Cabinet and is composed of the archbishop, the rector of the univ., together with representatives of commerce, industry, agriculture (2), the army and navy (1 each), and the president of the National Bank (opened in 1943). There has been a Chamber of Representatives since April 1948, there being 1 member for every 25,000 inhab. Elections are held quinquennially. The constitution guarantees private property, but the State has power to regulate economic activities, and 1 of the Cabinet posts is occupied by a minister of national economy.

Religion, Justice, and Education. The estab. religion is Rom. Catholicism, but universal toleration is the rule. P. has its own archbishop, whose see is at Asunción. There are bishops at Concepción and Villarrica. The civil ceremony alone renders marriage valid, but religious ceremonies are permitted. There are a supreme court, 2 courts of appeal (civil and commercial, and criminal), 10 judges of first instance, and 3 metropolitan police magistrates. The fiscal-general represents the State both in civil and criminal cases. In the provs. the functions of magistrates are exercised by lay justices of the peace, who also act as registrars; but Villarrica, Encarnación, Concepción, and Pilar have judges of first instance, civil, commercial, and criminal. Primary education is free and compulsory and is also provided for adults. There are about 1600 gov. primary schools and 74 private, with a total attendance of about 240,000

pupils, and over 7500 teachers. There are 83 secondary schools and special schools and a national univ. with about 2300 students, and there are also a number of special colleges and 100 vocational schools, half of which latter are in the cap.

Defence. There is an army of 3 divs., each with 2 regiments; a group of artillery, a group of cavalry, and a battalion of motorised engineers; also 2 regiments of mechanised 'cavalry' and 1 mounted regiment. There are 3 squadrons of aircraft. In war service is compulsory for those aged between 18 and 20 in the active army; between 20 and 29 in the active army reserve; between 29 and 39 in the national guard; and between 39 and 45 in the territorial guard. The navy comprises 2 armoured gun-boats, 2 converted merchantmen, and some well-armed riv. craft.

Communications. The P. R. is navigable for 12-ft draught vessels up to Concepción (180 m. N. of Asunción) and for smaller vessels for another 600 m. northward. The Paraná R. is navigable by large boats from Corrientes as far as Puerto Aguirre. Asunción, the chief port, is 950 m. from the sea. There are only 300 m. of public railways, together with 450 m. of private industrial rail lines, and less than 4000 m. of roads, mostly indifferent. The Paraguayan Central Railway, with 274 m. of standard gauge line, is a Brit.-owned railway, running from Asunción to Encarnación. It is one of the oldest S. Amer. railways and had its beginning in 1854. There is now a through train service from Asunción to Buenos Aires. The Ferrocarril del Norte Railway has 33 m. of metre-gauge line from Concepción to Horqueta. The other minor railways are forest lines of metre gauge or narrower. Air services are provided by 6 air lines (domestic and foreign). Contact with the neighbouring republics is by riv., rail, or air. It takes a little over 3 days by water from Buenos Aires to Asunción, 56 hrs by rail, but only 4 hrs by air. The air route to Rio de Janeiro takes 6 hrs. The national telegraph connects Asunción with Corrientes and Posadas (2070 m.). Telephone lines cover 6330 m., and the system has been gov.-controlled since the end of the Second World War.

Currency. A monetary law of Oct. 1943 estab. the guaraní as the unit of currency. It is equal to 100 of the old paper pesos. The guaraní is divided into 100 centimos. It is symbolised by the letter G (crossed). There are no gold or silver coins current, but there are nickel, bronze, and aluminium coins of $\frac{1}{2}$, 1, 2, 5, 10, 25, and 50 centimos. In 1949 the free market rate was 3.73 guaraníes to the U.S. dollar; in 1957, 114.71, which it had reached after the 1954 devaluation.

Towns. The cap. is Asunción, pop. (urb.) 205,605; (dist.) 430,000. Other prin. tns: Villarrica, about 31,000; Concepción, 32,500; Coronel Oviedo, 33,100; Jesús Trinidad, 24,000; Caazapa, 20,000; Caragatay, 19,000; Encarnación, 16,000; San Pedro, 15,000; Paraguari, 12,000; Coronel Bogado, 11,000; and Pilar, ----

History. P. was discovered by Sebastian Cabot in 1526, but the first colony there was settled in 1537 by Pedro de Mendoza, who founded the city of Asunción, and estab. the country as a vice-royalty of Peru. The war-like Guaraní long successfully resisted the invaders. In the latter half of the 16th cent. Jesuit missionaries arrived, and their work there for 150 years is one of the most marvellous in missionary hist. P. was the first republic to obtain its independence, and from 1814 to 1840 it was ruled by the remarkable despot, Dr Francia. He was succeeded by his nephew, Carlos Antonio López, who, dying in 1862, was succeeded by his son, Francisco López, an ambitious man, who organised a most efficient army, and seems to have aimed at becoming the arbiter of S. America. The other republics recognised the danger, and Brazil, Argentina, and Uruguay engaged in a long and sanguinary war against him, which ended in the defeat and death of López in 1870. The result was the ruin of P., whose pop. dwindled from 1,300,000 to about 200,000. Half a million of the people of P. are said to have been killed in the war with Argentina and Brazil in 1864. In 1912 the revolutions in progress were practically exterminating the male pop., and misery and desolation covered the land. Till recently peace was secured only by the advent or triumph of stronger political adventurers, and the duration of governments was short. Though the country had by no means recovered from these disasters, the pop. had again risen to over 1,000,000 when war broke out (1932-5) with Bolivia over the Gran Chaco (q.v. and see above).

During the Second World War the U.S.A. and Argentina both sought to influence the Paraguayan Gov., the latter being in the stronger position. In June 1946 pressure from the Paraguayan Army resulted in a modification of the gov., and the removal of all 'Nazi' leaders. President Morínigo remained on the understanding that he would revise his Cabinet, grant a general amnesty, and hold elections. But the delaying of these elections caused a revolt against him in Mar. 1947, which he was able to put down in Aug., with the help of Argentine arms. Its leaders having withdrawn into exile, it was safe for Gen. Morínigo to permit the presidential and parl. elections he had promised, and his nominee, Juan Natalicio González, a writer, was elected president (Feb. 1948). He was deposed after a few months, and during the series of short presidencies which followed the 'Colorado' party consolidated their hold on the state. The army head, Gen. Stroessner, became president in 1954: his regime was in many respects modelled on that of Perón (q.v.) in Argentina, and Stroessner offered Perón temporary asylum after the latter's overthrow in 1955.

Paraguay River, important riv. of S. America, an affluent of the Paraná (q.v.), rises in Mato Grosso in Brazil on a plateau of red sandstone. The P. takes a SW. course and, after flowing through a level country covered with thick forests, is joined from the W. by the Jaurú. It then flows S. through the marsh of Cáceres, and winds southwards, forming for a space the boundary between Brazil and Bolivia. It then pursues a SSW. course and passes through the republic of P. to join the Paraná a few miles above the tn of Corrientes. Its chief affluents are the Cuiabá, Tacuari, Mondégo, and Apá on the left, and the Jaurú, Pilcomayo, and Bermejo on the right; its total length is about 1800 m.; it is navigable for steamers to the mouth of the Cuiabá, 100 m. above the tn of Corumbá.

Paraguay Tea, see **MATÉ TEA**.

Paraíba, state on the NE. coast of Brazil, between Pernambuco and Rio Grande do Norte. Cotton-seed, cotton, oilcica oil, and tapioca are produced. Cap. João Pessoa. Area 21,730 sq. m. Pop. 1,713,260.

Paraíba do Sul, riv. in Brazil, which flows between the Sierra da Mantiqueira and the coast range of Rio de Janeiro, and is only partly navigable. Its valley, however, forms an important land-link with São Paulo. Length 600 m.

Parakeet, unscientific name for small long-tailed parrots, with a moderate beak and high, slender tarsi. Among the best known is the ring-necked P., which is very common in India and Africa, and in some dists. is a serious pest of agriculture. Its gay plumage and hardness make it a popular pet, and large numbers are exported. The crested ground P. or cockatiel is another hardy bird, and breeds readily in confinement. It and the undulated grass P. or budgerigar are natives of Australia; both are extensively kept as pets. A beautiful P. is the king P., which is about the size of a magpie and has a red head and breast and green wings.

Paraldehyde, colourless liquid (boiling-point 124° C.), obtained by adding a drop of concentrated sulphuric acid to acetaldehyde (q.v.). It has the formula $(C_2H_4O)_3$, and is used as a soporific (the so-called 'K.O. drops' of the crime novel). See also **HYPERNOTICS**.

Paraleipsis (Gk *para*, beside; *leipein*, to leave) is a figure of speech in which a speaker or writer emphasises something by pretending to pass it over, usually with some such phrase as 'to say nothing of,' or 'not to mention,' e.g. 'King Gama made enemies by his vanity and ill nature, to say nothing of his spiteful tongue.' See also **FIGURE OF SPEECH**.

Parallax. The P. of a heavenly body

comparatively close to the earth, e.g. any member of the solar system, is the angle between two lines drawn to it, one from the observer on the earth's surface and the other from the earth's centre. Obviously if a body is in the observer's zenith these 2 lines will coincide, in which case the body has no P., and if it is on the horizon the angle will attain a maximum value, and is then known as the *horizontal P.* (H.P.). Between these 2 extreme values the P. will vary owing to the rotation of the earth, and the effect of P. is to increase a body's zenith distance. The *Nautical Almanac* and other similar pubs. give the positions of the heavenly bodies as if they were viewed from the centre of the earth, thus eliminating the effects of P. The moon's P. is the easiest to measure and the method adopted is similar to that used by a surveyor who measures a base line and two angles. If *O* and *O'* are two observatories, separated as far as possible, and *M* is the moon, by a method well known to astronomers the angles *MOO'* and *MO'O* can be measured, and as the length of the line *OO'* is known, the distances *OM*, *O'M* are easily found and also the distance *CM*, where *C* is the centre of the earth. When the distance of the moon or any other object in the solar system from the earth's centre is known, the H.P., denoted by *P*, is found from $\sin P = a/d$, where *a* is the earth's equatorial radius and *d* the distance of the object from the earth's centre. The same principle is used for finding the distances and hence the H.P. of planets, but owing to their greater distances from the earth the same accuracy is not attainable because small errors in the angles corresponding to *OO'M* and *O'M* involve relatively great errors in finding the lines corresponding to *OM* and *O'M*. The H.P. of the moon varies because our satellite describes an ellipse in its revolution round the earth, and hence its distance *d* varies; the mean H.P. of the moon is about 57', whereas the maxima for Venus and Mars are 31" and 24" respectively, and for those of the other planets (not including all the minor planets) less still. The method for finding the moon's P. already explained, is applicable also to the sun and is as follows. Kepler's third law (q.v.) states that the squares of the periodic times of any 2 planets, that is, of their times of revolving round the sun, vary as the cubes of their mean distances from the sun. The periodic time of a planet can be determined with great accuracy from observation, and the minor planet Eros has proved very useful to astronomers for finding the P. of the sun owing to its close approach at times to the earth. Its periodic time is about 1½ years, and its mean distance from the sun is 1.45 times the earth's mean distance. From these figures it is possible to derive the distance of Eros from the earth at any particular time in terms of the earth's mean distance from the sun—not in m. Now when Eros makes a close approach to the earth (say about 16,000,000 m.) its distance from the earth is measured in the same way as the moon's

distance and expressed in m., and hence the astronomer knows that a certain number of m. corresponds to a certain fraction of the earth's mean distance from the sun. From this he knows the earth's mean distance from the sun in m. Mr A. Hinks used this method when Eros made a close approach to the earth in 1900-1, and the then astronomer royal, Sir Harold Spencer Jones, also utilised it when Eros made a closer approach in 1931. The following approximate figures will show more clearly how the sun's mean distance from the earth, known as the astronomical unit (A.U.), is derived. Using Kepler's third law, the mean distance of Eros from the sun is 1.45 A.U. and on a certain date its computed mean distance from the earth was 0.17418 A.U. On the same date its distance from the earth, found by the same method that is employed for determining the moon's distance, was 16,200,000 m., and hence 1 A.U. is $16,200,000/0.17418 = 93,005,000$ m. The H.P., derived from $\sin P = a/d$, a being 3963.35 m., the earth's equatorial radius, and d 93,005,000 m., gives $\sin P = 0.000042614$, or $P = 8''.79$ nearly. Other methods for determining the distances of the sun and the planets will be found under appropriate headings. See ABERRATION; PERTURBATIONS; VELOCITY OF LIGHT.

Stellar Parallaxes. The earth's radius subtends such a small angle at the distance of the nearest star that it cannot be detected. A much longer base line is necessary, and this is provided by the diameter of the earth's orbit, which is about 186,000,000 m. A star is observed at each end of a diameter, an interval of 6 months intervening, and the principle is practically the same as that used in finding the moon's distance. At each end of the diameter selected, not only is the star photographed, but in addition another faint star in its field is also photographed, the presumption being that the fainter star is very far off—so far that it may be assumed at an infinite distance and hence lines drawn from the earth at each position of its orbit to this faint star are practically parallel. In these circumstances a displacement of the brighter star whose P is sought, relative to the fainter star, takes place, from which the angle subtended at the former by the diameter of the earth's orbit is easily found. This supplies the necessary data for finding the distance of the star. Many refinements are essential in the method, but the above gives the general principle involved, and when the distance of the star has been determined its P is supplied with the following implication. The P of a star is the maximum angle subtended at the star by the earth-sun line; when this line is not at right-angles to the sun-star line, reductions are made so that the P refers to the maximum angle. An example will show how stellar P —often referred to as *ann. P*—can be reduced to A.U.s and from this to light years. The P of Proxima Centauri, the nearest star to us, is $0.783''$, and using the formula $\sin P = a/d$, or $d = a/\sin P$, a and d in this case denoting 1 A.U. and the

distance of the star, respectively, $d = 1/0.000003796 = 263435$ A.U. Since 1 A.U. is 93,000,000 m., the distance in m. is 24.5 million million, or 24.5×10^{11} . A light year is 5.88×10^{12} m., and hence the distance of the star is about 4.2 light years. Various other methods besides the above trigonometrical method are used for finding the distances of the stars. See STARS, *Cepheid Variables*; SPECTRUM AND SPECTROSCOPE; METROLOGY.

Parallax of the Fixed Stars, see preceding article and STAR.

Parallel Connection of electric circuits, joining the circuits between the same terminals, the voltage being the same across each circuit. On d.c., if the circuits have resistances R_1, R_2, R_3, \dots , the currents will be $\frac{V}{R_1}, \frac{V}{R_2}, \frac{V}{R_3}, \dots$ and the total current $V \times \left(\frac{1}{R_1} + \frac{1}{R_2} + \dots \right)$.

On a.c., if the admittances (q.v.) be $G_1 + jB_1, G_2 + jB_2, \dots$, the currents are $V(G_1 + jB_1), V(G_2 + jB_2), \dots$, the total $V(G_1 + G_2 + \dots) + jV(B_1 + B_2 + \dots)$. Connecting 2 d.c. generators in parallel to supply a load, the terminals must be joined by an "equalizing bar" to prevent the voltage of one dynamo dropping below that of the other, in which case it would be driven as a motor. Alternators must first be synchronised (see SYNCHRONISER). With 3-phase transformers care must be taken to connect the phases in correct sequence. Only transformers with the same transformation ratio can run in parallel.

Parallel Roads of Glen Roy. In the valley of the R. Roy in Invernessshire, 3 narrow terraces can be seen one above the other on the valley slopes. These terraces, which are known as the Parallel Roads, are natural features representing the beach deposits of a lake which filled the glen at a time when its outlet was blocked by ice during the Pleistocene glaciation. As the ice-front retreated, the water level of the lake sank, and terraces were formed at successively lower levels.

Parallelepiped, solid figure having 6 faces, all parallelograms, any 2 opposite being similar and parallel; the edges equal and parallel on opposite faces, the diameters meeting in a point. With square faces it becomes a cube. The ordinary rectangular box is another form. The volume is the product of the area of any face as base and the vertical height between it and the opposite face.

Parallelogram of Vectors. Vectors (q.v.), such as forces, velocities, and displacements, can be represented graphically by straight lines parallel to the directions of the vectors and having lengths proportional to their magnitudes. If 2 vectors are represented in magnitude and direction by 2 sides of a parallelogram drawn from a point, then their resultant is represented in magnitude and direction by that diagonal of the parallelogram which passes through the point. In the figure, PR is the resultant of the 2 vectors represented by PA and PB.

Similarly, the resolved parts of a given vector in 2 directions can be found by constructing a parallelogram with its diagonal parallel to and of a length pro-

portional to the given vector and with sides parallel to the 2 directions. Thus, in the figure, PA and PB are the resolved parts in the directions PA and PB of the vector PR.

Paralysis, or **Palsy**, in medicine, denotes the loss of power of movement, but applies also to loss of function; incomplete P. (diminished power) is known as *paresis*. There are 3 classes: *cerebral*, *spinal*, and *peripheral*. Cerebral P. arises from destruction of motor nerve cells of the surface of the brain, or from interruption in the nerve fibres leading to the spinal cord. 'Hemiplegia' is characterised by unilateral P. of the body in the legs, arms, etc., with aphasia (loss of speech), if on the right side. The facial muscles and tongue are generally affected, the eyelid and mouth drooping. Cerebral P. usually follows ruptured blood-vessels or thrombosis (q.v.) or embolism (q.v.). See **APoplexy**. Tumours, abscesses, fracture of the skull, epileptic fits, or hysterical fits may be the cause. Recovery may take place if the paresis results from pressure only but such is not common. Spinal P. is due to pressure, interruption, or destruction of the nerve cells or fibres in the spinal cord or those passing to the muscles. Sensory P. is more often found than in the cerebral form, where 'hemi-anæsthesia' is unusual. In 'paraplegia' both sides of the body are affected in certain areas depending on the position of the lesion in the spine; reflex movements may remain unaltered; motor areas on one side and sensory on the other may be affected. Spinal P. in its onset is seldom marked by convulsions, but it is often characterised by progressive wasting of muscles. Peripheral P. arises from affection of the nerves or muscles. Facial P. (Bell's P.) is due to affection of the seventh cranial nerve caused by disease of the ear, or exposure to draught. Lead palsy is characterised by 'wrist drop,' with affection of the muscles of the forearm. 'P. agitans,' the form in old age, is accompanied by tremors, loss of equilibrium and rigidity. 'Diphtheritic P.' is an affection of the structural protoplasm due to the toxins of the diphtheria bacillus. 'Birth P.' in its various forms, often in the legs and feet, is of frequent occurrence owing to difficult labour and consequent injury to the brain or spinal cord. 'Bulbar P.,' a rapidly fatal form, affects the

speech and centres of deglutition; it springs from the *medulla oblongata*. P. is usually accompanied by flaccid muscles, though there may be temporary rigidity; the muscular fibres are replaced by contractile connective tissue, and the limbs become permanently bent and immobile. Traumatism, embolism, hæmorrhage, tumour, and thrombosis are the chief causes; alcoholism and syphilis and other diseases affecting the circulatory system are also among the causes. Infantile paralysis (q.v.) (*poliomyelitis*), which affects the motor areas in the grey matter of the spinal cord, is a virus infection which is a further cause of P.

Treatment of P. depends upon its cause and upon the anatomical site of the affected muscles. It must also depend upon the patient's general condition. The general aim, without overtaxing the patient, should be to keep the paralysed muscles in as healthy a condition as possible so that they may more readily assume their function if and when the nerve lesion recovers. In particular, deformities arising from stretching of the paralysed muscles should be guarded against by splinting and other means. Physiotherapy, massage, and passive movements are helpful. The patient should be encouraged regularly to perform whatever movements he is capable of. Mental depression and intellectual deterioration need to be combated, and thought should be given to ways and means of stimulating interest in matters unconnected with the illness. Occupational therapy is helpful and, above all, the patient must be made to feel that despite his handicaps he still has a useful function in society. Great care must be taken to guard against pressure sores, which are a frequent source of trouble in those who are unable to move their position.

Paramagnetic, see **INDUCTION**, **MAGNETIC**.

Paramaribo, cap. and chief port of Surinam (Netherlands Guiana), on the Surinam R., 15 m. from the sea on a former coastal shell reef, and 214 m. from Georgetown, Brit. Guiana. It is the centre of the colony, and is on air routes between the U.S.A., Brazil, and the Netherlands. There is a deep-water frontage of a mile. In general appearance it is a city of old Dutch buildings and tree-lined streets. The old Government House on the Wilhelmina Square is of Georgian appearance. A neighbouring side is graced with a handsome statue of the queen. The 17th-cent. Fort Zeelandia is a reminder of a former age. A single-track railway runs to Kabelstation (83 m.). Pop. 86,000.

Paramatta, see **PARRAMATTA**.

Paramecium, or **Slipper Animalcule**, one of the group of Protozoa formerly known as Infusoria, but now classified as Ciliata. The name Infusoria (q.v.) was originally applied to these and similar organisms because they were observed in infusions prepared from such organic substances as hay, seeds, etc. The group is now limited to those protozoa which have a permanent

investing pellicle, a large and one or more small nuclei, and an arrangement of cilia by which they move about. One section of the ciliata includes organisms which are usually ciliated only in the young state and acquire their food from the surrounding medium by suction; these are known as *Suctoría*. The remaining members of the ciliata comprise organisms permanently provided with cilia, and it is to this group that the P. belongs. The P., as its alternative name suggests, is shaped like the sole of a slipper, but is only about 0.01 in. long. The surface is provided with rows of cilia arranged longitudinally. The cell is surrounded by a definite pellicle, and contains within its body food

PARAMECIUM, THE SLIPPER ANIMALCULE

A, anterior end; C, cilia; CV, contractile vacuole; D, dermis; MA N, macro-nucleus; MI N, micro-nucleus; FV, food vacuole; G, gullet; M, mouth; P, posterior end; TR, trichocyst; V, vestibule.

vacuoles formed by the particles of food collecting bubbles of water about them as they pass from the oral cavity into the endoplasm; the food passes in an elliptical path through the endoplasm and becomes gradually digested. There are also 2 contractile vacuoles which function alternately and act as osmotic organs. Water is constantly absorbed by osmosis over the whole pellicle, and these vacuoles suddenly contract and forcibly expel it. Experiments made to show that the function of these vacuoles is excretory have so far failed. The P. provides itself with food by lashing the water with its cilia. These also serve as an organ of locomotion, the cell taking a peculiar zigzag path at a constant angle to the general direction of its motion. The food is directed into a funnel-shaped 'mouth,' within which is a thin membrane. This, by its movements, aids the direction of the food into the animal. Reproduction is effected by fission and by conjugation.

In the former case, first the smaller or micronucleus, then the larger or meganucleus, become constricted and divide into two by oblique division, and the missing organs in either part are quickly regenerated. It is observed that frequent multiplication by fission diminishes the vitality of the organism and is succeeded by conjugation, when two exchange part of the substance of their nuclear apparatus and so obtain a new lease of life. When conditions become unfavourable the animals encyst themselves.

Paraná: 1. City of Argentina, cap. of the prov. of Entre Ríos, on the P., facing the tn of Santa Fé, 235 m. NW. of Buenos Aires. It is the centre of a grain-growing dist. For 9 years from 1853 the city was the cap. of the Argentine. The chief objects of interest to visitors are the governor's palace, the cathedral, and the Urquiza Park. P. is a bishop's see and the seat of a univ., and a thriving riv. port. Pop. 83,800.

2. Coastal state of S. Brazil, between Paraguay and the Atlantic. W. of the low-lying coastal strip are the mts of the Serra do Mar (c. 3000 ft). Timber, cereals, rice, fruit, and cotton are produced, and there are coal deposits. Many of the farmers are of It., Ger., or Slavonic origin. Cap. Curitiba. Area 77,717 sq. m. Pop. 2,115,547.

3. One of the most important rivs. of S. America, formed by the confluence of the Rio Grande and the Paranaíba. The Rio Grande rises in the state of Minas Gerais, Brazil, and flows NW. and W. to the point of confluence. As the P. the 2 rivs. then flow in a SW. direction through Brazil, then S., forming the boundary between Brazil and Paraguay. Thence it sweeps W. between Paraguay and Argentina to receive its prin. trib., the Paraguay. It then flows SW. to Rosario and SE. to unite with the Uruguay in the Plata estuary. Cataracts and rapids render it unfit for navigation over a large part of its course, but for the last 1000 m. it is always navigable even by large steamers. Its total length is about 2500 m., excluding the Rio Grande, its true headstream.

Paraguá, chief seaport of the state of Paraná, S. Brazil, 55 m. E. of Curitiba. It is situated on a lagoon-like bay of the same name; its quay is small but modernised. Coffee, sugar, spice, and maté are exported, as well as bananas, maize, pine-wood, and other products. The port dates from the colonial period, and in the tn there are some historic churches. The rail journey to São Paulo is 660 m. Pop. 13,000.

Paranoia, see INSANITY (CLASSIFICATION).

Parapet (from the It. *parapetto*), low or breast-high wall or fence, as a protection on bridges, terraces, flat roofs, etc. In Renaissance architecture P.s are generally balustrades. In Gothic architecture the P. is merely a continuation of the wall carried up above the edge of the roof and finished by a coping unless machicolated, in which case it projects

and overhangs the walls below. In the Lombardic buildings of Italy, and also in the Norman style, there is seldom any P., the eaves of the roof finishing the elevation. In Elizabethan buildings open-work P.s, sometimes formed of carved inscriptions, are common.

Paraphrase (from Gk *para*, beside, and *phrazein*, to tell), name given to a restatement of a passage in prose or verse, so as to bring out its meaning with greater lucidity, without altering the sense of the original by change, addition, or subtraction. In music a P. is a free adaptation of a piece of music so as to suit it to other instruments. The metrical arrangements of portions of Scripture which are sung with the psalmody in the Scottish Church are called P.s.

Paraphrenia, see under INSANITY (CLASSIFICATION).

Paraprosdokian (Gk *para*, against; *pros*, towards; *dokein*, seem) is a figure of speech in which an unexpected turn is given to a sentence, especially in the form of a sudden bathos (q.v.), as in the line quoted by Aristotle, 'Statefully swept he along, and under his feet were his chilblains.' See also FIGURE OF SPEECH.

Parapsychology, see PSYCHICAL RESEARCH; PSYCHOLOGY.

Paraselenae, see MOCK SUNS AND MOONS.

Parasites (Gk *parasitos*, one who eats beside, or at the table of another, or at another's expense), living organisms which pass the whole or a part of their existence on or in other living organisms or hosts without conferring any benefit. They do this essentially for the purpose of obtaining nourishment from their hosts, not merely for shelter. In recent years numbers of instances have been observed where one creature is in intimate association with another purely as a commensal (q.v.). For instance, small sea-anemones are transported in the claws of 2 species of crabs, which take any food the anemones cannot completely swallow. The anemones probably gain from the transportation more opportunities of catching prey. Some small fishes shelter themselves beneath the 'umbrella' of large jelly fishes, others in the gullet of large sea-anemones, and one in the hind gut of a sea-cucumber. But in none of these and other similar cases does one of the commensals live or rear its young at the expense of the other, and hence they are not termed P. These are, however, of considerable interest as indicating how in many cases a parasitic life was entered upon, and one view of symbiosis maintains that it is the perfection of parasitism.

Until parasitology became an estab. science, attempts were made to classify P.: there were Ectozoa, or P. which live on the surface of the host, and Endozoa, which live in the blood or internal parts; but this is artificial, and the only satisfactory classification is along biological lines. (For plant- or phyto-P. see PARASITIC PLANTS.) The gradation of the symbiotic into the ectoparasitic habit is well illustrated by different barnacles. *Balanus* lives almost indifferently as a

commensal on various animals such as whales, crabs, and sharks; but *Anelasma*, living on the shark, sends haustoria into it, and thus establishes itself as an ectoparasite. Having adopted this mode of life, *Anelasma* has apparently to be maintained by sharks or to die, for it is unable to make other animals its hosts as indifferently as *Balanus* makes them commensals. In this way biological species of both plant and animal P. have been estab. From these examples where the prey or host is quickly destroyed, there is every degree of elaboration up to the stage of such perfect and (at any rate in the adult stage) harmless parasitism as those which merge into symbiosis.

SOME EXTERNAL PARASITES

A, bed bug $\times 4$; B, flea $\times 6$; C, harvest mite $\times 6$; D, itch mite $\times 20$. (See also the illustration to LICE.)

The absence of serious injury by a parasite points to a long period of natural selection in which, on the one hand, the parasite has been brought to some degree of harmlessness, and, on the other hand, the host has become able to tolerate the parasite without being injured or poisoned by it. Some avoid killing the host only while their dependence upon it is essential. A caterpillar, for example, in which an ichneumon fly has laid her eggs, does not die until it has passed into the pupal stage when the grubs of the fly which have fed upon it have become full grown and have also pupated. As parasitism becomes more pronounced, definite structural features are evolved, such as hook-like claws or suckers for secure attachment to the host and cuticles that are adequately protected against the action of digestive juices—to such a high degree indeed of adaptation is evolved this power of tolerating the chemical qualities of the gastric juice, that some P. are poisoned

and destroyed if they gain admission to hosts of species other than those to which they have accustomed themselves. There are remarkable instances of this in the case of the microscopic parasite which causes malaria, and which can be conveyed only by the mosquito (*Anopheles*); it is destroyed in the system of other gnats. Similarly, the ciliated embryo of the liver fluke refuses to enter any snail other than *Limnaea truncatula* and also, according to recent work, young specimens of *L. stagnalis*, as an intermediate host. Motor and other organs become atrophied as in the wingless insects (e.g. fleas) which have adopted parasitic life, while in the leech the alimentary tract is considerably simplified, and in the tapeworm the digestive system is completely aborted, as to a large extent are the nervous and sense organs. A large proportion of the so-called Entozoa require more than one host in which to complete their life-history. The host in which the adult reproductive stage is reached is the 'ultimate' or 'definite' host, and that in which the life-history is begun with the entrance of the ova or newly hatched larvae is the 'intermediate' host. For instance, the embryos of the tapeworm, picked up by pigs with their food, become encysted in their muscles, causing 'measly' pork, which if not properly cooked introduces the tapeworm to the intestines of man, where it passes into the adult stage. To counteract the slender chances of the completion of the life-history, which in the case of the liver fluke passes through 7 distinct stages, many P. are extraordinarily prolific. A single tapeworm (see CESTODA), for example, produces some 75,000,000 young, of which perhaps, on the average, not more than one becomes estab. In its ultimate host. It is doubtful if any vertebrate is a true parasite, though the lamprey-like hagfish (*Myxine*) cuts its way into the turbot, cod, and other fish, where it is often found by fishermen; but its stay in the body of its victim is short. The highest P. of importance in the animal kingdom are the various Arachnids, which include the numerous mite species. Among insects P. are numerous, and with them may be mentioned aphides, or plant-lice, the gall-wasps and gall midges, and many others parasitic on plants.

As an instance of the artificiality of the classification of P. as external and internal, there is the instance of *Ascaris megalocephala*, which lives in the intestine of the horse and is usually described as an endoparasite. Since, however, no penetration of cells is involved, it seems better to regard organisms living in the gut as ectoparasites, and those in the cells or blood stream as endoparasites. Among flat worms or Platyhelminths, and round worms, or Nematodes, parasitism is very frequent and gives rise to a number of serious diseases. The Sporozoa—a class of the Protozoa or unicellular animals—include a large variety of parasitic organisms of such importance as those that cause malaria, sleeping sickness, and amoebic dysentery. P. are

usually described as degenerate, but the criterion of degeneracy needs first to be clearly estab. Viewed structurally, P. are usually much simpler than related free-living forms. They have evidently lost the complex structure once possessed, so that if complexity be a criterion, P. are usually highly degenerate. *Sacculina* and *Pellogaster*, for example, are little more than ova-producing structures. If, however, success be a criterion, most P. are better described as highly specialised rather than a degenerate, for they may be regarded as highly successful, and they have elaborate reproductive organs. The Nematodes, well advanced in parasitic habits, are very widely distributed and very numerous. The food of the parasite is often pre-digested by the host; consequently a simple alimentary canal or absorptive area is sufficient for the parasite. It is often transported by the host, and therefore needs no organs of locomotion, unless a free-living phase occurs in its life-history. Even in this case the organs of locomotion are usually ill-developed, since they are little used. Thus degeneracy of structure is correlated with adaptation to the mode of life, and it may be questioned whether adaptation is degeneracy. The degeneracy here appears to be an ethical question rather than a biological one.

Although P. are frequently highly successful, their hosts suffer considerably. Even when P. have estab. some sort of harmony with the host, to the extent that the host continues to live, there is frequently a reduction in size, and a disturbance in metabolism sufficient to effect sex reversal occurs when the crab is parasitised by *Sacculina* or by *Pellogaster*. Parasitism is a highly specialised mode of life favourable to the parasite, but, at best, harmless to its host. At its worst, it destroys the host, but this usually indicates the beginning of a parasitic career, or an attempt to parasitise a new host. See also BACTERIA; CESTODA; PATHOLOGY; SYMBIOSIS, and articles on individual P.

See A. M. Kennedy, *Parasitology for Medical Students*, 1925; C. Fox, *Insects and Disease of Man*, 1926; P. A. Maplestone, *The Nematode Parasites of Vertebrates*, 1926; R. Hegner, *Host-parasitic Relations between Man and his Intestinal Protozoa*, 1927; E. Brumpt, *Précis de parasitologie*, 1927; R. Hegner, F. M. Root, and D. L. Augustine, *Animal Parasitology*, 1929; D. and C. T. Rivas, *Clinical Parasitology and Tropical Medicine*, 1935; and A. C. Chandler, *Introduction to Human Parasitology* (7th ed.), 1945; T. Goody, *Soil and Freshwater Nematodes*, 1951; J. G. Baer, *The Ecology of Animal Parasites*, 1951; M. Rothschild and T. Clay, *Fleas, Flukes and Cuckoos*, 1952.

Parasitic Plants. A large number of plants, especially fungi, have developed parasitic habits, some of which are the cause of serious loss to cultivated plants and trees. The number of Brit. phanerogamic (flowering) parasites is small; the dodders (*Cuscuta*) are the only ones of serious economic importance, often doing

considerable damage to crops of clover and lucerne, into the tissues of which they send suckers. After germination a seedling dodder can live independently for 2 or 3 weeks; but if within that time it has not found a suitable host, it perishes, as the entire absence of chlorophyll prevents it from utilising inorganic food. The broomrapes (*Orobanchae*) are so dependent on their hosts that unless in contact with them the seeds cannot germinate. The toothwort (*Lathraea squamaria*) is also destitute of chlorophyll, but is said to supplement the food appropriated from the roots of various broad-leaved trees (e.g. hazel and elm) by animal organisms which get into small cavities in the leaves. In these cavities are glandular cells similar to those of certain insectivorous plants, but there is no conclusive evidence of the function of these cells. The mistletoe, eyebright, yellow rattle, and cow-wheat are partial parasites, for all these plants contain chlorophyll and can assimilate carbon dioxide, though dependent upon their hosts for water and salts. Among the fungi, the rusts and smuts do considerable damage to cereal crops; the mildews to hops, grape vines, gooseberry plants, and various fruit trees. *Phytophthora infestans* is the cause of potato blight, which led to the Irish potato famine in 1846-8. Ringworm and other skin diseases of man are caused by parasitic fungi (see ACTINOMYCOSIS; FUNGI). Most extraordinary of the numerous P. of the tropics is the huge-flowered *Rafflesia*, which grows on the *Cissus*; the flower, said to measure a yard in diameter, is the largest known. See F. T. Brooks, *Plant Diseases*, 1953.

Parasitology, the scientific study of parasites (q.v.).

Paratoluidine, see TOLUIDINE.

Paratroops, see PARACHUTE AND AIRBORNE TROOPS.

Paratyphoid Fevers, see ENTERIC FEVER.

Paravane is a device developed by Commander Usborn and Lt. (later Sir Dennistoun) Burney during the First World War as a protection for ships from mines. It consists of a cigar-shaped body made of welded steel plate. At its nose-end it carries an eye for a towing-cable, a fixed cutter for cutting the moorings of a mine, and a small steel plane for stability. At the tail-end are 2 rudders actuated by a hydrostatic valve, which controls the depth at which the P. is required to run; also small horizontal and vertical fins. A P. is towed on each side of a ship by steel ropes attached to the stem and is adjusted to run slightly below the level of the keel—about 50 ft from the ship's side and about 180 ft from the stem, depending on the length of the vessel. The towing-cable thus forms a wedge which when it comes in contact with the mine mooring-wire deflects the latter away from the ship and leads it to the powerful cutter on the P., where it is severed, thus permitting the released mine to rise to the surface, when it can be destroyed. There is no danger of a ship registering a direct hit with its stem on a mine, owing to the cushion of water

which a ship's stem pushes in front of her having the effect of deflecting the mine to one side or the other. Another type of P. contained explosives and was developed in 1916 to destroy submarines whose positions were approximately known. It was towed at high speed by the attacking vessel, and the charge could be fired by electricity or automatically on the P. striking its target. But, with the development of asides, the P. as an anti-submarine weapon became obsolete and is used to-day only as a protective device.

Paray-le-Monial, Fr. tn in the dept of Saône-et-Loire, on the Canal du Centre. It is a place of pilgrimage; here Marguerite-Marie Alacoque advocated devotion to the Sacred Heart (see SACRED HEART OF JESUS). There is an agric. market, and pottery and oil industries. Pop. 7800.

Parcae, see MOIRAE.

Parcel Post, see POST OFFICE.

Parceners, see CO-PARCENERS.

Parchim, Ger. tn in the dist. of Schwerin, on the Elbe, 22 m. SE. of Schwerin (q.v.). It has paper, foodstuff, and distilling industries, and was the bp. of Moltke (q.v.). Pop. 20,000.

Parchment (from *pergamena*, or Pergamum, where P. was first used for writing on instead of papyrus, q.v.), skin of the sheep, lamb, goat, pig, or calf, prepared for writing upon. When the skin is divested of its hair or wool, it is placed for some time in a lime-pit, and then stretched on a square wooden frame drawn tight by pegs. When in the frame it is first scraped on the flesh side with a blunt iron, then wetted with a moist rag, covered with pounded chalk, and rubbed well with pumice-stone. After a short pause these operations are repeated, but without chalk. The skin is then turned and scraped on the hair side once only. The flesh side is scraped once more, and again rubbed over with chalk. All this is done by the skinner, who allows the skin to dry in the frame, and then cuts it out and sends it to the parchment-maker, who repeats the operations with a sharper tool, using a sack stuffed with flocks to lay the skin upon instead of stretching it in a frame. See also MANUSCRIPTS; PERGAMUM; VELLUM.

Parcimony (Lat. *parcimonia*), The Law of, in philosophy, the rule that complex

powers, principles, or causes are not to be postulated without necessity, but that the simplest hypothesis is to be preferred. The law is enunciated by Wm of Ockham in the famous phrases—'Entia non sunt multiplicanda praeter necessitatem. Frustra fit per plura quod fieri potest per pauciora.' The first maxim (known as 'Ockham's razor') is aimed at the hypothesizing of abstractions, an error which he attributes to the Realists. See HYPOSTASIS; NOMINALISM.

Pardo Bazan, Countess Emilia (1852-1921), Sp. novelist and critic, b. Corunna, Galicia. Her title was granted by Alfonso XIII, and she was the first woman to be made counsellor of public instruction. She wrote numerous novels, the best dealing with Galicia, books on Fr. and Russian literature and travel, and collections of short stories and essays. Her most outstanding works are *Los Pazos de Ulloa*, 1886, a vivid portrayal of Galician country life; and *La Madre Naturaleza*, 1887. See E. González López, *L. Pardo Bazan, novelista de Galicia*, 1944.

Pardoe, Julia (1806-62), novelist, historian, and travel writer, b. Beverley, Yorkshire. She visited Portugal and wrote on her return *Traitor Traditions of Portugal*, 1833. A visit to Constantinople supplied material for *The City of the Sultan*, 1836, and *A Romance of the Harem*, 1839, and after going to Hungary she wrote *The City of the Magyar*, 1839-40. Later works were *Louis XIV and the Court of France*, 1847, and *The Court and Reign of Francis I*, 1849.

Pardon. In the United Kingdom the home secretary in the exercise of the royal prerogative (see CROWN) has the right to pardon offenders against the criminal law. A P. cannot be granted where private interests are mainly concerned in the prosecution of the offender (a principle which explains the obsolete rule that the Crown could not pardon a man 'appealed' of felony). For example, the Crown will not pardon a common nuisance while it remains unabated. Again, under an Act of Charles II, the Crown cannot pardon a person guilty of committing a man to prison out of the realm. It is the better opinion that the crown cannot pardon where the effect would be to nullify the effect of a recognisance to keep the peace; nor again is it the practice to pardon a contempt of court to the prejudice of the rights of a subject. A P. may be absolute so as to put the offender in the same position as if he had been innocent all along, or conditional, e.g. when a person sentenced to death is pardoned on condition that he submit to having his sentence commuted to penal servitude. In form a P. is granted by warrant under the great seal or under the sign-manual (qq.v.). Under the Act of Settlement no P. under the great seal can be pleaded to an impeachment by the Commons. In the U.S.A. the constitution gives the president the power to pardon offences against the U.S. Gov. except in the case of the impeachment of public officers.

Pardubice: 1. Region (*kras*) in Central

Czechoslovakia, part of the former prov. of Bohemia (q.v.). It is mountainous in the S., and is watered by the Labe (see ELBE). Area 1,633 sq. m. Pop. 423,000.

2. (Ger. *Pardubitz*) Czechoslovak tn. cap. of the region of P., on the Labe. It has petrol refineries, manufs. radio and telephone equipment, and has a trade in grain and timber. Pop. 44,000.

Paré, Ambroise (1510-80), Fr. surgeon, b. Laval, Maine, France. Although his parents were poor, he went to study surgery at Paris. He gained a great reputation during the Fr. campaigns in Italy, and was made surgeon-in-ordinary to Henri II. P. was the greatest of the army surgeons before Larrey (q.v.). He abandoned boiling oil and the cautery, until then used in the treatment of wounds, introduced artificial limbs, made improvements in obstetrical procedures, and invented many new surgical instruments. An Eng. trans. of his works appeared in 1634; the best Fr. ed. is by J. F. Malgaigne, 1840-1. See lives by S. Paget, 1899, and F. R. Packard, 1926.

Parent and Child. By Eng. law the complete relation of P. and C. exists only where the child has been born in lawful wedlock or where it has been legitimated by the subsequent marriage of the parents (see LEGITIMATION). There is no obligation on either parent at common law to maintain a legitimate child, though indirectly he or she could be compelled to do so through the old Poor Law Statutes, the Vagrancy Acts, and the Cruelty to Children Acts (see CHILDREN AND YOUNG PERSONS). An illegitimate child, whose parents have not married each other, is primarily maintainable by its mother, though if its paternity be proved an affiliation order can be obtained against the putative father compelling him to pay for the child's maintenance and education a sum not exceeding 20s. a week, until the child is 16. No person is required as father of an illegitimate child to give information concerning its birth, and the registrar of births and deaths may not enter in the register the name of any person as father of the child unless at the joint request of both parents. The effect of the Poor Law statutory obligation as re-enacted by the National Assistance Act, 1948 (Section 42), is that a husband is bound to support all his wife's children, whether legitimate or illegitimate, which she had when she married him, in addition to those he himself may beget by her.

Legitimate. Legitimacy by birth depends on the lawful marriage of the parents and the fact that the child was born in wedlock, though it is immaterial how soon after the marriage the birth takes place. In Scots law the position has for long been that children otherwise illegitimate may be legitimated by the subsequent marriage of their parents. The prin. effect of legitimacy is the right of the child to inherit and take his parents' real estate and personal estate respectively, though there is nothing to prevent the parent from willing away from his own issue the whole of such

property as does not form the subject of a settlement. The other results of legitimacy are the right to bear the father's name, and, to the extent indicated, the right to be maintained, educated, and protected. The parents are the natural guardians of their children, and their control endures in ordinary circumstances until the child reaches 21 or marries under that age. But the father is the legally favoured parent, a pre-eminence the principle of which found its strongest expression in the *patria potestas* of the Rom. father of an agnatic family (see HENR). In England the father has the right to the custody and control of the children, not only as against third parties but against the mother, even though the child be at the breast; but this exclusive right of the father has been so far modified by the Divorce Acts and the Infants Custody Act, 1873, that the court will, on the mother's petition, give her either access or complete control where it is clearly for the benefit of the child to do so. Under the Guardianship of Infants Act, 1886, the mother has the right to appoint by deed or will a guardian to act after her death, who will be entitled to act either alone or jointly with any guardian the husband may have appointed. The Adoption of Children Act, 1926, however, provides for the adoption of infants by applicants who must not themselves be under 25 years of age or less than 21 years older than the infant they are applying to adopt. Before granting an adoption order the court must be satisfied that every person (and this includes the natural parents) whose consent is necessary to the order both consents to and understands the nature and effect of an adoption order and, in particular, that the effect will be permanently to deprive him (her) of his (her) parental rights; and the court must also be satisfied that the order will be for the welfare of the infant. It is obvious that the only cases likely to arise are those in which the applicant(s) has already been maintaining the infant in his (her) own home. Prior to 1926 the law would not allow parents to enter into an agreement binding themselves to surrender the custody of their children; and if they had, in fact, given up control to third persons, they could at any time resume control subject to any doubt the court might entertain as to whether it would be for the child's benefit that it be taken away from the care of those who had actually reared it. In any case, if the child has been brought up by another person, or is boarded out by Poor Law or equivalent authorities, the court may make an order on the parents, if it restores the custody to them, to pay such remuneration for the past maintenance as may be just. Where any dispute arises between the parents as to the question of custody, and the child, if a boy, is not less than 14 years of age, or, if a girl, not less than 16, the court may allow the child to exercise a discretion and withdraw itself from the control of one or both of its parents. Where the husband and wife have separated and drawn up a deed of separation, providing

that the mother have access or full custody, the father will be bound by his agreement. Parents have a legal right to give or withhold consent to an infant child's marriage (see INFANT); such consent must be given honestly and without any view to the parents' own private advantage. It is almost needless to say that the right is of no great value, and that the absence of consent will not invalidate a marriage ceremony which is otherwise good, whatever effect it may have in debarring the disobedient child from succeeding to property or from other material benefits.

Under the former Poor Law Act of 1601 there was mutual obligation of maintenance on children and parents; but though grandparents might be compelled to maintain pauper grandchildren, the converse did not hold good. But under the National Assistance Act of 1948 the only responsibility now is that of parents to children. By the Children Act, 1908, the wilful neglect on the part of a parent to provide his child with adequate food, clothing, medical aid, or lodging, or to take steps to procure the provision of the same from the Poor Law authorities (now the National Assistance Board), is misdemeanour, for which he may be punished either summarily by a fine up to £25, with or without imprisonment up to 6 months, or on indictment by a fine up to £100, with or without imprisonment up to 2 years. When an order for maintenance is made against a soldier husband, it must be sent to the War Office, which dept may then order a certain part of his pay to be deducted and appropriated to the support of his children. The absence of any civil obligation to maintain is important in connection with the liability of parents for necessities supplied to their children under 21. A father who gives no authority, *a fortiori* who enters into no contract, is no more liable for goods supplied to his children than would be a mere stranger, though, of course, a jury is not unnaturally disposed, from his moral obligation to provide for his children, to infer an admission of liability in respect of such claims upon his children by tradesmen. But apparently mere knowledge on the part of the father that his child is being maintained by a stranger will not be enough to fix him with the liability to pay for the necessities supplied by the stranger on the ground of tacit acquiescence; it would be otherwise if he had deserted his child or it was in a destitute state, for in such cases the law always implies a liability to repay a stranger for necessities supplied.

Before the Elementary Education Act, 1876, it was not obligatory on a parent to have his child educated. Under that Act it is his duty to cause it to receive efficient elementary education in reading, writing, and arithmetic, subject to any reasonable excuse for not sending his child to school, e.g. on the score of ill health (see also EDUCATION). Rich and poor fathers are alike in this, that neither is legally bound to do more than cause his

child to receive a statutory elementary education. If, however, the child is under the custody of guardians, the latter are bound to educate him in a manner becoming his rank and station in society. Again there is no obligation on a parent to bring up his child in any particular religious creed, or indeed to instill any religious views in him at all. The father, however, has the right to choose in what religion the child is to be educated, *even though it be illegitimate and un-legitimated*, and he cannot release this right or bind himself conclusively to bring his child up in a particular faith, for the right is to be exercised not for his but for the child's benefit. Apparently a father cannot directly secure in what religion his child shall be brought up *after his death*, but he can accomplish the same object by choosing the right testamentary guardian.

A father acquires no legal interest in any real or personal property that may be given to or settled exclusively on his child, whether such property accrues to the child while under age or after majority. In ancient legal systems, like the Roman, children were unable for the most part to hold any property separately from their fathers (*see* *HEIR*). It seems a moot point whether a father is entitled to the earnings of his child. Much must depend upon the implied terms of any arrangement that may be supposed to have been made between them. If the father, after the child reaches a certain age, sends him out to work but undertakes to continue his board and lodging, it may be assumed that he does so only on the understanding that the child's earnings will be 'pooled' for the common benefit of the family. But there is nothing to prevent a child from making a formal contract with his father as to wages if he enters his father's service, and such contract would be enforceable against the father. Of course, if the father frees the child from his control he has no longer any hold over the child's earnings. A widow, being bound to support any children she has who are under 16, has a corresponding right to their earnings (as to the law of succession on intestacy see between P. and C., *see* *SUCCESSION, INTESTATE*). A child may make a gift to his parent, provided the gift is not tainted by any undue influence on the part of the parent; and conversely a parent's gift to his child gives the latter an exclusive property in the gift as if made over to him for valuable consideration. Further, a voluntary settlement is binding on the parent, and can, if necessary, be specifically enforced by the children (*see also* *PORTIONS; LAND LAWS; HORTICULTURE*). A child is under no legal obligation to support his parents, even though he may be in receipt of a handsome income and his parents be scarcely able to 'make both ends meet.' Prior to the National Assistance Act of 1948, if a parent became chargeable to the poor rate his children, if able, could be made to contribute to his or her support; now, however, the responsibility for the maintenance of parents in case of need is

upon the National Assistance Board, while the obligation to provide accommodation is upon the local authority.

If a daughter is seduced, her father, or mother, can bring an action for damages against the seducer, not directly for the seduction but for the loss of services consequent upon the daughter's becoming pregnant (if so) or sick. But it is essential for the parent to give some evidence, however slight, that the daughter did perform services for him (or her) of some kind. In regard to torts (actionable wrongs other than breach of contract) committed by children, e.g. libels, assaults, trespasses, negligence, the parent is liable only if he authorised the tortious act, or where it can be reasonably inferred that he must have known of and assented to its commission.

Illegitimate. As to the status of legitimacy and, inferentially, its converse, illegitimacy, *see* *LEGITIMACY; LEGITIMATION; BASTARD*. By common law an illegitimate child is *filius nullius* (the son of no man), and therefore has no parent on whom he has any claim or from whom he can derive any rights; but under the Legitimacy Act, 1926, an illegitimate child is on the same footing as a legitimate child provided the parents are subsequently married to each other; but this statutory provision does not avail to legitimate a child whose father or mother was married to a third person at the time of the birth of the child. Even before this change, an illegitimate child was so far the legal child of his parents as to be able to take a bequest to a 'child or issue' if he had in his putative father's lifetime gained the reputation of being, in truth, the son (or daughter) of his father. It is the mother and not the putative father of an illegitimate child who has the care and right of custody of such child during nurture. The mother is bound so long as she remains unmarried or a widow to support her illegitimate children until they reach 16 years of age. If she marries the husband becomes bound in her stead, though if the wife has separate property and the husband cannot support his family the wife must do so. *See also* *ADOPTION; BASTARD; CHILDREN, NATIONAL SOCIETY; CHILDREN AND YOUNG PERSONS; GUARDIANS; INFANT; LEGITIMACY; LEGITIMATION; REGISTRATION OF BIRTHS, MARRIAGES, AND DEATHS*.

See W. P. Eversley, *Law of Domestic Relations*, 6th ed., 1951; Lushington, *Law of Affiliation and Bastardy*, 7th ed., 1951; Sir W. Clark Hall and A. O. L. Morrison, *Law Relating to Children and Young Persons*, 5th ed., 1956.

Parents' National Educational Union, founded by Charlotte Mason in 1888, non-profit-making society of world-wide membership, offering practical help to parents and others. Members receive a monthly copy of the *Parents' Review*, and a leaflet giving reading and occupations for children under 5, and may use the lending library, where advice on educational problems may be given. The Parents' Union School is available to the children of members. The school is

conducted by correspondence and plans a wide curriculum in all usual subjects for children aged 5-18 working in P.N.E.U. schools and families. The Charlotte Mason College, Ambleside, Westmorland, offers a 3-year training in the philosophy of Charlotte Mason, and her principles are carried out in the Practising School attached to the college, in which students have part of their training. Address: P.N.E.U., Murray House, Vandon Street, London, S.W.1.

Parentucelli, Tommaso, see **NICHOLAS** (popes), *Nicholas V.*

Pares, Sir Bernard (1867-1949), historian and student of Slavonic languages and literature, educated at Harrow and Trinity College, Cambridge. He first visited Russia in 1898, subsequently in 1906 and often in later years, acquiring a wide knowledge of Russian political and social life before the 1917 revolution. His views on Russian constitutional advance at this period are given in his *Russia and Reform*, 1907. Appointed reader in Russian hist. at Liverpool Univ. (1906), he was prof. of Russian hist., language, and literature there from 1908 to 1917. But in the meantime he spent much of his time in Russia and, in 1914, with the consent of the Tsarist Gov., was appointed a Brit. observer with the Russian forces, describing his experiences in *Day by Day with the Russian Army*, 1915. K.B.E. in 1919, he was appointed to a chair of Russian in London Univ. in the same year; he developed, and became the first director of, the School of Slavonic and E. European Studies there. In 1925 he pub. his *History of Russia*. His chief work is *The Fall of the Russian Monarchy*, 1939, based on a careful examination of documents, memoirs and interviews, and his previous experiences in Russia, and thought one of the best existing narratives, from the liberal standpoint, of the causes and earlier incidents of the October Revolution. During the Second World War he lectured and broadcast on Russia in America and Canada, and in 1944 pub. a 'Penguin' book on *Russia and the Peace*, which followed a 'Penguin Special' on *Russia*. Other works: *Letters of the Tsar and Tsarina* (ed. Eng. trans. 1924), and a trans. of Griboedov's comedy *Gore at Uma*, under the title of *The Misfortune of being Clever*, 1925; and *Moscow admits a Critic*, 1936.

Paresis, see **PARALYSIS**.

Parhelia and **Paraselenae**, see **MOCK SUNS** and **MOONS**.

Parl, in Persian folk-lore a class of supernatural beings of beneficent character. The Persian *Ps* are of both sexes, although the female is more popularly used in legend, of surpassing beauty and immortal. They were created after the Devs, with whom they are in perpetual warfare. Moore's *Lalla Rookh* tells how a *P.* obtained admission to paradise.

Paria, Gulf of, inlet of the Caribbean Sea, between the is. of Trinidad and the mainland of Venezuela.

Pariah, name given to the lowest class of the pop. of India, which, not belonging to any of the castes of the Brahminical

system, is shunned even by the lowest Hindu, as touching a *P.* would render him impure.

Parian Chronicle, see **ARUNDEL MARBLES**.

Paris, second son of Priam and Hecuba. When he was born he was exposed on Mt Ida, but was brought up by a shepherd, and received the name of Alexander, or defender of men and flocks. Later he was received by Priam and married Oenone, but deserted her for Helen. He was called upon by Zeus to decide as to which was the fairest, Hera, Athena, or Aphrodite. Hera offered him the sovereignty of Asia, Athena renown in war, and Aphrodite the fairest woman for his wife. He decided in favour of Aphrodite. She took him to Greece, where he was received by Menelaus in his palace at Sparta, but carried off Helen, his wife, the most beautiful woman in the world. From this arose the Trojan war. *P.* was defeated by Menelaus, but was carried off by Aphrodite. He killed Achilles, but was wounded, on the capture of Troy, by Philoctetes with one of the arrows of Hercules. He returned to his wife, Oenone, but she refused to heal him and he died. Oenone, remorseful, thereupon killed herself. *P.* is represented as a beautiful beardless youth with a Phrygian cap.

Paris, Alexis Paulin (1800-81), Fr. scholar, b. Avenay (Marne). He pub. in 1824 *Apologie de l'école romantique*. In 1828 he was appointed to the dept of MSS. in the Bibliothèque Royale. During 1830-6 he completed a Fr. trans. of Byron's works in 13 vols., and from 1836 to 1848 compiled a valuable catalogue of the *Manuscrits français de la bibliothèque du roi*, which has formed the basis of all subsequent works on early Fr. literature. *P.* was the first to occupy the chair of medieval literature founded at the Collège de France in 1853. On his retirement he was made an officer of the Legion of Honour.

Paris, Gaston Bruno Paulin (1839-1903), Fr. scholar, son of Alexis Paulin *P.*, b. Avenay (Marne). He studied at Bonn, at Göttingen, and at the Ecole des Chartes. In 1865 he won his doctor's degree by a thesis on the *Histoire politique de Charlemagne*. He founded with *P.* Meyer, C. Morel, and H. Zotenberg, the *Revue critique* in 1866, and with *P.* Meyer in 1872 the *Romania*. His connection with these two journals was in great part the cause of the revival of philological study in France. Among *P.*'s works may be mentioned *De Pseudo-Turpino*, 1865, the *Vie de Saint-Alexis*, 1875, the *Petit Poucet et la grande ourse*, 1875, and the *Littérature française du moyen âge*, 1888, 1890. He succeeded his father as prof. of medieval Fr. literature at the Collège de France in 1872, of which he was appointed director in 1895.

Paris, Louis Philippe Albert, Comte de (1838-94), see **BOURBON**.

Paris, Matthew (c. 1200-59), historian and monk, entered the monastery of St Albans in 1217. He succeeded Roger of

Wendover as chronicler to the monastery (1236), and carried on the *Chronica Majora*, a hist. from the creation down to 1259, from the summer of 1235. He visited Norway in 1248, but returned to England in 1249. He is the outstanding Lat. chronicler of the 13th cent., his style being vigorous and bright, the material richly interlaced with the author's own foibles and prejudices; yet his writing is of great historic value, giving as it does information derived from leading actors in contemporary events. He also wrote *Historia Anglorum*, a summary of the chief events between 1200 and 1250. The standard ed. of the *Chronica Majora*, by Dr. Luard, was pub. in the Rolls Series, 1872-83.

Paris (anct. Lutetia), cap. city of France and of the Fr. Union, and also of the dept of Seine (q.v.). It is named from the Parisii, a Celtic tribe. The city is built on both banks of the Seine (q.v.), about 110 m. from the riv. mouth, in 2 unequal parts, with the Ile de la Cité at the centre. On the r. b. it is enclosed by a sweep of low hills known as the Collines de P. On the l. b. are the Butte aux Calles, Montsouris, Montrouge, and Mont Ste Geneviève. The rising ground in the suburbs was once the site of forts. The area at present occupied by the Place de la Bastille and the *Hôtel de ville*, known as the Marais, was, for a long time, under water. Of numerous islets there now remain only the Ile de la Cité, the Ile aux Vaches, now called St Louis, and the Ile de la Conférence, on which is built the Auteuil viaduct. The height of the city above sea level varies from 85 ft to 410 ft, the highest point being the hill of Montmartre (q.v.). Geographically P. occupies an important position, being situated in a fertile plain, on ground of recent alluvial formation, near the confluence of the Oise, the Marne, and the Yonne with the Seine, and (a factor of equal importance in early days) just at the point where the natural highway from the Mediterranean to the ocean is joined by the route from Aquitaine and Spain. The climate is temperate: the highest recorded temps. were 38° C. in 1874 and 1849; the lowest was -21° C. in 1929. P. has a built-up area of about 31 sq. m. Its pop. is 2,850,200, the density of pop. being the greatest in Europe.

Administration. The municipal gov. is under the prefect of the Seine dept and a municipal council, which is elected and which in turn elects a president. The *maires* of the 20 arrons. into which P. is divided, who assist the prefect in certain services, are, however, civil servants, appointed by the minister of the interior. There is a justice of the peace for each arron. The police are under a separate functionary, the prefect of police; both he and the prefect of the dept are appointed by the gov. The *juges de la paix* hold their courts at their respective *mairies*. A tribunal of police sits at the Palais de Justice. The Cour de Cassation, which sits cases before their actual trial, and the Tribunal de Commerce, also sit at the Palais de Justice. P. is also the seat of

the courts of first instance and appeal. It is the seat of the president of the rep., who resides at the Palais de l'Elysée. The National Assembly is housed at the Palais Bourbon, and the Council of the Rep. at the Palais de Luxembourg.

P. is the seat of an archbishopric, whose titular, normally a cardinal, is primate of the Ile de France. He has under his jurisdiction 94 par. churches, the Institut Catholique, 19 eccles. communities, 54 religious houses, and 1 seminary. There are more than 100 religious buildings of various other denominations and nationalities. P. has 38 hospitals, besides a number of foreign charitable institutions and private clinics. The cemeteries include that of Père Lachaise (q.v.), where the marshals of France are buried, as well as such famous writers as Balzac, de Musset, and Oscar Wilde. There are a number of prisons, but the famous one of St Lazare has been demolished.

Five official academies form the Institut. Their H.Q. are at the Hôtel Quai Conti, formerly the Collège des Quatre-Nations. The most famous is the Académie Française, founded by Richelieu in 1635. The others are the Académie des Inscriptions et Belles Lettres, the Académie des Sciences, the Académie des Beaux Arts, and the Académie des Sciences Morales. The Académie de Médecine is at the Faculté de Médecine at the Sorbonne (q.v.), the name by which the famous univ. of P. is often known. There are 2 municipal colleges and more than 2000 primary schools, besides a number of private educational establs. Twenty-one national museums are controlled by the Ministry of Education, 2 by the Institut, and 7 by various private bodies. The most important is the Musée de Louvre, one of the finest in the world, and the Musée Carnavalet, which specialises in the hist. of P. Among the 155 libraries and archives of P. the most important is the Bibliothèque Nationale (q.v.). The Bibliothèque de l'Arsenal houses the Rondel Collection, dealing especially with the theatre, and the Bibliothèque Mazarine possesses a collection of 900 incunabula. There are numerous places of amusement. The national theatres include the Opéra National and the Opéra Comique; the Comédie-Française and the Théâtre Populaire.

There are 6 railway termini in P., including the Gare du Nord, Gare de Lyon, and Gare St Lazare. For internal traffic there is the Métropolitain, and an extensive motor-bus service. There are airports at Le Bourget and Orly. The prin. markets are at the Halles Centrales. The dist. around P. supplies it with much of its food, and P. manufs. jam, automobiles, beer, boots and shoes, and refines sugar. There are also luxury manufs. such as jewellery, dresses, furs, clocks, engravings, dress trimmings and ornaments, embroidery, tapestry, porcelain, etc.

History. The Ile de la Cité, largest of the Seine is., was the nucleus of modern P. Before the Rom. conquest of the country, a small tribe of Gauls, known as the

Parisi, settled there. The Romans called the is. Lutetia, and built a camp there, and in 52 bc the country came under Rom. rule. The settlement began to spread on to the l. b. of the Seine and Caesar placed the tn and the region under the command of Labienus. A city was erected on this bank, large enough to contain massive arenas (excavated in 1856), but by the end of the 3rd cent. barbarian invasions forced the inhab. back to the is. St Denis and his companions, Rusticus

P. his cap. in 508, frequently residing there. After his conversion to Christianity he built the basilica of SS. Peter and Paul. Chilpine removed his cap. from P. in 567, and for the remainder of Merovingian rule P.'s hist. is sombre, except for the brilliant reign of Dagobert the Great (628-38). Charlemagne (768-814) succeeded the Merovingians. P. had only grown slowly under the Frankish kings, though the civil power of the church had greatly increased, and trade and

French Government Tourist Office

NOTRE DAME

and Eleutherius, were the first to introduce Christianity, towards the end of the 3rd cent., having been sent by the Pope, and St Martin continued their work in the 4th cent. P. was the cap. of Constantius Chlorus, who had a palace there. In 410 P. joined the Armorican league. Attila attempted to enter P. in 451, but is said to have halted at the prayer of St Geneviève, who became patron saint of the city. This incident is commemorated by Landowski's statue of the saint on the Pont de la Tournelle and is illustrated in one of the frescoes in the Panthéon. In the Frankish invasion P. was captured by the Merovingian King Clovis (481-511), who made

the guilds were flourishing. Charlemagne made P. a co., and it became a duchy under Charles the Bald. In 845 the Norsemen reached P. by the Seine and laid waste the city, sacking its monasteries and churches. The city stood a 54-month siege against them in 885, led by Bishop Gozlin and Count Eudes. In 892 the Norsemen were routed by Eudes, and they never again captured P. Under the Capetians, the line that was to reign until the revolution, commencing with Hugh Capet in 987, P. became the permanent cap. of France. Their palace was in the Cité, where the Palais de Justice now stands, the towers of the Condergerie being remains of it. Louis the Fat marked

out the second line of walls; these included the *faubourgs* of the l. b. In the reign of Henry I (1031-60) the church of St Martin des Champs, burned by the Norsemen, was rebuilt. The reign of Louis VI (1108-37) was marked by a great expansion of P., and the great abbey of St Victor and a nunnery at Montmartre were among the buildings erected. Between 1180 and 1213 Philip Augustus began the paving of P. and the building of its third wall. The wall was 8 ft thick, pierced by 24 gates, and fortified by about 500 towers. A part remains to-day. Besides this he built the Louvre (q.v.), a moated château, parts of 2 wings of which are incorporated in the present palace, and the remainder may be traced. The Louvre was originally a hunting lodge before the name came to signify any royal residence. Two great warehouses at the old market at Champpeaux, the origin of Les Halles, were also the work of Philip Augustus. It was in this reign, too (in 1182), that the choir of the cathedral of Notre Dame was completed, the first stone having been laid by Pope Alexander III 20 years earlier. The whole building, however, was not finished until the end of the 13th cent.

P. had by this time become the intellectual centre of Europe. In the first half of the 13th cent. the various schools organised themselves, thus giving to the univ. its definite character. P. Univ. was soon made famous by Peter Lombard, Abélard, and Sorbon, who gave his name to the Sorbonne. Louis IX, the Saint (1226-70), built the beautiful Sainte Chapelle (q.v.), famous for the magnificence of its structure and its stained glass. He founded many monasteries and abbeys, as well as the Hôtel Dieu. Philip the Fair estab. the Parlement, the chief legal tribunal of the kingdom, which he housed in his palace of the Cité. In 1302 the Third Estate met with the States-General for the first time, to discuss the question of the temporal supremacy of the Pope. In the reign of Philip VI, who succeeded to the throne in 1328, and in the succeeding reigns, France became the scene of Eng. invasions. In 1346 the *faubourgs* were laid waste. Some order was restored at the accession of Charles V (1364), a great builder and art patron; the fourth wall around P. was built, which included the first buildings on the r. b. As the Louvre was no longer part of the defences of P., he transformed it into a sumptuous palace; he also founded the first royal library. To him are also due the beautiful chapel of Vincennes and the raising of the Bastille (q.v.). The minority and reign of Charles VI (1380-1422) was a period of deep misery for P. The rivalry of the Armagnacs and Burgundians divided P. into 2 factions, and the Eng. occupied it, being driven out in 1446. P. then enjoyed a period of calm. During the reign of Charles VIII the Petit Pont and the Pont Notre Dame were rebuilt; the latter replaced the previous wooden bridge in 1499, the houses on the new bridge being the first in P. to be numbered. Francis I in 1528 began the building of

the Louvre des Valois, and founded the Collège de France. Religious wars broke out in France, culminating in the massacre of St Bartholomew's Eve (q.v.) in Aug. 1572 when the Huguenots in P. were murdered by the Rom. Catholics. Only after Henry IV's conversion to Rom. Catholicism in 1593 was peace restored, P. having suffered 2 sieges during the course of the wars. Catherine de' Medici had had erected the Petite Galerie on the S. of the Louvre, and had begun in 1564 the palace of the Tuilleries (q.v.). Henry elaborated a vast scheme for finishing the Tuilleries, quadrupling the size of the Louvre, and joining the 2 palaces by continuing the Grande Galerie to the W. He practically completed the *Hôtel de ville*, built the N. portion of the Pont Neuf, and incorporated the 2 islets W. of the Cité with the is. Under Louis XIII building began on the Île St Louis. The palace of Luxembourg, built by Marie de' Medici, was begun in 1615. Richelieu commissioned Lemerclat in 1624 to complete Henry IV's scheme for the enlargement of the Louvre. Lemerclat also designed the Hôtel Richelieu, which was later extended by Anne of Austria and renamed the Palais Royal. In 1614 Louis XIII laid the first stone of the first bridge from the Île St Louis, to the N. bank. P. again suffered internal dissension, culminating in the wars of the Fronde (1648-52) against Mazarin; but order was eventually restored to the advantage of the royal power. During Louis XIV's minority the building now known as the Institut de France was built as the Collège des Quatre-Nations, and also the Hôtel Mazarin, now the Bibliothèque Nationale. Louis XIV was responsible for many magnificent buildings. During his long reign much of medieval P. was demolished. He finished the N. wing and riv. front of the Louvre. Other buildings completed during his reign were the 2 domed churches of St Louis des Invalides and the Val de Grâce. The Porte St Martin and the Porte St Denis were transformed into triumphal arches. During this reign the court resided at Versailles and the pop. of P. insensibly lost their loyalty to the person of the king. In Louis XV's reign huge buildings arose: the Place Louis XV (now Place de la Concorde) and the church which was later secularised as the Panthéon. But for 30 years of Louis XV's reign nothing was done towards the completion of the Louvre, nor was there really much progress in P. during his or his successor's reign. Louis XVI began the fifth circuit enclosing P. (1788). The revolution started in 1789 with the storming of the Bastille and its destruction. The prin. events of the revolution took place in P., Louis XVI being guillotined there in 1793. Thousands of executions followed, but P. regained a degree of calm under the Directory and the Consulate, and the period of neglect and destruction came to an end. In 1785 Bonaparte opened fire from the steps of the church of St Roch on the royalists who were marching against the Convention. He soon rose to power,

and became emperor of the French in 1804, being crowned at Notre Dame in the presence of Pius VII. Napoleon commenced the modernisation of P. Perreault's colonnade to the Louvre was restored, the 4 façades of the quadrangle completed, and the Pont des Arts built. The 2 triumphal arches in the Place de Carrousel and the Place de l'Étoile were erected by Napoleon, though the latter, the Arc de Triomphe, was not completed until the reign of Louis Philippe. It is notable for its magnificent group sculpture by Rude, 'La Marseillaise.' The quays on the S. bank of the Seine were also built under Napoleon, and he ordered the church of the Madeleine, begun in 1764, to be completed as a Temple of Glory; it was not, however, finished till 1842, when it became a Catholic church. He drove 60 new streets through the city. In 1815 Napoleon was finally defeated. The sixth circuit was begun in 1818. There was a 3-day revolution in P. in 1830, when Charles X was deposed. This was commemorated by the bronze Colonne de Juillet in the Place de la Bataille. Louis Philippe's reign also ended in revolution, which led to the estab. of a rep. Between 1815 and 1848 the basilicas of Notre Dame de Lorette and St Vincent Paul were erected as well as many bridges, and 55 new streets were laid. The columns on the Place de la Concorde and the Place de la Baille were raised, but the greatest architectural event of the period was the careful restoration, by Viollet le Duc (q.v.) of Notre Dame (q.v.) and the Sainte Chapelle. In 1852 Louis Napoleon was proclaimed emperor. The seventh circuit, known as that of Thiers, was begun in 1841 and finished in 1869. In 1857 the N. façade of the Louvre was completed. The great changes which have made the modern P. were effected during the Second Empire under Baron Haussmann (q.v.), prefect of the Seine from 1853. All remnants of medieval P. were swept away. Over £34,000,000 were spent then on making 22 new boulevards and avenues. Haussmann's idea was to raise the height of P. instead of allowing it to continue to spread outwards. P. was besieged by the Germans during the Franco-Prussian war from Sept. 1870 to Jan. 1871, and the city suffered bombardment, damage, and famine. After the peace a civil war known as the Commune (q.v.) was waged in P., in which the *Hôtel de ville* and the Tuilleries were destroyed. The Eiffel Tower (q.v.) was constructed for the exhibition of 1889; that of 1900 marked the extension of P. into the plain of Grenelle. Under the Third Rep. the new *Hôtel de ville*, the new Sorbonne, the Trocadéro, the Opéra, and the church of the Sacré Cœur were built. In 1937 the Palais de Chaillot replaced the old Trocadéro. During the First World War P. suffered air-raids and was threatened with attack in Aug. 1914. A military governor was appointed and the seat of gov. removed to Bordeaux the following month. The battle of the Marne (q.v.)

drove the Germans away from the cap. Reinforcements were sent to the battlefield from P. in taxicabs. The gov. returned to P. in Dec. 1914. From 1916 to 1918 P. was attacked by 'Big Bertha.' In July 1919 an allied victory march through P. celebrated the signing of the treaty of Versailles, and on 11 Nov. 1920 the body of an unknown soldier was buried under the Arc de Triomphe. Between the 2 world wars some blocks of luxury flats in the W. of P., and some 30 new churches, products of the Catholic revival of the 1930's, were the prin. new buildings, apart from those already mentioned. Overcrowding has, however, been one of the social and economic effects of the wars.

In June 1940 Ger. troops occupied P., the French having withdrawn to spare it from devastation. In May 1941 a Ger. municipal councillor was appointed commissioner for P. Allied planes made numerous raids on the factory suburbs of P., notably a heavy night attack by R.A.F. bombers on the Renault works at Billancourt in Mar. 1942. In Aug. 1944 Gen. von Choltitz surrendered P. to Gen. Leclerc, after some bitter fighting had occurred between Fr. partisans and Ger. troops (see WESTERN FRONT IN SECOND WORLD WAR). P. had suffered little damage during the war, but nevertheless was faced in 1945 with a severe housing problem, since there had been no building done since 1939. New buildings were commenced both in the centre of P. and in its suburbs, and a number of Métropolitain stations were named after war personalities or incidents, e.g. Franklin D. Roosevelt.

Present-day Paris. The whole of P. was once surrounded by fortifications comprising 3 distinct lines of defence: the inner ramparts were demolished between the world wars. Beyond these there are separate rings of detached forts in the surrounding heights, the outer ring extending for about 75 m. and at about 8 m. from the ramparts, the intermediary forts varying in distance from the outer from 2 to 5 m. The inner line of fortifications confines P. to something roughly resembling a pear in shape, with the stalk towards the W., and the Cité and the Île de St Louis (on the bend of 7 m. which the Seine makes in its 5-hour flow through the city) for core. The riv. flows between broad stone embankments, being spanned by 32 bridges in its course. The greater part of the Cité is occupied by 5 buildings: Notre Dame, the Palais de Justice, to which a new wing was added in 1911-1914, the Sainte Chapelle, the Préfecture de Police, and the Tribunal de Commerce. The Île de St Louis is known now as one of the most peaceful quarters of P. These is., and across the riv. on either hand the busiest part of P. are found within the circuit of the boulevards, the broad, tree-planted thoroughfares which have replaced the ramparts of Louis XIII on the N. and of Philip Augustus on the S. Within this boundary, and on the N. or r. b. of the riv., the following are among the chief points of interest:

the Louvre; to the W. between its N. and S. wings is the Place de Carrousel, with the Arc de Triomphe, and stretching W. again the Jardin des Tuileries and the Place de la Concorde. Outside the circuit of the boulevards is the Avenue des Champs-Élysées; between the Louvre and the gardens is the site of the Tuileries. In a straight line with the Champs-Élysées is the Arc de Triomphe in the Place de l'Étoile, from which sev. avenues radiate. S. of this line, still on the r. b. of the riv., is one of the most fashionable residential areas. To the N. of

slums. N. P.'s suburbs are mainly industrial, particularly in the NE. On the S. bank of the Seine and within the space formerly enclosed within the walls of Louis Philippe is the Quartier Latin in which are to be found the various buildings of the univ. of P., the Institut, the Musée Cluny, the Panthéon, and the churches of St Severin and St Étienne du Mont. Between the 2 world wars a new univ. residential quarter was erected beyond the Porte D'Orléans, known as the Cité Universitaire, with different buildings to house the students of different national-

THE PARIS HEADQUARTERS OF UNESCO, AS SEEN FROM THE EIFFEL TOWER

the Jardin des Tuileries are the Ministry of Marine, the Ministry of Justice, and the Vendôme Column; to the N. of the Louvre the Palais Royal, the Bibliothèque Nationale, and the Bourse. E. of the Louvre are the Halles Centrales, in Tour St Jacques, the *Hôtel de ville*, the site of the Bastille, and the Bibliothèque de l'Arsenal. N. is the Hôtel de Rohan, the Hôtel Carnavale, and the Musée Victor Hugo. In the dist. N. of the Seine and beyond the portion already described the prin. points of interest include the following: just beyond the boulevards the Madeleine and the New Opera House. Further N. is the 'artists' quarter' of Montmartre. About 1 m. beyond the boulevards to the E. is the cemetery of Père Lachaise, and in the N. suburbs the abbey of St Denis (q.v.) containing the royal tombs. In St Denis and Aubervilliers are the cap.'s worst

ities: Collège France-Britannique, Collège au Japon, etc. Beyond the old Quartier Latin to the W. are the Ecole Militaire and the Champ de Mars, with the Eiffel Tower facing the Palais de Chaillot on the opposite bank of the riv. A little to the E. of these is the Hôtel des Invalides, and on the riv. bank close to the boundary the Ecole des Beaux Arts; and S. of that the Palais du Luxembourg with its beautiful gardens, and to the E. on the riv. bank the Jardin des Plantes. Just outside the old ramparts are the Bois de Boulogne on the W. and the Bois de Vincennes on the SE.

Paris: 1. City of Texas, U.S.A., the co. seat of Lamar co., 93 m. NE. of Dallas. It has cotton-seed oil mills, and a cotton-oil refinery. Pop. 18,700.

2. Tn and port of entry of Brant co., Ontario, Canada, 30 m. W. of Hamilton. It has potteries, knitting mills, and oil refineries. Pop. 5404.

Paris: 1. Famous pantomime of Nero's reign. He was a great favourite of the emperor, who declared him to be freeborn though originally a slave of Octavia; but when Nero attempted to become a pantomime he caused P. to be put to death, deeming him a dangerous rival. See Tacitus, *Annals*, xiii.

2. Famous pantomime of Domitian's reign, was a native of Egypt. He was a great favourite both with the emperor and the people, but was put to death for intriguing with the emperor's wife.

Paris, genus of herbaceous perennials (family Liliaceae), with a stout rhizome and erect stem, bearing 4 whorled net-veined leaves, and a solitary green flower followed by a berry-like fruit. The only Brit. species is the herb P., or true love knot (*P. quadrifolia*), a rather uncommon plant found in woods. The berry is black. *P. polyphylla*, Himalayan, bears yellowish-green flowers, succeeded by bright red berries, and is grown in gardens. Its perianth is normally in 8 reflexed parts, 4 large and lanceolate, and the alternating 4 small and narrow.

Paris, Treaties of, name given to various international peace treaties signed in P.; viz. the treaty signed 10 Feb. 1768, by Britain, France, and Spain at the end of the Seven Years War; the treaty signed on 3 Sept., 1783, between Britain and the Amer. commissioners, recognising Amer. independence; the treaty of 30 May, 1814, between the Allies and France after the abdication of Napoleon; the treaty concluded on 20 Nov. 1815 between the same signatories after the final overthrow of Napoleon; and the treaty of 30 March, 1856, signed by Great Britain, France, Turkey, Sardinia, and Russia at the close of the Crimean war. The peace conference after the First World War, which drew up the Versailles peace treaty, was held in P. in 1919-20; and the peace conference held in P. after the Second World War in 1946 drew up the peace treaties between the Allies and Italy, Hungary, Bulgaria, Rumania, and Finland.

Paris Métro. The Paris Métropolitan (Métro) is the underground railway system operated by the Paris Transport Authority. The first section was opened in 1900, and a very complete network has

been built up. About 120 m. are open to traffic. One short section is being experimentally operated by a rubber-tyred train running on a concrete track. This is the first of its kind in the world. The Métro has been the model for several other similar systems in large cities, e.g. Madrid.

Paris University, see SORBONNE.

Parish. The term par., as used to-day in connection with local gov., means no more, according to the Interpretation Act, 1889, as amended by the Rating and Valuation Act, 1925, than a place for which separate overseers were or could be appointed or a separate Poor Rate levied; but like all statutory definitions, that of par. is one of convenience only and not instruction. Originally the expression par. was properly of eccles. significance only; and though it has been suggested that the explanation of the origin of urb. pars. is involved in great obscurity, Blackstone's definition that a par. meant primarily 'that circuit of ground in which the souls under the care of one parson or vicar do inhabit' is probably as true of urb. as of rural pars. The difficulties arise from the fact that from quite early times the par. was regarded as being not only an eccles. but also a civil subdivision of the co., and that the legislature has generally dealt with the par. as the unit area not only for Poor Law purposes but for local administrative purposes generally. In parts of England the par. for local gov. purposes remains practically coterminous with the old eccles. bounds; but in a great number of urb. dists., and especially the metropolis, many pars. have been grouped into one, or the term has been used to cover other areas which, though not historically pars., have a not dissimilar organisation. The result is that in many cases a particular area may be a par. for civil but not for eccles. purposes, while in other cases a particular area may be a par. for some civil purposes and not for others. Historically a par. denotes a circumscribed ter. varying in extent and pop., but annexed to a single church whose incumbent (q.v.) is entitled to the tithes (or other commuted payment) within that ter. The creation of pars. in England was gradual and not complete till shortly before the Conquest. Most historians concur in the theory that the Eng. parochial divs. arose chiefly from lay foundations, the differences in extent being accounted for by the varying limits appointed for them at their origin. The origin of these lay foundations is to be sought in the early inadequacy of the means of divine worship supplied by the bishoprics and monasteries, when the feudal lords began to build their own demesne churches and oratories for their families and tenants. The bishops consecrated these places and consented to the incumbent residing at the church and receiving the tithes and offerings of the inhab. to whose use the particular church was limited, as well as any endowment which the founder happened to annex to it. The last concession made to the lay-founder was probably the advowson (q.v.).

For civil purposes the par. has ceased to be a unit of administration in urb. areas. In rural dists. the dist. is still divided into rural pars. for which there is a par. meeting and, in the more populous pars., a representative par. council also. See LOCAL GOVERNMENT.

Parish Clerk, see CLERK.

Parish Councils, see LOCAL GOVERNMENT.

Park, Mungo (1771-1806), explorer, b. Selkirk; he went to Edinburgh Univ., where he studied medicine and surgery, and distinguished himself as a botanist. In 1792 he went to Sumatra and there carried out certain botanical investigations, the result of which brought him into notice. In 1795 the African Association sent him to explore the course of the Niger, and this he did accompanied only by 2 servants. The journey was full of difficulties and set-backs. At one point he was imprisoned for 4 months by a hostile chief, and escaped with only his horse, and his pocket compass. At last, in July 1796, he found the long-sought Niger, and followed the riv. down-stream from Segou. But he was weak, hungry, and without means, and he had to turn back, finally collapsing with fever at Bamako after having traced the course of the riv. for 300 m. Only the nursing of an African, in whose house he remained for 7 months, saved his life. On his return in 1799 he pub. his *Travels* (see Everyman's Library), which achieved great popularity. He now estab. himself as a surgeon at Peebles, but the love of travel was too strong within him for such a life, and in 1805 he sailed for the Niger. This expedition was a much more ambitious one than the first and consisted of some 70 Europeans, including soldiers, artificers, draughtsmen, as well as native guides and carriers. They started, as before, from Pisanía, in the Gambia, but by the time they had reached the Niger only 11 Europeans were left alive; the rest had succumbed to fever and dysentery. P., however, was undeterred and determined to continue from where he had left off on his first expedition. With the help of the one soldier still capable of work, he built, out of 2 canoes, a serviceable boat which he called the *Joliba*, the native name for the Niger. Before setting sail in it with the poor remnants of his party he gave letters to a native guide to take back to the Gambia for transmission to England. One of these, addressed to the Colonial Office, ends on a note of high courage, to the effect that though all with him should die he would still persevere and if he could not succeed in the object of his journey he would at least die on the Niger. P. perished in the rapids at Bussa; but not before he and his companions had navigated a thousand m. of the riv. The *Joliba* seems to have got into a wrong channel, struck a rock, and remained fast. Hostile tribesmen on the bank attacked with spears and arrows, and, either because they were unable to defend themselves, or because the boat was smashed under them, the occupants were swept into the water

and drowned. Today at Pisanía there stands a monument commemorating this gallant Scotsman. See life by L. G. Gibbon, 1934.

Park, large enclosed piece of ground, usually with woodland and pasture, attached to a country house, or an enclosure in a tn ornamentally laid out for public recreation. In England a bor. or urb. council has the power to purchase land for such a purpose, and there are few tns that have not one or more public P.s. Those presented by private individuals are usually maintained by the bor. or urb. council. The word is also used for a large tract of land kept in its natural state for the public benefit. Among the most famous P.s, public or natural, may be mentioned Hyde P. and Regent's P. (qq.v.) in London, the Bois de Boulogne (q.v.) in Paris, the Tiergarten in Berlin, the Yellowstone National P. (q.v.) in the state of Wyoming, U.S.A., the Algonquin P. in Ontario, the Yosemite (q.v.) National P. in Central California, the Australian National P. at Port Hacking, the Rocky Mts (q.v.) and Jasper (q.v.) P.s in Alberta, and the Parc National Albert in the Belgian Congo, in which is Mt Karisimbi (14,780 ft high). But the great national P.s have nothing in common with a small Brit. public P., and may be more appropriately compared with the animal sanctuary at Whipsnade (q.v.). P.s like the Kruger National P. in S. Africa and the Buffalo and Wood Buffalo P.s in Alberta are essentially game reserves; and in the Brit. and Belgian E. and central African dependencies there are many P.s for the preservation of the fauna and flora of Africa. See also GAME RESERVES; NATIONAL PARKS; OPEN SPACES AND COMMONS.

Park Ridge, residential city in Illinois, U.S.A., a NW. suburb of Chicago. Truck farming is carried on. The O'Hare Field, Chicago international airport, is near by. Pop. 16,602.

Parker, Dorothy Rothschild (1893-), Amer. satirist and humorist, b. West End, New Jersey. Educ. at the Convent of the Blessed Sacrament, New York, she became a journalist, and was for a time book-reviewer on the *New Yorker*. Though satirical, she could command pathos, as in her short story 'Big Blonde,' which won the O. Henry Prize in 1929. Her books of verse include *Enough Rope*, 1927, *Sunset Gun*, 1928, *Death and Taxes*, 1931, and *Not so Deep as a Well*, 1936. *Laments for the Living*, 1930, and *Here Lies*, 1939, are vols. of short stories. She was married first to Edwin P. Parker and then to Alan Campbell, a film actor.

Parker, Sir Gilbert (1862-1932), politician and writer, b. Camden E., near Addington, Ontario, Canada, and educated at Toronto. He was Conservative M.P. for Gravesend 1900-18, and was made a baronet in 1915. He wrote poems, books of travel, and novels. Probably the most popular of his novels are *The Seats of the Mighty*, 1896, which was dramatised; *The Lane that had no Turning*, 1900; and *A Ladder of Swords*, 1904. His autobiography, *Tarboe*, appeared in 1927.

Parker, Horatio (1863-1919), Amer. organist and composer, b. Auburndale, Massachusetts. He studied at Boston and at Munich, where he was a pupil of Rheinberger. In 1884 he returned to New York and became an organist and choirmaster, and taught at the National Conservatory directed by Dvořák. Later he became organist at Trinity Church, Boston, and in 1894 prof. of music at Yale Univ. He visited England sev. times for performances of his works at the festivals (*Hora Novissima*, at Chester and Worcester; and *A Wanderer's Psalm*, at Hereford), and to receive the Mus.D.

sent to the Baltic against the fleets of Russia, Sweden, and Denmark. It will be remembered that it was his signal that Nelson ignored at the battle of Copenhagen by jocularly using his blind eye to look at the signals (see NELSON). P. later compelled Sweden to remain neutral, and was ready to sail to Kronstadt when the Tsar's death put an end to the hostilities.

Parker, Joseph (1830-1902), Congregational minister, son of a stonemason at Hexham-on-Tyne. About 1845 he became known as a local preacher and temperance lecturer. On entering the

CHATSWORTH PARK, DERBYSHIRE

Chatsworth House, a seat of the Duke of Devonshire, was built by Sir William Cavendish in 1557, and rebuilt by the first duke between 1687 and 1707.

from Cambridge in 1902. Among his works are (opera) *Mona and Fairyland*; (oratorios) *The Legend of Saint Christopher* and *The Dream of Mary*.

Parker, Sir Hyde (1714-c. 1783), adm., b. Tredington, Worcestershire. He commanded the Brit. fleet in the action off the Dogger Bank in 1781, in which 3 Dutch ships were destroyed and the rest compelled to retreat to harbour. Having been given command of the E. India fleet, P. sailed from Rio de Janeiro 12 Dec. 1782; but neither he nor his ship was again heard of. Nine years later its equipment was found and it was presumed to have been lost with all hands.

Parker, Sir Hyde (1739-1807), second son of above and a more famous adm. He distinguished himself in the Amer. war, blockaded the Dutch harbours in 1782, and commanded the fleet in the E. Indies in 1795. In 1801 he was in supreme command of the fleet which was

ministry in 1852, he became assistant to John Campbell at Whitefield's Tabernacle, London, soon afterwards going as pastor to Banbury, whence he went to Manchester. P. returned to London in 1869 as pastor of the Poultry church, and almost immediately began his great scheme for the erection of the building on Holborn Viaduct known as the City Temple, which was opened in May 1874. There he preached to large congregations and became famous among nonconformists for his powerful oratory. He wrote many books on religious subjects. See his *My Life and Teaching*, 1889, and *A Preacher's Life*, 1899.

Parker, Louis Napoleon (1852-1944), Brit. dramatist, composer, and pageant master, b. Calvados, France, his father being an Amer. lawyer and his mother Eng. His great-grandfather, the Honourable Isaac P., was from 1814 to 1830 chief justice of Massachusetts. P. made rapid

progress in the study of music and, at the instance of Sir Wm Sterndale Bennett, went to Sherborne school as piano master, and stayed in Sherborne for 20 years, teaching languages as well as music. P. later went to London to teach music, but instead became a playwright, improvising his own theatre from a large barn. The list of his works is long and, generally, his plays were more successful in America than in Britain. At one time 3 New York theatres were crowded by *Joseph, Disraeli*, and *The Paper Chase*, while *Pomander Walk* had a record run on tour in the States. It was in *Drake*, however, produced at His Majesty's Theatre in 1912, and revived in 1914, that P. reached his highest level in spectacular grouping on the stage. Already he had achieved a great reputation outside by his pageants at Sherborne, Warwick, Bury St Edmunds, and elsewhere, of which he tells in his reminiscences, *Several of My Lives*, 1928. Besides writing his own plays he was a skilful adapter of the work of others. His *David Copperfield* gave Sir Herbert Tree a great opportunity. His *Beauty and the Barge* was very successful, and *The Man in the Street* and *The Bugle Call* were effective curtain raisers. Of his later work mention may be made of *The Cardinal*, performed at St George's Theatre during Canterbury Week of 1930, and *The Lily of France*, a play on Joan of Arc produced at Nancy in 1936.

MATTHEW PARKER

Parker, Matthew (1504-75), archbishop of Canterbury, b. Norwich. In 1544 he was elected master of Corpus Christi College, Cambridge, and in 1545 vice-chancellor of the univ., in which capacity he manfully opposed the spoliation with which the colleges generally were threatened. In 1552 he was installed dean of Lincoln, but lived in retirement during Mary's reign, to be promoted on the accession of Elizabeth to the archbishopric of Canterbury. He sought to establish in

England a *via media* between Rom. Catholicism and Puritanism. He pub. *The Bishop's Bible*, 1563-8; *De antiquitate ecclesiae*, 1572; and eds. of Gildas, Asser, Aelfric, the *Flores historiarum*, Matthew Paris, and other important chroniclers. He presented a valuable collection of books and MSS. to Corpus Christi. See W. T. Hook, *Lives of the Archbishops of Canterbury*, 1872; A. S. Barnes, *Bishop Parker and the Anglican Orders*, 1922; and J. C. Whitebrook, *The Consecration of Matthew Parker*, 1935.

Parker, Sir Peter (1721-1811), admiral, b. Ireland, the son of Rear-Adm. Christopher P. (d. 1768). He served in the Mediterranean in 1743, and in 1775 was in command of a squadron which attacked Charlestown, being repulsed with the loss of 3 frigates. He took part in the reduction of Long Is. and Rhode Is. the same year; and in 1777, having been promoted to rear-adm., was appointed commander-in-chief at Jamaica. In 1782 he was created a baronet, and in 1799 promoted to be adm. of the fleet. He was the early patron of Nelson.

Parker, Theodore (1810-60), Amer. clergyman, b. Lexington, Massachusetts. Educ. at Harvard College, he settled as Unitarian minister at W. Roxbury in 1837. The rationalistic views which separated him from the more conservative portion of the Unitarians first attracted wide notice in consequence of an ordination sermon, in 1841, on 'The Transient and Permanent in Christianity.' He further developed his theological views in 5 lectures, delivered in Boston, and pub. (1841) under the title *A Discourse of Matters Pertaining to Religion*, which was followed by *Sermons of Theism, Atheism, and Popular Theology*, 1853.

Parker, Sir William (1781-1866), adm., the grandson of Sir Thomas P. (c. 1695-1784). He entered the navy in 1793, and served in the Channel fleet under Lord Howe, subsequently coming under Sir Hyde P. (1739-1807). He protected Brit. interests on the Tagus during the civil war of 1834. In 1841 he was appointed commander-in-chief in China, and, having captured Amoy, Ningpo, Woosung, and Shanghai, brought the war to a successful conclusion by seizing Chinkiang-foo. He rose to the rank of adm. in 1863.

Parkersburg, city of W. Virginia, U.S.A., on the Ohio R. 90 m. S. of Wheeling. It is centre of an oil, natural gas, coal, and clay region, and a shipping and distribution centre. Manufs. include rayon, steel, glassware, and porcelain. Pop. 29,700.

Parkes, Edmund Alexander (1819-76), prof. of hygiene, b. Bloxham, Oxfordshire. He studied at Univ. College, London. During 1842-45 he was assistant-surgeon in the Indian Army, and in 1840 was made prof. of clinical medicine at Univ. College. In 1855 he superintended a large civil hospital in the Dardanelles, opened to relieve the pressure upon the hospitals at Scutari during the Crimean war, and in 1860 accepted the chair of hygiene at the Army Medical

School. He was a pioneer of modern hygiene, and famous throughout Europe in the field of military hygiene. His most important work was his *Manual of Practical Hygiene* (8th ed., 1891), which has been trans. into many European languages.

Parkes, Sir Harry Smith (1828-85), diplomat, b. Birchall Hall, Bloxwich, Staffordshire. P. entered King Edward's Grammar School, but in 1841 went out to join his sisters, who had been settled some time in China. On his arrival at Macao he applied himself to the study of Chinese, which laid the foundation of his successful career. He was attaché in 1842 to Sir Henry Pottinger's punitive expedition up the Yangtze-kiang, and, though only 15, P.'s knowledge of the language made him of immense service to the commissariat. In Sept. 1843 he entered the Brit. Consulate at Canton eventually becoming head of the legation at Canton in 1857. Appointed consul at Shanghai (1861), he left there for diplomatic work in Japan in 1865. Returning to China in 1883, he took over the legation at Peking, carried through a valuable treaty with Korea, and acquired Port Hamilton for a Brit. coaling station in the N. Pacific.

Parkes, Sir Henry (1815-96), Australian statesman, b. Stoneleigh, Warwickshire. Possessed of very little education, he worked for some time as a labourer, but emigrated to Sydney in 1839, where he found more congenial employment. During his spare time he developed a taste for literature, publishing a small vol. of poems, *Stolen Moments*, in 1842. He became interested in politics, and in 1849 started the *Empire* newspaper, in which he expressed his views against the transportation of convicts. For some years he represented E. Sydney in the Legislative Assembly. P. came to England in 1861 as a commissioner for promoting emigration. On his return he was made colonial secretary in 1863, and when the Martin ministry resigned, in 1872, became Prime Minister, to which office he was 5 times re-elected. His financial position was never strong, and he died, a very poor man, at Sydney. P. was instrumental in passing the Public School Acts of 1866, and worked hard in the cause of Australian federation. See life by T. Bavin, 1941; M. D. McLaurin, *Sir Henry*, 1946.

Parkes, tn in Ashburnham co., New S. Wales, Australia, 277 m. WNW. of Sydney. It is mainly a wheat-growing and sheep-grazing area. Pop. 8100.

Parkhurst, see NEWPORT.

Parkinson, James (1755-1824), physician, b. Hoxton, London, son of a surgeon, to whom he was apprenticed. Nothing is known of his early years. He practised all his life in Hoxton. His name is perpetuated in 'Parkinson's disease' (paralysis agitans), of which he gave the first description in his *An Essay on the Shaking Palsy*, 1817. He was also one of the first medical politicians, wrote a useful *Chemical Pocket-Book*, 1799, and was a geologist of considerable merit (he wrote *Organic Remains*, 3 vols., 1804-11, and *Outlines of Oryctology*, 1822). See James

Parkinson, 1755-1824, ed. by M. Critchley, 1956, which includes a memoir by W. H. McMenemey and reproduces the famous *Essay*.

Parkman, Francis (1823-93), Amer. historian, b. Boston and educated at Harvard. He devoted his life to historical writing, as a rule taking for his subject the struggle for power between England and France in Canada. His books are still standard authorities on the hist. of colonial N. America. His prin. works are *The Conspiracy of Pontiac*, 1851, *The Pioneer of France in the New World*, 1865, *The Jesuits in North America*, 1867, and *Montcalm and Wolfe*, 1884. See M. Wade, *Francis Parkman: Heroic Historian*, 1942, and (ed.) *The Journals of Francis Parkman*, 1949.

Parlement, the Fr. tribunals which before 1789 were invested with sovereign judicial authority, and political and magisterial powers which eventually made them instruments of monarchical tyranny. According to Loyseau and Machiavelli, the P.s saved feudal France from dismemberment as in Italy and Germany, for most of the Fr. kings developed their powers as a weapon against feudality, and gave them, as far as possible, an independent status. This supreme power was soon turned against the monarchy, and in the reign of Louis XII the P. acted as a mediator between the king and the nation. Under Louis XIII the pretensions of the P. increased, especially after the dissolution of the États Généraux of 1614. It censured the queen, extravagance of all kinds, and the shackles put upon justice by the court and the nobility. In the ensuing struggle between the P. and the monarchy, the former was completely humiliated by the boldness of Cardinal Mazarin. On the death of Louis XIV the P. attempted to recover its old authority, tore up the will of the late monarch as it had that of his predecessor, and formally took the name 'sovereign court.' In 1762 the P. acquired tremendous popularity by declaring the abolition of the society of Jesuits, and in despoiling that society of its property. Finally, in 1792 the P. was abolished on the ground that the nation had never concurred in the election of its members. It is possible to regard the birth of liberty in France as synchronous with the abolition of the P.s, but Fr. historians acknowledge their services for France and the splendid characters they formed.

Parley, Peter, see GOODRICH, SAMUEL GRISWOLD.

Parliament. ORIGINS. Down to the revolution of 1688 the hist. of the Eng. P. reflects the struggles between the king, the nobility, and the people. After that date it becomes the hist. of the struggle for electoral reform, of the doctrine of ministerial responsibility, and of the party system. The landmarks of the pre-revolutionary period are the resistance of the king and the people, in alliance, to the tyranny of the feudal barons, and, later, the alliance of the barons and people against the encroachments of the royal prerogative; the admission to P. of the

medieval burgesses ostensibly to be consulted on taxation (the beginning of popular representation); the alternating concentration of power, first in the hands of the monarchs and then in the commons, between the end of the 13th cent. and the close of the Tudor period; the struggle, during the Stuart period, between the protagonists of the divine right of kings and the supporters of parli. privilege and lawful taxation, complicated by questions of religion; and the limitations of the royal prerogative as embodied in the Bill of Rights.

The term P. was probably first used in England by Matthew Paris (q.v.) in 1246, and introduced through the Normans or through intercourse with the Fr. kingdom. It is also used retrospectively by later writers, and in a record of the twenty-eighth year of Henry III the assembly in which Magna Carta was signed is mentioned as the 'Parliamentum Runnymede.' No precise meaning can be given to the term by reference to the class of persons that constituted the national assembly, though some historians differentiate the deliberative assemblies of the Plantagenet monarchs at and after the time of Simon de Montfort's celebrated P., by calling them 'P.s' as opposed to the 'Magnum Concilium' of the previous period. In spite of the despotic power to which some Eng. monarchs have attained, a national assembly of sorts can be traced back to Saxon times. This distinguishes the hist. of England from that of every other European kingdom. The Witenagemot becomes the Great Council, and the latter the bicameral P. But the A.-S. folk-moot, though a popular assembly which declared the law or custom of the countryside, was a localised institution, and did not deliberate such great matters as war and peace; and the Witenagemot was an aristocratic assemblage in the constitutional powers of which the people at large did not participate. It is possible that the people had some definite right to attend, e.g. when a new king was to be elected, but there is no evidence that they habitually did so; and we may, therefore, regard the Witenagemot or the later Magnum Concilium, or Council of Magnates, as the forerunner of the House of Lords, and perhaps the assembly at Runnymede as the lineal progenitor of the House of Commons, though until the year 1295 there appears, in spite of the frequent summonses of the burgesses to attend, to have been for the most part but one legislative chamber. The struggle between the king and the greater feudal barons was probably the predisposing cause of popular liberties; for the kings, at a time when William the Conqueror's notions of the appropriate relations between the kingship and the feudal hierarchy of tenants were as yet in the balance, generally found themselves forced to secure the support of the people at large, with the result that some idea of popular liberties slowly emerged, although largely in the land-owning class. The judicial, fiscal, and legislative reforms of Henry II sealed the doom, not

only of the barons, but also of any future monarch who should disregard the type of Eng. government and administration crystallised in those reforms. Thereafter the opposing forces were usually the king (and his foreign favourites) and those barons who, excluded from power and privilege, sought to win control over the Crown. The Commons were from time to time drawn into alliance with baronial factions, but attempts to introduce continuous control of the Crown broke down in face of the barons' reluctance to undertake such an onerous task. Finance and judicial business were the chief concerns of the representatives, and the king's court estab. a superiority in these matters over local feudal courts. P. was (and is) the 'high court.' 'No taxation without representation' has been the peculiar genius of Eng. government at almost all times, and Englishmen were familiar with the idea of representation long before the reign of John; for the king's officers (generally circuit judges) used to arrange financial matters with the commons' representatives in the shape of the recognitors of the grand assize (the progenitors of the modern co. member) and deputies sent by the bor. inhab. (the forerunners of the modern burgess). See BURGESS; ELECTORATE; JURY; REPRESENTATION.

The representative principle became further developed in the reigns of John and Henry III, when co. and bor. representatives were occasionally summoned to meet either the king or the barons in London or other tns. to confer about taxation. These conventions prompted a desire for a national P., though it was not till Edward I that a P. was summoned which consisted of representatives of all the estates of the realm (q.v.), viz. archbishops, bishops, superior clergy, barons, knights of the shires, and burgesses. Before De Montfort's famous P. of 1265 there were only 4 instances of co. representatives being summoned to the national council, in 1213, 1254, 1258 (the 'Mad Parliament'), and again in 1258. The prin. if not the only business was financial matters. Strictly the wording of Magna Carta required the king to consult the people's representatives on taxation; and as there already existed a recognised machinery in the shire-moots for the election of knights to nominate recognitors in civil suits (in other words, a working system of co. representation generally), the Crown had still less justification for abstaining from summoning at least the knights of the shires. The burgesses or tn representatives, however, were not called on until Simon de Montfort, earl of Leicester, who may be termed the creator of the House of Commons. The writs which he issued in 1264 required the sheriffs to return not only 2 knights from each shire, but also 2 citizens from each city and 2 burgesses from each bor. Henry III, though he called the burgesses to the national assembly, had no desire to consult them on matters of state; and indeed Edward I would appear to have favoured the idea merely because it was

an easier way of raising money than by a purely arbitrary method. But though the representatives were long ignored in legislation and deliberation generally, the fact that they were summoned regularly in time gave them political status. Moreover, although, at first, knights and burgesses deliberated and voted apart, the former soon forgot the fact that the representatives of the wealthy cities were socially their inferiors, and began to join with them in petitions for legislation. This alliance was made easier by the fact that younger sons of noble families, being excluded from rank by the heirs, were plain esquires. Finally, the knights broke away altogether from the greater barons or hereditary legislators, and sought the House of Commons as their appropriate sphere. By the reign of Edward III the Commons had become much bolder, and not only successfully asserted a right to veto enactments affecting the people at large, but declared to the king in P. that they 'refused to be bound by any of his statutes or ordinances unless made with their assent.' The Crown interested itself in the composition of the Commons (see ELECTORATE).

Since Magna Carta no king had questioned the right of the com. to send their representatives to P.; but the Crown did not hesitate to dispute the bor. representation, and in consequence sev. Acts were passed to check the Crown's attempts in this direction. These attempts generally took the form of incorrect returns of members by the Crown's nominees, the sheriffs. In Richard II's reign an Act was passed fining sheriffs who made false returns, and in the time of Henry IV the justices were empowered by statute to inquire into the same abuses. After the House of Commons was estab. as a separate legislative body, it began itself to restrict the suffrage (see ELECTORATE), e.g. an Act was passed in 1430 to restrict the co. franchise, formerly possessed by all freeholders, to those whose freeholds were worth 40 shillings a year. Towards the close of the Middle Ages, P. declined, more and more of the general petitions which were a chief function being referred to the executive branch of the gov. This process, analogous to the decline of P.s in France, Spain, and Germany, was halted only when the Tudors recognised the importance of attaching mass opinion to their benevolent dictatorship. Under the Tudors P. was at first entirely subject to the king; it was rarely summoned by Henry VII, or during the first part of the reign of Henry VIII. It was not until the latter years of Elizabeth's reign that the Crown's ascendancy began to be challenged. The dangers of civil war lingering on from the Lancastrian-Yorkist factions, and the need for a strong gov. to stamp out the remnants of baronial lawlessness, enabled Henry VII to maintain with ease the ultimate power of the Crown. To him P. was useful, but it was by no means necessary. Yet its usefulness in canalising popular support gave it some importance, and an effective resistance was later made

to Thomas Cromwell's attempts to introduce a standing army and other means of unlimited royal autocracy. In Henry VIII's reign P. was establishing a continuity important for the future. The breach with Rome was effected through P. and with parl. approval, since a façade of popular action was thus built up. Yet the fact that Henry used and consulted P. gave the institution an ever-increasing importance. The Sp. menace and the fear of Rom. Catholicism demanded a strong central authority, but after the defeat of the Armada a new spirit began to manifest itself, and Elizabeth's latter years were marked by an ever-growing independence of speech and action by P., complicated by the conflict between Puritanism and the Anglican Church. Repeatedly Elizabeth declared that there were topics—such as her marriage, religion, and foreign affairs—which were not to be considered matter for parl. concern, and repeatedly the more progressive elements denied this restriction. The Commons indeed came into collision with Elizabeth on sev. occasions, e.g. on the question of the queen's marriage and the settlement of the succession 1566; on eccles. matters, 1571 and 1593; and on monopolies, 1601. The control which the council had exercised over parl. deliberations began to give way to a new group of Commons leaders. With James I and Charles I this process developed with growing speed to the inevitable outcome in civil war. With all the Englishman's concern for precedent and legality, Crown and Commons appealed to the past. The lawyers became leaders in P., since they could produce justifications for parl. claims which were practically effective if theoretically doubtful; they could draft bills and organise business; and they were supported by the legal knowledge which almost every Stuart gentleman acquired as part of his education. The Stuarts claimed a theoretical divine right of kingship which was no less irritating because the Tudors had enjoyed it in actual practice. That the Crown also supported the estab. church added a further source of conflict with those of the commons who had embraced the Puritan beliefs. Once the claim of taxation without parl. approval had been advanced, and material interest reinforced religious and political ideas, compromise became impossible.

During the interregnum a period in which P. undertook executive authority was followed by one in which it lost all authority to Cromwell, whose rule convinced the nation that irresponsible gov. was not to be tolerated. The folly of James II reinforced the lesson, and the peaceful revolution of 1688 marked the beginning of parl. dominance over the Crown, and of the responsibility of the executive to P.

The clause in Magna Carta against the imposition of arbitrary aids found renewed expression in the Bill of Rights, which made illegal the levying of money for the Crown by pretence of prerogative, without leave of P. The Bill of Rights

gave the death-blow to prerogative for all time, and made it clear that the king was a monarch with powers limited by P. Henceforth the hist. of P. is that of party gov.: the wielding of the prerogative power by the party in the majority in the House of Commons, or rather by the Cabinet (*see* CROWN; CABINET; PARTY GOVERNMENT). The Crown was reduced to the exercise of personal influence, and even that suffered from the alien manners and speech of the first 2 Georges. But the victory over prerogative achieved by the revolution of 1688 was a far cry from

the greater barons were those who in their military, fiscal, and legal transactions dealt directly with the king, while the lesser transacted their business with the sheriff. If Simon de Montfort was the creator of the House of Commons, Edward I created the House of Lords; because even after 1215 the greater barons were by no means a strictly defined class, and it was merely by reason of Edward I's consistent exercise of his power to select those whom he chose to be summoned by special writ that the demarcation of the hereditary legislator from

Pitt is addressing the House. From the painting by Karl Anton Hickel.

the ideals of a democratic P.; for there followed the tremendous struggle for electoral reform and the disfranchisement of the 'rotten hors.' that culminated in the Reform Act of 1832. The subsequent hist. of P. has been treated both historically and critically in PARTY GOVERNMENT; CABINET; ELECTORATE; and POLITICS. The hist. of the House of Lords is to a great extent that of the Privy Council (q.v.), or rather of the Great Council of the Saxon and Norman kings out of which sprang the Privy Council, the Cabinet, the executive depts of state, and the high court (*see* CABINET; PRIVY COUNCIL; GOVERNMENT). It is important, however, to notice that before Magna Carta a distinction had grown up between the *maiores* and *minores barones*, and that by Article 14 of the charter the former were to receive a special writ and the latter a general writ, calling them to P. In fact,

titled persons not to be so highly honoured resulted. (*See also* NOBILITY on the principle of the hereditary right to the privileges of the peerage.) The House of Lords has undergone no essential change in its composition ever since that composition was stereotyped in the Middle Ages, though occasionally life peers sat in the House. Since the decision of the Committee of Privileges in the Wensleydale case (1856) no life peer, except spiritual peers and the lords of appeal in ordinary, has been allowed to sit in the House of Lords. The more recent hist. of the House of Lords will be found in the article REFORM OF THE HOUSE OF LORDS.

MODERN TRENDS. The imperial P. no longer legislates for the dominions or the greater part of the commonwealth, and it ceased to do so long before the Statute of Westminster (q.v.). Nor does it now venture to pass bills of attainder or confiscate

property or deprive people of life and liberty without due process of law, excepting in very rare cases. Yet theoretically it can do all these things, for there is no legal limit to what P. can enact. By contrast with the Amer. political system of checks and balances, the Eng. is designed, not unsuccessfully, to make it easy to determine what general line of policy shall be followed, and by what individuals it shall be carried out. In America it sometimes seems that the people authorise the president to follow some clear-cut policy, while at the same time they give authority to Congress to act differently, and to the supreme court to prevent either president or Congress from acting unconstitutionally. But democracy in England, which reduces the influence of personalities to the few leaders on either side, means the choice of a gov. with almost plenary powers. Hence, in the past, 'third' parties have faded out of the Eng. parl. scene, because the Eng. voter is averse to throwing away his vote on lost causes, although today a minority of the electorate still support the Liberal party. It is no doubt true that among the principles for which Wilkes successfully fought was the right of the electors to choose what candidates they liked for P. To-day the average constituency party may generally be willing to adopt a candidate recommended by the party machine; but it retains the ultimate power of selection, and sometimes exercises it against the wishes of party headquarters. In the eyes of an Amer. critic a parl. system in which complete power is put into the hands of a small group of men restrained only by public opinion and tradition seems undemocratic. For in the Amer. political system power is deliberately divided, little or no trust being reposed in the discretion of either the executive or the legislative power, while minorities have ample legal powers to impede the action of majorities. P. is a more important institution in the Eng. system than Congress is in the Amer., because it does not share its powers with a president or a court over which it has no direct control. Yet members of P. are less important than congressmen, because they delegate most of their powers to the ministry. This is not, however, undemocratic, for the Eng. voter at an election is primarily choosing a governing (majority) party and a Prime Minister, so that really the House of Commons is a kind of electoral college and national convention combined.

POWER AND JURISDICTION. The 'transcendent and absolute' power of P. for making laws was asserted by Coke, and Blackstone and Dicey use language to the same effect. P. is constituted by the Sovereign, the Lords, and the Commons, who together exercise the legislative functions. But each has other and separate functions. The whole executive authority resides in the Crown. Legislation is not the sole or even the more important function of either House. The Lords have an important part in revising legislation sent up from the Commons;

and it is also a forum for debates on topics of the day which can often be discussed by peers with expert knowledge, and in an atmosphere free of the excessive political heat engendered by controversy in the elected House. But its chief distinction lies in its exercise of judicial functions, as the ultimate court of appeal. The power of the Commons derives from its absolute right of imposing taxes and voting money for the public service, fulfilling the principle of representation and consent to taxation. The greater part of its time is occupied with financial business. In substance, P. controls legislation, as it does administration, by debating and ultimately approving the policy of the gov. If the Commons as a whole is hostile to the gov. it can compel it either to resign or to dissolve P. This is unlikely where the gov. possesses a party majority; but normally the gov. has at its command a stable parl. majority, which it controls partly by its power to dissolve P. Thus, though in one sense the House controls the gov., in a more practical sense the gov. controls the House. When the gov. has a majority in both Houses, the 'transcendent and absolute' authority of P. is the authority of the gov. But it is not really transcendent and absolute, for behind both gov. and the House of Commons is public opinion, which can quickly transform the whole parl. scene in times of emergency, as, for example, when in 1940 Neville Chamberlain's Gov. collapsed, and gave way to the Coalition Gov. of Winston Churchill.

While P. can, within the limits of public opinion, decide anything, a member of the Commons cannot bring forward any motion at any time he thinks fit, for the activity of private members is limited. The importance of the absolute legal authority of P. is that, as there is no constitutional limitation on legislation, there is no topic which the House cannot discuss, though not all matters can be discussed with equal facility, e.g. under a rule over two centuries old, if a Bill involves expenditure it can proceed beyond its second reading only if a minister introduces a financial resolution. In short, the 'transcendent and absolute' power of P. places enormous power in the hands of the gov., but it is not a power which can be seriously abused, for abuse would lead to retribution at the hands of the House of Commons or the electorate. Because it is a democratic system the Brit. parl. system can afford strong gov., and does not require constitutional limitations upon parl. authority (see W. Ivor Jennings, *Parliament*, 1939).

CROWN AND PARLIAMENT. By virtue of the prerogative the Crown is entitled to summon, prorogue (see PROROGATION), and dissolve P. On the accession of a new sovereign P. must assemble without delay (see DEMISE). The monarch does not pay official visits to P. except on stated ceremonial occasions, viz. at the opening of a parl. session. He (or she) can, but does not, personally attend to assent to Bills that have passed the

Houses. The formal ceremonial of the speech from the throne at the opening of a session is intended to indicate the nature of the state's relations with other countries, and generally to outline the gov. programme of legislation. To bring the name of the sovereign into debate in order to influence the opinion of the House is contrary to parl. etiquette, and no member is allowed to speak slightly of the sovereign. The monarch may dissolve P. when he chooses, but his discretion has become the constitutional privilege of the

Cabinet (q.v.). The mode of dissolution is by proclamation (q.v.), issued technically by the advice of the Privy Council (q.v.). Either House may adjourn for any period it likes; and generally adjourns for about 3 months from Aug. to Oct. The Crown has a statutory power to order a resumption of business when both Houses stand adjourned for more than 6 days. That P. must meet at least once a year is guaranteed by the fact that money for the public services is provided by ann. acts, and no demand for taxes would be legal unless it did meet (see Dicey's *Law of the Constitution*).

See HOUSE OF LORDS; REFORM OF THE HOUSE OF LORDS; HOUSE OF COMMONS; COMMITTEES, PARLIAMENTARY; PARLIAMENTARY PRIVILEGE; PARLIAMENTARY BILLS; GOVERNMENT; BRITISH COMMONWEALTH; and other Parl. entries. See Sir T. E. May, *Constitutional History of*

1952; Herbert Morrison, *Government and Parliament*, 1954; H. R. G. Greaves, *The British Constitution* (3rd ed.), 1955; J. F. S. Ross, *Elections and Electors*, 1955.

Parliament, Houses of, officially known as the Palace of Westminster, being originally a royal residence from the time of Edward the Confessor (who built the original palace) until Henry VIII. Additions and alterations were made at various times. In 1512 they were damaged by fire; Henry VIII later took York House (renaming it Whitehall Palace) from Wolsey, built St James's Palace, and abandoned the Westminster residence. In 1547 Edward VI granted the use of its chapel of St Stephen to the Commons, who had hitherto met in the chapter-house of Westminster Abbey, and there they remained until a fire in 1834 destroyed all the palace except Westminster Hall, the crypt of St

Stephen's Chapel, and the cloisters. A new Palace of Westminster was begun in 1840 in a rich adaptation of Gothic designed by Sir Charles Barry, assisted by A. W. Pugin; the lords occupied their chamber in 1847, and the formal opening by Queen Victoria followed in 1852. After Barry's death (1860) the completion was carried out by his son E. M. Barry. The House of Commons was destroyed by bombs in 1941. A new chamber designed by Sir Giles Gilbert Scott, substantially on the lines of the former building, was begun in 1948 and formally

Lords, a brilliantly decorated chamber. The thrones for the sovereign and consort, designed by Pugin, stand at its S. end; and in front of them is the Woolsack, traditionally held to have been placed in the house in the reign of Edward III. Wool was the staple commodity of England at this period, and the use of it for the Woolsack may have some connection with the court of the major of the Wool Staple that used to sit at Westminster. Formerly judges were directed to sit on woolsacks; now they do so only when attending the opening of parliament.

Crown Copyright: reproduced by permission from the Ministry of Works
THE HOUSES OF PARLIAMENT AND BIG BEN

opened on 26 Oct. 1950. Every part of the Commonwealth contributed some kind of furnishing for the new chamber. The exterior features of the H. of P. include the Clock Tower, 316 ft high, containing the hour-bell known as 'Big Ben' after Sir Benjamin Hall, who was first commissioner of works when it was installed; statues of A.-S. kings on the N. front; 300 statues of sovereigns and saints and a terrace on the river front; and the Victoria Tower, 336 ft high, at the S. end.

The public entrance is by a door in Old Palace Yard (the royal entrance is through the Victoria Tower) which, via the Royal Staircase, the 'Norman Porch', and the King's Robing Room leads to the Royal Gallery, which is crossed by the sovereign when opening parliament. The Princes' Chamber beyond leads to the HOUSE OF

The Woolsack in front of the Thrones is the seat of the lord chancellor. At the other end of the chamber is the Bar, at which the members of the Commons attend to hear the speech from the Throne at the opening of parliament and to hear the royal assent to acts of parliament. Also at the Bar are heard the final appeals on lawsuits. The seating for the peers is ranged the length of the chamber; the cross-benches are reserved for princes of the blood, and the seats on either side of the Thrones are for ambassadors and distinguished visitors. Above are the strangers' and press galleries. The chamber was used by the Commons, after a brief tenure of Church House, Westminster, when their own was bombed, the lords the while using the King's Robing Room. The N. end of the chamber leads

to the Peers' Lobby and the Peers' Corridor, then into the Central Lobby, with elaborately carved bosses, used with the adjoining Waiting Hall by visitors and constituents calling to see M.P.s. The panels over the 4 great doorways are filled with glass mosaic pictures of the 4 patron saints of the constituent countries of the U.K.: Saints George, Andrew, David, and Patrick. N. of this lobby is St Stephen's Hall, standing on the site of St Stephen's Chapel, founded originally by King Stephen in 1141 and rebuilt under Edward III as a collegiate chapel. Below it is the crypt dating from 1292-1327, and N. are St Stephen's Cloisters, a late Gothic structure, c. 1526-9. N. of the Central Lobby is the Commons Corridor leading to the Commons Lobby, and the Churchill Arch at the N. end, constructed of masonry from the bombed building, leads into the HOUSE OF COMMONS. The Speaker's Chair is at the N. end. The benches on his right are occupied by the members of the party in power, those on his left by the party in opposition, the front benches being occupied by cabinet ministers and opposition leaders respectively. Although the number of M.P.s is 630, there is seating for only 438. In front of the speaker's chair is the Clerk's table, upon which the Mace (symbol of the speaker's authority from the sovereign) is placed when the house sits as a house, but below the table when the house goes into committee (*see* COMMITTEES, PARLIAMENTARY). Above are the galleries for distinguished strangers, other strangers, and the press. The division lobbies are on the W. and E. sides of the chamber. The house is in session from Jan. to July, with adjournments at Easter and Whitsuntide, and then again from Oct. until Christmas. When it is sitting a light shows at night from the Clock Tower, and by day the Union Jack flies from the Victoria Tower.

The H. of P. are full of statues, paintings, and other representations of incidents and personalities in Eng. hist., more especially those connected with parliament. There is a multitude of rooms for all purposes ancillary to the work of the governing and legislative chamber, and for the purely social side. These include libraries, ministers', committee and law officers' rooms, dining- and smoking-rooms, and the Speaker's Residence is at the NE corner. Old Palace Yard, lying between the H. of P. and Westminster Abbey, is the site of the inner court of the palace built by Edward the Confessor. It later became a place of execution. Guy Fawkes and Sir W. Raleigh were executed here. New Palace Yard, at the NW. corner, was the courtyard of the new palace projected by William II, of which only the banqueting hall (Westminster Hall, q.v.) was built. This yard also became a place of execution.

See Sir Bryan H. Poll, *The Houses of Parliament*, 1950; Maurice Hastings, *Parliament House*, 1950.

Parliamentary Agents, persons who conduct the business of promoting private

Bills and proceedings upon petitions against such Bills in Parliament. Various duties and responsibilities are imposed on P. A. by orders of both Houses. No person may act as a P. A. until he has subscribed to a declaration engraving to observe the rules and practice of Parliament, and to pay all fees in respect of any petition or Bill upon which he appears, and has entered into a bond to observe such declaration. Persons other than solicitors or writers to the signet must apply in writing to the clerk of the private Bill office in order to qualify as a P. A., and must produce a certificate of respectability from a member of Parliament, barrister-at-law, or solicitor. No person is allowed to be registered as a P. A. unless he is employed in promoting or opposing some private Bill or petition pending in Parliament. The private Bill register in the private Bill office, containing the names of the town and country agents soliciting any particular Bill, may be inspected by the public. The P. A. perform the useful function of examining Bills on behalf of those affected who have neither the skill nor time to do it themselves. Many organisations such as the Federation of Brit. Industries, and associations of employees, employ P. A. to watch their interests.

Parliamentary Bills. A Bill is the working draft for intended legislation, the form in which an Act of Parliament first appears. There are three general categories—*public Bills*, dealing with matters of public policy, whether introduced by the Gov. or by a back-bench member (when they are distinguished by the description 'private members' Bills' as distinct from 'private Bills'); these public Bills include the second category, *money Bills*, relating to the imposition of taxes and the spending of money; and *private Bills*, defined in broad terms as being for the benefit of a person or body, e.g. local authorities and public utilities.

Most *public Bills* are introduced by the Ministry. There are limited opportunities for back-bench members to initiate legislation, and some notable social reforms have been brought about by this means; but the days set apart for this are few, there is a ballot at the beginning of each session for priority, and the hazards on the long road to the statute book are many. Bills other than money Bills may originate in either House.

The passage of a Bill through its several stages is the same in the two Houses. A Bill can be brought in by resolution of the House or presented by simply giving notice on the order paper. Its first reading has become a formality, leading to the Bill being printed and circulated to all members. The second reading is the all-important stage, when the main principles are discussed and voted upon; amendments can be moved for the rejection of the Bill, either declaring the reasons for so doing in a 'reasoned' amendment, or simply deferring the second reading to an ineffective time outside the session by the formula 'this day three (or six) months.' If the second

reading is carried the Bill is automatically referred to a standing committee (see COMMITTEES, PARLIAMENTARY) unless the House orders otherwise. The Lords normally take the committee stage in the whole House. In the Commons some Bills (consolidation, appropriation, and those imposing taxes) are always referred to the whole House, and Bills arousing major political controversy generally are. In the committee stage the contents of the Bill, its clauses and schedules, are examined in detail, and amendments made by agreement or on a majority vote. Whether occurring in the whole House or standing committee, this is a lengthy and laborious process, and the promoters of the Bill must be on the alert to detect and resist destructive or damaging amendments produced by the objectors. When a measure is hotly disputed and makes insignificant progress through the committee the Gov. can resort to special powers, commonly called the 'guillotine', to limit the time taken on the Bill as a whole and its sev. sections. When the committee examination is completed the Bill is returned to the House, and in its amended form reviewed by the full House on the 'report' stage. This affords a useful opportunity for reconsideration and decision on points reserved during the committee stage for further examination. (It is sometimes valuable to the Gov. as an occasion to reverse a decision taken by the committee against their wishes.) After the report stage the Bill moves forward to its third reading, when final judgment is pronounced upon it. (In the Lords this stage also is used to make amendments in its provisions.) After the third reading the Bill is sent to the other House to go through the corresponding procedure there.

Differences may sometimes arise because of amendments made by one House against the wish of the other. If these disagreements cannot be resolved the Bill is lost. The amendments in dispute are sent back from the one House to the other, with the reasons for disagreement stated. Negotiations are conducted between the two Houses, and agreement is sought in a compromise or by one House, in order to save the Bill as a whole, not insisting on its view prevailing.

The main purpose of a *money Bill* is the expenditure of money or the imposition of taxation or a public charge. It must be founded on a resolution passed in committee of the whole House. When certified by the speaker, who has sole discretion, a money Bill must be passed by the House of Lords, without amendment, within a month of being received from the Commons; otherwise it is presented to the sovereign for the royal assent and becomes an Act without the assent of the Lords. When both Houses are agreed the Bill is presented for the royal assent, nowadays signified by a commission consisting of 3 or 5 peers, and becomes an Act of Parliament. A special procedure has been introduced for exclusively Scottish Bills, which have the equivalent

of a second reading debate in the Scottish Standing Committee, as well as the committee stage.

Private Bills are subject to a separate code of regulations, in which a quasi-judicial procedure is combined with the process of passing legislation through the two Houses. Most private Bills are local in extent, and deal with such matters as boundary extensions or by-law powers; or authorise public service corporations and utility undertakings to exercise financial powers or carry out specified works. A few are more personal and individual, relating to matters such as naturalisation, divorce, change of name, and title to estates. All of them originate by petition.

The procedure requires that full notice be given so that interested parties may have an opportunity to be heard, and to this end the proposals are required to be publicly advertised, detailed plans deposited for examination, and owners and occupiers affected served with due notice. These matters are governed by a time-table related to the beginning of the session, and the Chairman of Ways and Means and the Lord Chairman of Committees arrange in which House a Bill shall be first considered. Private Bills are read three times in each House as public Bills, but this is formal unless objection is taken. On second reading the House can by resolution instruct the committee to which the Bill is referred what action it shall take on specified clauses or provisions. Private Bills are examined at all other stages by select committees (sometimes for convenience joint committees) which function as semi-judicial bodies, hear counsel on behalf of the contending parties, and examine witnesses. Private Bill procedure covers also the simpler and cheaper process of provisional orders, and its modern variant under the Statutory Orders (Special Procedure) Act of 1945. There is separate provision in this category for Scotland under the Private Legislation Procedure (Scotland) Act.

Parliamentary Committees, see COMMITTEES, PARLIAMENTARY.

Parliamentary Deposits. The promoters of private Bills in which authorisation is sought to carry out undertakings which may prove abortive shall make a deposit of money as a guarantee of good faith. The deposit is to be returned to the promoters where non-completion of work is due to want of compulsory powers. No deposit is required where the money needed for works is intended to be raised on the security of rates and no private profit is to be made.

Parliamentary Privilege is defined in *Erskine May* as 'the sum of the peculiar rights enjoyed by each House collectively as a constituent part of the High Court of Parliament, and by members of each House individually, without which they could not discharge their functions, and which exceed those possessed by other bodies or individuals.' The Lords possess in addition special privileges deriving from the peerage. The House of Commons

has particular privileges which have been stated in these terms—'The sum of the fundamental rights of the House and of its individual members as against the prerogatives of the Crown, the authority of the ordinary courts of law, and the special rights of the House of Lords' (Redlich).

Thus privilege is directly associated with the functions and service of either House: the unimpeded exercise by the House of its authority and functions, and the unhindered discharge by the members of their parl. duties. All privileges are founded either on the law and custom of Parliament or are defined by statute. While they have always been enjoyed by the Lords 'because they have a place and voice in Parliament,' the Commons had to struggle hard and long to assert their right to them, against the Crown and against the Upper House. At the opening of every Parliament, the speaker, after his election, makes a specific claim on behalf of the Commons to their ancient and undoubted rights and privileges, naming particularly freedom from arrest and molestation, liberty of speech in debate, and access to the sovereign whenever occasion shall require. The sovereign's confirmation of the claim 'in full and ample measure' is intimated by the lord chancellor and formally reported by the speaker to the Commons. No new privilege, however, may be created. This limitation has existed since 1704, when a resolution to this effect was accepted in both Houses.

Freedom of speech includes the right of each House to exclusive control over its own proceedings and unfettered initiative in all matters of legislation and discussion. This was confirmed by the declaration in the Bill of Rights 'that the freedom of speech, and debates or proceedings in Parliament, ought not to be impeached or questioned in any court or place out of Parliament.' Freedom from arrest or molestation possibly originated in the safe conduct accorded to those journeying on the king's business, and was naturally adopted as essential to those concerned with the affairs of the High Court of Parliament. This privilege is limited in the Commons to the period of a session and a reasonable time before and after, while members are travelling to and from Parliament—according to general usage 40 days. A peer's immunity from arrest is by ancient custom continuous. In relation to civil actions the privilege is unquestioned, although with the virtual disappearance of imprisonment in civil process it has lost most of its value. It does not apply to the processes of criminal law. Treason, felony, and breach of the peace were excepted from the earliest times, and since the Wilkes case (1763) it has been considered that privilege could not be claimed for any indictable offence. Nor does P. P. extend to contempt of the courts of justice, or to bankruptcy (a member adjudged bankrupt is debarred from sitting or voting until the bankruptcy is discharged, and after 6 months

the seat of a member of the Commons becomes vacant). If an M.P. is arrested on a criminal charge the House must be informed, and if he is committed or sentenced the judge so acquaints the speaker. The right of a member of the Lords to trial by his peers has been relinquished. Associated with the privilege of freedom from arrest is the right of an M.P. to exemption from jury service. The former right of resistance to subpoena has been waived. The right of access to the sovereign, formerly essential to the Commons, is not now exercised in Parliament. Out of Parliament it is the modern custom to use it for the purpose of presenting Addresses to the Crown. It is a privilege of the House as a whole, through the speaker, and is not possessed by individual members. In recent times it has been confined to ceremonial occasions, as after the First and Second World Wars, and on the silver jubilee of King George V, when the two Houses presented Addresses of congratulation which were received by the King in the Royal Gallery. The Addresses which form part of the ordinary procedure of Parliament are communicated by members who have access to the sovereign as Privy Counsellors or officers of the Household. The House of Lords as a body is entitled to access to the sovereign, and each member of it as 'hereditary counsellor of the Crown' possesses individually the right of audience.

Both Houses claim the right to punish actions which offend against their privileges, whether of the whole House or of its members, and similar protection is extended to the officers of both Houses. What is commonly described as a breach of privilege (for example, some action which can be held to molest or obstruct a member in the discharge of his parl. duties, or to attempt to influence or intimidate him, or to reflect on him or on the House as a whole) is better described as a contempt. The power to commit to prison and impose fines has been held by the Lords, because of its judicial origin, since ancient times. The Commons had to assert the right, and it was not definitely admitted by the Lords until 1704 (but for more than 200 years it has not imposed fines). The Lords can commit offenders to prison for any specified term. The Commons is regarded as unable to commit for a term extending beyond the end of a session. These powers are used rarely, and only for the gravest offences. The usual action is for an offender to be brought to the Bar of the House and there admonished by the Lord Chancellor or the speaker, as the case may be. When a member of the Commons is adjudged guilty of contempt he can be punished by being suspended from the service of the House, or for more serious misdemeanour by expulsion. Such a sentence (or expulsion) resolved upon by the Lords against one of its members would disqualify a peer from sitting in the House. Complaints of breach of privilege when accepted are followed by a resolution referring the matter to the Committee of

Privileges. They examine the complaint and report to the House, which then decides what further action, if any, is necessary. Each House, having exclusive control of its own proceedings, has the right to discipline its members, regulate its own procedure, and exclude the jurisdiction of the courts. *See also* PARLIAMENT; HOUSE OF COMMONS; HOUSE OF LORDS.

Parma: 1. Prov. of Italy, in NW. Emilia-Romagna (q.v.). It is mainly in the Apennines (q.v.), but in the N. there is a broad plain which is watered by the Po (q.v.) and its tribs., the P., Taro, Enza, and Stiroine; the Po forms the N. boundary of the prov. The prin. tns include P., Fidenza, and Salsomaggiore (qq.v.). Area 1365 sq. m. Pop. 392,000.

2. It. city, cap. of the prov. of P., on the P. riv., 52 m. NW. of Bologna (q.v.). It was probably Etruscan (*see* ETRURIA) in origin, and was colonised by the Romans in 183 bc; it is crossed E.-W. by the Aemilian Way (q.v.). In the 16th cent. it was the seat of the Farnese (q.v.) family (*see next art.*). The old walls remain, and there is an 11th.-cent. Romanesque cathedral, containing magnificent frescoes by Correggio (q.v.). There are other splendid churches, of which *S. Giovanni Evangelista* also contains work by Correggio, and *S. Maria della Steccata* contains the famous painting of 'Moses breaking the Tables of the Law,' by Parmigiano (q.v.). The Romanesque octagonal Baptistery (begun 1196) is celebrated, and there is a ducal palace, and also a univ. (1065). There is a large trade in agric. produce, and lace, silk, glass, and musical instrument industries. Pop. 122,000.

Parma, Duchy of. The former duchy of P. was created in 1545, when Pope Paul III (Alexander Farnese) invested his natural son, Pierluigi Farnese, with the duchy of P. and Piacenza. There were 8 dukes of P. of the Farnese line, and, after the line failed, the duchy was chiefly in Sp. hands. It twice came, for a time, under Austrian rule, until its conquest by the Fr. revolutionary armies in 1796. At the Congress of Vienna it was assigned to Maria Louisa, the wife of Napoleon, who was named Duchess of P., Piacenza, and Guastallo. Later the duchy fell to the Duke of Lucca. Finally, after the battle of Magenta, the duchy became a part of the new kingdom of Italy.

Parmenides (b. c. 515 bc), Gk philosopher, b. Elea, S. Italy. He wrote a poem *On Nature*, of which fragments survive. P.'s system marks one of the most important stages in the history of philosophy. In opposition to the earlier Monists, Thales, Anaximander, and Anaximenes (qq.v.), who maintained that the world had developed from a single element, P. held that there is no change or multiplicity. His argument involved an analysis of the verb 'to be,' which in turn drove later philosophers either to admit a plurality of original elements (as did Empedocles, Anaxagoras, and Democritus), or, like Plato and Aristotle, to discover another and immaterial kind of

being. *See* H. Diels, *Die Fragmente der Vorsokratiker*, 6th ed., 1951; J. Burnet, *Early Greek Philosophy*, 4th ed., 1945; F. M. Cornford, *Plato and Parmenides*, 1939; W. Jaeger, *Theology of the Early Greek Philosophers*, 1947.

Parmenion (d. 330 bc), Macedonian general. He was held in high esteem both by Philip and Alexander, the former of whom he served in the siege of Halus in 346 bc. He also took part in the battles of the Granicus, Issus, and Arbela, and being in command of the left wing of the army greatly distinguished himself. After the conquest of Drangiana his son, Philotas, was accused of plotting against Alexander's life, and the king, believing P. to be involved in the conspiracy, ordered him to be assassinated in Media.

Parmentiera, genus of fruit-bearing trees of the family Bignoniaceae, which flourishes in tropical countries. *P. coccinea*, which is known as the candle tree, is a typical example.

Parmigiano, Girolamo Francesco Maria Mazzola (1503-40), It. painter, sometimes called Parmigianino, b. Parma, an able exponent of the Lombard school, and the most distinguished of those who followed the style of Correggio (q.v.), somewhat exaggerating the height and slenderness of his figures. In 1523 he went to Rome to follow his studies, and was soon employed by Clement VII. He was in that city when it was stormed by the imperialists under Bourbon in 1527, and, it is said, was calmly at work on his picture of 'The Vision of St Jerome' when soldiers, bent on pillage, burst into his studio. He was, however, protected by their leader. Having agreed to execute sev. extensive frescoes in the church of S. Maria della Steccata, after repeated delays he was thrown into prison for breach of contract, and on being released he fled to Casal Maggiore, in the ter. of Cremona, where he died soon afterwards.

Paranába: 1. Riv. of NE. Brazil, rising in the SW. of the state of Piauí. It forms the boundary between Piauí and Maranhão, and after a course of 750 m. enters the Atlantic by 6 mouths.

2. Seaport of Piauí state, 175 m. ESE. of São Luís. It is of some importance for the export of tropical produce and cattle, and has an airfield. Pop. 31,000.

Parnasse, Le, name given to a school of Fr. poets who wrote for a review pub. by Alphonse Lemerre and ed. by Louis X. Ricard, called *Parnasse* and devoted entirely to poetry (1852-93). Among the chief poets were Stéphane Mallarmé, Verlaine, Lafenestre, and Theuriot. The chief characteristics of the school are beauty of style and plasticity of form, but it was gradually expanded and modified, developing ultimately into the school called Symbolist or Decadent. *See* M. Souriau, *Histoire du Parnasse*, 1930, and F. Vincent, *Les Parnassiens*, 1933.

Parnassia, a genus of perennial herbs, family Saxifragaceae, about 12 species native to N. temperate regions; *P. palustris*, Grass of Parnassus, is found in Britain.

Parnassos, mt (8070 ft) of Phocis, anct Greece, overlooking Delphi, the modern Lyakoura. It has 2 prin. peaks, called in classical times Tithorea and Lycorea, on the latter of which was the Corycian cave. It was regarded as one of the most holy mts of Greece, being one of the chief seats of Apollo and the Muses. It was also sacred to Dionysus.

L. J. Yell

SHEPHERDS OF MOUNT PARNASSOS

Parnell, Charles Stewart (1846-91), Irish politician, b. Avondale, Wicklow, entered Parliament as a member for Meath in 1875, and soon became a prominent member of the Irish Home Rule party led in the House of Commons by Isaac Butt (q.v.) who had founded it. He organised a policy of obstruction, which played havoc with the business of the House, and secured the support of the Fenians. He was in 1879 elected president of the National Land League, formed with the object of securing the ownership of land in Ireland for the occupiers. Shortly after the death of Butt in 1879 P. was unanimously elected to succeed him in the leadership of the Home Rule party at Westminster, and, because of his great influence over his followers, he was called 'the uncrowned king of Ireland.' In the autumn of 1881 he was imprisoned in Kilmainham jail for inciting to violence, but he was released in the following May, when an arrangement concerning Irish affairs, called the 'Kilmainham Treaty,' was arrived at with Gladstone. The murder of Lord Frederick Cavendish and T. N. Burke in Phoenix Park, however, upset all plans, though P. of course not

only had no connection with the crime, but denounced it in the House of Commons. In 1886, owing to the Conservatives and Liberals being nearly equal in numerical strength, he threw in his lot with Gladstone, and turned out the Conservative Gov. His price was the introduction of a Home Rule Bill, which was brought in and rejected. An appeal to the country resulted in the return of the Conservatives to power. In 1887 he was charged by *The Times* with having been actively concerned in the crimes perpetrated by the Land League. A special commission was appointed, and it was ultimately proved that the documents upon which *The Times* relied were forgeries by Richard Pigott (q.v.), who had sold them to the newspaper. P. was completely vindicated by the report of the special commission. Three years later P. was cited as co-respondent in a divorce action brought by Capt. O'Shea, a member of the Irish party, against his wife, and, being found guilty, Gladstone publicly stated that it was impossible for P. to remain leader of the Irish party. The majority of the party deserted him, and he retired from the leadership. In June 1891 he married Mrs O'Shea. He d. in the following Oct. See also HOME RULE. See T. P. O'Connor, *The Parnellite Movement*, 1889, and C. C. O'Brien, *Parnell and his Party, 1880-90*, 1957; also lives by R. B. O'Brien, 1898; W. O'Brien, 1926; St J. Ervine, 1928; H. Harrison, 1931.

Parnell, Thomas (1679-1718), poet, b. Dublin. Educ. at Trinity College there, he took orders in 1700, and was vicar of Finglas and archdeacon of Clogher. He was a friend of Swift and Pope, a contributor to the *Spectator*, and aided Pope in his trans. of the *Iliad*. He wrote various isolated poems, showing a fine descriptive touch, of which the most important are *The Hermit*, *The Night Piece*, and *The Hymn to Contentment*. There is an ed. of his collected works by G. A. Aitken, 1894, and all his poems are printed in *Minor Poets of the Eighteenth Century*, ed. by H. T. A. Fausset, 1930. See life by Goldsmith, 1770.

Pärnu (formerly German **Pernau**, Russian **Пернов**), seaport in Estonia, on the Gulf of Riga. Pop. (1956) 36,000 (c. 1914, 25,000). It was founded in 1255, and belonged variously to the Teutonic Knights, Poland, and Sweden; it was Russian 1710-1918. Cap. of P. Oblast within the Estonian Rep. 1952-3.

Parochial Schools (U.S.A.). In the main these are institutions maintained by the Rom. Catholic Church, although there are also some Lutheran and Episcopalian and Jewish schools. From the very beginning of the Amer. rep., in the larger centres of pop. where there was a considerable Rom. Catholic element, the Church hierarchy deemed it necessary to maintain its own schools, because in the public schools no religious instruction was given. This position was reinforced in the years following 1848, when there was a heavy migration of Ger. and Irish Catholics to the U.S.A. To-day

practically every Catholic par. has its own school maintained, not out of public funds like the public schools, but from the resources of the Church itself. In the large towns the schools are housed in as fine and up-to-date buildings as any in their section. The Rom. Catholics in 1956 maintained 9000 parochial and other elementary schools with 3,545,000 pupils, 2532 secondary schools with 672,000 pupils.

Parody (Gk *parōidia*, from *para*, beside, and *ōidē*, a song), writing, either in prose or verse, in which an author's style is copied and his sentiment mimicked in order to ridicule the original; or in which what is written on one subject is altered and applied to another by way of burlesque. The art is almost as old as literature, since wherever a writer of talent is found, there is also found a parodist. The *Batrachomyomachia* (Battle of Frogs and Mice), which was ascribed to Homer, is among the earliest known P.s. The merciless caricature of Euripides' style presented in Aristophanes, particularly in the *Frogs*, has never been surpassed for subtlety and humour. P. in Rom. literature occupied a subordinate place to satire, in which it sometimes appeared. P.s. of the extravagances of the time are found in Shakespeare, who was himself parodied by Marston. Dryden was very well parodied by Buckingham in his *Rehearsal*, 1672, whilst *The Splendid Shilling*, by J. Phillips, although somewhat over-rated, set the fashion of employing the sonorous rhythm of Milton for ludicrous subjects. A good collection of P.s. of the 18th cent. was contained in *A Pipe of Tobacco*, 1736, in which J. H. Browne mimicked with very good effect Colley Cibber, Ambrose Phillips, J. Thomson, E. Young, and J. Swift; the *Anti-Jacobin*, 1797, of J. H. Frore also contains some good P.s. In the following cent. the *Rejected Addresses*, 1818, of J. and H. Smith contained some exceedingly clever imitations of Wordsworth, Byron, Crabbe, Scott, Southey, Moore, and others; moreover, their P.s. were marked by no such bitterness and animosity as was Shelley's *Peter Bell the Third*, a P. of Wordsworth. The *Bon Gaultier Ballads*, 1855, of Sir T. Martin and Aytoun, and A. C. Hilton's magazine, *The Light Green*, 1872, contain good specimens of P.s. But the palm in this period must be awarded to C. S. Calverley, who, in *Verses and Translations*, 1862, and *Fly Leaves*, 1872, reached greater heights than any other Eng. parodist; his work is marked by such almost uncanny cleverness of craftsmanship that not only the turns of phrase, but the very turns of thought of his victims seem to have been appropriated. In the last part of the cent. the *Heptalogia, or Seven against Sense*, 1880, which was supposed to have been written by Swinburne, Andrew Lang's *Ban and Arrière Ban*, and the *Green Bays*, 1893, of 'Q' (Sir A. Quiller-Couch), are worthy of mention; and Owen Seaman, the editor of *Punch*, proved himself in the *Battle of the Bays*, 1896, and *Borrowed Plumes*, 1902, to be an excellent parodist. P. has also been

used effectively in the present cent. by T. S. Eliot and W. H. Auden.

In its commonest form, verbal imitation, P. demands no great ingenuity, and it is because that form is so easy that the whole art of P. has fallen into disrepute. A poem like Calverley's *Pedlar*, which parodies Lord Tennyson's *The Brook*, 1887, is excusable on the plea that it reproduces the spirit and style of Tennyson. Another good example of this form of P. is A. C. Hilton's *Heathen Pass-ee*, which parodies Bret Harte's *Heathen Chinee*, 1877. The verbal imitation form of P., however, ridicules style rather than matter. In its highest form P. aims at the literary merits in some isolated example of the works parodied. It burlesques the salient eccentricities rather than the essential characteristics. As regards prose, *Don Quixote*, 1605, parodies most excellently the medieval romance, and some of Thackeray's works, such as *Codlingsby*, are very fair P.s. The *Condensed Novels*, 1867, of Bret Harte are among the best examples of prose P.s, though some good work has been done in this direction by Barry Pain, Max Beerbohm, F. C. Burnand, and Sir Owen Seaman. Of both prose and verse P. Sir J. C. Squire is a master. P. and burlesque are very closely related (for examples of the latter art see **BURLESQUE**). See W. Hamilton, *Parodies of the Works of English and American Authors* (6 vols.) 1884-9; C. Wells, *A Parody Anthology*, 1904; W. Jerrold and R. M. Leonard, *A Century of Parody and Imitation*, 1913; C. R. Stone, *Parody*, 1915; J. C. Squire, *Apes and Parrots*, 1928; and G. Kitchin, *A Survey of Burlesque and Parody in English*, 1931.

Parol Altercation, see **PLEADINGS**.

Parole (Fr. from late Lat. *paravola*, Gk *parabolē*, story), word formerly in use as the equivalent of verbal or oral, but in this sense now employed only in the legal phrase P. evidence as distinguished from written evidence. In its more common sense it is an abbreviation of the Fr. phrase *parole d'honneur*, or word of honour. This is a military term, denoting a prisoner's promise that he will not attempt to escape, and that if released he will not again take up arms in the war in which he has taken part. It is a rule of international law that prisoners of war may be set at liberty on P. only if the laws of their country authorise it, and that in such case they are bound on their personal honour scrupulously to fulfil the engagements they have contracted, and their own gov. may not require or accept from them any service contrary to the P. given. A prisoner of war cannot be forced to accept his liberty on P.; similarly the hostile gov. is not obliged to assent to the prisoner's request to be set at liberty on P. The punishment for breach of P. is death. (Hague Conference rules, 1907—articles 10 and 11.) The term is also used as an equivalent for password, or used only by officers or inspectors of guard.

Paronomasia (Gk *para*, beside; *onoma*, word), or play upon words, is the placing together of words of similar sound, as in

'Might is right,' 'Not Angles but angels.' It is often used as equivalent to pun (q.v.). See also FIGURE OF SPEECH.

Paros, is. of the Grecian archipelago, Cyclades group, in the Aegean Sea, 4½ m. W. of Naxos. It is in shape a low pyramid, consisting largely of one huge mt of marble (Mt St Elias, formerly Mt Marpessa, 2530 ft). Parian marble was very famous in ant times for sculptural purposes, and is still used, the existing quarries being about 4 m. to the E. of the cap., Paroekia, or P. (pop. 2500). The bay of Naussa, on the N., affords excellent anchorage. The prin. products of the is. are marble, wine, fruit, and potatoes. P. was first colonised by the Ionian Greeks, and was conquered by the Persians in 490 BC. During the 5th cent. BC it became a member of the Athenian confederacy. Area 75 sq. m. Pop. 9000.

Parotid Gland, one of the salivary glands. It is situated in front of and below the external ear; its duct (Stensen's duct) is about 2 in. long and opens on the buccal surface of the cheek opposite the second upper molar tooth. The gland secretes saliva containing ptyalin, potassium, sulphocyanide, traces of urea, mineral salts, etc. See also MUMPS.

Parousia, The, see ADVENT.

Paroxysmal Haemoglobinuria, see BLACKWATER FEVER.

CATHERINE PARR

Parr, Catherine (1512-48), Queen of England, sixth wife of Henry VIII, b. Kendal, Westmorland, daughter of Sir Thomas Parr. She had already been widowed twice before she married Henry in 1543. C. had been well educated, and was Protestant in her religious views. She treated Henry's children with real affection. After the death of Henry, she contracted a marriage—of affection on her part and self-interest on his—with Thomas Seymour, Lord-Admiral of England (brother of Jane Seymour), who

neglected and ill-treated her. She d. after giving birth to his daughter.

Parr, Samuel (1747-1825), pedagogue and author, b. Harrow-on-the-Hill, son of an apothecary. He was educ. at Cambridge, becoming an assistant master at Harrow and headmaster successively at Colchester and Norwich schools. Having taken holy orders, he finally (1785) settled at Hatton, Warwickshire, where he took private pupils. He interested himself in political affairs and became prominent as a pamphleteer. P. was a great Latinist, but left no work to account for the great reputation for ability which he enjoyed in his lifetime. His chief power lay in his conversation, but though he was nicknamed 'the Whig Johnson,' he fell far short of his model. His writings, including correspondence, were pub. in 1828. See W. Field, *Memoirs of the Life, Writings, and Opinions of Samuel Parr*, 1828; E. H. Barker, *Parriana*, 1828; and P. Colson, *Private Portraits*, 1848.

Parr, Thomas (c. 1483-1635), 'Old P.', was a native of Alberbury, near Shrewsbury. He is said to have lived to the age of 152, and his longevity has been celebrated by Taylor the 'Water-poet.'

Parr, William, see NORTHAMPTON, MARQUESS OF.

Parr, see SALMON.

Parra, see JACANA.

Parrakeet, see PARAKEET.

Parral, see HIDALGO DE PARRAL.

Parramatta, suburb of Sydney (q.v.), New S. Wales, Australia, on the P. R., 14 m. W. of Sydney, after which it was the oldest tn in the colony. It is now mainly a residential and industrial area. Pop. 78,880.

Parratt, Sir Walter (1841-1924), organist, b. Huddersfield, son of the par. organist, and educ. privately. From 1854 to 1861 he was organist at St Paul's Church in his native tn, and in 1872 at Magdalen College, Oxford. He became organist at St George's Chapel, Windsor, in 1882, holding office until his death. In 1892 he was knighted and made Master of the King's Music. He was also prof. of music at Oxford, 1908-18, and from 1916 to 1920 dean of the faculty of music in London Univ. P. composed music for the production of *Agamemnon* at Oxford, 1880, as well as for the *Tale of Troy* and *The Story of Orestes*, and also odes, anthems, songs, and organ pieces, as well as various compositions on the occasion of royal weddings and other state ceremonies. He had much influence upon the development of organ playing in England. See life by D. F. Tovey and G. Parratt, 1941.

Parrhasius (Parrasios) (fl. 400 BC), famous Gk painter, was the contemporary and rival of Zeuxis. He was a native of Ephesus, but spent most of his time in Athens, and is ranked among the greatest Attic artists; indeed, he is said to have done for painting what Phidias did for sculpture. His picture of the Athenian Demos is famous, and his study of Theseus adorned the Capitol in Rome.

Parricide (Lat. *parricidium*, from *pater*, father, and *caedere*, to kill), crime of

murdering a parent or a near relation. In Rom. times the law against P. was very severe, special punishments being reserved for those who were found guilty. In some countries there may be a tendency even to-day to treat anyone guilty of P. with greater severity than other murderers, but the Eng. law makes no distinction.

Parrish, Anne (1888-1957), Amer. novelist, b. Colorado Springs. She studied art in Philadelphia, afterwards travelling a great deal. In 1915 she married Charles A. Corliss, who died in 1936, and in 1938 Josiah Titzell, poet and novelist. Best-known of her novels is *The Perennial Bachelor*, which won the Harper Prize in 1925. Others are *A Pocketful of Poses*, 1923, *Semi-Attached*, 1924, *To-morrow Morning*, 1926, *All Kneeling*, 1928, *The Methodist Fawn*, 1929, *Loads of Love*, 1932, *Sea Level*, 1934, *Golden Wedding*, 1936, *Mr Despondency's Daughter*, 1938, *Pray for a To-morrow*, 1941, *Poor Child*, 1945, and *A Clouded Star*, 1948.

Parrot, species of the family Psittacidae, most abundant in the warmer parts of Australia and S. America, though numerous in other tropical countries. They include a number of widely divergent forms and details of organisation. The plumage is often gorgeously coloured, but a few are soberly tinted. Most of them are arboreal in habit, but the owl P. or kapo of New Zealand is flightless and lives usually on the ground, though it can still climb trees. Another New Zealand P. differs from the rest of the group in having developed carnivorous habits. The characteristic large and powerful, much-arched bill, with its elongated tip, is well adapted in most P.s for tearing up fruit and cracking nuts, and in a number of species the tongue is highly specialised for extracting honey by means of a brush-like tip. Many species are favourite cage-birds. The best talker is the African grey P. (*Psittacus erithacus*), a bird of from 10 to 12 in. long; with the exception of the short, broad tail, which is bright scarlet, the plumage is pearl-grey in colour. The sexes are hard to distinguish, and as males are rarely imported, it is almost unknown for it to breed in captivity. Many Amazons are imported; one of the best talkers is the brilliantly coloured blue-fronted Amazon. A P. is taught to talk by repeating words slowly and distinctly over and over again, preferably from a place of concealment. Variety of food is necessary, and should include fruit, but little or no meat, if cuttlefish bone is excepted. Water for drinking is required in spite of a popular idea to the contrary, and many P.s like bathing water. Grit in the form of clean gravel is also essential for digestive pro-

See E. F. Daglish, *The Pet Keepers' Manual*, 1958.

Parrot Fishes, or **Parrot Wrasses** (Scaridae), group of fish in which the teeth of the jaw have coalesced to form extremely hard beaks which are able to bite off pieces of coral; these, as well as seaweed and molluscs, form the prin. food. They are all brilliantly coloured, and some

attain a length of 4 ft. *Scarus cretensis*, a Mediterranean species, was much esteemed by the ancients.

Parrotia, genus of 2 small deciduous trees, family Hamamelidaceae, of the Himalaya and Persia; *P. jacquemontiana* and *P. persica* are valued in gardens for their ornamental foliage, especially in autumn.

Parry, Caleb Hillier (1755-1822), physician, b. Cironcester, Gloucestershire. After studying medicine at Edinburgh, where he qualified M.D. in 1778, he settled in practice at Bath. In 1787 he bought a farm and became one of the best scientific agriculturists. He was for many years physician to Bath General Hospital. He gave the first clear account of exophthalmic goitre (sometimes called 'Parry's disease') describing 8 cases, the first in 1786. He was the first to record facial hemiatrophy. Both these contributions to medicine are recorded in *Collections from the Unpublished Medical Writings of C. H. Parry*, 1825. He also gave one of the earliest accounts of angina pectoris (1788). See W. Macmichael, *Lives of British Physicians*, 1830.

Parry, Sir Edward Abbot (1863-1943), judge and author, b. London. Co. court judge at Manchester, 1894-1911, then at Lambeth, retiring in 1927; president of the Pensions Appeal Tribunal, 1917-18. His plays include *Kalamampus* (children's play, in collaboration with Louis Calvert, 1895, produced in 1901); *England's Elizabeth* (with Calvert, 1901); *What the Butler Saw* (with Frederick Mouillot, 1905). Other pubs.: *Letters from Dorothy Osborne to Sir William Temple*, 1887, 1902; *Pater's Book of Rhymes*, 1901; *What the Judge Saw*, 1912, and *What the Judge Thought*, 1922, both reminiscences; *The Law and the Poor*, 1914, intended to promote certain legal reforms; *The Law and the Woman*, 1916; *The Drama and the Law*, 1924; *The Overbury Mystery*, 1925; *The Gospel and the Law*, 1928; *Berrington*, 1929, a novel; *The Bloody Assize*, 1929; *My Own Way: an Autobiography*, 1932. P. will be remembered longer as an author than as a lawyer, although he did excellent work in his profession.

Parry, Sir Hubert (1848-1918), composer, b. Bournemouth. Educ. at Eton and Oxford, after leaving the univ. he studied music under Sterndale Bennett and Macfarren. He was appointed prof. of composition and musical hist. at the Royal College of Music, 1883, and director, on the death of Sir George Grove, in 1894. The 5 scenes from *Prometheus Unbound* attracted much attention in 1880, and his mastery of choral work appears in *Blest Pair of Sirens*; but his early promise was not wholly fulfilled. Spontaneity and a sense of constructive purpose are often lacking, though they appear in his best works. He excelled in the setting of Eng. works. His literary works include *Studies of Great Composers*, 1877; *The Art of Music*, 1893; and *Style in Musical Art*, 1900, 1911. Among his other compositions are music to *The Birds* and *The Frogs* of Aristophanes; music to the *Agamemnon* of Aeschylus; *Judith*; *King*

Saul; Te Deum; Invocation to Music; A Song of Darkness and Light; The Vision of Life; and Jerusalem (a setting of the poem prefacing Blake's *Milton*). See R. A. Streatfeild, *Hubert Parry, 1913*, and C. L. Graves, *Hubert Parry: His Life and Works, 1926*.

Parry, Sir William Edward (1790-1855), sailor and explorer, *b.* Bath. P. commanded expeditions to the Arctic in 1819-20, 1821-3, 1824-5, and 1827; the first 3 voyages being attempts to discover the NW. Passage, and the fourth, from Spitsbergen, to reach the N. Pole, when he reached lat. 82° 45' N. The charts he made of the N. seas were very valuable to navigation. He was voted a sum of money by Parliament for reaching long. 110° W. in lat. 74° 44', and was made hydrographer to the Admiralty, and later rear-adm. The accounts of his voyages form an interesting chapter in the hist. of arctic exploration. It was owing to his skill and resource that the passages of Lancaster Sound and Barrow Strait, Prince Regent Inlet, and Wellington Channel were discovered. A memoir was pub. by his son, Edward P., in 1857.

Parry Islands, group in the Arctic Ocean belonging to Canada, W. of Baffin Bay and N. of Lancaster Sound, Melville Sound, and Barrow Strait. The P. I. include Bathurst, Melville, Cornwallis, and Prince Patrick Is., are covered with tundra, and are uninhabited. Sir W. E. Parry, after whom they are named, visited them in 1819, and the expeditions searching for Franklin explored them further.

Parry Sound, tn of Ontario, Canada, 221 m. W. of Ottawa, on Georgian Bay (Lake Huron), with lumbering industry. Pop. 5350.

Parsec, unit of astronomical distance for objects outside the solar system: the distance of a star of parallax (q.v.) one second of arc, i.e. 3½ light-years, or 19 million million miles, generally expressed in the form 19×10^{14} m. See METROLOGY.

Parsees (Parsis), the last survivors of the old Iranian race. When the Arabs conquered Persia in the 7th cent., the P. fled to India rather than give up their anct Zoroastrian religion, consisting of fire-worship, belief in metaphysical dualism, and the practice of good thought, word, and deed. The P. are mostly in Bombay, and number barely 100,000 all told. For over 1300 years they have kept intact their individuality and sturdy independence of habit and customs, and a mode of living which is more W. than E. They are an enterprising race, foremost in the trade, commerce, and industries of India. They were the first to open cotton mills, iron and steel works, and research institutions in India, and from them came the naval architects who a hundred years ago built ships-of-the-line for the R.N.

The Indian political freedom movement was started by them, and 3 members of the Brit. House of Commons have been P. They were the first to teach non-communalism to Indians by sinking wells and building schools, hospitals, and

caravanserais which were open to all without distinction of caste, colour, or creed.

There is not an uneducated man or woman among them, and their charitable trusts and institutions are such that no Parsee need go without food, clothes, or shelter if he is unable to provide these for himself. Purity being the basic principle of their religion, they keep themselves and their homes scrupulously clean and tidy. Altogether they are among the most enlightened and progressive of the races and nationalities of India.

Parsley (*Petroselinum crispum*), biennial flavouring and garnishing herb. It will grow in almost any soil, but does best in a deep rich moist loam. A single sowing of seed is made in April, and from the seedlings, if kept thin, a supply of plants can be secured for 2 seasons. P. makes a handsome edging to beds.

Parsnip (*Peucedanum sativum*), native Brit. umbelliferous biennial, long valued for its edible tap-roots. It is hardy and easily grown in deeply dug soil, which need not be rich. The seed, which must be new, should be sown in March, and the seedlings thinned out until the plants are set apart. The roots are ready for use in Oct., but until required may be left in the ground, where their flavour improves.

Parson (Lat. *persona*; *parson* and *person* are the same word, the *person* being so called because 'by his *person* the Church, which is an invisible body, is represented'—Blackstone): 1. Priest of a par. or eccles. corporation. During his life a P. has the freehold in himself of the parsonage house, the glebe, the tithes, and other dues. Strictly the rector in holy orders is a P., while the vicar is not.

2. In common usage any ordained clergyman, and also nonconformist ministers and preachers.

Parsons, Sir Charles Algernon (1854-1931), inventor and engineer, son of the third earl of Rosse, *b.* in London, was educated privately and at St John's College, Cambridge. He is best known in connection with the steam-turbine which bears his name, and which he rendered suitable for the generation of electricity and the propulsion of vessels. The first turbine was produced in 1884; the torpedo boat *Turbinia* was the first to be fitted with turbine engines. He was made a fellow of the Royal Society in 1898. Other inventions of his are an improved variety of gramophone and a non-skid device for motor tyres. K.C.B. 1911, O.M. 1927. He received the Copley medal of the Royal Society in 1928. He wrote on the turbine and other engineering matters. In 1926 pub. *The Scientific Papers of William Parsons, third Earl of Rosse*. See life by R. Appleyard, 1933, and R. H. Parsons, *The Steam Turbine*, 1946.

Parsons, or Persons, Robert (1546-1610), Jesuit and polemical writer, *b.* Nether Stowey, Somerset, and educ. at Oxford. In 1574 he resigned his fellowship at Balliol, entering the Society of Jesus at Rome in 1575, and being ordained priest 3 years later. He and

Campion (q.v.) were selected for the work of the Eng. mission, directed chiefly from Douai, and he landed at Dover in 1580; but Campion was arrested and P. had to flee the country. He went back to Rome, whence he continued to direct the Eng. mission, and later went to Spain, where he founded a number of institutions for training Eng. priests. He was a man of great attainments and amazing industry, but is best remembered for his inveterate political intrigues. He played a considerable part in the policy which eventually led to the dispatch of the Sp. Armada for the invasion of Britain. His great aim was working for foreign intervention on behalf of Eng. Catholics. Among his best-known controversial pamphlets is the *Brief Discourse concerning certain reasons why Catholics refuse to go to Church*.

Parsons, William, see ROSSE, EARL OF.

Parsonstown, see BIRR.

Parthenay, Fr. tn, cap. of an arron., in the dept. of Deux-Sèvres, on the Thouet. It has interesting old buildings and anct ramparts. There are cloth industries, and fences are manuf. Pop. 7900.

Parthenius, BARTAN-SU, or BARTINE, riv. of Anatolia, Asiatic Turkey, the tn of BARTAN, on its banks, being on the site of the anct vil. of Parthenia. It was the chief riv. of W. Paphlagonia, and formed part of the boundary between Paphlagonia and Bithynia. It rises on Mt Olgasys and flows NW. into the Euxine (Black Sea), 10 m. from ANASTRIS.

Parthenocissus, family Vitaceae, genus of deciduous climbers with twining or adhesively tipped tendrils, closely akin to Ampelopsis and Vitis. *P. quinquefolia*, Eastern N. America, is the True Virginia Creeper, though the term is also applied to *P. vitacea*. *P. henryana*, *P. thomsonii*, and *P. tricuspidata* are choice Chinese species, hardy on walls, and beautiful in autumn colour.

Parthenogenesis, see BIOLOGY; FERTILISATION; ALTERNATION OF GENERATIONS.

Parthenon (from Gk *parthenos*, a virgin), most celebrated Doric temple of anct Greece, and one of the finest pieces of architecture in the world, receives its name from its dedication to the virgin goddess Athena. It was commenced in 447 BC and finished in 432 BC. Its architects were Ictinus and Callicrates, but the whole of the work was carried out under the supervision of the sculptor Phidias, by whom the statue of Athena Parthenos, which stood in the *naos*, was executed. The temple is situated on the S. side of the Acropolis at Athens. It is octastyle (with 8 columns in front) and pseudo-dipteral (with only one range of columns at the side). The number of columns along the flank is 17, counting those at the corners. Behind the corners of the peristyle are 6 columns, somewhat smaller in size. The most notable feature in the architecture of the P. is the delicacy of the refinements introduced to counteract various optical illusions. These are to be found everywhere, in the curves of the columns, stylobate, cornice, etc.

E.E. 9

Often they are so slight as to be revealed only on the most careful measurement. The chief dimensions are as follows (outside measurements): length, 228 ft; width, 101 ft; height, 64 ft; length of *naos*, 98 ft; width of *naos*, 63 ft. The fine sculptures of the metopes, frieze, etc., were mostly removed to the Brit. Museum by Lord Elgin in 1801-16. The worst of the injuries which the P. has suffered from war and pillage was inflicted in the siege of Athens by the Venetians in 1687, when a shell exploded in a powder-magazine in the centre, and demolished much of the side walls. Some slight damage, chiefly in the shape of scars and splintering, was caused by shell and mortar fire during the Second World War, and from rifle fire in the succeeding disturbances. There is an immense literature on the P. See the official *Guide to the Department of Greek and Roman Antiquities in the British Museum*, which contains plans of the building. The sculptures are dealt with in H. B. Walters's *The Art of the Greeks* (chap. vi, 31st ed.), 1934. See also ARCHITECTURE, 2.

Parthenope, see NAPLES.

Parthenopean Republic, formed in Naples (q.v.) under the direction of the Fr., in Jan. 1799. Naples, once called Parthenope, was reoccupied for the Bourbon house by Cardinal Ruffo, the Fr. leaving their protégés to their fate. Nelson then arrived, and, ignoring the armistice concluded between the two sides, sanctioned the execution of sev. republican leaders, including Francesco Caraccioli (q.v.).

Parthia, anct name of a country of W. Asia, situated to the SE. of the Caspian Sea, and corresponding to the N. portion of the Persian prov. of Khorassan. The country was primarily subject to Persia, and later to the Seleucidae. But in 250 BC the satrap Pherecles was slain, and Arsaces, leader of the Parnians, a subdivision of the Dahae, was proclaimed first King of P.; such is the official account, but in all probability Pherecles was satrap of Pstaeue, to the NW. of P. The empire thus started grew in importance, until after the time of its greatest power, under Mithridates I and II, it extended to the Euphrates, Caspian Sea, Indus, and Indian Ocean. From the 1st cent. BC onwards P. waged many wars with Rome, and was at one time her ally and at another her vassal. The Parthian cavalry were very famous, and from their method of shooting as they appeared to retreat comes the expression a 'Parthian shot.' In AD 226 the country was annexed to the new kingdom of Persia, founded by Artaxerxes. The cap. of the Parthian Empire was Ctesiphon (q.v.), of which some remains exist. Their language is sometimes called Pehlevi. The Lat. poets of the Augustan age use the names Parthi, Persae, and Medi indifferently. See N. C. Debevoise, *A Political History of Parthia*, 1938.

Parties to a Crime, see CRIMINAL LAW.

Parting, in metallurgy, the separation of gold from silver by heating with concentrated nitric acid, in which the silver

* X

dissolves while the gold remains unaffected. This process is now obsolete.

Partinico, tn in Sicily (q.v.), 15 m. SW. of Palermo (q.v.). It is an agric. centre, has textile manufs., and is known for its wine. Pop. 23,400.

Partisans, see GUERRILLAS.

Partition, in equity (q.v.), the div. of a joint estate in land into separate parts. P. may be effected either by a deed, by agreement between the joint tenants, by order of the Ministry of Agriculture, or by a P. action in the chancery div.; but in the last case the court must, under the Partition Act, 1868, direct a sale instead of P. if tenants to the extent of one-half require it. See also JOINT TENANCY; COMMON, TENANCY IN.

Partition Coefficient. When a substance is shaken up with 2 immiscible liquids, in both of which it dissolves, it distributes itself between the 2 liquids in such a way that the ratio of its concentration in them is a constant, called the P. C. of the substance in these solvents.

Partnership. In Eng. law a P. is the relation which subsists between 2 or more persons carrying on a business in common with a view to profit. It is essential to an understanding of the Eng. law of P., the fundamental principles of which are to be found in the consolidating Partnership Act, 1890, to distinguish P.s from companies and corporations, notwithstanding that the law of unincorporated companies consists of 'little else than the law of partnership modified and adapted to the wants of a large fluctuating number of members' (Lindley). And the same is true of companies which are incorporated (see COMPANY). In short, though registered joint-stock companies are P.s, they are P.s of an exceptional nature, and are expressly excluded from the provisions of the Partnership Act, 1890. The prin. differences between companies and P.s proper are these: (1) A P. is not a distinct entity from the persons composing it, and hence the personal liability of partners for the P. debts is unlimited, although recourse must first be had by the creditors to the P. assets; but the liability of a joint-stock company is generally limited either to the amount unpaid on the shares or by guarantee, and when its assets are exhausted nothing further remains for the creditors. (2) A registered company (other than a private company) may consist of any number of members not less than 7; but a P. may not contain more than 20, or, in the case of a banking P., 10 members. A 'private company' with limited liability and containing as few as 2 members is now, however, perfectly lawful (see on this at the end of the article on COMPANY; and also COMMANDITE, SOCIÉTÉ EN).

(3) The formation and continuance of a P. depend on the mutual confidence in and personal relationship of the different members to each other, but such a relationship between the shareholders of a company is virtually non-existent. (4) Every partner is entitled, subject to the terms of the P. agreement, to participate in the business; but in the case of companies the manage-

ment is delegated to directors, who, in most cases, are in that position mainly by their own appointment, regardless of the wishes of the shareholders. It is not always easy to determine whether a particular transaction constitutes a P. or not; and, in particular, agreements to lend money to a P. must be carefully drawn to avoid the inference that the lender was really a partner. The Act of 1890 is notoriously cryptic on the subject, especially in regard to the inference to be drawn from a profit-sharing agreement. The general effect, according to high opinion, is that sharing profits without more implies a P.; but if there are other facts these, too, must be taken into consideration; e.g. if A lent money to B in return for a share of accruing profits, but in no way interfered in or controlled B's business, and had no power to prevent the misuse of the assets, A would probably not be held to be in P. with B. A *bona fide* loan will not constitute the lender a partner with the borrower; but it must be a loan with a personal liability on the part of the borrower to repay, and the lender must not take an interest in or share of the capital *in specie*, because that of itself would imply a joint interest in or part ownership (i.e. P.) of the capital and profits. In other words, lending on the security of a share in a P. is one thing; contribution towards a joint speculation in return for a proportionate share of profits quite another, and generally conclusive evidence of a P. The Act also provides that the following facts, *inter alia*, do not, taken by themselves, constitute P.: (1) The receipt by a servant of a share of profits by way of remuneration, or by a widow or child of a deceased partner of a portion of the profits by way of annuity. (2) The receipt of a portion of profits by the vendor of the goodwill of the business. (3) The receipt of a debt out of accruing profits.

A written agreement is not essential to the formation of a valid P., and indeed a P. may be inferred from a general course of dealing. But in practice deeds are usually drawn up, and it would be highly imprudent not to guard oneself by some document. Writing, however, is required in the case of a P. which is either intended to last for more than one year or is only to commence at a future date exceeding a year ahead (see CONTRACT; FRAUDS, STATUTE OF), subject to the effect of part performance. The matters that common prudence demands the settlement of in the agreement are these: (1) The nature of the business. (2) The duration of the P. (3) The firm name. (4) Mode of providing the capital. (5) Banking account and signing of cheques. (6) Management. (7) Accounts. (8) Expenses and profits. (9) Effect of the death of a partner or the dissolution of the firm for any other reason. (10) Provision for the family of a deceased partner. (11) Arbitration. A firm may lawfully carry on business under any name or style, whether those of the partners themselves or not, provided, if they adopt other than their own names, the result is not calculated to deceive the

customers of other persons already trading in such name and thereby to deprive another business of profits that would otherwise have accrued to it. It is a moot point whether partners can lawfully carry on a business in their own names if those names are already well known to the public as the style of an existing firm; and all that can be said with certainty is that if the new firm is deliberately trying to pass off its goods as those of the old firm, or represent its business to be the same, the latter can get an injunction against the former.

Certain P.s are unlawful: those against public policy or *contra bonos mores*, e.g. a P. in the profits of a gambling-hell or a bawdy-house; those the membership of which is in excess of the statutory numbers; medical or solicitor P.s where some of the partners are not properly qualified to practise. A bookmaking P. is not *per se* illegal, but if it was intended to carry it on at a 'place' within the meaning of the Betting Act, 1853, it would be illegal (see GAMING). The prin. legal effect of a P. being unlawful is that the court will not recognise actions by any of the partners against any of their fellow partners. All the partners in any firm are agents for each other, and each can bind the firm to the extent of his apparent or ostensible authority. Limitations of authority as a rule cannot affect third persons unless they had notice of such limitations, but only give the firm a remedy against the individual partner or partners who have exceeded those *de facto* limitations. To be within the apparent authority of a partner the act: (a) must be done in relation to the P. business; (b) must be incidental to the usual business of the firm: e.g. where the business is not of a commercial nature, or where there is no buying or selling of goods, a partner cannot issue negotiable instruments or borrow or pledge the firm property, though he can sign ordinary cheques; the firm would only be liable for an act outside the scope of its business if the partner who did it had express authority to do it; and (c) must be done in the character, not of an individual, but of a partner, or in the firm name or in some other manner indicative of an intention to bind the firm.

Every partner is liable for the P. debts, and the creditor can sue any or all of them; and if he obtains judgment against the firm he may issue execution (q.v.) against the private property of the members if the P. assets prove insufficient. If he chooses to sue one or more partners separately, and obtains judgment, he cannot enforce that judgment against the partners he chose not to sue, nor can he sue such other partners by reason of not obtaining satisfaction against those he did sue. When a partner retires an agreement by the continuing partners to release him from existing firm liabilities will not release him as against those creditors who do not assent to the arrangement. A new partner is only liable by special agreement for debts incurred by the firm before he became a member. Generally

only partners can be responsible for firm liabilities; but if any person by his conduct 'holds himself out' as a partner, he will not be allowed afterwards to deny a role upon the assumption of which outside people may have been induced to give credit to the firm. It is only upon the principle of 'holding out' that a retiring partner can be made liable for debts contracted after his retirement, i.e. if he allows himself to appear to remain a member. To escape future liability he should give express notice of his retirement to habitual customers of the firm, and by a general notice in the *London Gazette*. Only actual members of a firm are liable for the torts (i.e. wrongs independent of contract) of a partner; the doctrine of holding out does not apply to torts, and even an actual member cannot be held responsible for the fraud or other tort of a fellow member of a firm unless the act (a) was within the ordinary course of the firm's business, or done with the other partners' authority; or (b) consisted of a misapplication of funds or other property received by the misapplying partner within the scope of his ostensible authority (or received in the first instance by the firm) and misapplied whilst in the custody of the firm. The ordinary rights of a partner *inter se* are generally regulated by agreement. Unless modified by agreement the following rights are implied: (1) to take part in the business; (2) to have the business carried on according to the terms of the P. agreement; (3) to be indemnified by the firm against personal liabilities incurred by him in the ordinary course of the firm's business; (4) to be paid interest at 5 per cent on advances by him to the firm beyond the capital he has originally agreed to subscribe; (5) to prevent new partners being admitted against his wishes; (6) to have the firm's books kept at the prin. place of business; (7) to share equally in the capital and profits; and (8) to enjoy the confidence of his co-partners.

A P. may come to an end: (1) at the will of any partner where no fixed term has been agreed on; or (2) by fluxion of the term agreed upon if any; or (3) upon the performance of the venture for the accomplishment of which the P. was formed; or (4) by bankruptcy or death of a partner (unless otherwise agreed upon in the P. deed or agreement); or (5) by the desire of the other partners if one member suffers his share of the assets to become charged for his private debts; or (6) by the fraud of one partner on his co-partners; or (7) by the occurrence of some event causing the P. to become unlawful; or (8) by the decree of the court upon the application of one or more of the partners (a) where some partner has become insane, or permanently incapable, or been guilty of such conduct as makes it impracticable for the others to continue in P. with him; (b) when the business can only be carried on at a loss; and (c) whenever the court thinks it 'just and equitable' to order a dissolution.

Limited Partnerships. The Limited Partnerships Act, 1907, provides for limited P.s of not more than 10 persons in

the case of banking or more than 20 in other cases who are 'general partners' and who are liable for all debts and obligations of the firm, and of one or more 'limited partners,' who will not be liable for the firm's debts or obligations beyond the amount they have contributed to the P. capital. A limited partner may not take part in the management of the P. business, and he has no power to bind the firm. But he may, personally or through his agent, at any time inspect the books of the firm and examine the state and prospects of the business, and may consult with the other partners in such matters. If he takes part in the management of the business he will be liable for all debts and obligations incurred while he so takes part in the management. Any differences arising as to ordinary matters connected with the business may be decided by a majority of the general partners. A limited partner may with the consent of the general partners assign his share in the P. A limited partner cannot dissolve the P. by notice. See Sir A. Underhill, *Principles of the Law of Partnership* (6th ed. by G. Hesketh), 1950; N. Lindley, *Law of Partnership, including Limited Partnerships* (11th ed.), 1951; and Sir F. Pollock, *The Law of Partnership* (15th ed. by L. C. B. Gower), 1952.

Partridge, Eric Honeywood (1894-), New Zealand lexicographer, b. Gisborne, New Zealand. Educ. at Queensland Univ., from 1910 to 1913 he was a schoolmaster, then during the First World War served as a private in the Australian infantry. From 1921 to 1923 he held a Queensland Travelling Fellowship and studied at Oxford, and from then till 1927 was a lecturer in English. His most important work was his great *Dictionary of Slang and Unconventional English*, 1937, which was twice revised. A large work on similar lines is his *Dictionary of the Underworld*, 1950. He also pub. a *Dictionary of Cliches*, 1940; a *Dictionary of Abbreviations*, 1942; *Usage and Abuse*, 1947, a guide to good English; *Name into Word*, 1949, a dictionary of proper names that have become common nouns; and *You Have a Point There*, 1953, a guide to punctuation. After the Second World War, in which he served with the Royal Air Force, he collaborated in a *Dictionary of Forces Slang*, 1948. He also pub. *British and American English Since 1900*, and many smaller books on language.

Partridge, John (1644-1715), astrologer, b. E. Sheen, Surrey. He pub. a number of pamphlets and books dealing with astrology, and issued an almanac entitled *Merlinus Liberatus* (1670). He also wrote *Astrological Vade Mecum* (1679), *Flagitiosus Mercurius Flagellatus* (1697); and a trans. of Mynsicht's *Treasury of Physic*. His almanac was ridiculed by Swift.

Partridge. Two P.s are common in Britain, but it is usually the grey P. (*Perdix perdix*) that is associated with the name. The other is the Fr. or red-legged P. (*Alectoris rufa*), which was introduced into Britain towards the end of the 18th cent. by the Marquess of

Hertford. Its sides and flanks are transversely barred, and its flight is more rapid than that of the grey P. In this species the plumage is mainly brown; the breast is bluish-grey, freckled with brown, and with a horseshoe patch of chestnut on a white ground on the lower breast. The sides are barred with chestnut. The wings are rounded and short. P.s pair very early in the year, the males, like the males of most gallinaceous species, being very pugnacious. The nest is made with a minimum of trouble on the ground in fields or hedgerows, and contains from 10 to 16 pale greenish-yellow eggs. The hen hatches them, but the male is attentive to her during incubation. The young are fed chiefly on ant pupae, and other insects when these are not available; these and snails and slugs form a considerable proportion of the food of older birds, but in addition grain and other seeds are consumed in great quantity when obtainable. The young remain with their parents for some months, forming coveys of about 20 birds. In the morning and evening they search the stubble and pastures for food, but during the day they hide wherever safe cover may be found. The season for partridge shooting is from 1 Sept. to 1 Feb. See B. Vesey-Fitzgerald, *British Game*, 1948.

Partridge Wood, or Cabbage Wood, is derived from *Andira inermis*, a loguminous evergreen tree, native of S. America.

Parts of Speech, in grammar, are usually reckoned as being 8 in number. This number was fixed by the Greeks, and though the classification has been changed since their time, the number has remained permanent. Aristotle, in his philosophical works, speaks of 3 parts of speech, nouns (*onomata*), predicates (*rhemata*), and connectives (*sundesmoi*). The later Gk writers fixed the parts of speech as follows: noun, verb, participle, article, pronoun, preposition, adverb, conjunction. The adjective was included under the noun, and here also came certain pronouns and numerals. When the Romans took over this system of classification an alteration was necessary, for the Lat. language contained no article. For this class the interjection was substituted. The Romans also abolished the participle class, but kept the number at 8 by giving the adjective a class by itself. The Rom. classification is that now generally adopted. It must not be supposed, however, that either of these arrangements is entirely satisfactory. They are both somewhat arbitrary, and the boundaries that separate one class from the other are very narrow. Words are now almost invariably assigned to their classes according to the function that they perform, and this simplifies matters when once a satisfactory definition of each part of speech has been obtained. According to this method a large number of words can each serve at different times as different P. of 8. The use of words as nouns which are really adjectives is very common, while the participle, though formally a verb, is more frequently used as an adjective than

as a verb. Similarly the verbal noun partakes of the nature of a noun. Adjectives and adverbs have always been more or less interchangeable. The interjection has no function in the sentence, and so should not, strictly speaking, be included in the list. It is the conventionalised form of those early and semi-inarticulate sounds with which primitive man eked out his gesture language. The other parts of speech were all primarily derived from the verb and the noun. See GRAMMAR, and articles on each of the separate P. of S.

Party Government (Party System). Gov. by party in one form or another exists in most civilised countries, and political parties are a corollary of any democracy where the electorate is large.

The Eng. dual party system was evolved from the historical accident of the div. into Whigs and Tories in the Stuart period, a div. which had become stereotyped into a tradition that it corresponded to a real divergence of political outlook—the Tories being the representatives of monarchy, Anglicanism, and insularism, the Whigs the aristocratic party of foreign adventure and expansion. By the mid-19th cent. the 2 great parties had approached near to each other, and, in Gladstone's words, the only distinction was that one 'was rather more stationary, the other more movable.' His own great contribution was to convert the old Whigs into the Liberal party, which held the gov. of England in alternation with that Conservative party which was largely Disraeli's refashioning of the old Tories. Eng. P. G. is a contradiction of the constitutional theory of gov. by king, lords, and commons. In the earliest decades of the 20th cent. the Liberal party appeared to be pledged to schemes of social reform and retrenchment, while the Conservative party seemed to be bent on the preservation of vested interests and some scheme of tariff reform. There are 2 main political parties in England, the Labour party having replaced the Liberal party as the natural opponents of the Conservatives. (A detailed statement of the growth and policy of the Labour party will be found under LABOUR PARTY.) However, political re-alignment is a standing possibility.

The struggle between Commons and Crown was theoretically decided in 1688. The chief development of the 18th and 19th cents. was the evolution of Cabinet gov. based upon party majorities.

The Eng. party system is eminently favoured by the fact that the ministry of the day has gradually succeeded in drawing virtually the whole of the legislative as well as the executive power into its hands. It differs from the group systems of P. G. in vogue before the Second World War on the Continent in that in the latter there were always, or nearly always, present in the legislative assembly one or more groups of 'irreconcilables,' whose immediate object was to change the existing form of gov., sometimes by peaceful, sometimes by violent, means, in the same manner that the Communist party, whilst participating in the Eng. parl.

system, ultimately seeks a totalitarian rule.

In recent times there has been a tendency to refer to royal commissions of experts outside the House of Commons questions which require ability not found in politics. In times of grave crisis P. G. has been abandoned in favour of coalition. See CONSTITUTION; GOVERNMENT; PARLIAMENT; POLITICAL PARTIES; REPRESENTATION. See R. T. McKenzie, *British Political Parties*, 1955; and J. F. S. Ross, *Elections and Electors*, 1955.

United States. Here the party system has evolved some distinctive features. Beyond influencing public opinion, directing gov. policy, and winning elections, the Amer. party organisations select candidates for office and procure positions for party workers. (Party patronage existed in 18th-cent. England, but was replaced by a politically neutral civil service.)

The party system originated during the discussions over the federal constitution (1787-91). The Federalist party, led by Alexander Hamilton and John Adams, maintained the supremacy of the central gov. and the subordination to it of the states. The Antifederalist party, which soon became known as Republican or Democratic-Republican, was led by Thomas Jefferson; it stood for the independence of the states in legislation, administration, and jurisdiction. The Federalist party declined in influence and disappeared between 1820 and 1830; it was replaced by the National Republican and, later, the Whig party. The Democratic-Republicans under Andrew Jackson came to be known as Democrats. About 1854 the Whig party fell out over slavery, and 2 years later a new Republican party was formed, supporting most of the Whig traditions. Since that time the Republicans and the Democrats have alternated in power. There have been many smaller parties, including Populist, Socialist, Prohibitionist, and Progressive.

The Democratic party, under President Jackson, was the first to establish elaborate party machinery. The machinery of an Amer. party consists of 2 bodies, one permanent and the other temporary. The first body includes a national committee and various geographically subordinate committees, such as state, co., and congressional dist. Each committee is locally independent, and is concerned with the management of party affairs, the organisation of meetings, and superintendence of the poll. The temporary machinery of the party consists of the periodical conventions (or equivalent meetings) of party delegates in the different election areas for making party nominations to elective posts. A few months before every presidential election a national convention is held, to which the state conventions send 2 delegates (with alternatives) for each congressman or U.S. senator, plus 'bonus' delegates depending on state victory in the preceding election. Delegates from states with presidential primary elections are 'instructed' to support initially the successful candidate in the state election; other delegates may be

instructed by their state convention, or may be uninstructed. The first business of the national convention is organisation, with appointment of a temporary and a permanent chairman and of various committees, including one on platform and resolutions. The temporary chairman delivers the 'keynote' address and then yields the gavel to the permanent chairman. Meanwhile the platform committee holds hearings and proceeds to write the party platform, which it submits to the pleasure of the convention. When the platform has been adopted the alphabetical roll of the states is called, and, in turn, they name their candidates for the party nomination for president. As soon as this is completed the roll is called again for the delegate vote, by states, on the candidates named. The process is repeated until one candidate receives a majority vote. The party nominee for vice-president is then chosen in the same way.

The Republican party (q.v.) has tended to strengthen the central gov.; the Democratic party (q.v.) to uphold the rights of the states. Notwithstanding this tradition, the Democratic administration of Franklin Roosevelt probably interfered more with states' rights than any other administration in Amer. hist. The Democrats include many conservatives; the Republicans some of the boldest advocates of social economic experiment. Although the largest single block of opinion in the Democratic party is the conservative one in the S.—still predominantly Democratic in spite of some upsets—it is the party more consistently opposed to big business and finance. It has powerful city organisations, of which Tammany Hall in New York is best known. It has won the support of many liberals and of a large part of organised labour, in the absence of a national Labour party. Farmers, except in the S., have normally voted Republican; but at times they have swung *en masse* to the Democratic side. The Republican party, whose greatest strength has long been in the E. and the middle and far W., is primarily conservative and has favoured industry. See C. E. Merriam and H. F. Gosnell, *The American Party System*, 1929; T. W. Cousins, *Politics and Political Organisations in America*, 1942.

'Single-party Government.' The antithesis to the party system as understood in England or the U.S.A. or any of the Brit. dominions, or to the group system of France, etc., is the single-party form of gov. of Fascist, Communist, or 'authoritarian' regimes. 'Single-party government' is a misnomer or even a contradiction in terms, for a coherent party system implies the existence and political influence of more than one party. The essential feature of any authoritarian system is that it is 'nationalist' in character and intolerant of political opposition. See FASCISM; NATIONAL SOCIALISM; RUSSIA.

Paruta, Paolo (1540-98), Venetian historian. He was appointed official historian to the republic. His *History of*

the War of Cyprus, and *History of Venice from 1513 to 1551*, were pub. after his death.

Parvati, or Uma, consort of Siva (q.v.). Parvise (from Lat. *paradisus*, enclosed garden), an enclosed space in front of a church, as formerly at St Paul's Cathedral, London. (A room over a church-porch should not be called a P.)

Pasadena, city of California, in Los Angeles co., 10 m. NNE. of Los Angeles. In the foothills of the San Gabriel Mts, it has an altitude of from 750 to 1000 ft, and has sev. mt peaks in the immediate vicinity ranging from 3200 to 6000 ft, with 2 observatories. Its fine climate and picturesque surroundings make it a famous winter health resort, its vicinity to Los Angeles making it a favourite residence of cinema artists. Fruits and flowers and subtropical trees and plants grow and bloom all the year round. P. grows fruit for export, particularly oranges and lemons. Cork-oak grows, also eucalyptus, and pepper-growing is an important industry. P. manufs. furniture and precision instruments, and has machine shops. It is the seat of the Calif. Inst. of Technology, P. College, P. City College, the John Muir College, and other institutions. It holds an annual Tournament of Roses. Pop. 104,577.

Pasajes, see SAN SEBASTIÁN.

Pasang, see AEGAGRE.

Pasargadae, anct city of Persia. Cyrus the Great made it his cap. and built a number of palaces and temples there. The cap. was transferred to Persepolis (q.v.) by Darius. P. was situated near the R. Polvar, about 55 m. NE. of Shiraz. The prin. ruins include the tomb of Cyrus. See also PERSIAN ART.

Pascagoula, riv. of U.S.A., in the SE. portion of Mississippi. It flows for a course of about 250 m. into a small bay of the same name, on the Gulf of Mexico, and is navigable for about 100 m.

Pascal, Blaise (1623-62), Fr. mathematician and devotional author, b. of a good family of lawyers at Clermont-Ferrand. As a mathematician, his youthful achievements of discovering by himself *Euclid*, Book I up to Proposition 32, at the age of 12, and of writing a book on conic sections (which gained the approval of Descartes, and which is the foundation of the modern treatment of the subject), at the age of 16, gave promise of extraordinary ability. This promise was amply fulfilled; by following up the experiments of Torricelli, he succeeded in determining the weight of air, and from this he arrived at the means of measuring altitude by reading barometric pressure. He invented the hydrostatic press, and also a calculating machine; and in pure mathematics he investigated the theory of probability and the differential calculus. P. embraced a monastic life in 1654, and came under Jansenist influence at Port Royal. In the same year he enjoyed the famous mystical experience referred to in the wonderful prayer known as the *Memoir*. The following year Antoine Arnauld, the virtual chief of the circle, being threatened with censure by

the Sorbonne for his teaching on efficacious grace, called upon P. to defend him. The result was his celebrated *Lettres provinciales* (1656-7), regarded by Voltaire as 'witty as Molière and sublime as Bossuet.' The following year his health broke down, and he died 4 years later. His *Pensées sur la religion* were pub. in 1669; they were ostensibly the jottings for a projected *Apologia*. P. recognised that Christianity is a bond between the greatest and the most degraded, as symbolised particularly at the Crucifixion; he refuted the sceptic and modified the Stoic

BLAISE PASCAL

position accordingly, in his own brilliant style. This may account for the dictum that 'he juggled with God and with the immortality of the soul'; and this in turn for his condemnation by some critics (e.g. Cousin) as a pessimist. Nietzsche called P. 'the one logical Christian.' The Eulogium of P. by Bordes-Demoulin, which won the prize of the Fr. Academy on 30 June 1842 is to be found in many eds. of the *Lettres*. The best ed. of the *Pensées* is that of Lafuma, 1955. There is a trans. from L. Brunschvicg's edition by W. F. Trotter in Everyman's Library. Fangere's ed. of the *Lettres provinciales* is the most reliable. P.'s complete works were ed. by L. Brunschvicg and E. Boutroux in 1908. See L. Brunschvicg, *La Génie de Pascal*, 1924; C. J. Webb, *Pascal's Philosophy of Religion*, 1929; M. Bishop, *Pascal*, 1938; H. F. Stewart, *The Secret of Pascal*, 1941; and D. Patrick, *Pascal and Kierkegaard*, 1948.

Pasch, Gk for Passover and Easter (q.v.). **Paschal**, name of 2 popes and 1 antipope. (1) *Paschal I* (817-24), a Roman, notable chiefly for his relations with the Emperors Louis and Lothair, the latter of whom he crowned in 823. In his pontificate the iconoclastic controversy began. He was canonised. (2) *Paschal II*, known also as *Rainerius* (1099-1118), reigned while the question of investiture was being disputed, and thus came into conflict with Henry I of England among others. (3) *Paschal III* (Guido of Crema),

antipope, was set up in 1164 by Frederick Barbarossa, and continued the opposition to Alexander III. At the instigation of Frederick he canonised Charlemagne.

Pasco, Cerro de, see CERRO DE PASCO. **Pascoli**, Giovanni (1855-1912), It. poet and scholar, b. San Mauro di Romagna Rimini. In 1905 he succeeded Carducci in the chair of It. literature at Bologna Univ. His first collection of verse, *Myricae*, was pub. in 1891, mostly poems of simple country life. In 1897 followed *Primi Poemetti*, and *Canti di Castelvecchio* in 1903. His *Poemi conviviali* (1904) are more classical in inspiration, and deal with eternal themes. The *Poemi italiani* (1911) are patriotic poems, evoking events of Italy's past. He also wrote excellent poetry in Latin, and trans. Shelley, Tennyson, and Wordsworth. P. departs from the tradition in his use of profuse images, his deliberate symbolism, his unusual rhythms, and his large vocabulary. His influence on younger poets was immense. See *Pascoli*, *Poems*, trans. A. M. Abbot, 1927; A. Galetti, *La poesia e l'arte di G. Pascoli*, 1924; A. Pompeati, *Pascoli*, 1939; A. Zamboni, *Pascoli*, 1941.

Pas-de-Calais: 1. Or Strait of Dover (see DOVER).

2. Dept of the N. of France, formed of most of the ant. prov. of Artois, and the maritime portion of Picardy. It has a coast-line on the Strait of Dover (q.v.). The surface is generally flat and well watered. The prin. agric. products are cereals, potatoes, sugar-beet, and tobacco, and livestock breeding is important. There is a rich coalfield, and textile, metallurgical, sugar, and other manufs. The coastal areas have fishing and tourist industries. The dept was the scene of severe fighting in both World Wars, and many parts of it suffered greatly. In 1944 the Germans launched flying bombs (q.v.) from sites in the dept. The prin. towns are Arras (the cap.), Béthune, Boulogne-sur-Mer, Montreuil, St-Omer, Calais, Lens (q.v.). Area 2606 sq. m. Pop. 1,276,800.

Paseng, see GOAT.

Pasha, **Pacha**, or **Bashaw**, title derived from the Persian, and applied to commanders of high rank, naval, military, or civil, in the Turkish Empire. At one time it was limited to princes of the blood. Every general or governor of a prov. was *ex officio* a P.

Pashto, see PUSHTU.

Pasig: 1. Riv. of Luzon, Philippine Is. It flows W. from the N. end of the Laguna Bay, emptying into Manila Bay at Manila.

2. Cap. of Rizal prov., Luzon, Philippine Is., on Pasig R. 7 m. E. of Manila. Pop. 35,407.

Pasiphaë, daughter of Helios and Persis, wife of Minos. A nymphomaniac, she concealed herself in a wooden cow made for her by Daedalus, and became mother of the Minotaur (q.v.).

Paso del Norte, El, see CIUDAD JUÁREZ. **Pasque Flower** (*Pulsatilla vulgaris*), beautiful Brit. plant so called because of its purple flowers which appear about

Easter time. It is a good rockery plant, but prefers a dry, chalky soil.

Pasquier, Etienne (1529-1615), Fr. advocate and writer, b. Paris. Early destined by his parents to follow the career of an advocate, he studied law at the Bologna Univ. under Socin, and was admitted to the Bar in 1549. During his earlier days he indulged his literary tastes by publishing *Recherches sur la France* (in encyclopaedia form), 1560; *Monophile* (dissertations on love), 1555; and his forceful *Exhortation aux princes*, 1561, advocating freedom of conscience. The first named led to his obtaining in the *Parlement* in 1564 a brief for the univ. of Paris, the law-suit arising out of the Jesuits' attempt to gain admission to that univ. Thenceforth he appeared in numerous *causes célèbres*. In 1588 he became deputy in the States-General (q.v.). In 1603 he resigned his office of advocate to the king, and devoted the rest of his life to literature. The collected works of P. were pub. in 1725. See Margaret J. Moore, *E. Pasquier, historien de la poésie et de la langue française*, 1934. See also his delightful *Letters*, pub. in 3 vols., 1619.

Pasquin, or Pasquino, name of a cobbler of Rome, celebrated for the gibes he hurled at every turn. He lived at the corner of the Palazzo Orsini, and at his death the mutilated statue of a gladiator, which was found under the pavement near his stall, was put up on the same spot and received the name P. It became customary to affix to this statue satirical verses directed against prominent personages, which were hence called *pasquinades*. The satires were for the most part epigrammatic replies to some topical question affixed on the pediment of a statue of Marforio, which stood near by. A celebrated instance is the following:

Marforio. E vero, Pasquino, che tutti Francesi sono ladri?

Pasquino. Tutti, no, ma buona parte.

('Is it true, Pasquin, that all Frenchmen are thieves?')

'All! no, but the greater part of them.')

directed against and being a pun upon the name of Napoleon Bonaparte, on the occasion of the Fr. occupation of Rome.

Passacaglia (Sp. *pasar*, walk, and *calle*, street), originally a Sp. dance, but now an instrumental composition based on a ground, i.e. a tune continuing throughout, usually, but not necessarily, in the bass, as it always does in the Chaconne (q.v.). The best-known example actually called P. is Bach's for organ; there is a famous P. for harpsichord by Couperin, and the finales of Brahms's Fourth and of Vaughan-Williams's Fifth Symphonies are other familiar Ps.

Passage, Court of, anct. existing civil court of record in the bor. of Liverpool. Formerly the mayor acted as presiding judge, assisted by bailiffs of the bor.; but by the Court of Passage Act, 1834, a qualified legal assessor was added to the bench, and 4 years later the mayor and bailiffs were dispensed with altogether. Finally, an Act of 1893 made the assessor the sole presiding judge, with powers not

inferior to those of a high court judge. Generally speaking, only those actions can be tried in this court where the defendant at the time the action was launched resided or carried on business within the jurisdiction, or, by leave of the judge or registrar, where the whole or part of the cause of action arose within the jurisdiction.

Passage Island, see CULEBRA.

Passage West, tn and shipping centre in Cork harbour, Rep. of Ireland. The upper Cork harbour begins here with depths of 52 ft at low water. Pop. 2660.

Passaic: 1. City of New Jersey, U.S.A., 13 m. NW. of New York. The E. part consists chiefly of a plain, whilst the W. is more hilly and almost entirely residential. The chief buildings of interest are the city hall, general hospital, general public library, and the Jane Watson Reid Memorial Library. The prin. manufs. are rubber goods, metal wares, silk, cottons, worsted, radio and telegraph equipment, railroad cars, brakes, chemicals, paper products, and biscuits. Pop. 57,702.

2. Riv. of New Jersey, U.S.A., rising in Morris co., and flowing between Union and Essex cos. for a course of about 80 m. into Newark Bay. The falls at Paterson (70 ft) supply abundant water-power for the tns of Newark, Paterson, and P.

Passamaquoddy, tribe of N. Amer. Indians of Algonquin stock, allied to the Penobscots. The remnant of them reside on the W. shore of Passamaquoddy Bay, in the state of Maine, and number over 600.

Passamaquoddy Bay, inlet of the Atlantic between Maine, U.S.A., and New Brunswick, Canada. It is 30 m. in length and about 20 m. in breadth at the entrance, and is deep, sheltered, and never blocked by ice. P. project was begun in 1935 in the U.S. part of the bay to salvage heavy tides (18 ft) for hydro-electric power, but it was abandoned. Proposals have been made to revive the project under U.S.-Canadian sponsorship.

Passaro, Cape, Battle of, battle fought between the Eng. and Sp. fleets in 1718. The Spanish had captured the is. of Sicily, and were besieging Messina. The Brit. fleet, under Adm. Byng, raised the siege and compelled the Spaniards to withdraw from Sicily.

Passarowitz, see POZAREVAC.

Passau, Ger. tn in the *Land* of Bavaria (q.v.), 92 m. ENE. of Munich (q.v.). It is on the Austrian border, at the confluence of the Danube, the Inn (q.v.), and the Ilz. It was by origin a Celtic settlement, and later a Rom. camp. In 739 St Boniface (q.v.) made it a bishopric; the bishop became a prince of the Empire in the 13th cent., and P. developed into a riv. port of great importance. On the suppression of the bishopric in 1803 the tn became a Bavarian possession (the present bishopric was estab. in 1817). P. is a beautiful tn, standing on wooded heights and possessing a wealth of curious streets and anct. mansions. It is dominated by its massive baroque and Gothic cathedral (14th-17th cents.) and by a great fortress, begun in the 13th cent. It

has brewing, paper, tobacco, and engineering industries. Pop. 35,000. See P. Mader, *Pasau*, 1925.

Passchendaele, tn in Flanders, near Ypres. The tn and P. ridge, the high ground in front of Ypres, were the scene of bitter fighting in the third battle of Ypres on 12 Oct. and 26 Oct. to 10 Nov. 1917. The ridge was the immediate objective of the allies' offensive from Ypres after the Messines-Wytschaete ridge had been taken by the Brit. troops of Eng. and Irish and dominion units. The Ger. defences were strengthened with 'pill-boxes' or concrete redoubts bristling with machine-guns, and, being level with the ground, difficult to reduce by artillery fire and fatal to attacking infantry. The Brit. forces, after heavy losses, entered P. itself on 30 Oct., but were driven out again almost immediately. The Canadians retook the tn on 6 Nov. and held their positions in face of desperate Ger. counter-attacks, and throughout the next days the allies successfully cleared the sides of the ridge; its surrender in the battle of Picardy (or the Lys) in April 1918 was a sore blow to Brit. pride. The tn was eventually recaptured at the end of Sept. 1918. Eng. military critics have severely criticised the Fr. and Brit. high commands for the whole conception and strategy of this costly and tragic battle of the days of static trench warfare.

Passenger Pigeon (*Ectopistes* (or *Columba*) *migratoria*), N. Amer. bird whose sudden and complete disappearance is the most remarkable in zoological hist. It was probably the most gregarious bird in existence, and during its breeding season used to occupy a crowded area of over 100 sq. m. On account of its value as a table delicacy it was ruthlessly persecuted, and in one year 15,000,000 dead birds were dispatched from Michigan and Pennsylvania. In 1888 it failed to take up its usual breeding quarters, and then disappeared without trace, the last known specimen dying in 1914 at Cincinnati zoological gardens. Its main features were its long wings and longer narrow tail.

Passenger Rail Services, see RAILWAYS. **Passeriformes**, order of perching or passerine birds, characterised especially by the 4-toed foot, the claw of the hind toe, which is separately controlled, being larger than that of any of the other toes. This is by far the largest order of birds, consisting of 5000 to 6000 species—about half the number of known birds. Only among its numbers is the power of song much developed. There is, however, a section of the order which includes a number of songless birds, none of which are found in Europe.

Passfield, Lady, see WEBB, BEATRICE. **Passfield**, Sidney James Webb, Baron (1859-1947), socialist, historian, and statesman; b. London, son of Charles Webb. He was educ. at private schools in London and spent some years in Switzerland and Germany, completing his education at the City of London College, Birkbeck College, and King's College. He was a clerk in a colonial broker's office in London, 1875-8; by open competition

he reached the status of lower div. clerk in the War Office, 1878-9; he was surveyor of taxes, 1879-81; colonial office clerk, 1881-91. In 1885 he was called to the Bar, and gained the LL.B. of London Univ. He was member for Deptford on the L.C.C., 1892-1910. Prof. of public administration, London School of Economics, 1912-27; and one of the senate of London Univ., 1900-8; he served on the Royal Commission on Trade Union Law, 1903-6; the Coal Industries Commission, 1910; the Royal Commission under Development Act, 1910-22; and many important committees. Labour M.P. for the Seaham div. of Durham co. 1922-9, he was P.C. in 1924, being president of the Board of Trade from Jan. to Nov. of that year. In 1929 he was ennobled and became secretary of state for the colonies and dominion affairs (from 1930 to 1931 for colonies only). His greatest achievement is the placing of the Brit. socialist movement in its historical setting by the books he wrote in collaboration with his wife, Beatrice Webb (q.v.). Although he held Cabinet rank in 2 Labour Govs. he was never a prominent figure in public life, and when he entered the House of Commons in 1922 his career had begun to draw towards its close. It was indeed with reluctance that he accepted the office of president of the board of trade in 1924, and he had already contemplated retirement when, as a peer, he once more assumed office in the dominions and colonial offices. Yet in practical achievement he accomplished more than most politicians of his day as in the development of social and political reform. Through the Fabian Society, of which he was one of the pioneers (see under FABIAN SOCIETY), he played the most conspicuous part in converting Brit. Socialism from a propaganda of social revolution to a programme for the working-class movement, and more than any other led the Labour party to accept the Fabian interpretation of Socialism. But his greatest interest was education, and, having become chairman of the Technical Education Board, he strove to bring secondary and univ. education within reach of the working classes (he lectured in political economy at the City of London College and Working Men's College); and he was so far successful that the subsequent revolution in educational administration, the transfer of control to local authorities, the development of secondary education, and the enlargement of the univ. system were all for the most part due to his efforts. The Fabian programme, much of which the Education Act of 1902 embodied, was also his work. He was entitled to particular credit for his share in the creation of the Imperial College of Science and Technology, and the development of a unified library system in London.

The Webbs formed a partnership unique in the public life of their generation, and one to which the socialist movement must be ever grateful. One of their striking achievements was a visit to Russia in 1932 and 1934, which resulted in *Soviet Communism: a New Civilization?*,

1935, which work, however, proved the least acceptable of the Webbs' writings, critics condemning its too ready acceptance of gov. statistics and its failure sufficiently to consider the loss of individual liberty in the Soviet system. This, however, in no way lessens the magnitude and importance of the work, both in affairs and in writing, which this long partnership performed. The ashes of Lord and Lady P. (d. 1943) were interred in Westminster Abbey in Dec. 1947. The great mass of pubs. by Lord P. include, with his wife, *History of Trade Unionism*, 1894, revised 1920; *Industrial Democracy*, 1897; and a series of vols. on the hist. of local government (*English Local Government*, 1908-22); also his *Socialism in England*, 1890; *A Constitution for the Socialist Commonwealth of Great Britain*, 1920; *English Poor Law History*, 1927-9; and *Soviet Communism*, 1935. See the autobiographies of Lady P., *My Apprenticeship*, 1926, and *Our Partnership*, 1948; also Margaret Cole (ed.), *The Webbs and their Work*, 1949.

Passion Flower, family *Passifloraceae*, genus of climbing herbs and shrubs, many of which bear flowers of a form which led devout settlers in S. America to give the plants their name. The 3 stigmas were seen to represent nails, one transfixing each hand, and one the feet, of the crucified Christ; the rays of the corona, the crown of thorns; the 5 anthers, the wounds; the 10 parts of the perianth, the 10 faithful apostles; and the digitate leaves and tendrils, the hands and scourges of those who scourged Him. *P. caerulea* is hardy in warm, sheltered gardens, but the other species require culture under glass. *P. edulis* is the Granadilla, grown for its fruit. The genus also includes plants formerly classed under *Tecsonia*.

Passion Music. From the earliest days of the Christian Church it has been the custom to read the hist. of the Passion of Christ during Holy Week, but it is impossible to say at what date the hist. began to be solemnly chanted, though it was certainly before the 8th cent. In the Rom. Church the Passion gospels are sung in plainchant by 3 priests in 3 different tones, one taking the words of our Lord, another the words of the evangelist, and a third those of other characters. The people (*turba*) are, when possible, represented by the choir, for whom magnificent polyphonic music was written by Palestrina and Victoria. The same elements are retained by the Ger. Passion, from Schütz to Bach; in the latter's P.s the evangelist (tenor) relates the story in recitative, Christ (bass) sings short sentences in *arioso* style, the *turba* is by turns reflective and dramatic (i.e. a commenting chorus or an actual crowd), and arias are interspersed, the text of which is not taken from the Gospels but is a contemporary poet's reflection on them.

Passion Play, drama in the form of the old miracle plays depicting the Passion of our Lord. P. P.s are found during the later Middle Ages, especially in Germany

and the Tyrol, and they reached the height of their excellence during the 16th cent. The best-known modern example is the Oberammergau P. P., first mentioned in 1633 in connection with a vow made by the peasants, after a severe visitation of the plague, that they would perform a passion drama once in every 10 years. The text of the Oberammergau play has sov. times undergone revision. See F. W. Farrar, *Passion Play at Oberammergau*, 1890, and the *Official Guide to Oberammergau*, 1950. See also MIRACLE PLAY.

Passion-tide, the last 2 weeks before Easter.

Passionists. 'The Congregation of Discalced Clerks of the Most Holy Cross and Passion of our Lord Jesus Christ' was founded by St Paul of the Cross about 1730, its rule being approved in 1741 by Benedict XIV. They are engaged in revival and mission work in various parts of the world. The P. were introduced into England in 1841.

Passive Resistance. This term, which figured largely in the newspapers shortly after the passing of the Education Act, 1902, was the name given to the movement, whether organised or not, for the refusal to pay the new education rate. By this Act voluntary elementary schools became rate-aided for the first time in the hist. of the great education controversy, and the rate in aid, which was levied as part of the co., bor., or dist. rate (as the case might be), was vehemently objected to by nonconformist (mainly) ratepayers, on the ground that by compelling them to maintain church schools the legislature was guilty of endowing a particular religious denomination and one with which they had no sympathy. In India, between the two world wars, Gandhi (q.v.) embarked upon a campaign of opposition to what he conceived to be Brit. injustice and oppression, which was characterised by professedly non-violent tactics known as 'P.R.', as well as 'civil disobedience' and 'non-co-operation.' In industrial disputes the principle of P.R. is exemplified in dilatory tactics, variously known as 'going slow,' 'ca' canny,' and 'working to rule.'

Passivity, state induced in certain metals whereby they become insoluble in dilute acids. P. is caused by dipping the metal (e.g. iron, chromium) in concentrated nitric acid. It can be removed by rubbing with sandpaper, etc.

Passmore Edwards, see EDWARDS.

Passoeroean, see PASURUAN.

Passos, John (Roderigo), see DOS PASSOS.

Passover, (Heb. *pesah*), first of the 3 great festivals commanded to be observed in the Pentateuchal codes. According to Exodus xii, it was instituted to commemorate the *exodus* from Egypt, in particular the 'passing over' of the houses of the Israelites (distinguished by the sprinkled blood on the door-posts) by the angel of the Lord when the first-born of the Egyptians were slain. The order of its celebration was to be thus: A lamb or kid, a male of the first year, without

blemish, was selected by each household (or, if the households were small, by 2 conjointly on the tenth day of the month Abib (Nisan), and it was kept till the fourteenth day of the month, when it was killed and roasted and eaten with unleavened bread and bitter herbs. . . . for thou earnest forth out of the land of Egypt in haste . . . (Deut. xvi. 3.) They were, therefore, to eat it in haste, standing, with their loins girded, their shoes on their feet, and their staves in their hands, as those prepared for a journey. None, whether Israelites or strangers, were to partake of it unless they had been circumcised. During the 7 days for which the feast lasted none but unleavened bread, called *Mazoth*, was to be eaten, on penalty of being cut off from the people, and special sacrifices were appointed for each of these days. The first and the last of these 7 days were considered as full feasts and 'no manner of work shall be done in them, save that which every man must eat' (Exod. xii. 16). Outside Palestine the P. lasts 8 days, of which the first 2 and the last 2 are full feasts. The paschal lamb is still sacrificed by the Samaritans on Mt Gerizim.

Passport, warrant of protection and authority to travel. P.s may be obtained from the P. Dept. of the Foreign Office and through the local offices of the Ministry of Labour. U.K. P.s are now primarily issued to persons who are citizens of the U.K. and Colonies, that is, persons who were born or naturalised in the U.K. or Colonies as constituted on 1 Jan. 1949, or whose fathers were born in such a ter. Persons who were born or naturalised in a Commonwealth country should apply for P. facilities to the High Commissioner of that country. Since 1 Jan. 1949 an alien woman does not automatically acquire her husband's Brit. nationality upon marriage, neither does a Brit. woman lose her Brit. nationality upon marriage to an alien. Foreign P.s are available for 5 years from the date of issue, and may be renewed for further consecutive periods up to 5 years, but in no case beyond 10 years from the date of original issue. The address of the P. Office is Clive House, Petty France, London, S.W.1, and there are branch offices in Liverpool and Glasgow and an agency in Belfast to which personal application may be made. U.K. passports are normally endorsed for all foreign countries.

Passy: 1. Dist. of W. Paris, beside the Bois de Boulogne (q.v.). It is a residential area, and has associations with many names famous in history and art—Lamartine, Rossini, J.-J. Rousseau, Lamassant, and Balzac (qq.v.), amongst others. There are numerous clinics and convalescent homes.

2. Fr. com. in the dept of Haute-Savoie. It is a tourist centre. Pop. 6600.

Paste, form of adhesive usually made by mixing flour with water (about 2 lb. to the gallon). The water is added gradually and the whole well mixed. An ounce of alum is added to

increase the adhesiveness, and the whole boiled and well stirred. Bookbinders usually add about an ounce and a half of resin instead of the alum, thus getting a thicker and still more tenacious P. See ADHESIVES; GLUE.

Pasteboard, see CARDBOARD.

Pastel, or Crayon, Drawing, name applied to a method of painting with dry pigments. The use of coloured chalks has a long history, and many European old masters used them to heighten the effect of a drawing. Crayon 'painting' was practised in England from an early date, and John Riley (1646-91) produced many works in P., but Francis Cotes (1725-70) was the first Englishman to develop the art fully, and his portraits of Mr and Mrs Joab Bates and Lord Hawke testify to his high ability. He was followed by John Russell, R.A. (1765-1806), who brought the art to perfection. But it came to be a favourite medium not only in England (especially for portraiture), but also on the Continent in the course of the 18th cent., such names as Rosalba Carriera, J. E. Liotard, and the great master Quentin de la Tour being conspicuous. Chardin used the medium in rivalry with him. In more modern times it has been practised by Degas, Toulouse-Lautrec, Millet, and Whistler. Some of Degas' most beautiful ballet scenes and nude studies were executed in pastel. Its revival in the latter half of the 19th cent. was due to a renewed appreciation of the swift and free handling it allowed and the fresh and luminous effects it could produce.

See J. L. Sprinkle, *A Guide to Pastel Painting* (Rowney).

Pasternak, Boris Leonidovich (1890-), the most outstanding contemporary Russian poet, of Jewish origin. He studied music and philosophy at Moscow and Marburg. As a young man he joined the Futurist literary movement. He wrote lyrical (*A Turin in Clouds*, 1914, *Over the Barriers*, 1917, *My Sister Life*, 1922, *Themes and Variations*, 1923, *The Second Birth*, 1932, *On Early Trains*, 1943, *The Terrestrial Expanse*, 1945), autobiographical (*Spektorskiy*, 1926), and historical (*Lieutenant Schmidt*, 1926, *The Year 1905*, 1927) poems, and some prose works (remembrances, *The Safe Conduct*, 1931). From the late 1920's P. led the life of an 'internal émigré'. Unable to publish original works he often turned to translation (brilliant translations of Shakespeare's tragedies, Goethe's *Faust*, Petőfi, and Georgian poets). His novel, *Dr Zhivago*, pub. abroad 1957, is a masterpiece and an effective condemnation of the Bolshevik revolution as a spiritual reaction. At present he is widely considered the leader of the intellectual opposition.

Pasteur, Louis (1822-95), Fr. chemist and bacteriologist, b. Dôle (Jura), the son of a tanner. He was educ. at Artois, Besançon, the École Normale, and the Sorbonne. B.-es.-L. 1840, and became a mathematics master; B.-es.-Sc. 1842. He studied chemistry and physics, and worked specially on isomeric compounds.

In 1852 he was appointed prof. of chemistry at Strasburg, where he married Mlle Laurent. Earlier he made a classical investigation of tartaric acid and discovered that tartaric acid crystals showed faces that were inclined to the right, while the crystals of *para*-tartaric acid showed faces inclined sometimes to the right and sometimes to the left. Separating the two types, he proved that the 'right-faced' crystals rotated polarised light to the right and 'left-handed' crystals rotated the light to the left, a mixture of the two being inactive. For this work he was awarded the Rumford

Hachette

LOUIS PASTEUR

Medal of the Royal Society (1856). In Strasburg his attention was turned to fermentation, and he showed that *Pentecillium glaucum* destroyed only the right-handed portion of the inactive tartaric acid. He was appointed prof. of chemistry at Lille in 1854. In the breweries of this he examined the 'diseases' of beer, wine, and vinegar, and discovered the micro-organism of fermentation, thus killing the old theory of 'spontaneous generation' by proving the presence of bacteria in the atmosphere and the healthiness of injured living matter when protected from them. These researches led directly to Lister's epochal work on antiseptics, having proved the germ theory of disease. Meanwhile his work on acetous, lactic, and vinous fermentations was pub. (1876) in *Études sur la bière*, with great advantage to an important industry in his native country. His recommendation of heat treatment of beer led to *pasteurisation* (q.v.). This was not his only service directly to industry. In 1865 he carried out a masterly and classical research on the disease attacking the silkworm, discovered that there were in fact 2 diseases caused by

different microparasites, and showed how they could be prevented (*Étude sur les maladies des vers à soie*, 1870). In the midst of this work P. suffered a cerebral haemorrhage and never entirely recovered from the consequent paralysis. He next turned to the study of chicken cholera and, by investigating the causal virus, demonstrated the principle of preventive inoculation; by attenuating (weakening) the virus and then inoculating it a mild attack of the disease was produced in the subject, who thereafter became immune. A similar result followed his work on anthrax (1881), the bacillus of which had already been discovered. In 1880 P. began experiments on rabies (hydrophobia) which were to lead to the most startling discovery of his career. Although he did not succeed in isolating the virus, he located it in the central nervous system and was able to produce a vaccine of attenuated virus. On 16 July 1885 he inoculated Joseph Meister, an Alsatian boy who had been bitten by a rabid dog; the child did not develop rabies. A great wave of enthusiasm and generosity following this discovery led to the foundation of the Pasteur Institute in Paris, where P. was able to carry on his work and train others; this is now one of the most important of its type in the world; other P. institutes have since been founded. Outside the institute in Paris stands a statue of P. inoculating Joseph Meister, who later became its concierge and d. by his own hand during the occupation of France in 1940.

Numerous other discoveries are accredited to P., whose name is one of the greatest in medicine. His many writings appeared in collected form (*Œuvres de Pasteur*, 7 vols., 1922-39). The best *Life*, by R. Valléry-Radot, appeared in Eng. trans. 1930; see also Eleanor Doorly, *The Microbe Man*, 1938; R. J. Dubos, *Louis Pasteur, Free Lance of Science*, 1951; and *Life* by E. M. Attwood, 1954. See also DAIRY (for pasteurisation); PASTEUR TREATMENT.

Pasteur Treatment, name given to Louis Pasteur's (q.v.) inoculation treatment for procuring active immunity against anthrax, hydrophobia, and other virulent diseases. It consisted in the injection of a preparation containing the particular organisms causing the disease. These organisms had their virulence reduced by growth under unfavourable conditions. When injected they stimulated the blood to produce antibodies which remained for some time and protected the person from the particular disease. The principle was based on the treatment of smallpox by vaccination, and Pasteur's inoculations were the forerunner of the modern practice of immunisation against infective diseases. See also BACTERIA and RABIES.

Pasteurisation, see DAIRY.

Pastiche, or **Pasticcio**, in literature or art, a patchwork of borrowings, or work in imitation of another's style. In music a stage entertainment for which the music was not written by a single composer, but

put together from various earlier works by any number of composers who happened to be popular. The words were therefore written to the music, not the reverse, as in opera, etc. In 18th-cent. Italy, however, words as well as music, especially from Metastasio's works, were often taken over by a P. The P. was especially fashionable in the 18th cent. The ballad opera and the vaudeville were both P.s of a kind.

Pasto, city of SW. Colombia, cap. of Nariño dept, on a flank of the P. volcano (14,000 ft), 140 m. NE. of Quito. It is the seat of a bishop, and has a univ. There are gold mines near, and it is a rich agric. centre. Pop. 27,600.

Paston Letters, correspondence of a Norfolk family of that name, together with state papers and other documents, covering the period from 1422 to 1509. They form an invaluable source of information on 15th-cent. life and manners, and on conditions during the Wars of the Roses (q.v.), as well as giving vivid portraits of some of the Paston family. The most complete ed. is that of James Gairdner (6 vols.), 1904; there is also an ed. in Everyman's Library. A fictional study based on the Letters is *Beloved Lady*, by Barbara Jefferis, 1955.

Pastor, or Rose-coloured Starling (*Pastor roseus*), beautiful member of the starling family. The adult bird has a long crest which, like the head, neck, and throat, is glossy violet-black; the back, shoulders, and under-surface are a delicate rose-pink, and the wings and tail greenish-black. It is common in India and occasionally visits Europe.

Pastoral Epistles, see under TIMOTHY; TITUS.

Pastoral Letter, letter addressed by the bishop of a diocese to the whole body of clergy and the people under his jurisdiction. Such letters are usually read out from the pulpit of each par. church.

Pastoral Poetry is poetry descriptive of country life, and includes pastoral drama, in which the characters represent shepherds or other country people. Except in such cases as the Dorsetshire poems of Barnes, it is a perfectly artificial genre, and the rustic setting does little more than mask the thoughts and emotions of the country and era in which the pastorals are produced. The origin of the pastoral must be sought in classical literature. Aelianus makes Stesichorus of Himera (d. about 555 bc) its inventor, but the earliest extant pastorals are those of Theocritus (c. 270 bc). In these may be found the germ of the European pastoral, and many of the names of the shepherds and shepherdesses of Theocritus (e.g. Lycidas, Corydon, Daphnis, and Amoryllis) did duty in all countries. Virgil's 10 *Eclogues* also exercised considerable influence. In Italy the first vernacular pastoral romance is the *Ameto* of Boccaccio, 1342, but a more famous example is Sannazaro's *Arcadia*, 1504. Petrarch, and after him Mantuan, made the pastoral a veil for satiric treatment of women, courtiers, and ecclesiastics. Spenser's *Shepherd's Calendar*, 1578, owes much to the pastorals of

Mantuan. The first pastoral drama was Politian's *Favola di Orfeo*, which was produced at Mantua in 1472, and the most famous of its successors was the *Aminto* of Tasso, 1573. The most famous Sp. pastoral was Montemayor's romance of *Diana*, 1568, well known in Elizabethan England. In 1590 appeared Sir Philip Sidney's prose romance of *Arcadia*, which had, however, been written many years before. Many of the Elizabethan dramatists also wrote romances, mainly in the manner of *Euphues*. The best known of these is Lodge's *Rosalynde*, 1590. The pastoral drama found its 3 greatest exponents in Fletcher, *The Faithful Shepherdess*, Shakespeare, *As You Like It*, and Ben Jonson, *The Sad Shepherd*. Among the last masques in pastoral style was Milton's *Comus*. There was a revival of the pastoral in the 18th cent., which produced the pastorals of Pope and Ambrose Phillips, over which the pair quarrelled. Gay's *Shepherd Week* was intended as a parody of Phillips's, but was, in point of fact, the best of the group. It was, however, surpassed by Ramsay's *Gentle Shepherd*, 1728, in which the artificial element is less obtrusive. Since that time the pastoral has not been a popular poetic form. See E. K. Chambers, *English Pastorals*, 1887, and W. W. Greg, *Pastoral Poetry and Pastoral Drama*, 1906.

Pastoral Staff, see CROSIER and LIS-MOIRE CROSIER.

Pastoral Theology, branch of theology which deals with the duties of the clergy as shepherds of souls.

Pastorales, see BASQUES.

Pasture, term loosely applied to all grassland which is grazed at any time. It may refer to permanent P., temporary P. or ley, or even to rough grazings on hill land.

Pasuruan, or Passerocean, tn of E. Java, Indonesia, on the N. coast, 50 m. by railway SSE. of Surabaya. It has considerable trade. Pop. 37,000.

Patagonia, S. portion of S. America, lying E. and W. of the Andes, and divided between Chile and Argentina. The name P. arises from the nickname 'Patagones,' or big feet, applied by early Sp. explorers to the clumsily shod aborigines of the extreme S. The Chilean portion lies S. of Llanquihue and comprises the provs. of Chiloé and Magallanes (Magellan ter.), while the Argentine extends S. from the Río Negro, and includes the ters. of Río Negro, Chubut, and part of Santa Cruz (qq.v.). The whole W. region is occupied by the Andes, rising from 3000 to 6000 ft, with forests on the lower slopes; the rainfall is very heavy. The E. dist. is a plateau, rising in terrace fashion with layers of sandstone and basalt. A great part is barren, but in the N. part irrigation enables wheat to be grown, and immense flocks of sheep graze on the plains. The greater part is a vast plateau, almost uninhabited; the ter. of Santa Cruz has barely one inhab. to 25 sq. m. W. H. Hudson says: 'It has a look of antiquity, of desolation, of eternal peace, of a desert that has been a desert from of old, and will

continue a desert for ever.' In the Chilean portion of Tierra del Fuego is Punta Arenas, a flourishing tn and port, with a very large trade in wool. Patagonian output of wool averages 50,400 tons per annum. Petroleum is being produced at Springhill and Comodoro Rivadavia. The total area of P. is about 300,000 sq. m. The original natives belonged to 2 races, the Tehuelches, noted for their great stature, and the Gennakens, who are practically extinct. See also TIERRA DEL FUEGO.

Patan: 1. Walled tn of Bombay State, India, 64 m. NNW. of Ahmedabad. P. is on the site of the anct city of Anhilwara, in the 8th cent. AD the cap. of the Hindu Kings of Gujarat, which was captured by Mahmud of Ghazni about AD 1024.

2. Tn of Kathiawar Peninsula, Bombay, see SOMNATH.

Patang, see PAAN.

Patani: 1. Province of Thailand, between Kelantan and Singora, on the E. coast of the Malay Peninsula. Area 6000 sq. m. Pop. 199,252.

2. Tn, cap. of the above state, on the E. coast, in about 6° 51' N.

3. Cape on the E. coast of the Malay Peninsula, at the entrance to the Gulf of Siam.

4. Riv. of Thailand, Malay Peninsula, flowing NE. and N. through P. into the Gulf of Siam in about 6° 55' N.

Patavium, see PADUA.

Patch, Alexander McCarrell (1889-1945), Amer. soldier, b. Arizona, son of a captain of West Point Military Academy. P. entered West Point in 1909, and was distinguished as an athlete. In the First World War he was a director of the Army Machine-Gun School in France, and later served in the Aisne-Marne, St Mihiel, and Argonne offensives. In 1936 he joined the Infantry Board at Fort Benning in Georgia, after diligent study at the general staff school and at the army college. In 1941 he commanded the infantry training centre at Camp Croft, in S. Carolina. In 1943 he was put in command of ground forces at Guadalcanal, taking part in the assault which drove the Japanese from the Henderson Field area, personally leading the attack which stormed Mt Austin. In March 1944 he succeeded Gen. Patton in command of the Amer. Seventh Army, leading the Amer. ground forces in the invasion of S. France.

See also WESTERN FRONT IN SECOND WORLD WAR.

Patcham, residential dist. of Brighton, Sussex, England, with a Doom painting in the par. church dating from the 12th or 13th cent., probably the oldest complete Doom shown in any church.

Patching, see NEEDLEWORK.

Patchouli Plant, *Pogostemon heyneanus*, synonym *patchouli*, a soft-wooded shrub of about 3 ft. of India and Burma, family Labiatae, with small, whitish flowers with a purple tinge in June. It is the source of the Patchouli perfume, the Pucha-pat of the Hindus, of peculiar scent, held to be disinfectant. The leaves are distilled to extract a volatile oil; the dried plant used to stuff mattresses, pillows, etc. It

requires warm greenhouse culture in Britain.

Patchwork, see EMBROIDERY.

Patel, Framjee Nasarwanjee (1804-94), Parsee merchant and philanthropist, b. Bombay. In 1819 he began a successful business career in the firm of Frith, Romanjee & Company. At this time in India prominent merchants became *de facto* bankers, since few people had large capital resources. In 1844 P. founded the firm of Wallace & Company; from this he retired and in 1849 founded Framjee, Sands & Company. He will be remembered, however, for the work he did for his fellow countrymen in India. Since the Parsees were exiled from Persia, Parsee law was in a chaotic state, particularly as regards the laws of marriage and intestacy. P. served on a commission to investigate this and became president of the Parsee Law Association. He was held in high regard by both Indians and British.

Patel, Vallabhbhai Jhaverbhai (1875-1950), Indian Nationalist leader, b. near Nadiad, 30 m. S of Ahmedabad, then in Bombay Presidency. He first practised law locally and then went to England, where he was called to the Bar at the Middle Temple. On returning to India he practised at Ahmedabad, but soon took an active part in politics. His association with Gandhi (q.v.) and the Indian National Congress began in 1916, and lasted till his death. He soon evinced a remarkable flair for organisation, and was largely responsible for the striking success of many of the mass demonstrations and civil-disobedience campaigns stimulated by the Congress. It was on account of this exceptional gift that he was called 'Sardar' by Gandhi, a title by which he was commonly known thereafter. From 1924 to 1928 he was President of Ahmedabad Municipality and there showed that his talents included administration on a large scale. He was Chairman of the Congress Parl. Sub-Committee from 1935 to 1942, and in this position exercised close control over the first Congress ministries to take office in the provs. (now states). He was twice imprisoned during the Second World War together with all the prominent Congress leaders.

In the Interim Gov. of India, formed in 1946, he became Home Minister and Minister in charge of Information and Broadcasting. After independence and partition in 1947 he remained in these posts and also became *de facto* Deputy Prime Minister under Jawaharlal Nehru. In those capacities he was directly responsible for 2 outstanding achievements. One was the complete disruption of the Communist-organised all-India railway strike in 1949, and indeed the total defeat of the campaign of violence and lawlessness waged by Communists between 1948 and 1950; the other was the peaceful integration of the former princely states in the new India. That this was completed without undue rancour and, except in the peculiar cases of Hyderabad and Junagadh, without a show of force indicates not only a knowledge of power but also a knowledge of how to use it.

P., a practising Hindu as well as a fervid nationalist, probably never accepted the idea of a Muslim State; his agreement to the partition of India was the result of his intensely practical approach to all problems, but can never have satisfied his sentiment. His death deprived India of the most clear-headed and experienced of her leaders.

Patella, see KNEE; LIMPETS.

Patén, a shallow, circular dish used in the celebration of Mass. It is made of gold or silver gilt and solemnly consecrated. Upon it lies the sacrificial bread from the beginning of Mass until after the offertory; it is not used again until the breaking of the Sacred Host and the subsequent gathering of crumbs from the corporal (q.v.). The corresponding vessel in the oriental Liturgy is the *discus* (see *DISCUS*, 2). A P. is also used in the Anglican Communion service.

Patener, Joachim (c. 1480-1524), b. Dinant or Bouvignes, pupil of Quinten Matsys, worked at Antwerp and is noted as one of the earliest painters to make landscape a main element in pictorial composition. In 1521 he met Dürer, who mentions him as a landscape painter. Modern interest in landscape has given him special prominence as a pioneer.

Patent Medicines, see PROPRIETARY MEDICINES.

Patents and Inventions. P., or more correctly letters patent, are documents in which the Crown vests a subject with special rights or privileges; e.g. the privileges appertaining to the peerage are conferred on a newly made peer by the issue of letters patent. This article is exclusively devoted to such letters patent as confer upon a person the sole right to make, use, and vend an invention for a limited period of time. Such a grant creates a monopoly (see *MONOPOLY*) in favour of the patentee. Apart from copyright (q.v.) and trade marks (q.v.), P. are the only species of property which give an exclusive right. A trade mark differs from a patent by reason that 'it has not merit and the benefit of mankind as its consideration,' its object being 'to indicate the source from which an article comes; not to restrain others from manufacturing such articles.' There can be and is in law no exclusive right in a mere secret, and the original possessor of, for example, a secret process of manuf. cannot, in the absence of some contract, prevent another person from making use of his secret if he be successful in acquiring the knowledge of it, though it would be otherwise if the latter acquired the information confidentially from the former or during the progress of experiments conducted by the former. Difficulties as to the person entitled to a particular invention have very frequently arisen between masters and servants. The whole of this part of the subject of P. is obscure, but the principle underlying all the cases is that an employer who conceives an idea has no right to the inventions of a man, whether servant or an independent, whom he employs to carry it out.

To be entitled to letters patent for an

invention, the applicant must be either the 'true and first inventor' of the subject-matter or the 'true and first importer' of an invention from abroad. The first of the above 2 phrases by no means speaks for itself; but it is generally understood that an actual inventor includes not only a person who is incontestably and literally the first man to light upon and carry out a particular idea, but anyone who has embodied in practical form some idea which, in the main, is his own, though others may have contributed suggestions in details and improvements which in themselves do not amount to distinct and separate inventions. But it must always be borne in mind that if anyone who is concerned to upset a patent in the chancery div. of the high court can prove that the patent, though admittedly novel so far as the world generally is concerned, was not discovered by the ingenuity of the patentee, but was borrowed from some book or another person, the court will decide against the patentee. The 'true and first importer,' on the other hand, need have displayed no merit whatever to be entitled to a patent; e.g. he may be a mere agent or trustee of a foreign inventor. By the Patents Act, 1949, any person who has applied for protection for any patent in any foreign state with which the Brit. Gov. has entered into international arrangements for mutual protection of inventions is entitled to a patent for his invention in England in priority to other applicants; and such patent, on registration, will be dated as of the date of the protection previously obtained in the foreign state, provided the application is made within 12 months from the time of applying for protection in the foreign state. The above statutory provision applies also to such Brit. dominions as have entered into mutual arrangements with the mother country.

By the Statute of Monopolies (see *MONOPOLY*) P. for inventions last 14 years, but this term was increased by an Act of 1919 to 16 years. By the same Act the subject-matter of a valid patent can only be a 'new manufacture,' and the Act of 1949 defines 'invention' by reference to the old Act. A valid patent may be granted in respect of: (1) The discovery of a principle together with a method of applying it to a practical result or making it applicable to the production of a new manuf. (2) A new and useful combination of old parts. (3) The novel application of an old principle, provided a useful manuf. results; but the patentee cannot go outside the application which constitutes his invention, and the method of application must be really novel. (4) The application of an old material to a new purpose, provided there is actual novelty in the mode of using the old or known material or thing as distinct from the novelty of purpose. (5) The invention of processes for manufacturing well-known articles of commerce. (6) A new combination of new and old or all old processes, materials, or contrivances so as to produce or do something more cheaply or quickly or effectively than before.

Even if the ultimate result of a combination be both novel and useful, the combination will not be patentable unless there is invention or 'manufacture' in the mode of combination itself. (7) A new product, material, or machine. 'Novelty' as construed by the courts is essential. Either the patentee must be the true and first inventor, or the subject-matter of the grant must be a new manuf. in itself, or newly introduced into the realm. In the law courts, where 'novelty' is in issue, the inquiry really turns on how far there has been such 'prior use' or 'prior pub.' as will invalidate the patent. In this context it is to be noted that if a man makes an invention, the object of which is to obtain a new result, the patent is entitled to a much more liberal construction by the courts than if the invention were merely to obtain an old result by new means.

The element of novelty may be summed up in the following propositions: (1) If once the public generally become cognizant of an invention, no matter by what means, no patent can be granted for it. But everything essential to the invention must have been known in order to invalidate the grant. (2) The use of a thing for any particular purpose is not an 'anticipation' of a patent which claims the use of the same thing for an entirely different purpose. (3) Novelty is not the same as discovery, for a thing may have been discovered before, but never made public. (4) An invention that has been previously made by someone else, even though not disclosed to the public, is said to have been 'anticipated,' and if such anticipation be proved a patent cannot stand. (5) A prior unsuccessful experiment does not constitute publication. (6) Offering for sale amounts to pub. only if the article offered for sale shows the manner of its manuf. (7) Prior use in a Brit. dominion or colony will not bar the right to a patent in England. (8) Imparting a secret to another or others in confidence is not communication to the public unless the public generally have by reason thereof in fact become fully acquainted with the invention. (9) It is useless to try to upset a patent on the ground that some pub. book contains it, if in reality the book contains merely a suggestion of the invention as opposed to such a description as would enable a person to effect the manuf. The above principles may appear in the highest degree technical; but it is pertinent to observe that the progress of opinion against monopolies is inherently opposed to the endowment of any individual effort that cannot properly lay claim to originality.

To apply for a patent the inventor must first file a provisional or complete specification of the nature of his invention at the Patent Office, 25 Southampton Buildings, London, W.C. The services of an accredited patent agent are usually employed by the inventor to draw up the specification, for any substantial error in preparing the document may render the patent void; and further, if at any time during the subsistence of a patent someone can show that the description in the

specification is so incomplete that no one could produce the result claimed, the patent will be null and void. Sometimes, however, a patentee will be allowed to amend his specification if the erroneous parts do not vitiate the whole patent. After the specification has been deposited the examiner of the Patent Office investigates the application in order to see whether the specification and drawings properly describe the invention, and whether the invention claimed has in fact been described in some anterior specification deposited at the office in connection with any application for a patent made within 50 years next before the date of the application under examination. (A prior provisional specification not followed by a complete specification will not affect the claim.) The comptroller-general of P., having satisfied himself that the above requirements have been satisfied, causes the specification to be advertised in the official Jour. of P. The patent will then be sealed after 2 months, provided there is no opposition. There are only 4 grounds of opposition: (a) that the applicant got his invention from the opponent; (b) that the invention has been claimed in a complete specification for a Brit. patent of prior date other than one deposited pursuant to an application made over 50 years before the date of the application for the opposed patent; (c) that the specification does not sufficiently or fairly describe the nature of the invention or the manner in which it is to be performed; (d) that the complete specification describes and claims an invention different from that described in the provisional specification (a provisional specification protects for 6 months), and that the former really forms the subject-matter of an application made by the opponent in the interval between the hearing of the provisional specification and the complete specification. The comptroller's powers (which are subject to an appeal to the attorney-general) are, as may be inferred from the above enumeration of grounds of opposition, limited to determining either the identity of an invention or whether the applicant is fraudulent; he cannot oust the jurisdiction of the courts by deciding a question of infringement. The fees on patents for inventions are:

	£	s.	d.
On application for provisional protection	1	0	0
On filing complete specification	4	0	0
On notice to have patent sealed	3	0	0
On application for certificate of payment of renewal:			
Before the expiration of the 4th year from the date of patent, and in respect of the 5th year, £5; of the 6th year £6; of the 7th year, £8; then £2 more each year up to £16 for the 11th; then £1 more each year up to £20 for the 15th; then £20 for the remaining life of the patent	165	0	0
Total	173	0	0

Other small fees are also payable as may from time to time be presented by the Board of Trade.

Revocation. Any person may petition to revoke a patent on the ground: (a) that it was obtained in fraud of his rights; (b) that he and not the grantee was the true inventor; or (c) that he has publicly used or sold the thing claimed as an invention before the date of the patent. If the petitioner satisfies the court that he is right, he may himself be granted a patent to expire on the date the revoked patent would have expired. A patent not less than 4 years old may also be revoked by the comptroller at the instance of anyone who shows that it has during those 4 years been worked mainly outside the U.K.

Compulsory Licences. A patentee may be ordered by the court to grant licences to work his patent if it can be shown that he has not himself adequately worked his patent, or manufactured his patented article, or granted licences on reasonable terms, so as to prejudice any existing, or the estab. of any new, industry.

Infringement. The remedy for infringement is by injunction (q.v.) to restrain further infringements, coupled with a claim either for damages or for an inquiry as to profits in respect of past infringements. The usual defences to such an action are: (a) a denial of infringement; (b) a denial that the plaintiff was the first and true inventor; (c) a denial of novelty; (d) an allegation of the insufficiency or incompleteness of the specification; (e) an allegation that the patent has been worked principally abroad; (f) an allegation of fraud on the defendant's rights; and (g) a denial of utility (doubtful as a defence).

The procedure in applications for the grant of P. is contained in the P. Rules, 1949 (S.I. 1949, No. 2385) and the P. (Amendment) Rules, 1955 (S.I. 1955, No. 117). The full list of fees payable on the grant of P. is contained in those rules.

In view of much criticism of the existing Patents and Designs Acts, the gov. in 1944 appointed a departmental committee under the chairmanship of Kenneth R. Swan to consider what changes were desirable in the Acts (1907-38), and in the practice of the Patent Office and the courts. Recommendations made in the first interim report of the Swan Committee (Cmd. 6618, April 1945) were embodied in a short amending Act of 1946. This Act modified existing practice as a matter of urgency in view of patents lapsing daily, to enable patentees, who had been prevented from working their P. by war restrictions, to resume working under extended patent protection as soon as possible.

Important changes in the law relating to P. and registered designs were made by the gov. in an Act to give effect to many of the recommendations of the Swan Committee's second interim and final reports (Cmd. 6789, April 1946, and Cmd. 7206, Sept. 1947). The new Act makes no changes in fundamental principles, but

adapts patent law to modern requirements. One of the main purposes of the Act is to strengthen the provision against abuse of patent rights or the insufficient use of patented inventions. This is to ensure that inventions are used to the fullest extent to increase industrial efficiency. All the existing remedies are retained, but the circumstances in which they can be resorted to are extended to cover cases where the invention is not being worked to the fullest extent, or where an export market is not being supplied, or where the working of another patent is hindered by the refusal of the patentee to grant a licence on reasonable terms. The Act provides for action being taken by a gov. dept. in the public interest, particularly in cases adversely reported on by the new Monopolies and Restrictive Practices Commission. This commission has power to inquire into all restrictive practices affecting P., but the Act which constituted it does not provide specific action to follow on adverse reports. Other clauses modify the provisions relating to the use of patented inventions for the service of the Crown, and make permanent provision for ensuring secrecy of inventions in the interests of the defence of the realm. The courts have held that when the patentee himself uses an invention for the services of the Crown a gov. dept. cannot relieve him of his contractual obligations to other persons. The Act provides this relief. When others are authorised to use the invention the patentee will, in general, receive compensation, but it is provided that he shall be liable to share this with any other person entitled to contractual rights against him. The Act also provides that an application for a patent may be made by the assignee of an inventor, and an inventor's application may be taken over at any time by his assignee. There will be introduced a new system of dating P. and allowing priority based either on provisional specifications or on earlier applications in countries belonging to the International Convention for the Protection of Industrial Property. Another amendment of the law will help to protect the position of an inventor who is an employee in the event of a dispute arising with his employer as to the rights of the parties in respect of the invention. Power is given to the comptroller of P. to settle such disputes in appropriate cases, and he may act upon an application by either of the parties. This will enable an inventor to have a claim decided without incurring the heavy expense of a court action against an employer. It is proposed that in future all appeals from the comptroller's decisions should go to the P. Appeal Tribunal. The Act came into operation on 1 Jan. 1950.

In order to secure for Britain and its industries the benefit of inventions and discoveries by Brit. scientists the gov. in April 1948 introduced a Bill to establish a national corporation for the development and exploitation of inventions, to which body the Board of Trade may make advances of up to £5m., within 5 years of its estab., for working capital. The

during their course; the inquiry into their causes forms the dept. of aetiology. Until Virchow pub. his *Cellular Pathology* in 1858, the science was hardly in existence, for not until the microscope revealed the fact that man was a community of living cells was it recognised that their vicissitudes were the true basis of the study of human disease. The rapid and wonderful development of biochemistry has made important contributions to knowledge of the metabolism of the cell in health and in some forms of disease; of the production of endocrines and their effect on the body; of toxins and anti-toxins. Pasteur's (q.v.) work, originally chemical, in connection with fermentation, led to bacteriological science, and showed that the cell had friends and enemies; his eradication of specific disease among silkworms conclusively showed how science could wage war on germs inimical to cells. Kock's discovery of the anthrax bacillus in 1876 and the tubercle bacillus in 1882, by his culture method of isolating bacteria, led to the discovery of the organisms responsible for fowl cholera, septic disease, typhoid, cholera, diphtheria, tetanus, etc. Lister's work in antiseptic treatment of wounds was of equal importance, and Jenner's in smallpox; nor must the peculiar genius of Huxley, outside the ranks of medical scientists, be overlooked. In 1893 Theobald Smith, in the case of bovine malaria or Texas fever, showed for the first time that parasites (q.v.) such as the tick could act as intermediary hosts and transfer disease from animal to animal; Manson and Ross proved that malaria was transmitted by a mosquito (*Anopheles*), so that every parasite has subsequently been a suspected agent in the transmission of disease. Ehrlich's researches in chemotherapy, with his theory of 'side-chains' or 'receptors', proved of great use in practical investigations. Metchnikoff's study of immunity and the discovery of anti-toxin by von Behring were also landmarks in the general advance. Great as had been the advances in bacterial pathology, medicine at the turn of the century was almost entirely clinical in practice and empirical in treatment. The clinician was at the bedside, the pathologist in the laboratory. It was not to be long before the practical applications of pathology began to extend into clinical medicine, and this century has seen the birth of the clinical pathologist. The science of pathology now includes bacteriology, immunology, histology, morbid anatomy, haematology, chemical pathology. Bacteriology and immunology were the first laboratory sciences to intrude into bedside medicine. In 1906 Wasserman, Neisser, and Bruck perfected the complement-fixation reaction diagnostic test for syphilis (q.v.). At about the same time Almroth Wright developed the autogenous vaccine. In 1908 Schick introduced his test for susceptibility to diphtheria, and von Pirquet (1907) and Mantoux (1910) the tuberculin sensitivity tests. The Dicks (1924) followed with a test for susceptibility to scarlet fever. The natural sequence of these events was

the development of measures for immunisation and the prevention of epidemics. In the decade following 1930 much work was done in differentiating the various strains of bacteria by selective culture media and what is known as 'phage typing.'

Chemical pathology is now largely the science of blood chemistry, a science brought into importance by the discovery of insulin in 1922 by Banting, Best, and Macleod, and the consequent need to estimate the sugar content of blood in diabetics being treated with insulin. Since chemical change is the basis of all physiological function, the importance of the biochemist will continue to increase in the future in the diagnosis, control, and cure of disease. The discovery by Minot and Murphy in 1926 of the curative effect of liver in pernicious anaemia brought the haematologist to the fore as an active agent in the accurate diagnosis and controlled treatment of that disease. The discovery of the rhesus factor in blood by Landsteiner and Wiener in 1940 was the start of continuing discoveries of other factors which have made blood transfusion, and the investigations of pregnancy, haemolytic anaemias, and diseases of newborn infants a highly specialised subject (see OBSTETRICS and PREGNANCY). Some progress has been made in the recognition of the relation between psychogenic phenomena and the glandular secretions, and possibly the greatest advances in the future will be made in connection with psychopathology. The discovery of the sulphonamide drugs, such as sulphanilamide, and antibiotics such as penicillin (q.v.), streptomycin (q.v.), and chloramphenicol (q.v.) have provided new weapons in the battle against bacteria. See also BIOLOGY; BACTERIA; PARASITOLOGY; CANCER; PSYCHOPATHOLOGY; TUBERCULOSIS.

See E. R. Long, *History of Pathology*, 1928; A. W. Hewlett, *Pathological Physiology of Internal Diseases* (3rd ed.), 1928; H. D. Power and W. W. Hala, *Principles of Pathology*, 1929; W. G. MacCullum, *Pathology* (7th ed.), 1940; R. Muir, *Textbook of Pathology* (6th ed.), 1951; W. Boyd, *Surgical Pathology* (7th ed.), 1955; H. T. Karsner, *Human Pathology* (8th ed.), 1955; E. T. Bell, *Textbook of Pathology* (7th ed.), 1952; and E. H. Kettle, *Pathology of Tumours* (3rd ed.), 1945; B.M.A. Ed. H. A. Clegg, *Fifty Years of Medicine*, 1950.

Pathology of Plants, see PLANTS.

Patiala and **E. Punjab States Union (PEPSU)**, federation of Indian states set up on 5 May 1948. It is formed of the states of Faridkot, Jind, Kalsia, Kapurthala, Malerkotla, Nabha, Nalagarh, and Patiala, and more than one-third of the inhab. are Sikhs. Patiala is the H.Q.

Patience, generic name for card-games for 1 player. There are over 500 P. games, some requiring skill and luck, some merely luck. Until the end of the 19th cent. rules were passed down orally, and there may still be games unrecorded. Many P.s, however, differ little from their fellows

except in the nature of their lay-out. Most are based on the principle of building the whole pack in ascending or descending sequence on specified 'foundation' cards: if the player succeeds in this he 'wins.' As an example, here is the well-known game of Carlton. Shuffle 2 packs together and deal from left to right a row of 8 cards face upwards; then a row of 7 overlapping the top row; then 6 and so on down to 1, to form a lay-out of 8 depot columns. The bottom card for the time being of each column is exposed and playable to foundation aces—which are laid aside to form a foundation row as they appear in play—in ascending sequence of suit, and to depots in descending sequence of alternate colour, the object of the game being to build both packs on foundations. A sequence or part of a sequence ending in an exposed card may be played from depot to depot if it will fit. When all the cards of a column have been played the resulting space must be filled with any exposed card or sequence. When all available cards have been played, deal from left to right 1 card face upwards to the bottom of each depot column overlapping the card already there. No card may be played at this turn until every depot column has received its addition. Continue to play and deal in this way until the pack is exhausted. Only 1 deal through the pack is allowed.

Other games are based on 'pairing,' like Pyramid. Deal a pyramid of 28 cards in 7 rows, 1 card at the top, a row of 7 at the bottom. The 2 second-row cards overlap left and right corners of the top card, and so on. All cards in the bottom row are exposed and available to begin with; when 2 adjacent cards are played they uncover 1 in the row above, which becomes available in its turn. The dealing card and the top card for the time being of the discard pile are also available for pairing. The object is to lay aside the whole of a single pack in pairs of cards whose pips add up to 13, jack counting 11, queen 12, and kings being laid aside singly.

Patino, see PATMOS.

Patio (Sp.), in a Sp. or Sp.-Amer. house, an inner courtyard, corresponding to the It. *cortile*.

Patmore, Coventry Kersey Dighton (1823-96), poet, b. Woodford, Essex, the son of Peter George P. (1786-1855), author and sometime editor of the *New Monthly Review*. He began to write poetry while still at school, and pub. his first vol. of verse in 1844. Two years later he was appointed to an assistant librarianship in the Brit. Museum. In 1849 he contributed to the organ of the Pre-Raphaelites, the *Germ*. He was largely responsible for promoting the volunteer movement of 1851. His prin. poetical works are *Poems*, 1844, *The Betrothal*, 1854, *The Espousals*, 1856, *Faithful for Ever*, 1860, and *The Victories of Love*, 1862: the 4 poems, and a selection of earlier poems, making up *The Angel in the House*, 1863, *Odes*, 1868, and *The Unknown Eros*, 1877. While he is not to be identified with the intellectual movement of the mid-19th cent. or with

the Pre-Raphaelites, he has a gift of verse somewhat akin to Wordsworth's in its simple, dignified treatment of homely themes. *The Angel in the House* is really a novel in verse, with domestic virtues as its poetical theme. The more philosophical parts of the poem reveal the mysticism which is to be found still more developed in *The Unknown Eros*, a series of odes notable for the poet's power of expressing intricate thought in verse. Eds. of his poems include that of 1897 (new uniform ed.) and of B. Champneys, 1906, who ed. also his correspondence, 1900. See studies by Sir E. Gosse, 1905, and O. Burdett, 1921; also F. Page, *Patmore: a Study in Poetry*, 1933; D. Patmore, *Portrait of my Family, 1783-1896*, 1935, and (ed.) *The Life and Times of Coventry Patmore*, 1949.

Patmos (It. *Patmo*), volcanic, rocky, and barren is. (length $7\frac{1}{2}$ m., greatest breadth $4\frac{1}{2}$ m., area 22 sq. m.) belonging to the Dodecanese in the E. Aegean. Here St John the Evangelist is believed to have written his Revelations after his banishment by Domitian in AD 95. The monastery of St John was founded in 1088 by St Christodulus. Pop. 2600.

Patna, city and cap. of Bihar State, India, lies on the Ganges, opposite the confluence of the Gandak, 140 m. E. of Benares. The P. high court came into existence in 1916. There is a federal univ., founded 1917, and a fine library, which contains a famous collection of Persian and Arabic MSS. The Gola is an immense circular structure built in 1786, designed as a granary but seldom so used. The anct. and beautiful Pataliputra, which Megasthenes describes as Palibothra, and which Asoka aggrandised, once stood on the site of P.

Paton, Sir Joseph Noël (1821-1902), painter of Pre-Raphaelite affinities, b. Dunfermline, Fife. A member of the Royal Scottish Academy, 1850, he exhibited at the Royal Academy from 1856 to 1869, his subjects being taken largely from legend and history. The 'Quarrel of Oberon and Titania' exhibits much imaginative power and a bewildering variety of detail. In other pictures, e.g. 'Lux in Tenebris,' 'Mors Janua Vitae,' and 'The Evening Star,' he worked in a religious and didactic vein. A fabulous rose window in Dunfermline Abbey was designed by him. He achieved some success as a poet, and many of his songs have been set to music.

Patras, or Patrae, third largest port of Greece and the cap. of the dept. of Achaia on the Gulf of Patras. It exports currants, wines, skins, and wood products. An important city in the days of Augustus, it became the cap. of Achaia under the E. empire, but was destroyed by the Turks in 1827. The modern city is built to a regular plan. Pop. 79,000.

Patras, Gulf of, inlet of the Ionian Sea, opening out of the Gulf of Corinth, between Aetolia to the N. and Achaia to the S., on the W. coast of Greece. Length 30 m.

Patres Conscripti, see SENATE.

Patriarch (Gk *patriarchēs*, the head of a family): 1. Name given to the fathers of

the human race, spoken of in the Scripture hist., such as Noah, and also to the great progenitors of the Heb. race, Abraham, Isaac, Jacob, and Jacob's twelve sons.

2. Name also given in the Christian Church to the bishops of certain metropolitan sees, especially in the E. The sixth canon of the Nicene Council mentions Rome, Antioch, and Alexandria as the 3 metropolitan sees at the time.

Patricians (Lat. *patricii*, the kin of the *patres*, or heads of the old Rom. *gentes*, or tribes) were the aristocracy of ant. Rome. In primitive times they were the whole *populus Romanus* (Rom. people), who assembled together in the national *comitia curiata*. The political hist. of early Rome is an account of the fierce and prolonged struggle between the upstart plebeians (q.v.), sprung chiefly from the conquered tribes, and the hereditary P., descended from the old Rom. families. The victory rested with the former, who by 300 bc were eligible for all the offices of state, from the quaestorship to the dictatorship, and even for the pontificate, long jealously withheld. Constantine changed the meaning of *patricius*, by making it a title of the highest honour conferred on persons who enjoyed the chief place in the emperor's esteem. Under the old Rom. law no child was released from *patria potestas* (father's power) by having any dignity or office (except a vestal virgin). Justinian conferred the privilege of being *sui juris* or independent of the paternal power on those enjoying the dignity of the patriciate, the son being freed immediately on the grant of the imperial patent. The power of making *patricii* was, in general, used very sparingly by the emperors, and hence the title became an object of ambition even to foreign princes. The ant. order of *patricii* was in time replaced by the *nobiles*, whose rank depended on their wealth and office.

Patrick, St (c. 385-c. 461), son of a Rom. official named Calpurnius, who administered municipal affairs in Britain at Bannavem Taberniae. This is a lost place name, but modern scholars appear to agree that it was situated on the shores of the Severn estuary. During a pirates' raid on the dist., Patrick, aged 16, was captured near his father's villa and taken to Ireland where he was sold as a slave. (His task was to herd his master's swine on the slopes of a nearby mt.) This was a searing experience for the Christian boy, but he learned how to pray in his solitary captivity and was thus initiated into the mystical life. When he was 22 the spiritual prompting on which he had learned to rely advised him to make a bid to escape, and told him the direction to take in order to board a ship making ready to sail. He walked 200 m. in obedience to this direction, succeeded in boarding the ship and, after many further adventures, rejoined his kinsfolk.

He now began to have a vision in which he heard the voices of Irish children crying to him to come back again to them. Convinced of his vocation to be a priest, he went to France, probably first

to Lérins and then to Auxerre, to study for ordination. Shortly after he was ordained, he realised his ambition when Pope St Germanus sent him to Ireland to replace a missionary named Palladius, who had died within a year of undertaking the mission.

St P.'s procedure was bold and vigorous. Soon after his arrival in Ireland, he presented himself at the High-King's court at Tara, demanding permission to preach the Gospel. His knowledge of the people and of their language stood him in good stead. Although the work of evangelising Ireland was full of hardship, and St P. was often in danger of his life from the Druids, the results attracted the notice of the Christian world. In a little more than 10 years, he had the whole country linked up with churches, staffed by a zealous native clergy, to whom a tide of conversions was steadily flowing, and he was in a position to establish the seat of the primacy at Armagh. The number of Irish men and women who volunteered for the monastic life surprised even himself, although he gave such a heroic example of austerity and endurance. For nearly 30 years he was never absent from his people, 'afraid,' as he tells us himself, 'to lose the labour which I began.' When he was already elderly, he spent the 40 days of Lent on the summit of Croagh Patrick, maintaining an unbroken fast in a mighty appeal for the perseverance of the Irish people in the Faith.

There was an intensely personal element in the story of Ireland's conversion to Christianity. The story of the runaway slave who came back of his own accord to bring the Gospel to a people who had cruelly used him laid such a hold on the imagination of the Irish that St P. became the subject not only of their veneration but of the deep human affection which distinguishes his cult. In their subsequent dispersion throughout the world, they carried and handed down to posterity this warmth of feeling for the national apostle. While his feast day on 17 Mar. is a holiday of obligation and a national holiday in Ireland, it is also celebrated by the Irish race all over the world.

St P. has left 2 documents of great value and unquestioned authenticity: his *Confession* and his *Epistle to Coroticus*, which present a remarkable self-portrait. See lives by J. B. Bury, 1905, and Eoin MacNeill, 1934; also J. Ryan, *Irish Monasticism*, pp. 59-96, 1931; T. F. O'Rahilly, *The Two Patricks*, 1942; Dr Ludwig Bieler, *Life and Legends of St Patrick*, 1948, and *Works of St Patrick*, 1953.

Patricroft, tn of SE. Lancashire, England, 5 m. W. of Manchester, with silk throwing and weaving mills, cotton mills, quilting factories, iron works, etc. Pop. 24,239.

Patrippassians, see MONARCHIANTISM.

Patristics, Patrology, see FATHERS OF THE CHURCH.

Patroclus, see ACHILLES.

Patrol (ultimately from Fr. *patrouiller* = *patouiller* = to flounder in mud), detachment of troops sent out in advance of the

main body to reconnoitre the country and gain information as to the position and movements of the enemy. The same duties are now often carried out by armoured cars or tanks, and of course by reconnoitring aircraft during mobile warfare, especially during pursuit. Military P.s are of two kinds: 'reconnaissance,' usually in search of information above the ground, and especially about mines, and 'fighting' P.s, usually in search of information about enemy strength. They must fight to obtain prisoners or identifiable corpses. The chief non-military use of the term is in connection with motorised police detachments and the fire-fighting sections of forestry services. See also DOVER PATROL.

Patron (Lat. *patronus*, from *pater*, father), important term in Rom. law. It was the duty of the *patronus* to safeguard the interests of his *clientes* (dependants), men, that is, who were not admitted to the full rights of citizenship. The P. fed, boarded, and advised his client, gave him land usually, and was his representative in the eyes of the law. In return the client obeyed him, followed him to war, and gave him pecuniary aid. In the latter days of the republic the client was practically a free citizen; under the empire he was often merely a sycophant in his P.'s household. Technically a P. in Great Britain is one who has a church living in his gift, but the word is generally used of all benefactors and protectors, including the saints.

Pattern-making, see CASTING.

Patti, Adelina (1843-1919), It. singer, b. Madrid. At an early age she gave a series of concerts. After a course of training, she made her début in New York in 1859 as Lucia in the opera by Donizetti. In 1861 she went to England and took London by storm with the exquisite clearness and beauty of her voice. The year after she went to Paris, and she resided there until 1870, paying yearly visits to London, where she remained the prime favourite for many years. Her most famous parts were those in *Puritani*, *Sonnambula*, *Norma*, *Trovatore*, *Lucia di Lammermoor*, and *Traviata*. In later years she gave up the stage for the concert hall. She married the Marquis de Caux, but was divorced from him in 1885; in the following year she became the wife of the It. tenor Nicolini. On his death in 1898 she married the Baron Cederström. See H. Klein, *The Reign of Patti*, 1920.

Patti, coastal tn in Sicily (q.v.), 32 m. WSW. of Messina (q.v.). It is on the Bay of P., an inlet of the Tyrrhenian Sea (q.v.), and has a 13th-cent. cathedral. Near by is the site of *Tyndaris*, a tn founded by Dionysius the Elder (q.v.). Pop. 12,000.

Pattison, Mark (1813-84), scholar, b. Hornby, Yorks. Educ. at Oriel College, Oxford, in 1839 he became a Fellow of Lincoln, and in 1861 Rector. In 1875 he pub. a life of Casaubon. His *Sermons and Collected Essays*, ed. by H. Nettleship, appeared in 1889; his introspective *Memoirs*, ed. by his wife, were pub. in

1885. See L. Tollemache, *Recollections of Pattison*, 1895.

Patton, George Smith (1885-1945), Amer. general, b. San Gabriel, California, of a family of soldiers. P. graduated at W. Point in 1909. Commissioned in the cavalry, he was aide-de-camp to Gen. Pershing in 1916 in Mexico, and later, in the First World War, was a captain on Pershing's staff and attended a course at the Ft. Tank School. He organised the Amer. Tank Centre and also an Amer. tank brigade, which he commanded with distinction in the Saint-Mihel attack of Sept. 1918, and later in the Meuse-Argonne battles. Between the world wars he held a cavalry command, served in Hawaii, and became a lieutenant-colonel. In 1940 he was appointed to command the 2nd Armoured Div., becoming, in 1941, commanding gen. of the First Armoured Corps. In anticipation of the allied N. African campaign he estab. a desert training centre in California and built a co-ordinated offensive force. He led the Amer. attack on Casablanca, and was afterwards chosen to command the Seventh Army in the invasion of Sicily. In April 1944 he was transferred to the W. front, taking command of the Third Army. He cut off the peninsula of Brittany and then swept on to Paris, the Ger. frontier, and the Siegfried line. When the Germans made their last big effort of the war in the Ardennes offensive, P., whose forces were fiercely engaged on the Saar, answered the First Army's call for help by pulling out and changing direction to strike 60 m. northward over frozen roads against von Rundstedt's (q.v.) flank, probably his greatest military feat. In the advance to the Rhine, after von Rundstedt's repulse, he again played a leading part. Crossing the Rhine at Frankfurt, he maintained the impetus of his advance through central Germany and into Bohemia. Prague lay open to him, but for political reasons he was not allowed to occupy it, and at Pilsen his great advance ended. In April 1945 he was nominated a full general and his army occupied Bavaria. Owing to his scepticism over the necessity for the 'de-Nazification' programme, he was removed from the command of the Third Army and transferred to the command of a skeleton force, the Fifteenth Army. He d. as the result of spinal injuries received in a motor accident near Mannheim. He pub. *War as I Knew It*, 1947. See also J. Wellard, *The Man in a Helmet*, 1947; H. H. Semmes, *Portrait of Patton*, 1955.

Pâturages, tn in the prov. of Hainaut, Belgium, 5 m. SW. of Mons. There are coal mines, construction workshops, and manufs. of paints and shoes. Pop. 10,600.

Pátzcuaro, tn of Mexico in the state of Michoacán, situated near the lake of the same name. The lake, which is 6700 ft above sea-level, is 30 m. in circumference, with native Tarascan vils. on its shores and is. Wildfowl and fish are abundant. The tn, which has narrow cobbled streets, is 270 m. from Mexico city. Pop. about

10,000. See M. Toussaint, *Pátzcuaro*, 1952; U.N.E.S.C.O., *New Horizons at Tzintzenhuaro*, 1953.

Pau, Fr. tn, cap. of the dept of Basses-Pyrénées, on the Gave de Pau. It was the cap. of Béarn (q.v.) and of Fr. Navarre (see NAVARRA). The anct castle was the bp. of Henry IV of France (q.v.). P. trades in horses, wine, leather, and rugs. It has a mild climate, and is a much-frequented health resort. Bernadotte (see CHARLES XIV) was b. here. Pop. 46,200.

Pauker, Ana (1894-), Rumanian politician, of Jewish descent. She studied medicine in Switzerland, and became a Communist in 1921. She was imprisoned sev. times, during the intervals spending some time in Russia and the U.S.A. In 1941 she was released from prison in an exchange of prisoners between Rumania and Russia, and joined the Red Army. P. returned to Rumania in 1944 and immediately acquired great political influence, becoming head of the Rumanian Communist party. From 1947 to 1952 she was foreign minister, but was generally considered to be the real ruler of Rumania during that period. In 1952, however, she suffered political eclipse. Though generally regarded as utterly ruthless, it is probable that P. was considered too independent a personality by the Soviet regime in Moscow, and her dismissal marked a further step in complete Russian domination of Rumania.

Paul, St, the Apostle (c. 3-c. 67), the great apostle of the Gentiles, was b. at Tarsus in Cilicia. Though a Jew of the tribe of Benjamin, a Hebrew sprung from Hebrews, he was by birth a Rom. citizen, having inherited this privilege from his ancestors, upon one of whom it had been conferred. The exact year of his birth is uncertain, and the first mention of his name in the N.T. writings is in connection with the martyrdom of St. Stephen (AD 33). His Jewish name was Saul, the form Paul being used in the Gk and Rom. world. It is highly improbable that there is any connection between this name and that of his first great Gentile convert Sergius Paulus. Saul learned the art of tent-making, of which industry Tarsus was a local centre; for it was a custom among the Jews to instruct their youth, even of the highest respectability, in some mechanical art. He was educated in the learning of the times, and later went to Jerusalem to study the laws and traditions of his people under Gamaliel, a distinguished Rabbi. Being a man of great talent, ardent mind, and inflexible resolution, and being devotedly attached to the institutions of his country, he contemplated with alarm and anxiety the progress of the new religion. Accordingly he took an active and prominent part against the Christians, pursuing them with zeal and unrelenting fury. He obtained letters from the Sanhedrin to the synagogue of the Jews at Damascus, and also to the governor, authorising him to apprehend and bring to Jerusalem whomsoever of the disciples he might find there. While on this journey his miraculous conversion

took place. The journeys and events of his laborious life up to his captivity in Rome are described in the Acts of the Apostles. He may subsequently have revisited the E. and Spain. P. suffered martyrdom at Rome c. AD 67.

The Canon of the N.T. assigns to P. the authorship of 13 epistles, and the Rom. Catholic Church also attributes to him the Epistle to the Hebrews. Some of his speeches are recorded in the Acts. From these writings we learn that P. suffered from physical disability, the exact nature of which is unknown. But though weak in body, he was a man of unflinching energy and of a bold and passionate nature.

Theology of St Paul. The letters and speeches of P. which have come down to us were all directed to one purpose, the proof of Christ's claims to be the Messiah promised to the Fathers and the exposition of what these claims meant, with exhortations to the fulfilment of moral duties and advice as to the management of eccles. affairs. P.'s interpretation of the meaning of his Lord's work was accepted by the early Church, as may be seen in 1 Pet., the Johannine writings, and epistle to the Hebrews. It is difficult to formulate Pauline theology, because we have to cull it, not from treatises, but from occasional letters which only contained what bore on the question at issue. All that can be attempted is to sketch the system of P. in its central ideas. To P. as a Jew, righteousness, with its converse, sin, is of primary import; this at first was purely external, but the Tenth Commandment led him to recognise the spirituality of the demands of the law (Rom. vii. 7). Over against this is his Christology. The crucifixion was the 'stumbling block' which hindered him from recognising Jesus as the Christ. When Jesus met him on the way to Damascus he was forced to recognise His Messiahship; with this the problem assumed a new shape. The question 'Why had the Messiah died?' led P. to the idea of atonement: 'The wages of sin is death,' but He had no sin. Hence P. was led to look on His death as substitutionary. Death was wide as the race, therefore sin must also be universal; if so, the origin of sin must be found in the origin of the race, 'in Adam all died.' Jesus is the second Adam in whom 'all are made alive' (1 Cor. xv. 22); the result of the physical union to the first Adam is counterbalanced by spiritual union to Christ (1 Cor. vi. 17). All, however, do not benefit by the life-giving power of Christ's death: only those who believe. Those who believe are to be received into glory at the coming of the Lord (1 Thess. iv. 15). With this is connected the Last Judgment and the resurrection (Acts xvii. 31; 1 Tim. iv. 16). P. did not look forward to the salvation of individuals only, and that in a future life; he also contemplated a regenerated society on the earth. The Church, the assembly of all believers, was the new Israel. From the old covenant he drew the idea of the conjugal symbol for the relation of the

Church to her Lord (Eph. v. 32). The Church was to be a self-sufficing republic, not going before civil tribunals (1 Cor. vi. 1-6). The psychology by which P. explained conversion and the consciousness of sin after it, as also inspiration and prophecy, and the explanation he gives of the rise of Church orders, are all subjects of study.

The works on St P. are very numerous. See W. J. Conybeare and J. S. Howson, *The Life and Letters of St Paul*, 1862; F. C. Baur, *Paul, his Life and Work*, 1873; O. Pfleiderer, *The Influence of the Apostle Paul on the Development of Christianity*, 1885; A. Sabatier, *L'Apôtre Paul* (trans.), 1891; B. G. Stevens, *The Pauline Theology*, 1892; A. B. Bruce, *St Paul's Conception of Christianity*, 1894; J. G. Machen, *Origin of Paul's Religion*, 1921; P. Prat, *Théologie de St Paul* (trans.), 1926, and *St Paul* (trans.), 1928; C. A. Scott, *Christianity according to St Paul*, 1927; A. Schweitzer, *Mysticism of Paul the Apostle*, 1931; C. H. Dodd, *The Mind of St Paul*, 1936; J. Maritain, *St Paul*, 1942, 1948; and R. Sencourt, *St Paul*, 1948.

Paul, Canons of St. see BARNABITES.

Paul, the name of 5 popes:

Paul I (757-67), a brother of Stephen II. With the help of Pepin, King of the Franks, he continued the opposition to the Lombards, but his pontificate was of little importance.

Paul II (1464-71) (Pietro Barbo), b. Venice, 1417 or 1418. He added greatly to the magnificence of the city of Rome. In 1470 he decreed the observance of the Jubilee every 25 years.

Paul III (1534-49) (Alessandro Farnese), b. Cambrino, 1468, belonged to a noble family. He was a man of great learning and wealth, unequalled in tact and diplomacy, but his early life was stained by immorality. After his consecration much opposition was excited by the elevation to the cardinalate of his 2 young grandsons, aged 14 and 16 respectively. He convoked the Council of Trent, which assembled in 1545, and approved the foundation of the Society of Jesus.

Paul IV (1555-9) (Giovanni Pietro Caraffa), b. Capriglio, 1476, came also of an illustrious family. His early life had been most ascetic, and he was one of the founders of the order of Theatines. His pontificate was marked by many reforms, though when elected he was already 79 years of age. His diplomatic ability was less marked, as was shown by his relations with England and Cardinal Pole.

Paul V (1605-21) (Camillo Borghese), b. Rome, 1552, had been specially trained in jurisprudence, and his excellence as a canonist is shown in the course of his pontificate. He was a strict disciplinarian, and his excommunication of the Republic of Venice produced a schism which lasted a year. He did much for the city of Rome itself.

See F. Hayward, *History of the Popes*, 1929, Eng. trans. 1931.

Paul I (1754-1801), Russian emperor.

son of Peter III and Catherine II, succeeded his mother in 1796. He re-established primogeniture as the basis for succession to the throne, repealing Peter I's law that each emperor could choose his successor; he also repealed Catherine II's Charter for the Gentry and restricted the labour a serf had to do for his squire to 3 days a week. But he was a pedant and a tyrant, causing dissatisfaction among his *entourage*, and he was strangled during a palace revolution in favour of his son Alexander I. Russian foreign policy under P. sought to resist the domination of Europe by either France or England. Russia took part in the anti-French coalition, 1798-9, when Suvorov (q.v.) won great victories over the French in Italy.

Paul (1901-), King of the Hellenes, brother of George II (q.v.), whom he succeeded in 1947. He married Princess Frederika of Brunswick in 1936, by whom he has 3 children, his son, Prince Constantine (b. 1940), being heir-presumptive to the Gk throne. P. has attempted to popularise the Gk monarchy, and has identified it closely with Gk aspirations in Cyprus.

Paul, Father (Paolo Sarpi) (1552-1623), Venetian patriot and ecclesiastic, is important chiefly for his place in the contest between the city of Venice and the papal see during the pontificate of Paul V, in 1606. He carried on a vigorous controversy with Bellarmine as to the papal prerogatives, and his activity led to his excommunication and attempted assassination in 1607, in which he was severely wounded. His most important literary work is a highly tendentious *History of the Council of Trent*, 1619.

Paul, Jean, see RICHTER, JOHANN PAUL FRIEDRICH.

Paul, Vincent de, see VINCENT DE PAUL.

Paul-Boncour, Joseph (1873-), Fr. politician, b. St Aignan-sur-Cher. After a brilliant career at the Univ. he was called to the Paris Bar. In 1900 he pub. *Le Fédéralisme économique*. In 1906 he was elected to the Chamber as an Independent Socialist for the dist. of Loire-et-Cher. In 1911 he joined the Socialist party and became Labour minister in the Monist-Bertaux Cabinet. During the First World War he held a command in Lorraine. P. left the Socialists in 1931. He was a prominent member of the trade delegation to the League of Nations and took part in the discussions on disarmament. He was Prime Minister for the short period of Dec. 1932-Jan. 1933, when his gov. fell over a minor financial question. Under the leadership of Blum he was in 1933, and again in 1938, Minister for Foreign Affairs, when his policy was to secure collective security in Europe. He headed the Fr. delegation to the United Nations Assembly in Jan. 1946.

Paul of Samosata (fl. 3rd cent. AD), heretical teacher, b. at Samosata in Commagene. About 260 he became Bishop of Antioch, where he also acted as vice-regent to Zenobia, the Queen of Palmyra. He taught the Monarchian heresy (see MONARCHIANISM) that God is one, and that the Trinity is only a name

for the 3 forms in which God has expressed Himself. In 264 Paul's teachings were condemned at the Council of Antioch, and 5 years later he was deposed. But he was supported by Zenobia, and continued to retain his position until the city was taken by the Emperor Aurelian in 273. Followers of P. of S. existed as late as the 4th cent. See C. G. A. Harnack, *History of Dogma* (vol. iii.), 1894.

Paul the Deacon (**Paulus Diaconus**, known also as **Warnefridus**) (c. 720-99?), a Lombard, b. in Friuli, who became a monk in the monastery of Monte Cassino. He wrote *Historia gentis Langobardorum Libri VI*, dealing with the period from 568 to 744, as well as other works of importance in the hist. of monasticism. His *Historia romana* is a sequel to the *Breviarium* of Eutropius.

Paul Veronese, see under **VERONESE**, **PAUL**.

Paulding, James Kirke (1778-1860), Amer. author, b. Pleasant Valley, New York. Self-educ. and early developing a taste for writing, he was a friend of Washington Irving, and wrote a portion of *Salmagundi*. During the war of 1812 he pub. the *Diverting History of John Bull and Brother Jonathan*; in 1813 a parody of the *Lay of the Last Minstrel*, entitled *A Lay of the Scottish Fiddle*; and in 1814 a more serious work, *The United States and England*, a defence against articles in the *Quarterly Review*. This work attracted to him the attention of President Madison, and caused him to be appointed a member of the Board of Naval Commissioners. In 1817 he pub. a defence of the S. states and of slavery in *Letters from the South, by a Northern Man*. His numerous other works include *Königsminne*, a novel, 1825, *Merry Tales of the Three Wise Men of Gotham*, 1826, *The New Pilgrim's Progress*, 1828, *Tales of a Good Woman*, 1829, *Book of St Nicholas*, 1830, *The Dutchman's Fireside*, 1831. These were followed by *A Life of Washington*, 1835, and *Slavery in the United States*, 1836, in which the institution is defended on social, economical, and physiological grounds. Later he was appointed secretary of the navy.

Paulet, or **Powlett**, **Charles**, see **BOLTON**, **DUKE OF**.

Pauli, Wolfgang (1900-). Swiss physicist, b. Vienna. Since 1928, prof. at Swiss Federal Institute of Technology, Zürich. He studied at Munich with Sommerfeld. As a student he wrote the article 'Theory of Relativity' for the *Mathematical Encyclopædia*, still one of the best presentations of the subject. He worked on Niels Bohr's interpretation of atomic spectra in terms of quantum theory, and made further discoveries which served Bohr as the main factor in his explanation of the periodic system of the elements. His Exclusion Principle does not permit a plurality of electrons to occupy the same energy level, or more accurately to possess the same quantum numbers. P. also had a share in the development of matrix mechanics. In 1945 he was awarded the Nobel prize for physics. He has pub. papers on nuclear physics, equilibrium of radiation and

molecules, entropy in quantum statistics, and similar subjects. Pub. *Meson Theory of Nuclear Forces*, 1946.

Paulicians, heretical sect which arose in Syria and the E. during the 7th cent., and whose beliefs were a blend of Manichaeism and Gnosticism (qq.v.). The name is generally said to be derived from the apostle St Paul, for whose writings the sect had an especial veneration. The P., who themselves refused to accept any title but 'Christians,' underwent severe persecutions from the E. emperors, and they are said finally to have died out in the reign of Alexius Comnenus. The Bogomils, Cathari, Albigenes, etc., are their spiritual descendants, and in Armenia P. communities continued till recent years. See C. A. Scott, article 'Paulicians' in Hastings's *Encyclopædia of Religion and Ethics* (vol. ix.), and C. G. A. Harnack, *History of Dogma* (vol. ii), trans. 1895-6.

Paulinus, **St** (d. 644), first Archbishop of York. A Roman by birth, he became a monk and was sent out in 601 by Gregory the Great as auxiliary to St Augustine. He laboured as a missionary first in Kent and then in Northumbria, where he had accompanied Ethelburga, daughter of the Kentish king, Ethelbert, on her marriage with King Edwin, and was responsible for the rapid evangelisation of the country. But when Edwin was killed P. fled to Kent, where he became Bishop of Rochester, and the Northumbrian church he had founded virtually ceased to exist.

Paulinus, Gaius Suetonius, Rom. governor of Britain AD 59-62. He subdued the rebellious Iceni and defeated Boadicea (q.v.) in 61. In 66 he became a consul, and in 69 was a general in Otho's wars against Vitellius.

Paulinus of Nola, Meropius Pontius (c. 353-431), priest and poet, b. Bordeaux, son of the Rom. praetorian prefect in Gaul. Prefect of Rome for a time, he went to Spain, became a Christian (c. 390), and later Bishop of Nola in 409. Some of his letters, and most of his poems, are extant, showing fluency and high quality of writing. His complete works, ed. by W. Hartel, are printed in vols. 29 and 30 of the *Corpus Scriptorum Ecclesiasticorum Latinorum* (1894).

Paulus, Julius (fl. 3rd cent. AD), distinguished Rom. lawyer, of the circumstances of whose birth little is known. He worked as a jurist in the reigns of Septimius Severus and Antoninus Caracalla, and was legal assessor to Papinian (q.v.), upon whose works he wrote a commentary. About one-sixth of Justinian's *Digest* consists of extracts from P.

Paulus, Lucius Aemilius, Rom. general; consul in 219 BC, and again in 216, when he perished at Cannae. His more famous son, who bore the same name, was consul for the first time in 182 BC. During his second tenure of office, in 168, he won a decisive victory at Pydna over Perseus, King of Macedonia, and was granted the title Macedonicus. P. d. in 160 BC; and it was on the occasion of his funeral games that the *Adelphi* of Terence was first staged.

Paulus Aegineta (625-90), Gk physician, b. in Aegina. He was connected with the medical school of Alexandria. He was particularly skilled in surgery and gynaecology. His chief work, an encyclopaedia of medicine in seven books, went through numerous eds. and trans. (see Eng. trans. by F. Adams, 1844-7).

Paumann, Conrad (c. 1410-73), blind Ger. organist, see GERMAN (AND AUSTRIAN) MUSIC.

Paupers, see MENDICANCY; **POOR LAW**; VAGRANTS.

Pausanias (d. 470 BC), Spartan gen. son of Cleombrotus and nephew of Leonidas. In 479 BC the Spartans allied with the Athenians against the Persians, and placed P. in command. At the battle of Plataea the Persian forces were routed, and P. is said to have acquitted himself with great valour. He continued the war against Persia in 478, and aimed at becoming tyrant over the whole of Greece. To bring this about it was necessary to gain the support of the Persian king, and he conducted a treasonable correspondence with Xerxes. His perfidy was discovered, and he was starved to death as a punishment, by order of the ephors.

Pausanias (fl. 2nd cent. AD), celebrated Gk traveller and geographer, probably a native of Lydia, and there is evidence to show that he had lived long near Mt Sipylus. Of his personal hist. little is known, but passages in his great work, a *Periegesis* or *Itinerary of Greece*, show him to have been a contemporary of Antoninus Pius and M. Aurelius. See the edition with trans. by Sir J. G. Frazer (6 vols., 1898). See also Sir J. G. Frazer, *Pausanias and other Greek Sketches*, 1900.

Pavan, a dance of the late Renaissance, of uncertain but probably It. origin (the It. name *padovana* suggests that it came from Padua), with some connection, however, with the Fr. *basse-danse*. It is nearly always in slow common time, though P.s in triple rhythm are not unknown. As a musical composition it was as a rule paired with another and more lively dance, the galliard (q.v.), which was in triple time. The same tune was sometimes used, rhythmically transformed.

Pavello, Ante, see CROATIA.

Pavese, Cesare (1908-1950), It. novelist, b. Cuneo, Piedmont. He wrote some poetry (*Lavorare stanca*, 1936; and *Verrà la morte*, 1951), but his primary importance is as a writer of novels and long short stories. His realism is mingled with intense poetic feeling and a growing sense of the vanity of human existence. P. committed suicide at the age of 42. His best work, *La luna e i falò*, 1950, was translated into many languages (Eng. trans. by L. Sinclair, *The Moon and the Bonfire*, 1952). Other novels include *La Spiaggia*, 1942; *Feria d'agosto*, 1946; *Il compagno*, 1947; *La bella estate*, 1949.

Pavetta, dwarf shrub with white flowers and ornamental leaves, cultivated in greenhouses. The best-known species is *P. cafra*, 3-4 ft high.

Pavia: 1. Prov. of Italy, in SW. Lombardy (q.v.). It is mainly a fertile plain,

but is mountainous in the S. It is watered by the Po (q.v.), and its tribs., the Ticino, Trebbia (qq.v.), Olona, and Sesia. There are numerous canals, the most important of which connects the Ticino and Olona. Silk, cheese, cattle, rice, cereals, chestnuts, fruit, and wine are produced. The prin. towns include P. and Mortara (qq.v.). Area 1146 sq. m. Pop. 513,000.

The covered bridge over the Ticino, destroyed in the Second World War.

2. (anct. *Ticinum*; later *Papia*) It. city, (cap. of the prov. of P., on the Ticino, 18 m. S. of Milan (q.v.). It was founded by the Ligurii, and became the cap. of the Longobards (q.v.) until it was taken from them by Charlemagne (q.v.) in 774. It was sacked by the Hungarians in 924, and in 1359 it was taken by the Visconti (q.v.). In 1500 it was sacked by the Fr. Charles V defeated and captured Francis I (q.v.) here in 1525, but in 1527-8 the tn was again in the hands of the Fr. It was annexed by Austria in 1714, was pillaged by Napoleon (q.v.) in 1796, and became part of united Italy in 1859. Church councils were held in the tn in 1081, 1160, and 1423. P. has still its anc. walls, and has a cathedral, begun in 1488 but not completed until 1898. The basilica of S. Michele, in which the old 'kings of Italy' were crowned, dates from the 12th cent. There is a beautiful 14th-cent. Visconti castle, and a univ., said to have been founded by Charlemagne, but formally constituted in 1361. A magnificent 14th-cent. granite bridge of 7 arches which crossed the riv. was damaged during the Second World War and collapsed; it has been replaced by a copy, 5 m. N. of the tn is the famous monastery, the *Certosa di Pavia* (q.v.). P. has a

trade in agric. produce, wine, silk, and cheese; it has also important marble works, and manufs. sewing machines. Pop. 67,000.

Pavilion (O.F. *pavillon* = tent), either (i) a lightly constructed building for recreation or display; or (ii) a projecting feature at the end of a classical façade; or (iii) a detached block of a hospital or sanatorium, isolated for medical reasons.

Pavise, see **SHIELD**.

Pavlitza, see **PHIGALIA**.

Pavlodar: 1. Oblast (prov.) of the Kazakh S.S.R. of the Soviet Union. It bestrides the Irtysh R. and has rich mineral and chemical deposits. Wheat and millet are cultivated. Pop. 400,000.

2. Cap. of P. oblast. It has meat and tanning industries. Pop. 60,000.

Pavograd (Ukrainian *Pavlohrad*), tn in the Dnepropetrovsk Oblast of the Ukraine, 40 m. E. of Dnepropetrovsk. It has some industry and there is coal mining. It was founded in 1778, and before 1917 was a centre of a lively trade in grain, cattle, and horses. Pop. (1956) 35,000 (c. 1914, 40,000).

Pavlov, Ivan Petrovich (1849-1936), Russian physiologist, b. Ryazan, son of a vil. priest and educ. first at a theological seminary and then in St Petersburg, in general science at the univ. and in medicine at the Military Academy. In 1891 he was made director of the physiological dept. of the newly estab. Institute of Experimental Medicine; in 1897 prof. of physiology at the Military Academy; and in 1907 one of the 4 scientific members of the St Petersburg Academy. His earliest important work was on the physiology of circulation. His next was on digestion, involving researches on conditioned reflexes, and, through them, on animal psychology. These researches reformed all ideas of the processes of digestion and were the foundation of modern knowledge of the subject. Subsequently he began to study the higher nervous activity of man, using individuals with functionally and anatomically diseased brains. On his eighty-fifth birthday the Soviet Gov., which he was always criticising, gave him a large sum for the extension of his laboratories and a pension of 20,000 roubles. He won the Nobel prize in medicine in 1904 and received the Copley Medal of the Royal Society in 1915. See also **BEHAVIOURISM**; **CONDITIONED REFLEX**. Biography by B. P. Babkin, 1951.

Pavlova, Anna (1881-1931), famous Russian ballerina, b. St Petersburg. At the age of 10 she entered the state-endowed Imperial Ballet School attached to the Mariinski Theatre in St Petersburg, where in 1906, having passed rapidly through all its grades, she became prima ballerina. She first danced outside Russia in 1907. In 1909 she appeared in Paris with the Diaghilev Ballet, but thereafter she danced with her own company, travelling all over the world and bringing ballet to many places which had never seen it before. She was not an innovator in the sense that those who worked with Diaghilev were, and the works in which

she danced were generally of no particular artistic value. But by her own transcendent genius as a dancer she spread the popularity of ballet much wider than did the Diaghilev Ballet, laying the foundation for the world-wide interest in ballet to-day. Her most famous dance was *Le Cygne*, which Fokine arranged for her to music by Saint-Saëns. She herself composed the choreography of *Autumn Leaves*,

E.N.A.

ANNA PAVLOVA

a ballet with music by Chopin. From 1912 her home, when she was not touring, was in Hampstead. She d. of pneumonia at The Hague, when beginning a European tour. See lives by V. Dandré (her husband), 1932, and C. W. Beaumont, 1932.

Pavlovo, tn in Gor'kiy Oblast of U.S.S.R., on R. Oka 40 m. SW. of Gor'kiy. It has extensive metal-working industries (autobuses, tools, cutlery, hardware), and has been known since the 17th cent. as a centre of metal-working crafts. Pop. (1926) 16,000.

Pavonia, genus of Malvaceae, small shrubs or herbs found in tropical America and Asia. *P. odorata* is cultivated in Indian and Burmese gardens for its

fragrant flowers. Grown in Britain as greenhouse plants are *P. intermedia*, a hybrid with white flowers, and variety *kermesina*, a dwarf with white flowers, and *P. multiflora*, 1-2 ft high, with purple flowers.

Pavonidae, see PEACOCK.

Pawnbroker. The Pawnbrokers Acts of 1872 and 1922 define a P. as one who keeps a shop and purchases or takes in goods, paying or lending thereon any sum not exceeding £10 under an agreement, express or reasonably to be implied, that the goods may be afterwards repurchased or redeemed. A P. may not act without a licence from the Inland Revenue Commissioners, the penalty for so acting being £50. Such licence, the duty on which is £7 10s., can only be obtained on production of a certificate from a magistrate. For dealing in silver a plate licence (£5 15s.) is required, and a moneylender's licence (£15) if the P. wishes to advance more than £10. Magistrates must grant certificates to applicants within their jurisdiction unless the applicant is of bad character or his shop or any adjacent premises owned by him are frequented by persons of bad character. Twenty-one days' notice of an intended application must be given by registered letter to the dist. superintendent of police, and 28 days prior to application a notice must be affixed for 2 consecutive Sundays on some church door, or, if there be none, some conspicuous public place. Pledges must be redeemed within 12 calendar months from (and exclusive of) the day of pawning (with an additional 7 days' grace). Pledges for 10s. or under if not redeemed become the P.'s absolute property. Pledges for more than 10s. must be sold by auction, and any P. may purchase at the sale. A P. must not take goods if the pawner refuses to take a ticket. If the pawner has lost his ticket or had it stolen or destroyed, he must get from the P. a form of the declaration to be made before a magistrate with respect to the missing ticket. Both the pawner and some person who can identify him as the owner of the goods or as the person entitled to hold the lost ticket must make the declaration. The form of declaration when completed and delivered back to the P. operates to put the declarant in the same position as if he had produced the ticket, and the P., unless he knows the declaration to be false, will then incur no liability for delivering the goods to him. If a pledge be destroyed or damaged by fire, the P. must pay within the redeemable period the value of the pledge less loan and profit; the value is taken to be the amount of the loan plus profit plus 25 per cent on the amount of the loan. For the ticket of goods pledged for 10s. or less the P. is entitled to charge $\frac{1}{4}$ d. and an additional charge of $\frac{1}{4}$ d. for each 5s. or part of 5s. lent; loans above 10s. and not exceeding £2, $\frac{1}{4}$ d. for the ticket and the same rate of profit as above; for loans above £2, the profit of $\frac{1}{4}$ d. per month is reckoned on each 2s. 6d. or part of 2s. 6d. unless a special contract is made and a

special ticket given in accordance with the prescribed form under the Act of 1922. A P. may not, without rendering himself liable to a penalty of £10, receive a pledge from any person appearing to be under 14 (in London, under 16) or intoxicated. A P. who takes stolen goods may find himself ordered by a magistrate to restore them to the true owner if the pawner be convicted; but the magistrate will ordinarily consider the conduct both of the P. and the owner in making any order. It is provided by the Firearms Act (1937) that a P. may not take in pawn firearms or ammunition.

The Liability for War Damage Act, 1939, provides, in the case of loss or damage of a pledge by fire due to war, that the P. is not liable to make any payment, and unless the pawner redeems the pledge he is not liable to repay the loan. This provision applies only to pledges on which a loan of £10 or less has been made. Before 1939 there were 2700 P.s in Britain; in 1949 the number had declined to 1600, including 150 in London. See also MONT-DE-PIÈTRE. See L. P. Stubbs, *Guide*, 1866; A. Hardaker, *Brief History of Pawnbroking*, 1892; L. Lallemant, *Histoire de la charité*, 1912; also *Pawnbrokers' Gazette* (weekly).

Pawnee, N. Amer. Indian tribe of Caddoan linguistic stock, formerly living in Nebraska. They fought much with the Dakota (q.v.) and assisted the Whites by furnishing scouts. To-day they number about 1000 in a reservation in Oklahoma.

Pawpaw, *Asimina triloba*, family Annonaceae, a deciduous tree of SE. U.S.A., which is cultivated for ovoid melon-like fruit, with yellowish, sweet pulp, in temperate regions.

Pawtucket, city of Providence co., Rhode Is., U.S.A., 6 m. N. of Providence, and near the city of Central Falls. It lies on both sides of P. R., which is navigable below the falls, and covers an area of about 10 sq. m. The chief industries are the manuf. of textile cottons, silks, brads, hosiery, machinery, and metal, paper, and wood products; there is also textile bleaching and dyeing. The first U.S.A. cotton factory was estab. here in 1790. Pop. 81,436.

Pax Augusta, see BADAJOZ.

Pax Julia, see BEJA.

Pax Romana, abstinence from war enforced on states subject to the Rom. Empire. The orderly administration of justice and the universal peace, which the Rom. Empire estab. from the Atlantic to the Euphrates, did not, however, long survive the inroads of the Teutonic tribes who in W. Europe apportioned the inheritance of the Lat. *orbis terrarum* between them. Rom. power had become weakened by Julius Caesar's time, but the Gallic conquest added to the ageing body of the Rom. state a limb which contributed largely to the renewal of its youth; for Caesar himself laid the foundation of Rome's monarchical power, and in the world's hist. it played a part of incomparable importance simply by the fact that the current of the Germanic invasion into the Rom. Empire was thereby

dammed at a time when the Germanic world could have shattered Rom. and, with it, classical civilisation, but could not have absorbed it.

Augustus gave Rome 50 years of peace and good government, and he estab. a form of empire which was destined to endure for many years. But all the early Teutonic codes, being based, however remotely, on the right of private war and private vengeance, might deter but could not eradicate the instinct which urges the members of semi-civilised communities to avenge their own wrongs. Hence the P. R. died with the empire, and the able organisation of Charlemagne could effect no more in the W. half of the empire than a very partial resuscitation (*see also under* GOD'S TRUCK). Pax Britannica has the same connotation in relation to the Brit. Empire (q.v.).

Pax Romana, Rom. Catholic organisation devoted to the maintaining of contacts between univ. students and to promoting moral and social welfare through their influence. It was founded in 1921 by students and undergraduates of 18 nations at Fribourg in Switzerland. Since then it has grown to world-wide extension by affiliating existing organisations. In 1946 it was divided into a senior or graduate branch and a junior branch. In England the Newman Association and the Union of Catholic Students are respectively the senior and junior Brit. constituents of these branches.

Paxo, smallest of the 7 chief Ionian Is., 10 m. SSE. of Corfu. Its length is 6½ m. and its breadth 2 m. The surface is mountainous, and it produces olives, almonds, and vines. Cap. Galos, on the E. coast. Pop. of is. 3000.

Paxton, Sir Joseph (1801-65), gardener and architect, b. Milton Bryant, Bedfordshire. While serving as a gardener, attracted the attention of the Duke of Devonshire, who in 1826 appointed him superintendent of the gardens at Chatsworth. He designed the building for the great exhibition of 1851, and 2 years later removed the glass and iron structure to Sydenham, where it was called the Crystal Palace. He represented Coventry in Parliament from 1854 until his death. He wrote sev. horticultural works, including *A Botanical Dictionary of all Plants known in Britain*, 1868.

Pay As You Earn, *see* INCOME TAX.

Payerne (anc. Paterniacum), small tn of Switzerland, 10 m. W. of Fribourg, in the canton of Vaud. Pop. 5500.

Paymaster, in navy, *see* PURSER.

Paymaster-General. The office of P.-G. was reorganised in 1836, the various offices of paymaster of the army, navy, ordnance, and civil service being by that Act consolidated into one office. To this office are now paid all the public moneys due for the army, navy, air force, and civil services. The issue of money for the Consolidated Fund services is made by Treasury requisition to the comptroller and auditor-general; and when the latter, being satisfied that the requisition complies with Acts governing the proposed expenditure, makes the necessary order,

the Treasury directs the Bank of England to transfer the sums required from the Exchequer account to that of the P.-G. Similarly, requisitions for credit are made by directions from the Treasury to the bank to transfer the sums specified to the 'supply account' of the P.-G. The depts concerned are then informed that the sums voted by Parliament are placed to their respective accounts with the P.-G., and from that moment they become responsible for their disbursement in accordance with the votes. The office is unpaid. *See* Sir W. R. Anson, *Law and Custom of the Constitution*, 1886-92.

Payn, James (1830-98), novelist, b. Cheltenham. He began his literary career when, as a Cambridge undergraduate, he pub. in 1852 2 vols. of verse. He then became a contributor to *Chambers's Journal*, of which he was editor from 1859 to 1874. From 1883 he was editor of the *Cornhill Magazine* until within 2 years of his death. His first novel, *The Foster Brothers*, appeared in 1859, and had some scores of successors, including *Lost Sir Massingberd*, 1864, *Walter's Word*, 1875, *By Proxy*, 1878, *The Canon's Ward*, 1884, and *The Talk of the Town*, 1885. Most of P.'s stories are sensational or have an element of mystery in them, and, though the chain of coincidence is often strained, the plots are usually ingenious and well worked out.

Payne, John Howard (1791-1852), Amer. actor and dramatist, b. New York. His first appearance on the stage was in Home's *Douglas*, in which he at once achieved success. In 1813 he appeared in London, estab. himself in England, and had a successful career both as actor and author for upwards of 30 years. He wrote *Clari, or the Maid of Milan*, 1823, containing the well-known song, 'Home, Sweet Home,' *Charles II*, 1824, and others, and adapted plays from the Fr. *See* G. Harrison, *The Life and Writings of John Howard Payne*, 1885, and W. T. Hanson, *The Early Life of John Howard Payne*, 1913.

Paysandú, dept. of Uruguay, with an area of 5117 sq. m., and an important cattle industry. Wine is produced and the dept. is rich in minerals. The city of P., on the Uruguay R., is the cap. of the dept. of P. and the second city in the republic. It is accessible from the ocean. There are large slaughter-houses, and tinned meat and tongue are exported. P. is the centre of the meat-preserving industry. Other activities are breweries, distilleries, tanneries, sugar refineries, shoe and soap factories. P. is the headquarters of the Midland Railway. The city is being modernised. By rail it is 300 m. N. and then W. from Montevideo (q.v.). Pop. (dept) 90,000; (city) 60,000.

Paz, La, *see* LA PAZ.

Paz Soldán, Mariano Felipe (1821-86), Peruvian historian and geographer, b. Arequipa; studied and later practised law there and at Lima; in 1860 he became director of public works. He wrote *Atlas Geográfico del Perú*, 1861; *Historia del Perú independiente*, 1868; *Diccionario geográfico estadístico del Perú*, 1877; and *Historia de la guerra del Pacífico*, 1884.

Pazand, or Avesta, see PERSIA, Language and Literature.

Pea. Two species of *P.s.* are cultivated in Britain, and of both there are a large number of varieties. The garden *P.* (*Pisum sativum*) is not known to exist in a wild state; its flowers are white, and its seeds are yellowish-white or bluish-green. They are gathered unripe and eaten as green *P.s.*, one of the most nutritious and popular vegetables. The earliest crops are raised from seeds of forcing varieties sown in gentle heat in Dec. The earliest

A, garden pea; B, sugar pea.

outdoor plants are raised from seed sown under glass in Feb. and planted out in Mar. or April. The field *P.* (*P. s.* variety *arvense*) has purplish flowers, and is harder than the garden *P.* It is, however, a very uncertain farm crop, doing best on light land rich in lime; it follows barley in a rotation. The dry straw or haulm averages about a ton per acre, and is used as fodder. The variety known as the sugar *P.* has an edible pod.

Peabody, George Foster (1795-1869), Amer. philanthropist, b. Danvers (now Peabody), Massachusetts, U.S.A. Having amassed a fortune as a dry goods merchant, he settled in England in 1837, where he continued in business. He gave largely to educational institutions, and was a lavish donor to Harvard and Yale. He is principally remembered in England for his gifts to the London poor, amounting in all to half a million sterling. Out of this sum were built the 'P. Dwellings', the first of which was opened in Spital-fields in 1864. A retiring man, he declined a baronetcy and the G.C.B. In 1866 he estab. a museum of archaeology and ethnology at Harvard and of natural hist. at Yale. In 1940 there were estab. in his memory radio and television awards for meritorious service by broadcasters.

Peabody, city of Massachusetts, U.S.A., in Essex co., 17 m. NE. of Boston, with

leather industries. Formerly S. Danvers, in 1868 it was renamed after George Peabody (q.v.), who was a native. Pop. 22,645.

Peace, Charles (1832-79), criminal, b. Sheffield, where he received his first sentence for robbery in 1851. Before his execution at Leeds on 25 Feb. 1879, for the murder of Arthur Dyson on 29 Nov. 1876, he confessed to many burglaries and to the murder of a policeman at Manchester in 1876.

Peace, Breach of, see BREACH.

Peace, Clerk of the, see CLERK OF THE PEACE.

Peace, Commission of, see JUSTICES OF THE PEACE.

Peace Ballot, unofficial referendum on the subject of peace or war sponsored by the League of Nations Union in 1935 to test public opinion on 4 specific questions, the public being asked to reply 'Yes' or 'No' to each: whether they were in favour: (1) of the League of Nations; (2) of all-round disarmament; (3) of the private manuf. of arms; and (4) (a) of economic and (b) military action against an aggressor nation. The total of papers returned was 11,640,066, and exceeded the most sanguine expectations of the organisers. The vast majority of the answers to most of the questions were in the affirmative, the largest number of negative answers being to question (4) (b) 2,366,184, and to question (3). The moving spirit in the ballot was Lord Robert Cecil (q.v.). The announcement came at an opportune moment, for Brit. attachment to the ideals of the League of Nations was soon to be put to the test over the Italo-Ethiopian crisis.

Peace Conference. For P. C.s before the First World War, see HAGUE CONFERENCE. For P. C.s after the First World War, see PEACE CONFERENCE (1919); LOCARNO CONFERENCE AND TREATIES; also COVENANT OF THE LEAGUE OF NATIONS. For P. C.s after the Second World War, see EUROPE. History; and see history sections of articles on countries concerned.

Peace Conference (1919), assembled on 18 Jan. 1919 in Paris. There were 70 delegates representing 30 states. Great Britain, the U.S.A., France, Italy, and Japan sent 5 delegates each, Belgium, Brazil, and Serbia 3 each, and the remainder 2 or 1. After the formal opening, the conference sat but rarely, its sessions being largely ceremonial. The actual work was carried on by special committees which discussed such individual topics as the 'league of nations,' 'reparations,' 'war responsibility,' 'labour legislation,' etc. The committees sat *in camera*, and only such reports as were approved by the spokesmen of the Great Powers were submitted to the plenary conference. Originally there was a Council of Ten, constituting the Supreme Council; this was reduced to 5 and then, after Japan dropped out, to 4—Wilson, President of the U.S.A., Clemenceau, Lloyd George, and Orlando of Italy. Then Italy withdrew over the Fiume question and the council was reduced to the 'Big Three.'

Differences of outlook were hard to reconcile. Wilson's main preoccupation was with his project for a league of nations, while Great Britain was concerned chiefly with the supremacy of the seas and the control, through the mandatory system, of the Ger. colonies. The principle of self-determination proved a thorn in the settlement of boundary disputes, notably as between the Balkan states, Poland and the Ukraine, the Poles and the Czechoslovaks, and Italy and Yugoslavia. France held strong views on her rights to economic privileges in Germany and special political and financial privileges in the Saar valley. A proposed defensive alliance between Great Britain, France, and the U.S.A., contrary to the earlier pronouncements against alliances within the league, was also one of the causes of delay. In the result, President Wilson, rather than incur possible opposition to his League of Nations, gave way on such of the above questions as were really opposed to his ideals; but even though the It. delegates seceded for a time, he refused to yield to the It. demand for the cession of ter. guaranteed to Serbia by various secret treaties. Difficulties also arose over a territorial settlement in the Pacific, owing to the traditional conflict of interests between Australia and New Zealand on the one hand, and Japan on the other. But after some 4 months of deliberations, the allied diplomatists submitted the draft of the proposed treaty with Germany to the Council, and this draft was accepted by the P. C. in plenary session on 6 May. On 7 May the P. C. having become the Peace Congress, at which Germany was to be represented, the draft was handed to Count Brockdorff-Rantzau, the Foreign Secretary of the Ger. rep. at Versailles, and accepted, though only after protests and a political crisis in Germany, unconditionally on 23 June, the last day of grace. After the treaty was ratified, further conferences were held at San Remo, The Hague, and Spa in April, May, and June 1920 respectively, to discuss reparations, disarmament, mandates, and the Adriatic question. For Peace Conference with Turkey see under LAUSANNE.

Sequel to the Peace Settlement of 1919-1920. The peace settlement of 1919-20 was ill calculated to promote peace even for a limited period. The new co-operative system embodied in the League of Nations was stultified from the start by the defection of its protagonist's (Wilson's) country and by the fact that it was not sustained by the organised opinion of the nations as a whole. There were grave inherent imperfections in the treaty of Versailles, not the least of which was the lack of large-scale economic planning. The severity of the treaty struck the weak Weimar Republic a mortal blow, for in Ger. opinion it identified democracy with humiliation. Moreover, the French, under the lead of Clemenceau, were dissatisfied with the peace settlement, which, in their view, afforded them no real security because of the Anglo-Amer. veto on the separation

of the l. b. of the Rhine and on the Fr. annexation of the Saar. France, too, regarded the League of Nations as an Anglo-Amer. creation, and therefore reposed no confidence in its practical utility in time of need. The League membership seemed to show that the body was merely a perpetuation of the victorious allied and associated powers (minus America), involving the sharp div. of Europe between the satiated and the hungry, or the 'Haves' and the 'Have-nots.' As a fully satisfied power it was natural for the Brit. Empire to welcome the experiment of the League and its Covenant as a stabilising influence in the world offering, through the machinery of collective security, a way of escape from 19th-cent. isolationism on the one hand and, on the other, from provocative alliances like the Anglo-Fr. *entente* and the Brit. alliance with Japan. Thus the 'peace settlement' contained the seeds of a new conflict and the peace was lost as soon as the military victory was won. It has been said with truth that there were only two ways of averting another contest: the first was the path of reconciliation implicit in the Fourteen Points (q.v.) and outlined in Lloyd George's memorandum 25 March 1919; the rival policy, favoured by most Frenchmen, consisted in depriving Germany of the means of aggression. The first would have involved admitting Germany to the League of Nations soon after the foundation of that body, fixing reparations (q.v.) at an amount capable of being paid within a generation, the fulfilment of Article VIII of the covenant concerning disarmament, and the return of some colonial ter. under mandate. During the Locarno quinquennium it seemed as if France were converted to the policy of reconciliation, but the change was only superficial. Locarno was a failure, not necessarily because it was based on unsound principles, but because it was not implemented by larger measures of conciliation. The Locarno treaties, though they had their origin in Germany, were never more than an illusion, for Russia necessarily looked upon them as a one-way arrangement designed to stabilise the W. while leaving the E. open to Ger. attack. Through the two decades between the two world wars the theory of the balance of power was never abandoned and, rightly or wrongly, Germany regarded the Franco-Russian Treaty of 1933 as a violation of the Locarno settlement. Briand's scheme for a European federation, outlined at the League Assembly of 1929, provoked much discussion, but was soon dropped, for the states and peoples had too little confidence in one another to co-operate systematically in great affairs. The various pacts and protocols, and treaties of mutual assistance drafted from time to time at Geneva, were regarded by many as likely to revive the old system of military alliances and therefore as being contrary to the spirit of the covenant; while the much-advertised Kellogg Pact, which declared that the signatories were not debarred from the right to defend themselves against unprovoked attack,

was thereby reduced to the level of a pious assertion. The optional clause (q.v.) referring disputes to the permanent court of international justice, was futile, for the signatories pledged themselves only to the submission of legal or treaty disputes, thereby excluding many of the most inflammable problems. Disarmament proved a snare, for no one could foresee, after the Washington treaties, which were promptly described by Balfour as an unmixed benefit to mankind, that Japan would before long abandon her conciliatory mood, resume her expansionist drive, and repudiate her treaty obligations. France, following the repudiation of Wilson by Congress in 1920, concluded agreements with Belgium in 1920, Poland in 1921, and Czechoslovakia in 1924, and then looked in vain to Curzon for a new military alliance with England. In 1934, when France, alarmed by Hitler's armament estimates, broke off discussions with Germany, disarmament was dead. The subsequent rearmament of Germany, the It. invasion of Abyssinia followed by a vacillating policy of sanctions by Britain and France, the dispatch of Italo-Ger. troops to Spain to support Franco, and renewed Jap. aggression in China, were in effect the beginnings of a new world conflagration. The attempt to organise the world was, however, again made after the end of the Second World War, in the United Nations Organisation (q.v.).

Peace River, tn in Alberta, Canada, 320 m. NW. of Edmonton, a junction for transport to the N. in rich, wheat-growing country. It has long been the centre of the fur trade. The tn, which takes its name from the river, was first visited by Sir Alexander Mackenzie when on his way to establish fur-trading posts for the North-West Co. and to find a way to the Pacific Ocean in 1792. The famed Alberta Tar Sands, now being developed for commercial use, are located close to the tn. Its industries are farming, fur trading, oil, lumbering, and dairy products; the climate is favourable for the cultivation of excellent fruit and vegetables. Pop. 2200.

Peace River, riv. of W. Canada, rising in the Rocky Mts, near 55° N., Brit. Columbia. It flows NE., receiving the drainage of Lake Athabasca, and finally empties its waters into the Great Slave Lake, being for the last 120 m. called Slave R. The dist. drained by it is usually known as the P. R. dist. Its length is estimated at 1100 m. See F. H. Kitt, *Peace River Country*, 1927.

Peace Treaties: 1. *First World War*.

Treaty of Brest-Litovsk, between Russia and Germany, 3 Mar. 1918; preliminary peace between Rumania and Central Powers, signed at Bucharest, 5 Mar. 1918, and ratified 7 May 1918; annulled at Versailles, 1919; treaty of Versailles signed by the Allies and Germany 29 June 1919, ratified in Paris 10 Jan. 1920; treaty of Saint-Germain-en-Laye, between Allies and Austria, signed 10 Sept. 1919, ratified at Paris, 16 July 1920; treaty of Trianon, between Allies and Hungary, signed 4 June 1920; treaty of Neuilly, between Allies and Bulgaria, signed 27 Nov. 1919, ratified in Paris, 9 Aug. 1920; treaty of Sèvres between Allies and Turkey, signed 10 Aug. 1920 (never ratified); treaty of Lausanne, between Allies and Turkey, signed 24 July 1923, ratified in the autumn of 1923 (for clauses see individual heads).

2. *Second World War*. Treaties between the Allies and Ger. satellites were signed and ratified in 1947, namely with Italy, Hungary, Rumania, Bulgaria, and Finland (the U.S.A. was not at war with the last of these), having been drafted by Britain, America, Russia, and France. An Austrian peace treaty was signed by the same 4 powers in 1955, after sev. years of protracted negotiations caused by differences between the Russian and W. attitudes.

National Film Board, Canada

PEACE RIVER BRIDGE ON THE ALASKAN HIGHWAY, AT THIRTY-FIVE-MILE POST

Peach, luscious fruit of *Prunus persica*, a tree (family Rosaceae) which was introduced from the E. to S. Europe early in the Christian era and to Britain in the 16th cent. The P. and the nectarine, a smooth-skinned variety, are again being grown in the open air, but the bulk of the market supply is grown under glass, where temps. of 45° at night and 55° by day are sufficient until the fruit has stoned, when it may be raised 10°. For the production of fruit by June the trees are started in Dec.; they are sometimes trained on walls and sometimes on wire frames. Both soil and atmosphere must be kept moist through the growing season. Outdoor

* Y

culture on walls facing S. with proper management is successful in S. England. The early bloom and growth need shelter from spring winds and frosts by means of a coping fixed near the top of the wall over the trees, light canvas or other material being suspended from it during frosty nights. Planting is best done in the autumn in soil only moderately rich, but containing lime. P.s were introduced into N. America by European settlers, and are now extensively cultivated. The P. reaches its highest perfection in the middle states; they are grown in orchards like apples. See NECTARINE.

Peacham's Case, the case of Edmund Peacham, rector of Hinton St George, Somersetshire, who was convicted in 1615 of high treason for having written a sermon which made seditious reflections on the Crown and gov., but which had neither been printed nor pub. Peacham had been prosecuted in the high commission court for a libel on his bishop and on the consistory court and sentenced to be deprived of his orders. Pending that prosecution his house was searched, apparently for papers connected with the alleged libel, and the officials happened to find a MS. treatise in the form of a sermon, together with some loose sheets containing, in very offensive language, such an attack on the personal conduct of the king and the actions of his ministers as would, if pub., have amounted to a seditious libel. The king and his council eventually decided to proceed against him for treason under the statute of Edward III (*see* TREASON) in 'compassing the king's death.' James directed Bacon, then attorney-general, to confer with the judges of the king's bench to ascertain, and no doubt influence, their opinion. Chief Justice Coke objected to this mode of taking judicial opinions as contrary to the custom of the realm. The servile puisne judges, however, did not hesitate to give an opinion favourable to the Crown. Coke gave an equivocal written opinion: of the two grounds for questioning the treasonable nature of the sermon, first, that it had never been pub., secondly, that even if it had, it did not amount to treason, Coke appears to have passed over the first, but boldly asserted that no mere declaration of the king's unworthiness to govern amounted to treason. P. was brought to trial at Taunton assizes, convicted, and sentenced to death. He was not, however, executed, but died in jail 7 months later.

Peacock, Thomas Love (1785-1866), novelist and poet, b. Weymouth, son of a glass merchant, Samuel P., of London, who d. when the boy was 3. His mother was Sarah Love, daughter of a master in the navy, a woman of strong character, who sympathised with her son's literary aspirations. He pub. a vol. of poetry, *The Monks of St Mark*, in 1804, and another, 2 years later, *Palmyra*. In Wales, where he lived 1810-11, he met his future wife, Jane Gryffyth, whose personality he is said to have adumbrated in his fragmentary romance, *Sir Calidore*. He pub. more poetry, including *The Philosophy of*

Melancholy, 1812, and in 1814 produced a satirical ballad, *Sir Proteus*. He became friendly with Shelley, who assisted him with money. His novels of this period were *Headlong Hall*, 1816, *Melincourt*, 1817, and *Nightmare Abbey*, 1818. These with *Sir Calidore*, are brilliant prose extravaganzas, and full of humorous dialogue and situations; but, while they secured a certain vogue, they were not productive of much profit. In 1819 he was given an appointment in the India Office, which made him independent. Just prior to this he had nearly completed his romance *Maid Marian*; its delayed pub. (1822) led

T. L. PEACOCK

to the supposition that he had plagiarised Scott's *Ivanhoe*, but in fact it was written before that work. It was dramatised in Planché's opera libretto of the same title (music by Bishop). P. seems to have shown marked ability in his official capacity, particularly in drafting official papers. His official work interfered somewhat with his literary labours; but in 1829 he pub. *The Misfortunes of Elphin*, which travesties the Reform Act under the guise of anct Welsh hist., and in 1831 *Crotchet Castle*. His last novel was *Gryll Grange*, 1861. His short novels (*Headlong Hall*, *Nightmare Abbey*, and *Crotchet Castle*) are unique in form and content in Eng. literature. Many of the leading figures of his day—Coleridge, Shelley, Byron, Canning—are the butts of his good-humoured Aristophanic satire. In each the scene is laid in the country house of some *parvenu* Maecenas, who gives a house party at which a number of ill-assorted and violently opposed intellectuals drink and gormandise while wrangling with one another in a witty disputatious symposium. Interspersed in the dialogue are many delightful lyrics and snatches of verse, largely of a convivial

strain, and indeed here may be found some of the finest drinking songs in the language. The 'Headlong-ap-Headlong' chorus in *Headlong Hall* and 'If I drink water while this doth last' in *Crotchet Castle* are excellent examples of a now vanished form, while Cypress's (Byron) song in *Nightmare Abbey* ('There is a fever of the spirit') is as Byronic, in the best sense, as anything Byron himself wrote. P.'s works, all too little read, give abundant evidence of a strong personality, and of gifts of humour and satire. He is described by Sir Edward Strachey as 'a kind-hearted, genial, friendly man, who loved to share his enjoyment of life with all around him, and self-indulgent without being selfish.' The standard ed. of P.'s works is the Halliford, ed. in 10 vols. by H. F. B. Brett-Smith and C. E. Jones, 1924-34. There is also an ed. of his novels by D. Garnett, 1948. See lives by C. van Doren, 1911; J. B. Priestly, 1927; B. T. L. Cellini, 1937; and O. Campbell, 1953. See also A. M. Freeman, *Thomas Love Peacock: a Critical Study*, 1911, and A. H. Able, *Meredith and Peacock: a Study in Literary Influence*, 1933.

Mitroricpic

WHITE PEACOCKS

Peacock, or Peafowl (*Pavo*), small genus of beautiful gallinaceous birds. The common P. (*P. cristatus*) is a native of India and Ceylon, in parts of which P. shooting is a recognised sport. It is bred to a small extent in France for the production of the feathers. The flesh of young birds is white and resembles a pheasant's in flavour, but though formerly much valued as a table delicacy is now rarely eaten; the eggs are also edible; but it is chiefly for the beauty of the cock's plumage that P.s are kept. If enclosed they are very mischievous, and

are best given a large space containing a shrubbery, or they may not breed. The male should have 3 to 6 hens with him. The hen lays about 10 eggs in the spring, and incubation takes 30 days. She remains with her chicks 8 months, and is, therefore, the best mother for them. The male's head, neck, and breast are rich purple, and the head bears a crest of feathers webbed only at the tip. The feathers of the back are green with copper-coloured lacing; the whitish wings are striped or barred. The glossy-green feathers, ocellated at the tips, are the tail coverts, the true tail feathers being a dark rich chestnut. The female's plumage is much more subdued. The Jap. P. (*P. muticus*) is a very beautiful species, and breeds freely with the other. There is a third species, the black-winged P. (*P. nigripennis*), which is believed to be a hybrid of the common species.

Peacock Butterfly (*Vanessa io*), beautiful and common butterfly, measuring about 2 in. across the wings, which are a dull deep or brownish-red, and which bear each an 'eye' rather like those in the peacock's tail. The butterfly hibernates through the winter, and in early spring lays its eggs on stinging nettles; they hatch into a black and yellow caterpillar, with 6 rows of black spines and a series of white dots arranged transversely along the body.

Peafowl, see PEACOCK.

Peak, The, hill-country of NW. Derbyshire, England, at the southern end of the Pennine range. It lies between Manchester and Sheffield. The Peak has no fixed line of demarcation; the name covers the whole plateau north of Buxton. The greater part is now a National Park. The prin. summits are Kinder Scout (2088 ft), High Peak (1980 ft), Axe Edge (1860 ft), and Mam Tor (1700 ft). The underlying rock is millstone grit, lying in beds which dip concavely inwards from the perimeter. The moorlands are famed for their rough beauty, good walking, and grouse-shooting. Castleton is called the cap. of the Peak. The Peak cavern near by goes 500 yds into limestone. Gritstone climbing is a popular sport. The best-known climbing edges are at Laddow in the Woodhead valley, Stanage near Sheffield, the Downfall of Kinder Scout, Windgather, Castle Naze, Black Rocks, Cratcliffe Tor, and many others. See Sir W. Scott, *Peril of the Peak*, 1822; C. Porteous, *Peakland*, 1954.

Peake, Harold John Edward (1867-1946), archaeologist and anthropologist, b. Ellesmere. A pioneer in the investigation of the distribution of types, he early realised the close interdependence of physical anthropology and material archaeology, as may be seen from his *Beginnings of Civilisation*, 1928. P. was a member of the council of the Society of Antiquaries, 1928-30, and was awarded the Huxley medal of the Royal Anthropological Institute in 1940, for his *Study of Pre-historic Times*. His other works in this field include *The English Village*, 1922, based on his lectures at the Univ. College of Wales; *The Corridors of Time*

Series (with Prof. H. J. Fleure), 1924 onwards; *The Archaeology of Berkshire*, 1931; while his more popular works include *The Origin of Agriculture*, 1926; *The Flood*, 1930; and *Early Steps in Human Progress*, 1933.

Peanut, see GROUNDNUT.

Pear, or **Pyrus**, family Rosaceae. The European *P.* is now held to be derived from *Pyrus communis*, a native of Europe and Asia to the Himalaya; and cultivated since very early times; Pliny mentioning 39 varieties known to the Romans. *P. communis* grows wild in Britain, also *P. cordata*, often called the Celtic *P.* Cultivated *P.s* are usually grafted; standard trees on seedling *P.s*, others on dwarfing Quince stocks, for cordons, espaliers, bush, and pyramid trees. As few varieties are self-fertile, *P.s* should not be planted singly or of one variety; exception is Conference. The fruit should be gathered slightly unripe.

Alligator *P.s* or Avocado *P.s* are the fruit of *Persea gratissima*, an evergreen tropical tree. Anchovy *P.* is the edible fruit of *Grias cauliflora*, a W. Indian evergreen tree. Prickly *P.* is a name given to *Opuntia* (q.v.).

Pearl, Raymond (1879-1940), Amer. biologist; b. Farmington, New Hampshire. He graduated at Dartmouth, 1899, gained his Ph.D. at the Univ. of Michigan, 1902, and studied in Leipzig and London. From 1925 he was director of Institute for Biological research, Johns Hopkins Univ. He is chiefly known for his work on heredity and seriation. Pubs. include *Variation and Differentiation in Ceratophyllum*, 1907; *Modes of Research in Genetics*, 1915; *The Nation's Food*, 1919; *The Biology of Death*, 1922; *Introduction to Medical Biometry and Statistics*, 1923; *Studies in Human Biology*, 1924; *The Biology of Population Growth*, 1925; *Alcohol and Longevity*, 1926; *To Begin With*, 1927; *The Rate of Living*, 1928; and *The National History of Population*, 1939.

Pearl, lining of the shell of many marine and fresh-water molluscs. It is a secretion laid on in a very thin coat and overlaid repeatedly so that it attains considerable thickness. It consists of calcium carbonate, with various organic matters; sp. gr. 2.5-2.7. The iridescence is partly due to the number of very thin layers and probably to the varying conditions of growth. *P.* is produced chiefly by *Aviculidae*, *P. oysters*, and the riv. mussels, *Unionidae*.

Mother of Pearl consists simply of the lining, which is cut out and fashioned into useful and ornamental articles, and is particularly used for inlay work. It is obtained from species and varieties of the genus *Margaritifera*, the best coming from Macassar, Manila, and W. and N. Australia. The Straits Settlements, Panama, and some Pacific Is. send large quantities into the markets.

Distribution. The Persian Gulf, particularly round the is. of Bahrein, is especially noted for its anct and magnificent grounds. There are other fisheries in the Polynesian Is., the Sulu Archipelago, off New Guinea, W. Australia,

Queensland, Torres Strait, Ceylon, and America off Lower California. The species containing the *P.s* are *M. vulgaris*, *Avicula macroptera*, and *M. fucata*; the last-named provides the finest specimens in the Persian Gulf.

Formation. *P.s* are due to the attempt on the part of the mollusc to kill and rid itself of a minute worm. In the case of the Ceylon fisheries, Herdman made a complete study of the question; the parasite was a larva of a tapeworm, and the life-hist. is traced; in the free-swimming stage it attacks the oyster, which is devoured by the file-fish, the ray which feeds on this being the host of the adult form. Lyster Jameson, in the case of the common mussel, found that the pest was a trematode, the adult of which is found in the eider duck and scoter; their droppings infect the cockles and carpel shells, and these in their turn the mussels. Sand and other irritants may in some cases also be the nucleus round which the *P.s* are formed. In any case the mollusc surrounds the irritant with an excretion which solidifies into a thin layer of 'nacre,' more and more concentric layers are added, until an almost truly spherical *P.* is formed. These are found chiefly in the soft parts of the mollusc, or loose. Some are found in the shell and are hemispherical, the *perle bouton*. *Perle Baroque* is solid and not so well shaped, while *coq de perle* is hollow and covered with irregular knobs. *Fresh-water pearls* which are once again very fashionable are found in the N. hemisphere in rivs. of the temperate region; fishing was carried on in Scotland some 300 years ago, and Brit. *P.s* are mentioned by Pliny and Tacitus. *False pearls* are clover imitations; the scale of fresh-water fish is digested in ammonia and injected into thin glass balls till the film forms on the inner surface; wax or gum is then injected to give a solid interior, while the glass is removed by hydrofluoric acid. 'Cultured' *P.s* are produced by introducing into its flesh a foreign substance, which the oyster covers with nacre. For so-called cave pearls see OOLITE, and N. Casteret, *The Descent of Pierre Saint-Martin* (Eng. trans.), 1955, pp. 123, 124.

See L. Boutan, *La Perle*, 1925; J. Holman, *The Mystery of the Pearl*, 1941.

Pearl-ash is prepared from wood ash. The potashes are extracted by solution, evaporated out and strongly heated, thus giving a refined 'potash.' The chief constituent of *P.* is potassium carbonate, K_2CO_3 . *P.* is of interest as the first drying agent for gases; it was introduced for this purpose by H. Cavendish about 1770.

Pearl Grain, see METEOROLOGY.

Pearl Harbor, inlet with a narrow entrance, about 7 m. W. from Honolulu, Oahu Is., belonging to the Sandwich or Hawaiian group in the E. Pacific Ocean. In order to protect the Pacific coast and to control the Panama Canal, the U.S.A. Gov. fortified it; important and extensive military works were constructed. The dredging of P. H. was finished in 1912, and dry docks, fortifications, as well as a naval station, constructed. The dry

dock at the naval station was officially opened in Aug. 1919. The base has 3 locks with 10 sq. m. of navigable water and hundreds of anchorages. Ford's Is., on which is Luke Field, is in P. H.; Hickam Field and Wheeler Field are near by, as is Kaneohe Naval Air Station. On 7 Dec. 1941 P. H. was suddenly attacked by a large force of Jap. bombers, and great damage was done to warships, installations, etc., with considerable loss of life. Thus was America forced into the war.

The Japanese Attack on 7 Dec. 1941. Prior to the Jap. air attack a Jap. submarine was sighted at 6.30 a.m. in the prohibited area outside P. H. and sent

morally guilty. Hawaii, sitting behind its 'Maginot line' of the Pacific Fleet, simply reflected the over-confidence and complacency of the mainland. The reports of the army and navy boards of inquiry and statements on them by the secretaries of war and the navy were made public in Aug. 1945. The Army Board concluded that the extent of the disaster was due primarily to the failure of Gen. Walter C. Short, the army commander, adequately to alert his command; to the failure of the war dept to direct him to make an adequate alert; and to the failure to keep him sufficiently informed of developments in negotiations

Imperial War Museum: Crown copyright

PEARL HARBOR: DECEMBER 1941

to the bottom. Later 3 midget Jap. submarines passed unmolested into the harbour, the net across the entrance not having been closed. The air attack, carried out by small waves of planes from sev. aircraft-carriers, came from the N. Only 105 Jap. planes took part, but their attack was directed to predetermined objectives. The prin. airfields were singled out for attack. Nineteen Amer. vessels were damaged, including 6 battle-ships wrecked or sunk; combined U.S. service casualties were 3303 killed or missing and 1272 wounded.

Fifth-column treachery played a large part in the success of the Jap. attack. The official report of the Roberts Inquiry Board shows that there were some 200 agents in Honolulu alone who were acting under orders from the Jap. consul-general. The board, however, considered that the attack would have been far less damaging but for the over-confidence and complacency of the Amer. armed forces. In a sense, however, all America was

between Japan and the U.S.A. The secretary of war considered that Gen. Short's relief of command was sufficient punishment for his errors of judgment. The Navy Board found that Adms. H. R. Stark and H. E. Kimmel did not do the necessary things to prevent just such a defeat as had occurred and that they failed to demonstrate superior judgment. The secretary of the navy directed that neither Adm. Kimmel nor Adm. Stark should hold any position which required the exercise of superior judgment. Neither the secretary of war nor the secretary of the navy considered that any officer concerned with the disaster should be court-martialed, and in this they agreed with the recommendations of the boards of inquiry that nothing further should be done. See U.S. State Dept White Paper, *A Record of the Efforts for Peace and American Foreign Policy during the Fateful Decade from 1931 to 1941*; H. Feis, *The Road to Pearl Harbor, 1941*; and W. Lord, *Day of Infamy, 1957*.

Pearl Islands, numerous group of is. in the Bay of Panama, 40 m. S.E. of, and belonging to, Panama (q.v.). Pearl and other fisheries are carried on.

Pearsall, Robert de (1795-1856), musician and composer, b. Clifton. Besides his musical works (including madrigals and cantatas) he made a trans. of Schiller's *Wilhelm Tell*. He lived much in Germany, and his compositions and theories were influenced by the strict style of classical polyphonic composers.

Pearse, Padraic (Patrick) Henry (1879-1916), Irish politician and scholar, b. Dublin; associated from his youth with the literary side of the extreme nationalist movement and an original member of the Sinn Féin (q.v.) organisation. He founded St Enda's College, a secondary school for boys, designed for the encouragement of Irish nationalism. In 1897 he also founded the New Ireland Society. He was elected to the executive of the Gaelic League and ed. its weekly *Jour*. On the outbreak of the Easter rebellion (1916) he became commandant-general of the Irish Republican Army and president of the Provisional Gov., and he was a signatory of the declaration of the Irish Rep. After holding out for a week against the gov.'s troops, he surrendered unconditionally, was tried by court martial and executed. He was the author of poems, stories, critiques, and plays. His *Collected Works* were pub. in 2 vols. (1917 and 1918). See also J. J. Horgan, *Parnell to Pearse: Some Recollections and Reflections*, 1948.

Pearson, Sir Cyril Arthur (1866-1921), journalist and newspaper proprietor, b. Wookey, Somerset. Educ. at Winchester, he began his journalistic career by joining the staff of Sir George Newnes. Having won a competition, he secured a sub-editorship on *Tit-Bits* as a prize. He became manager of the firm; but, after remaining in this position for 4 years, left to start *Pearson's Weekly* as an independent venture. This was followed by *Home Notes*, *Pearson's Magazine*, *Short Stories*, *Ladies' Magazine*, *M.A.P.*, and *Rapid Review*. In 1900 he founded the *Daily Express*, and in 1905 he became owner of the *Standard* and chief owner of the *St James's Gazette*. In 1910 his sight began to fail, and he soon went totally blind. Thereafter, he devoted his chief energies to promoting the welfare of the blind, and founded St Dunstan's charity for blinded sailors and soldiers, 1915. In 1916 he was made a baronet, and in 1917 G.B.E. He wrote *Victory over Blindness*, 1919. See life by S. Dark, 1922.

Pearson, Hesketh (1887-), biographer, b. Hawford, Worcestershire. He was educ. at Bedford Grammar School. In 1911 he went on the stage, and took part in various productions by Tree, Granville Barker, and George Alexander. After service in the First World War he returned to the stage, but during the next 10 years he also made a beginning in literature with the pub. of 4 books, of which *Modern Men and Manners* was the first, 1921. With *Doctor Darwin*, pub. in 1930, he entered upon the career in which he

made a wide reputation in England and America as a writer of biographies notable for their zest, humour, and power in delineating character and describing incident. These include Sydney Smith, *The Smith of Smiths*, 1934, Hazlitt, *The Fool of Love*, 1934, Gilbert and Sullivan, 1935, Labouchère, *Labby*, 1936, Tom Paine, 1937, John Nicholson, *The Hero of Delhi*, 1939, Bernard Shaw, 1942, Conan Doyle, 1943, Oscar Wilde, 1946, Dickens, 1949, and Disraeli, *Dizzy*, 1951. His autobiography, *Thinking It Over*, was pub. in 1938.

Pearson, John (1613-86), Bishop of Chester, b. Great Snoring, Norfolk; studied at Cambridge, fellow of King's College (1634-40), M.A. (1639), D.D. (c. 1660). In 1640 he became prebendary of Salisbury and rector of Thorington, and in 1645 acted as chaplain to Goring's army, the last remnant of the Royalist forces. In 1654 he accepted a charge at St Clement's Eastcheap, London, and in 1659 pub. his sermons under the title *An Exposition of the Creed*, a work of great ability and reputation. In 1660 he became master of Jesus College, Cambridge; in 1661 joint superintendent with John Earle of a trans. of the Prayer Book into Latin; in 1662 master of Trinity College, Cambridge; and in 1673 bishop of Chester. His *Minor Theological Works*, ed. with a memoir by E. Churton, were pub. in 1844.

Pearson, John Loughborough, R.A. (1817-97), architect, b. Brussels. He came to London and worked under Anthony Salvin and Philip Hardwick, and in 1843 set up independently, becoming famous as a restorer of Eng. cathedrals, including Bristol, Canterbury, Chichester, Exeter, Lincoln, and Rochester; also Westminster Abbey and Westminster Hall. His greatest new building was Truro Cathedral, 1879-87. He also designed Brisbane Cathedral; St Augustine, Kilburn; St John, Red Lion Square. many other churches, and the Astor Estate Offices, London. He was awarded the R.I.B.A. Royal Gold Medal, 1880.

Pearson, Karl (1857-1936), scientist, b. London. Educ. at Univ. College School, London, and Cambridge, where he was third wrangler. In 1882 he became prof. of geometry at Univ. College, London, and in 1885 prof. of applied mathematics and mechanics there. He was Galton prof. of eugenics in the univ. of London, and Darwin medallist of the Royal Society. His works include *Inquiries into Human Faculty and its Development*, 1883; *The Moral Basis of Socialism*, 1885; *History of the Theory of Elasticity and Strength of Materials* (with J. Todhunter), 1886-93; *Socialism in Theory and Practice*, 1887; *The Chances of Death, and Other Studies in Evolution*, 1897; *National Life from the Standpoint of Science*, 1901; *Grammar of Science*, 1902, Everyman's Library, 1937; *Tables for Statisticians*, 1914-30; *Life and Letters of Francis Galton*, 1915-25; ed. *Biometrika*, 1902-30, and *Annals of Eugenics*, 1925-30.

Pearson, Westman Dickinson, see COWD-RAY, VISCOUNT.

Peary, Robert Edwin (1856-1920), Amer.

Polar explorer and adm.; b. Cresson Springs, Pennsylvania. Entered the navy in 1881, and worked as engineer's assistant on the Nicaragua Canal. In Arctic exploration he is celebrated as the first to reach the N. pole. In 1886 he reconnoitred the ground in Greenland; in 1891-2 he spent 13 months in N. Greenland, and crossed it by sledge, a 1200-m. journey. A similar sledge journey was performed in 1893-5 in N. Greenland during a 25-month stay there. Summer voyages were undertaken in 1896 and 1897. The next journey occupied 4 years, 1898-1902, and was again spent in exploring the N. end of Greenland and its is. The *Roosevelt*, a specially built vessel, equipped with wireless telegraphy, was used in the expedition of 1905. He reached the then farthest N. in lat. 87° 6', 200 m. from the Pole—the big 'leads' and ice drift causing great trouble. He wintered 1908-9 at Cape Sheridan in the *Roosevelt*, and started on a sledge journey in the following season for the Pole; this he claimed to have reached 6 April 1909. He pub. *Northward over the Great Ice*, 1898; *Nearest the Pole*, 1907; and *The North Pole*, 1911; see also the *Geographical Journal*, Vol. 22, No. 6, 1903; Vol. 36, No. 2, 1910. He was made a rear-adm. in 1911. See lives by F. Green, 1926, J. Gordon Hayes, 1930, and W. H. Hobbs, 1937.

Peasant Proprietor, see METAYER SYSTEM and SMALL HOLDINGS.

Peasantry, term applied to rustics or countrymen, including agric. labourers and peasant proprietors, i.e. persons owning their own cottage and small amount of land. Every country has its peasants or rustic classes. See VILLEIN for hist. of Eng. peasants; METAYER SYSTEM and SMALL HOLDINGS. See J. C. and H. P. Cox, *Rise of the Farm Labourer*, 1874; J. W. Robertson-Scott, *The Dying Peasant*, 1926; Eileen Power, *Peasant Life (c. 1100-1500)*, 1932; and M. E. Fordham, 'European Peasantry,' in vol. v of *European Civilisation*, 1937.

Peasants' Revolt (1381). In the reign of Richard II the general distress among the poorer classes in England, following on an epidemic of the Black Death, and discontent at the enactment of a statute of labourers which attempted to prevent the peasantry taking advantage of the scarcity of labour resulting from the Black Death, came to a crisis when the poll-tax was enforced in 1379. Riots soon followed in sev. parts of England and a mob, sev. thousands strong, seized Rochester Castle and marched to Maidstone. Wat Tyler became their leader, a man of obscure origin but undoubted courage. Canterbury was seized and sacked; they then marched to London. John Ball, 'the mad priest of Kent,' joined them, having been liberated from the archbishop's prison. They continued burning and plundering, and many beautiful buildings were burnt and sacked, among them John of Gaunt's palace of the Savoy. On reaching London they seized the prisons of Newgate and Fleet. London was the scene of pillage and riot. The

boy king rode out to confer with Tyler, but with little effect. The mob then seized the Tower and murdered Archbishop Sudbury and Sir Robert Hales. Richard again went to make peace at Smithfield; Sir Wm. Walworth, the lord mayor of London, who rode with the king, killed Tyler; meanwhile the Bishop of Norwich had routed the Norfolk rebels, and the revolt was broken. See E. Powell, *Rising in East Anglia in 1381*, 1895; Sir C. Oman, *The Great Revolt of 1381*, 1906; A. Steele, *Richard II*, 1941.

Peasants' War. In 1524 the peasants of the Black Forest, Germany, influenced chiefly by economic distress, banded together and rose against the nobles. The revolt rapidly spread throughout the S. of the country. They demanded in 12 articles the right to elect their own ministers, to be allowed to kill wild game and to fish, and the reduction of the villein service. In Thuringia the peasants were especially successful. The army of the Swabian League, led by Philip of Hesse and encouraged by Luther, defeated them at Frankenhausen in 1525, and over 100,000 were killed, including Munzer, their leader. See E. B. Bax, *The Peasant War in Germany*, 1899, and O. H. Brandt, *Der Deutsche Bauernkrieg (1525)*, 1929.

Peastone, see OOLITE.

Peat, deposit of decaying vegetable matter in the presence of stagnant water, formed of mosses, marsh, heath, and moorland plants. In a P. bog the surface is generally covered with growing plants, while below is the decomposing matter; the deposit may be many feet deep, becoming in the lower part brown or black in colour and compact in structure; indeed, under great pressure and at high temp. coal is produced in this manner, oxygen and hydrogen being given off till little else but carbon remains. In dists. where it abounds, as in Ireland, where P. is estimated to cover one-seventh of the whole area, P. is cut into turfs, stacked to dry, and employed as fuel; but its other uses are numerous. It makes an excellent absorbent litter, has been manufactured into numerous fabrics, and from upland P. the fibrous material used in the culture of many garden plants is obtained. See also FUEL. See B. F. Haanel, *Facts about Peat*, 1924; and H.M.S.O., *The Winning, Harvesting, and Utilisation of Peat*, 1948.

Peat Moss, see SPHAGNUM.

Peč (Ipek, or Petch), tn in Serbia, Yugoslavia, in the autonomous prov. of Kosovo-Metohija (q.v.). It is on the Bistrica, at the foot of Mt Koprivnik. In the Middle Ages it was the seat of the Serbian patriarchs, and the great monastery in which they resided, incorporating 3 churches and a chapel, remains. P. is a busy commercial tn. Pop. 21,700.

Pecan, or **Pecan** (*Carya pecan*), tall hickory tree, native of N. America, bearing long leaves and edible nuts of exceptionally good flavour. The shell is thin and the kernel is easily extracted.

Peccary, 2 species of tropical Amer. pigs, which differ from old-world swine by the presence of a strong-smelling gland

in the middle of the back, secreting a musky substance, and by the upper tusks being directed downwards instead of upwards. They have no tail and the fifth toe of the hind foot is absent. Only 2 young are produced at a birth. Adult animals are from 16 to 18 in. high and weigh from 40 to 60 lb. The collared P. (*Pecari tajacu*) extends from Patagonia to the S. border of the U.S.A. The white-lipped P. (*Tayassu pecari*) ranges between Brit. Honduras and Paraguay, where it associates in large herds which often seriously damage cultivated crops. Both P.s are pugnacious and dangerous, capable of inflicting severe bites. They are generally hunted with well-trained dogs, and after a short chase are brought to bay, when they are killed with firearms.

Pecol, Gioacchino, *see* LEO (popes), *Leo XIII.*

Pechenga (1920-45 Petsamo), settlement in Murmansk Oblast of NW. Russia, an ice-free port on Barents Sea, 75 m. NW. of Murmansk. Important nickel deposits are exploited near by. Pop. (1939) 500. P. was founded as a monastery in 1533; in the 16th cent. it was a Muscovite foreign trade port. From 1920 to 1945 it belonged to Finland.

Pechora, navigable riv. in the NE. of European Russia. It rises in the Ural Mts and flows N., SW., and N. again into the Barents Sea. Length 1100 m., basin 126,000 sq. m. The chief ports are Pechora and Nar'yan-Mar. The basin is the coldest region of Europe and has the thickest snow cover; there are large coal deposits (*see* VORKUTA).

Pechory (Estonian *Petseri*), tn in the Pskov Oblast of NW. Russia, 25 m. W. of Pskov. It is notable for the famous Pskov-P. cave monastery, founded in 1473. Until the 18th cent. P. was an important frontier fortress. Pop. (1938) 5000, half Estonian. It belonged to Estonia 1920-45.

Peckham, dist. of London, near the N. of the bor. of Camberwell. The manor of P. was once the property of the Abbey of Westminster, and later of Henry I. P. was once famous for its fair. After c. 1820 it became built up and industrialised, but P. Rye Park remains unspoiled. In P. are the S. Metropolitan Gas Works, the Licensed Victuallers' Asylum, and the Pioneer Health Centre.

Peckham Experiment, health centre, founded as an experiment into the nature of health, as distinct from the study of either the cure or prevention of sickness, originally opened in a small house in Queen's Road, Peckham (London, S.E. 15), in 1926. A 'Family Club' was formed, and all married couples (with or without children) were invited to join, at a family subscription of 1s. weekly. More than a hundred families joined in the 3 years that this first centre was open. In May 1935 a new centre was opened in Peckham, a larger enterprise, which not only extended the previous service but also provided a new social structure to vivify the health of the member-families. The health centre was an experiment

built, equipped, and to a large degree maintained by voluntary subscriptions; lack of funds forced it to close in 1951. *See* G. Scott Williamson and Innes H. Pearce, *The Case for Action*, 1931, *Biologists in Search of Material*, 1938, and *Science, Synthesis and Sanity*; G. Scott Williamson, *Physician Heal Thyself*, 1935; Innes H. Pearce and Lucy H. Crocker, *The Peckham Experiment*, 1943.

Pecock, Reginald (c. 1395-c. 1460), bishop and author. He became a fellow of Oriel College, Oxford, in 1417. In 1431 he became master of Whittington College, London, and rector of its church; in 1444 Bishop of St Asaph, and in 1450 Bishop of Chichester. He was an active controversialist, most of his energies being directed against the Lollards. In 1447 he roused popular indignation by a sermon against church reform, delivered at St Paul's Cross. The extreme character of his writings brought him into disrepute with the eccles. authorities. In 1457 he was expelled from the Privy Council, of which he had been made a member, made a public abjuration at St Paul's Cross, and resigned his bishopric (1458). He retired to Thorney Abbey. In his prose he had clarity, the gift of choosing homely examples, and a wealth of words.

Pecos, riv. of the U.S.A., rising in NE. New Mexico, and flowing SE. and S., through Texas, to join the Rio Grande 35 m. NW. of Del Rio. Its prin. importance is as a source of irrigation, the U.S. national reclamation service having estab. projects at Carlsbad and Hondo to serve 30,000 ac. Important dams on the riv. are Alamogordo, Avalon, and McMillan. Erosion control experiments have been made. Length 926 m.

Pécs (Ger. *Fünfkirchen*; anc. *Quinque Ecclesiae*), city of SW. Hungary, cap. of the co. of Baranya, at the S. foot of the Mecsek Mts, 105 m. SSW. of Budapest (q.v.). It dates from Rom. times, and its bishopric was founded by St Stephen (*see* STEPHEN I of Hungary) in 1009. The first Hungarian univ. was estab. here in 1367 (the present univ. was transferred from Bratislava (q.v.) in 1922). After the battle of Mohács (q.v.) in 1526 the Turks occupied the tn for more than a cent. During the anti-Russian risings of Oct.-Nov. 1956, P. was one of the centres of Hungarian resistance. There is a fine 4-towered Lombard-Romanesque cathedral (11th-16th cents., rebuilt 1891); other notable buildings include a 16th-cent. mosque, now a church. The prin. industries are the manuf. of pottery and agric. machinery, tanning, distilling, and meat-packing. Coal is mined near by, and there is an airfield. Pop. 88,000.

Peculiar (O.F. *peculier*, private; Lat. *peculiaris*, of private property), in Eng. law, a par. or church having jurisdiction within itself, and exempt from the jurisdiction of the ordinary, e.g. Westminster Abbey. *See also* DEAN.

Peculiar People, evangelical Protestant Christian denomination founded in 1838. Its churches are arranged in circuits, with ordained ministers, central presbytery, youth organisation, and Sunday school

conference. The P. P. beliefs are distinguished by belief in the plenary inspiration of Holy Scriptures, baptism of believers, Holy Communion, and Divine healing.

Pedal (from Lat. *pes*, foot), name given to a lever worked by the foot in various musical instruments, also on a bicycle, etc. The organ has a P. keyboard of 20 or more P.s, producing a musical scale in the bass register, the piano usually only 2 (sustaining, improperly called 'loud,' and 'soft'), whilst the harp has 7 foot levers to raise and lower the pitch of the notes.

Pedanius, see DIOSCORIDES, PEDACIUS.
Pedestrian Crossings, see TRAFFIC REGULATIONS AND SIGNS.

Pedestrianism, see ATHLETICS.

Pediculus and **Pediculosis**, see under LICK.

Pedigree, tabular view of the members of any particular family, with the relations in which they stand to each other, together, usually, with some slight notice of the prin. events of the life of each, such as the time and place of birth, marriage, death, and burial. Sometimes these are accompanied by reference to par. registers, monumental inscriptions, marriage settlements, or other documents containing evidence of the facts mentioned in the P. But when much of such additional information is introduced, the record is a genealogical hist. rather than a P. P.s properly so called are not of very frequent occurrence in the writings of the Middle Ages, but later the continual claims to dignities and armorial insignia prompted the College of Heralds to compile a public record of all the families of distinction, and, as a consequence, a splendid collection of P.s (to be found in the visitation books at the College of Arms) has come down to us. Besides these, there are private collections in the library of the Heralds' College and in the Brit. Museum, and in private possession. It is only in the case of peers and those laying claim to arms that the registration of a P. is compulsory. See J. H. Round, *Family Origins*, 1930, and A. W. H. Clarke, *London Pedigrees and Coats of Arms*, 1935.

Pediment, triangular space or gable over the portico at the ends of the roof of classic buildings. It is enclosed by horizontal and raking cornices, the latter of which follow the slopes of the roof. It is frequently enriched with sculpture, for which it forms a fine setting. The doors and windows of classic buildings are often surmounted by P.s, either straight-sided or curved.

Pedlars, see HAWKERS AND PEDLARS.

Pedometer, instrument which indicates the distance walked. Shaped like a watch and carried in the pocket, it is so constructed that when the body is raised by the spring of the foot then a lever acts upon the wheels and an index-hand indicates on a dial plate the number of paces (usually) or the number of miles (more rarely and less accurately) travelled. A hodometer (Gk *hodos*, way) is an instrument for indicating the distance

travelled by any wheeled vehicle. Since the mechanism is worked by the revolution of the axle, it is obviously more reliable than a P. A cyclometer is another form used on bicycles. A hubodometer records mileage and checks petrol and oil consumption in a motor vehicle; it occupies the place of the regular hub-cap on one of the front wheels.

Pedrell, Felipe (1841-1922), Sp. composer, b. Tortosa, was almost wholly self-taught, but learnt much as a chorister at Tortosa cathedral. He first published music in 1871 and had his first opera, *El último Abencerraje*, produced at Barcelona in 1874. He was the leader of the Sp. nationalist movement in composition and also became a famous scholar in the domain of old Sp. church music, much of which he edited. Among his later operas *Los Pirineos*, 1902, *La Celestina*, 1903, and *El Comte Arnau*, 1921, are the most important; he also wrote incidental music for *King Lear*, church music, cantatas, orchestral and chamber music, etc.

Pedro I (Dom Pedro de Alcântara) (1798-1834), emperor of Brazil, b. in Lisbon; the second son of John VI of Portugal and Carlota Joaquina, sister of Ferdinand VII of Spain. He became heir-presumptive to the throne of Portugal by the death of his brother Antonio. In 1807, when Napoleon's troops under Junot invaded Portugal, Dom P. and the rest of the royal family went to Brazil under Brit. protection. In 1817 he married Leopoldina, Archduchess of Austria, daughter of the Emperor Francis I. On his father's return to Portugal in 1821 he became prince-regent of Brazil, and, declaring for Brazilian independence, was crowned emperor in 1822. On the death of John VI of Portugal 10 Mar. 1826, he became Pedro IV of Portugal. In 1828 he was ousted by his brother, Dom Miguel, but abdicating the throne of Brazil in 1831, Dom Pedro returned to Portugal and conducted a successful campaign against his brother. See S. Corrêa da Costa, *Every Inch a King*, 1950.

Pedro II (Dom Pedro de Alcântara) (1825-91), Emperor of Brazil, b. in Rio de Janeiro. His father, Pedro I, abdicated in his favour in 1831, and, after a regency, he was crowned in 1841. He ruled with much tact and judgment, but was forced to abdicate in 1889.

Pedro the Cruel (1334-69), King of Castile and León, succeeded his father, Alfonso XI in 1350. He was popular with the common people on account of his justice, but alienated the clergy and nobility. When he marched to put down rebellion in Estremadura his brother, Henry, betrayed him and he was taken prisoner; but he escaped and in turn speedily crushed the rebels. Becoming suspicious of everyone, the rest of his reign was occupied in reinforcing his own authority as a feudal tyrant and also in wars against Aragon and Granada. The epithet 'Cruel' was due to the murder of his brother Don Fadrique in 1358. Oppressive taxes now destroyed the popularity he had earned for even-h

justice. His other brother Henry returned from France at the head of other exiles, and supported by Du Guesclin (q.v.) with forces from Aragon and France and with aid from the Pope. Edward the Black Prince was, however, persuaded to ally himself with P. and defeated Henry and Du Guesclin at Navarrette, 1367. But when P. failed to fulfil his promises Edward recrossed the Pyrenees and left P. to his fate. Rebellious now broke out everywhere against him, and when Henry returned a second time P. was routed at Montiel and slain.

Peebles: 1. Co. in S. Scotland, also called Tweeddale, as it consists mainly of the upper valley of the R. Tweed, which rises in the co. P. is bounded by Dumfriesshire on the S., Lanarkshire on the W., Midlothian on the N. and E., and Selkirkshire on the E. and S. There are numerous remains of Brit. hill forts and sepulchral mounds, and there is a Roman camp at Lyne near Peebles. P. finally came under Scottish rule in 1018. The co., being a group of hills, is mostly pastoral, with the arable lands chiefly in the valleys and on the lower slopes of the uplands. The highest hill is Broad Law (2754 ft); other hills are Hartfell (2650 ft) and Minchmoor (1855 ft). The chief riv. is the Tweed, rising in the S. of the co., which has a number of small tribs. Agriculture and cattle rearing are the chief occupations. Coal is found in the N. of the co. Woollen manufs. are important. The chief tns are Peebles (the co. tn), an anct royal burgh, and Innerleithen. Roxburgh, Selkirk, and P. together return one member to the House of Commons. Area 348 sq. m.; pop. 15,240.

2. Royal burgh (since 1367) and co. tn of the above co., situated at the confluence of the Eddleston with the Tweed, 23 m. S. of Edinburgh. Often visited by the Scottish kings, P. probably received its charter from Alexander III. There are woollen mills. Pop. 6000. 1 m. W. is Neidpath Castle, a massive ruined keep.

Peekskill, tn of New York, U.S.A., in Westchester co., on the Hudson, 42 m. N.E. of New York City. It is in a truck-farm and resort area, and manufs. alcohol, gin, jewellery, and leather and textile goods. Bear Mt Bridge crosses the Hudson 4 m. NW. Pop. 17,730.

Peel, Arthur Wellesley Peel, Viscount (1829-1912), politician, youngest son of Sir Robert P., b. London. He was educ. at Eton, and Balliol College, Oxford, and was elected in 1865 Liberal M.P. for Warwick. P. became parl. secretary to the poor law board in 1868, secretary to the board of trade in 1871, and in 1880 under-secretary for the home dept. In 1884 he was chosen to fill the important office with which his name will always be associated, Speaker of the House of Commons, and to which he was 3 times re-elected. On his resignation (owing to falling health) in 1895, he was created a viscount.

Peel, John (1776-1854), Cumberland yeoman, who for some fifty years maintained a pack of hounds at Caldbeck,

where he was born and lived all his life. He is known chiefly as the hero of the song *D'ye ken John Peel*, said to have been written impromptu by his friend, John Woodcock Graves, about 1829 (some say 1820), to a folk-tune *Bonnie Annie*. It is the regimental march of the Border Regiment.

Peel, Sir Robert, second Baronet (1788-1850), statesman, b. near Bury, Lancs., the eldest son of Sir Robert P., a rich cotton manufacturer. He went to Harrow, and afterwards to Christ Church, Oxford, where in 1807 he took a double

SIR ROBERT PEEL

first. He entered Parliament as a Tory in 1809, and in the following year Lord Liverpool appointed him under-secretary for war and the colonies. This office he held until 1812, when he became chief secretary for Ireland for 6 years, during which period he fought the growing influence of O'Connell, opposed Catholic emancipation, and estab. the Royal Irish Constabulary. He retired from office in 1818 with a considerable reputation as a judicious administrator and an able debater. Four years later he entered Liverpool's Cabinet as home secretary, which office he retained until the Premier's death in 1827. His valuable reforms included the reduction in the number of capital crimes, prison amelioration, and the foundation of the Metropolitan Police (hence nicknamed 'Peelers' or 'Bobbies'). In the following year he was, under Wellington, home secretary and leader of the House of Commons, and in 1829, being convinced of its necessity for the peace of Ireland, supported Wellington's measure for Catholic emancipation. In 1834 he became Prime Minister and

chancellor of the Exchequer, but he held office only for a few months. In opposition he set himself the task of organising the Conservative party, and in 1839, when Melbourne resigned, he was invited to form his second gov., but abandoned the task in consequence of the 'bedchamber question.' He became Prime Minister again in 1841. He held no office save that of the first lord of the Treasury, but he was for all effective purposes chancellor of the Exchequer. As a financier he proved himself extremely capable, and introduced many reforms in the fiscal system of the country; he took steps to develop free trade, taxed incomes over £150 per annum, and carried a Bank Charter Act in 1844. In other spheres, Catholic Irish endowments were permitted, and the Canada-Oregon border dispute settled.

He was at first opposed to the repeal of the corn laws, for which there was strong agitation throughout the country, but after the failure of the harvest in 1845 he became convinced of its necessity. His colleagues would not support him in this, and he resigned; but Lord John Russell failing to form a gov., he returned to office and brought in and carried his Corn Law Bill. He was bitterly attacked for his change of face on this question, but he had earlier laid down the principle which guided him: 'As minister of the crown I reserve to myself, distinctly and unequivocally, the right of adapting my conduct to the exigency of the moment, and to the wants of the country.' A few days after this measure became law he was defeated on an Irish Bill, and retired from office. He was thrown from his horse on Constitution Hill on 29 June 1850, and died from his injuries 3 days later. P. was one of the leading statesmen of his era, distinguished not only for his considerable administrative ability, but also for the intellectual honesty which led him to sacrifice his own interests and those of his party for the sake of measures he considered necessary for the general welfare. His speeches were pub. in 1853, and his memoirs, ed. by Earl Stanhope and E. Cardwell, in 1856. See lives by Justin McCarthy, 1891; C. S. Parker (*Sir Robert Peel, from Private Papers and Correspondence*), 1891-9; J. R. Thurstfield, 1898; and T. Lever, 1942; see also H. W. Davy, *The Age of Grey and Peel*, 1929, and W. P. Morell, *British Colonial Policy in the Age of Peel and Russell*, 1930.

Peel, tn and watering place on the W. coast of the Isle of Man, 11 m. NW. of Douglas. On the summit of a rock in Peel Bay are the ruins of an anct castle and cathedral. There are fisheries, and P. is noted for its locally cured kippers. Pop. 2600.

Peel, or **Peel-tower** (Lat. *palus*, a stake), a fortified keep, particularly one built in the 16th cent. in the border country of England and Scotland as a defence against raids. It was originally a structure of earth and timber, strengthened with palisades. The later P.s had massive square towers with turrets at the angles, and a door half-way up, the lower vaulted part

being used for cattle, whilst the upper portion served as a dwelling-place.

Peele, George (c. 1558-c. 1597), dramatist and poet, b. London. From Christ's Hospital he went to Oxford, where he had a reputation as a poet and wrote his *Tale of Troy*, 1589. It is generally assumed that after coming down from the univ. he became an actor, but of his performances nothing is known. His first play was *The Arraignment of Paris*, 1584, and this was followed by many others, including *The Battle of Alcazar*, printed 1594, *The Old Wives' Tale*, printed 1595, and *David and Bethsabe*, printed 1599, most of which were rewarded with success. He wrote many miscellaneous verses, and the best among them perhaps is the 'gratulatory poem' entitled *The Honour of the Garter*, 1593. His works were ed. by A. Dyce, 1861, and A. H. Bullen, 1888. See study by P. H. Cheffaud, 1913, and H. D. Sykes, *Sidelights in Elizabethan Drama*, 1924.

Peerage, see **NOBILITY**.

Peerson, Martin (c. 1572-1650), composer, b. March, was probably under the patronage of Sir Fulke Greville, took the B.Mus. at Oxford in 1613 and about that time moved to London, probably as Master of the Children at St Paul's. He wrote much Eng. and some Lat. church music, fantasies for strings, secular vocal pieces, etc.

Peeters, Jan, see **PETERS, JAN**.

Peewit, see **POVER**.

Pegasus, winged 'horse of the fountain,' which sprang from the blood of Medusa when her head was struck off by Perseus. While drinking at the fountain of Pirene P. was caught by Bellerophon with a golden bridle, which Athena had given him. On P., Bellerophon conquered the Chimaera, but endeavouring to ascend to heaven upon his winged horse, he fell down upon the earth. P., however, continued his flight to heaven, where he dwelt among the stars. P. was also regarded as the horse of the Muses.

Pegasus, anct Gk constellation, called by Tycho Brahe (1628) P. or Equus alatus. These names refer to its resemblance to the form of a horse, P. being the winged horse of Gk legend. It is one of the 21 N. constellations and lies between Andromeda and the head of Aquarius. The 'great square' of P. is formed by α Pegasi, β Pegasi, γ Pegasi, and α Andromedae.

Pegmatite, very coarse-grained crystalline rock usually occurring in veins. The commonest types of P. are closely related to granites, and consist principally of felspars and quartz. Many P.s contain concentrations of rare elements, and are thus of great economic importance. Gemstones such as beryl and topaz, mica and felspar suitable for industrial purposes, and valuable ores of tin, tungsten and many other metals, can be obtained from some P.s. See **PNEUMATOLYSIS**.

Pegu: 1. Cap. of P. dist., in a div. of the same name, Lower Burma, stands on the riv. of the same name, 45 m. N.E. of Rangoon. The tn was founded in the latter half of the 6th cent. AD, and rose

to a position of great importance in the 16th and 17th cents., being cap. of the Mon P. Empire overthrown by Burma in 1757. There is a fine pagoda still remaining. P. became British in 1852. It is now a railway junction. In the Burmese campaign of 1945 the Jap. Twenty-eighth Army, trying to escape from the Allies' trap near P., was mown down by the allied Fourteenth Army (q.v.). Pop. 25,400. The div. has an area of 13,258 sq. m. and a pop. of 2,961,000. The dist. has an area of 4404 sq. m. with a pop. of 583,000.

2. Riv. of Lower Burma, has a length of 180 m. Its source is in the P. Yoma Mts, and it flows SSE. and SW. to join the Rangoon R.

Péguy, Charles (1873-1914). Fr. writer, b. Orleans of peasant stock. His father died when he was a youth, and his mother earned her living by repairing chairs. Overcoming all obstacles, the boy managed to take the courses at the École Normale, and later attended the Sorbonne. He determined to remain in Paris and, with no money, he founded in 1900 a pub. which was destined to become famous, *Les Cahiers de la Quinzaine*. The *Cahiers* were something new in Fr. literary pub. They were not magazines. Rather they were complete books, often written by himself on some burning topic of the day. Romain Rolland contributed some of his best books. Others who were introduced to the Fr. public were the brothers Tharaud, Julien Benda, André Suarez, André Spire, and Bernard Lazare. But P. himself was the ardent soul of the pub. Influenced by Bergson, he proved himself a passionate seeker of the truth. The anti-clerical Socialists and many Catholics were puzzled by P., who was at the same time an ardent Catholic and an ardent Socialist. In the Dreyfus affair he became a zealous Dreyfusard, but he made a distinction between the political Dreyfusards and what he called the Dreyfusard mystics, who battled unselfishly only for the triumph of justice. As a lover of Fr. hist. and an ardent Catholic at heart, he devoted much of his poetry to a celebration of the youth of Joan of Arc. In rapid succession he wrote gigantic poetical works on this subject: *Le Mystère de la charité de Jeanne d'Arc*, 1910; *Le Mystère des saints innocents*, 1912; *La Tapisserie de sainte Geneviève et de Jeanne d'Arc*, 1913. He wrote also an enormous poem entitled *Eve*, 1913. One of his most famous *Cahiers* was devoted to his master Bergson. In both his prose and his verse he hewed out a style for himself in which he did not fear to write in the popular tongue. When the war broke out with Germany he reported at once for active duty, was offered a captaincy, but preferred to be a simple soldier. He was killed 5 Sept. 1914, when fighting in the battle of the Marne. Since his death a whole library has been written about him, notably books by J. and J. Tharaud (1926), Daniel Halévy (*Péguy et les 'Cahiers de la Quinzaine'*, Eng. trans., 1947), and his own son Marcel, who has also

revived the *Cahiers*, and above all by his friend Romain Rolland. Rolland, in his *Charles Péguy*, 1942, has created a brilliant work of art out of the confused material of interminable pamphlets and even more interminable poems left by P. P. is on the whole a political writer, except in such works as *Victor-Marie, Comte Hugo*, 1910, in which he is a great moralist and a great critic, though his style is marred by endless repetition and intolerable exaggeration. See also studies by P. Archambault, 1939; J. Delaporte, 1944; and A. Rousscaux, 1946.

Pehlavi, see PAHLAVI.

Peine, Ger. tn in the Land of Lower Saxony (q.v.), 23 m. E. by S. of Hanover (q.v.). It has a palace and an old monastery. Oil deposits have been discovered in the vicinity. Pop. 30,000.

Peine Forte et Dure, species of torture formerly applied by the law of England to those who, on being arraigned for felony, refused to plead and stood mute, or who peremptorily challenged more than 20 jurors, which was considered a contumacy equivalent to standing mute. In the beginning of the 13th cent. this penalty seems to have consisted merely of a severe imprisonment with low diet, persisted in till the contumacy was overcome. But by the reign of Henry IV it had become the practice to load the offender with weights and thus press him to death; and till nearly the middle of the 18th cent. pressing to death was the lawful mode of punishing persons who stood mute on their arraignment for felony. During the 15th, 16th, 17th, and even the 18th cents. various cases are recorded of the infliction of the punishment in question. Latterly a practice prevailed, which had no sanction from the law, of first trying the effect of tying the thumbs tightly together with whiplcord. Juliana Quick, in 1442, charged with high treason in speaking contemptuously of Henry IV, was pressed to death. Walter Calverly, of Calverly in Yorkshire, arraigned at the York assizes in 1605 for murdering his 2 children and stabbing his wife, was pressed to death in the castle by a large iron weight placed on his breast. In 1720 a person of the name of Phillips was pressed in Newgate for a considerable time till he was released on his submission. As late as 1741 a person is said to have been pressed to death at the Cambridge assizes, the tying of his thumbs having been first tried without effect.

Peiping, see PEKING.

Peipus, or (Russian) Chudskoye, lake in E. Europe between Estonia and Pskov Oblast of NW. Russia. Length N. to S. 90 m., width 32 m., area 1356 sq. m. It has a S. arm, the Pskov Lake, and is connected through the R. Narova with the Gulf of Finland. The Teutonic Knights were defeated by the Novgorodians in the famous Ice Battle on the P. in 1224.

Peirce, Charles Santiago Sanders (1839-1914), Amer. physicist and logician; b. Cambridge, Massachusetts. Graduated, Harvard, 1859. On U.S.A. coast survey. Conducted investigations into earth's

density and ellipticity, and light-wave lengths. First to use term 'pragmatism' in connection with philosophy, to connote a common-sense system in which Belief is identified with Action (see *Popular Science Monthly*, Jan. 1878). When Wm James (q.v.), professing to follow P., substituted Truth for Belief in this formula—thus producing a Pragmatism the opposite of P.'s—P. renamed his own principle Pragmaticism. His chief pub. work was *Studies in Logic*, 1883.

Peirene Fons, see PIRENE.

Peisistratus, see PISISTRATUS.

Pekan (Indian name), Fisher Marten, or Pennant's Marten (*Martes pennanti*), N. Amer. species, larger than those found in the Old World, being about 4 ft in length, including the tail. Its face is dog-like; fur brown, with white patches on chest and belly. Its favourite food is said to be the Canadian porcupine (*Erythron dorsatus*), but it frequently steals the fish used to bait traps, whence its popular name fisher marten.

Pekin, city, cap. of Tazewell co., Illinois, U.S.A., on Illinois R. and Waterway, in an agric. and coal-mining area, 9 m. S. of Peoria. Chief industries are dairy and food products, distilling, steel tanks, and burial vaults. Pop. 21,900.

Pekinese, breed of lap-dog. It is of Chinese origin, and differs from the Eng. toy spaniel in having a flat skull and tail curved over the loins. Preferably weighing 5-8 lb., it is heavy in front, with short, broad muzzle, falling away lion-like behind. Long-haired, with thick undercoat, it is light-red or yellow, mottled with white. The golden tan are truest to type.

Peking, cap. of China, in the prov. of Hopel, lies in the alluvial plain between the Pailho and the Yungtingho R.s in lat. 39° 54' N. and long. 116° 27' E. From N. to NW. it is partly encircled, at distances of 10 to 20 m., by the Yenshan and Chüntushan mts., which are crowned with the E. section of the Great Wall (q.v.), like the back and wings of an arm-chair; and it faces the P'ohai Bay to the SE. The name P. signifies 'the N. Capital,' to distinguish it from Nanking, 'the S. Capital,' which was once the cap. of the early Ming dynasty (1368-1420). In the 6th cent. BC P. was the site of Chi, cap. of the northernmost State of Yen. In the Han dynasty P. was known as Yüeping, and in the T'ang as Fanyang. It was made the cap. successively by the Khitan (Liao), the Nüchen (Chin), and the Mongolian (Yüan) invaders from the 10th to the 14th cents. In the Yüan dynasty it was called Tatu, 'the Great Capital.' Yung-lo, the 3rd emperor of the Ming dynasty, removed his cap. from Nanking to P. in 1421, and most of its present palaces, temples, and city walls have been built since his time. The Manchus captured the city in 1644, and it remained the cap. of China until 1928, when Chiang Kai-shek moved his gov. to Nanking and renamed P. Peiping, meaning 'the North suppressed.' The removal of the cap. deprived P. of its political significance, which had lasted for 5 cents., and caused the gov. to lose

strategic control of Manchuria (q.v.), which was soon afterwards occupied by the Japanese (1931). However, the city remained the cultural centre of China from 1928 onwards, having as its mainstay the 6 best univs. of China and many national research institutes and colleges, which refused to be 'suppressed.' It was in P. that the students launched the May Fourth Movement (see CHINA, *History*) in 1919; and after the Jap. aggression in 1931 it was again the students of P. who started the nation-wide campaign of United-Front Resistance against the Japanese, and thereby forced the Nanking gov. to alter its subservient policy towards Japan. During the Sino-Jap. War P. was the first victim to fall into Jap. hands, and was occupied by the latter from July 1937 to Sept. 1945. In the ensuing civil war the city was handed over to the People's Liberation Army without a fight on 1 Feb. 1949; and when the Chinese People's Gov. was proclaimed on 1 Oct. 1949, P. was re-estab. as cap. of China.

Since 1950 the metropolitan area has been enlarged to 3 times its old size, and its pop. has grown from a little more than a million before the war to 2,700,000 in 1954 and 4,600,000 in 1957. P. now consists of 3 parts: with the 2 old cities as its centre, it is flanked by 2 newly added areas in the NW. and E. suburbs. The former, stretching 7 m. to the Summer Palace, is the cultural city, occupied by the science institutes of the Academia Sinica, the National Peking Univ. (9000 students), the Tsinghua Univ. (20,000), and more than 20 other univs. and colleges. There are also the huge P. Zoo, the Botanical Garden, the Industrial Exhibition Hall, as well as old parks and temples. The E. suburb is being developed into an industrial city with textile mills and machine factories. The Kuanting hydro-electricity station, which supplies P. with water and power, is 40 m. due W. of the old city; between them are the Mentoukou coal mines and the Shihchingshan steel plant. Due S. is the airfield, which accommodates the largest jet planes, and the main railway junction is 8 m. from the SW. corner of the city. P. is well served with 7 railways stretching in all directions, and both the Yungtingho and the old canal are now navigable. Its air lines link the cap. with all the major cities of the country, including Lhasa, Urumchi, and Kashgar (qq.v.), and with neighbouring countries.

Old P. is composed of 2 cities. The square Inner City (known in Europe as the Tartar City) is surrounded by a massive stone wall 50 ft high and 60 ft thick, each side measuring 4 m. The Outer City, adjoining the S. wall of the Inner City, is oblong in shape, with its longer sides running E.-W. for 5 m. The walls are pierced by 17 gates, which are surmounted by towers 100 ft high. Surrounding the Outer and Inner City walls is a wide moat fed with water from the Jade Fountain Park in the W. Hills. In the W. part of the Inner City is a chain of artificial lakes, the earth therefrom forming hills which are covered with

the rock-gardens, apartments, and temples of the erstwhile Imperial Winter Palace, now open to the public. P. is one of the few caps. in the world that were well planned before they were built. With the square Palace City (perimeter 6½ m.) in the centre of the Inner City, all the broad main streets intersect at right angles with geometrical precision. The Tienanmen (Gate of Heavenly Peace) Square, which is large enough to contain half a million people, and which stretches from the front of the Palace City to the central S. Gate of the Outer City in a straight line

green sea of foliage, with its palaces and towers emerging like islands. Though the suburbs resemble any modern European city, many dists. within the walls of P. remain much as they were cents. ago, with old restaurants, tea-houses, book and stationery shops, medicine-herb shops, and curio and lantern shops dating back to the 17th or 18th cent. The erstwhile picturesque camel caravans, which used to plod the dusty roads, have gone; so have the rickshaws and the demi-monde in the Eight Great Lanes. Buses and tramcars now run on the metalled roads.

Camera Press

THE IMPERIAL THEATRE IN THE SUMMER PALACE, PEKING

The front view of the stage. The seats of the audience are placed in the open courtyard.

through parks, is somewhat similar to the Avenue des Champs Élysées in Paris. Outside the N. wall of the Palace City is the Chingshan Hill crowned with 5 pavilions, the central and highest of which occupies a point in the straight line formed by the 3 main palaces in the Palace City, the Tienanmen Tower, the marble Monument of Revolutionary Martyrs (110 ft high), and 4 other anc. towers. To the N. of the Chingshan Hill are the twin Drum and Bell Towers. The whole Palace City is now the site of the Palace Museum and the Historical Museum. The 15th-cent. Temple of Heaven, with its colossal, round, marble Altar of Heaven, is in the S.E. corner of the Outer City. The dwelling-houses within the city walls are practically all bungalows built round inner quadrangles, with spacious gardens planted with tall trees, so that in summer the city is a

The P. street is no longer 'a dust tray when the weather is fine, an ink box when it is wet.' The climate of P. is cold and dry in the winter, with the lakes frozen to form ideal skating rinks; but the temp. rises to above 80° F. in summer. There are on the average less than 8 weeks of wet days in the year; but in April there are a few days of very unpleasant dust storms coming from the Gobi desert. Otherwise the P. sky is always blue, against which the glazed porcelain tiles of the palace roofs dazzle the eye with their golden rays.

Pelagian Islands (It. *Isole Pelagie*), group of is. in the Mediterranean, lying between Malta and Tunisia (qq.v.). They belong to Italy, and administratively are part of the prov. of Agrigento (q.v.). The group consists of Lampedusa (q.v.), Linosa (area 2 sq. m.; pop. 350), and Lampione.

Pelagic Fauna. The ocean may be divided into two main parts, benthic and pelagic. The former includes all of the sea bottom, while the latter concerns the whole mass of water. Pelagic animals are those that move freely in the sea between the surface and the sea floor. Some have limited powers of movement and are generally small (plankton), while others (nekton) are larger and more active and are not at the mercy of the currents. The most numerous of the non-microscopic plankton animals are the crustaceans, especially the copepods. Among the nektonic animals are cuttlefish, squid, fishes, and whales.

Pelagius, celebrated heresiarch of the early 5th cent., author or systematiser of the doctrine called after him Pelagianism. According to this doctrine there is no original sin, and man does not need grace in order to avoid actual sin and to attain salvation; his free will is sufficient for this purpose, though grace makes the attainment of salvation easier. P. was probably b. about the middle of the 4th cent. in Britain, his name being supposed to be a Gk rendering of the Celtic appellative *Morgan*, or sea-born. He was a monk; it is certain, however, that he never received holy orders. He settled in Rome, and at the end of the 4th cent. he had already acquired a considerable reputation for sanctity and learning. In 410, after the sack of the city by the Goths, he and his disciple Celestius withdrew to Carthage. Here Celestius sought ordination. His doctrines became the subject of discussion, in which St. Augustine took a prominent part, and in a synod sev. opinions ascribed to Celestius were condemned. P. had meanwhile gone to Jerusalem, and news of the proceedings at Carthage having been carried to Palestine in 415, he was accused of heresy before the synod of Jerusalem by Orosius (q.v.). The impeachment failed, and in a synod subsequently held at Diospolis in the same year, P. evaded condemnation by accepting the decrees of the synod of Carthage. The W., however, was more sharp-sighted or less indulgent. A synod of Carthage, in 416, condemned P. and Celestius, and wrote to Pope Innocent I. requesting his approval of the sentence, with which request Innocent complied by a letter which is still extant. On the death of Innocent, Celestius came to Rome in person, and P. addressed a letter to the new Pope Zosimus, and in a council which Zosimus held Celestius gave such explanations that the Pope was led to believe that the doctrines of P. had been misunderstood. A further council of 214 bishops, however, was held at Carthage, in which the doctrines of P. were formally condemned in 9 canons, which were sent to Rome with full explanations. On receipt of these decrees Zosimus reopened the cause, cited and condemned Celestius and P., and pub. a decree, called *Epistola Tractoria*, adopting the canons of the African council. Nineteen It. bishops refused to accept these canons, and were deposed. Their leader, who may be regarded as the greatest

theological advocate of P., was the celebrated Julian, Bishop of Eclanum, near Beneventum. P. himself was banished from Rome, in 418, by the Emperor Honorius. After his banishment, he is supposed to have returned to his native country, and to have d. there. P.'s *Fourteen Books of a Commentary on St Paul's Epistles*, his *Epistle to Demetrius*, and his *Memorial to Pope Innocent* have escaped destruction, probably from their being included by collectors in the works of St. Jerome. They are much mutilated, but yet almost certainly genuine. See G. Vossius, *History of Pelagius*, 1655, and commentaries by J. F. Dudaus, 1719, and T. C. Lillenthal, 1738. See also SEMI-PELAGIANISM.

Pelargonium, commonly but incorrectly called Geranium, a genus of perennial plants (family Geraniaceae) which, since their introduction from S. Africa at the beginning of the 18th cent., have been highly valued as greenhouse and border plants. As exhibition plants they have not the vogue they formerly had. They are classified into five main groups: (1) zonal, with marked leaves; (2) show, with large flowers, which when semi-double are called regal; (3) fancy, with smaller flowers; (4) ivy-leaved, valuable for hanging baskets; (5) scented-leaved. Cape P.s. yet another group, are mostly evergreen shrubs from the Cape of Good Hope; they need greenhouse culture, as do the show and fancy kinds. All are easily propagated from cuttings. Bedding plants are set out in June and lifted again in Sept. Greenhouse plants can be brought into flower at any time by pinching off flower buds through the summer and properly regulating temp. See GERANIUM.

Pelagian, i.e. belonging to the Pelagii, a term used by ant. Gk writers apparently with two distinct meanings. It is used in some places simply as an equivalent of prehistoric or primeval, whilst in other passages a definite race appears to be indicated. If such a race existed it was widely spread over the coasts and is. of the E. Mediterranean and the Aegean; its ethnological relations are obscure. The later Gk writers, such as Hesiod, talk of the Pelagii as a separate race, but their evidence was probably scanty. See *Iliad*, ii. 681-4 and 840-3; x. 428-9; xvi. 233-5, etc.

Pelayo, or **Pelagius**, Visigothic chieftain, considered to be the first Christian king of Spain. He became King of Asturias (q.v.) about AD 718. See SPAIN.

Pelecyopoda, see RIVALVES.

Peleus, son of Aeacus and Endeis, brother of Telamon, and King of the Myrmidones at Phthia. Together with Telamon, he was banished for the murder of Phocus, and fled to Eurytion, King of Phthia, in Thessaly, who gave him his daughter Antigone to wife with a third of the kingdom. P. accidentally slew Eurytion at a hunt, and fled to Iolcus. Later he was married to the Nereid Thetis, and became father of Achilles.

Pelaw Islands, see PALAU ISLANDS.

Pelham, Henry (c. 1695–1754), statesman. He was the younger son of Thomas, first Baron P., and was educ. at Westminster and Hart Hall, Oxford; he entered Parliament in 1717, and 7 years later became secretary for war. He was paymaster of the forces in 1730, and in 1743 first lord of the Treasury and chancellor of the Exchequer. His influence in the House of Commons was based upon systematic corruption.

Pelham-Holles, Thomas, elder brother of the above, *see* NEWCASTLE, DUKE OF.

Pellias, son of Poseidon and Tyro (daughter of Salmoeneus) and twin brother of Neleus. Exposed by their mother, the twins were preserved and reared by some countrymen. They later learnt their parentage, and on the death of Cretheus, King of Iolcus, who had married Tyro, they seized his throne, but P. soon expelled Neleus. After P. had long reigned there, Jason came and claimed the kingdom. To get rid of him, P. sent him to Colchis to fetch the golden fleece (*see* ARGONAUTS). After Jason's return, P. was cut to pieces and boiled by his own daughters (the Peliades), who had been told by Medea (q.v.) that this would restore him to vigour and youth.

Pelican (*Pelecanus*), genus of pelicaniform birds, characterised by the 4 toes being united by a web. They have a huge extensible or dilatable pouch which is supported by the 2 flexible bony arches in the lower mandible. The legs are short and the feet large, the tail short and rounded, the neck long, and the body large and ponderous. The wings are long and expansive, and with them the birds are capable of rapid flight, and also of soaring without perceptible movement of the wings. The species are widely distributed, frequenting the seashore, margins of lakes, and feeding almost exclusively on fish, which is deposited in the pouch for subsequent digestion. The common P. (*P. onocrotalus*) formerly existed in Britain, and is now found around the Mediterranean. Its plumage is white, tinged with red. It usually nests on the ground and lays 2 or 3 white eggs. The young are at first brown, and the mother feeds them by pushing their beak into her pouch. The appearance of the red tip of the bill pressed against her breast probably gave origin to the fable that she feeds her young on her own blood. *P. erythrorhynchus* occurs in N. America, where also is found *P. occidentalis*, the only diving P. Species also occur in Australia and Asia.

Pelican State, *see* LOUISIANA.

Pelileo, tn of E. central Ecuador, completely destroyed, with others, in the disastrous Ambato earthquake of Aug. 1949. Andean agriculture is carried on. Pop. 2500.

Pellion, anc. name of a range of mts on the coast of Thessaly, associated in Gk mythology with Ossa. The giants are said to have piled these two mts one on top of the other to reach Olympus. The chief summit is now called Mt Plessidi (5308 ft).

Pélissier, Aimable Jean Jacques, Duc de Malakoff (1794–1864), marshal of France,

b. Maromme, near Rouen. He joined the first expedition to Algiers in 1830. In 1839 he was made lieutenant-colonel and returned to Algeria, taking part in the battle of Isly in 1844. He was made gen. of a div. in 1850, and in the Crimea was at first in command of the first corps and afterwards held the chief command before Sevastopol. The storming of the Malakoff was his most notable success; for this he received a marshal's baton, was created Duc de Malakoff on his return to France, and was granted 100,000 francs. He was Fr. ambas. in London from 1858 to 1859, and from 1860 until his death was governor of Algeria. *See* life by V. Derrécazail, 1911.

Peljesac, peninsula in Croatia, Yugoslavia. It is 42 m. long and runs parallel to the Dalmatian coast, to which it is joined by a narrow strip of land 25 m. NW. of Dubrovnik. It has rich vineyards, and produces a white wine called *Grko*.

Pella: 1. anc. tn of Macedonia, between Salonica and Edessa. The bp of Philip II and Alexander the Great, it was the anc. cap. of Macedonia. A probable site was unearthed in 1957.

2. Dept of Macedonia, Greece. Pop. 117,000.

Pellagra, dietary deficiency disease due to lack of the pellagra-preventing vitamin nicotinamide (*see* VITAMINS). Nicotinamide is one of the B₃ complex of vitamins, is heat stable and readily soluble in cooking juices. It is found mainly in yeast, liver, kidney, heart, pork, beef, and salmon. Nicotinamide is synthesised by the action of the micro-organic flora of the alimentary canal. P. occurs in Italy, Spain, S. France, Algeria, and Egypt. Mild forms are not unknown in this country in people who neglect themselves. The disease is characterised by a sore tongue and mouth, digestive disorders, loss of weight and weakness, irritability, discoloration of the skin, and, in the late stages, mental disorder. The skin rash of P. is similar to sunburn in the early stages, and occurs symmetrically and bilaterally on parts of the body most exposed to light. Later the areas of dermatitis become pigmented and the skin thickened. Pellagra-like symptoms may also occur when there is faulty ingestion, absorption, or utilisation of nicotinamide, as in chronic alcoholism.

Pellecchia, Monte, *see* SABINE HILLS.

Pellegrini, Carlo (1839–89), It. caricaturist, b. Capua, but came to England. His work in *Vanity Fair* from 1869, over the signature 'Ape', consisting of a series of portraits of public men, is one of the best examples of personal caricature extant. He also executed a red plaster statuette of Robert Lowe, Lord Sherbrooke.

Pellegrino, *see* VALLE, PIETRO DELLA.

Pellow, Sir Edward, *see* EXMOUTH, VISCOUNT.

Pellow's Group, or Sir Edward Pellow's Islands, small group of is. in the SW. of the Gulf of Carpentaria, Australia. They lie close to the coast, opposite Port McArthur.

Pellicanus, Conrad (1478-1556), Alsatian scholar and reformer, b. Ruffach, his real name being Kürschner; educ. at Heidelberg. He joined the Franciscans at Ruffach, and was later transferred to Tübingen. He held eccles. positions at Pforzheim and Basel, and became one of the most learned men of his day, especially in Hebrew. In 1526 he turned Protestant, and in 1527 was made by Zwingli prof. of Hebrew at Zurich. He wrote a Heb. grammar (1504; reproduced 1877), an autobiography (Latin, 1877; German, 1891), and a *Biblical Commentary*, 1532-5. See life by E. W. Reuss, 1893.

Pellico, Silvio (1789-1854), It. poet, b. Saluzzo, Piedmont. His tragedy entitled *Francesca da Rimini*, 1818, gained him an honourable name amongst It. poets. He also trans. the *Manfred* of Byron, with whom he was acquainted. Having become connected with the secret society of the Carbonari, he suffered 10 years' imprisonment, an account of which he pub. under the title *Le mie Prigioni*, 1833, trans. into most European languages. See lives by R. Barbiera, 1926; and B. Allason, 1933.

Pellionia, family Urticaceae, genus of ornamental creeping herbs, with coloured leaves, of which *P. daveauana* with olive-green, tinged violet, elliptic leaves, and *P. pulchra* with oblong, light-green, black-veined leaves, purplish beneath, are both of Cochinchina, and grown in warm greenhouses in Britain.

Pellisson-Fontanier, Paul (1624-93), Fr. historian, b. Béziers; studied law at Toulouse and went to Paris. In 1657 he became secretary to Nicolas Fouquet, minister of finance, who in 1659 made him master of accounts at Montpellier. On Fouquet's fall in 1661, P. was imprisoned in the Bastille. He was released in 1666, and became historiographer to Louis XIV, of whom he wrote a hist. (*Histoire de Louis XIV jusqu'à la paix de Nimègue*).

Pellitory of the Wall (*Parietaria diffusa*), family Urticaceae, perennial herb, with reddish brittle stems, hairy leaves, and axillary clusters of small flowers. The stamens are very sensitive to touch. It occurs on walls, and an infusion was a rustic medicine. Tincture of P. is made from *Anaclytus pyrethrum* of S. Europe.

Pell-mell, see MALL, THE.

Pelopidas, Theban statesman and gen. In 383, when Thebes was taken by the Spartans, he went to Athens to form a party for the liberation of the city. In 379 he forced the Spartan garrison of Thebes to surrender. In 375 he defeated the Spartans at Tegyra, and in 371, in conjunction with Epaminondas, estab. Theban supremacy by the victory of Leuctra. In 367 he went on an embassy to Persia, and in 364 was killed in a successful battle against Alexander of Phœræ at Cynoscephalæ.

Peloponnese (*Pelops* and *nēsos*, island, i.e. the is. of Pelops (q.v.)), also called *Morea*, the peninsula forming the S. part of Greece (q.v.), connected with central Greece by the isthmus of Corinth and separated by the Gulfs of Lepanto and

Patras. It was divided into the dists. of Achaia, Sicyonia, Corinthia, Argolis, Arcadia, Laconia, Messenia, and Elis; the chief rivs. were the Eurotas and the Alpheus. The chief cities were Sparta and Argos, the latter holding supremacy until the 7th cent. bc and the former thenceforward to the 3rd cent. The name *Morea* is due to the peninsula's resemblance to a mulberry leaf. Patras is the chief port. Area 8354 sq. m. Pop. 1,129,000.

Peloponnesian War, chiefly between Athens and Sparta, lasted with some intervals from 431 to 404 bc. The war may be divided into 3 main periods: (1) from the beginning until the peace of Nicias in 421 bc; (2) from the peace of Nicias until 413, when the peace was formally broken by Sparta; (3) from 413 to the capture of Athens in 404 bc. During the first period Athens was successful until 424 bc, when the fortune of war changed. The Athenian leader for the first two and a half years was Pericles, and thenceforward Nicias. The Spartan gen. Brasidas saved Megara and transferred the war into Thrace. Athens was greatly afraid of the spread of disaffection among her subject cities, and made peace on slightly disadvantageous but not dishonourable terms. During the second period, although nominally at peace, Athens and Sparta were continually employed in plots against each other's interests, and fought in the Peloponnese and in Sicily. During the third period Alcibiades, who was in joint command of the Athenian expedition to Sicily, was recalled, and went for a time to Sparta. The Athenians were finally expelled from Sicily with heavy loss, and the war transferred to Asia Minor. Prior to 408 Athens won sev. naval victories, although many of her subject allies revolted. After the battle of Cyzicus in 410 the Spartans made proposals of peace which were rejected by Athens. The fortunes of the war now gradually went against Athens until, after the destruction of her fleet at Aegospotami in 405 bc and a 5-months' siege, the city surrendered in April 404. The defences were destroyed and Athens was made subject to Sparta, being handed over to an oligarchy of 30. See also GREECE, History. See the *History of the Peloponnesian War*, by Thucydides, a contemporary; B. W. Henderson, *The Great War between Athens and Sparta*, 1927; G. B. Grundy, *Thucydides and the History of his Age*, 1948.

Pelops, grandson of Zeus, and son of Tantalus, King of Phrygia, and Dione or Euryanassa. To test the divinity of certain gods who visited him, Tantalus served them a repast in which the main dish consisted of P. None touched the dish save Demeter, who tasted the shoulder. Zeus restored P. to life and replaced the missing shoulder by one of ivory. P. married Hippodamia, daughter of Oenomaus of Elis, by defeating the latter in a chariot race, after bribing Myrtilus, the king's charioteer; Myrtilus tampered with the chariot, which broke down, killing

Oenomaus, but when he claimed the bribe, P. threw him into the sea. As he died he cursed the house of P., and his curses were fulfilled. P. was honoured among the Greeks, especially at the Olympic games, which he restored. The Peloponnesus (island of P.) was named after him. See Ovid, *Metamorphoses*, vi. 404; Virgil, *Georgics*, iii. 7; Pindar, *Olympionicae*, i. 24; Hyginus, *Fabularum Liber*, 84; Sophocles, *Electra*, 505; Pausanias, v. 1; Apollodorus, ii. 4, 5, etc.

Pelota (Lat. *pila*; Sp. *pella*, ball), ball game popular in Spain, the Fr. Basque dists., and Sp. America. Players wear a curved basket attachment (*cesta*) on the right hand. The hard ball weighs about 4 oz., is made of rubber and wire, and is covered with leather. It is struck with the *cesta* against 2 walls at right angles.

Pelotas, second city in Rio Grande do Sul, Brazil, at the S. of Lagoa dos Patos; 20 m. NW. of Rio Grande by rail. The chief industry is the preserving of beef, while hides are also exported. There are glass factories and flour mills. Pop. 80,000.

Pelists, light infantry of ancient Greece; so called from the *pellê*, a small round shield.

Peltonen, Vihtori (real name Johannes Linnankoski) (1869-1913), Finnish author, one of the men who, with Kivi, founded modern Finnish literature, was b. at Askola. His father was a vagabond labourer, who often, tiring of working on a farm, went from market to market with horses, or laboured with the bands who pilot the timber floating down the rivers and lakes. The boy thus knew no settled home and had no chance of schooling; but he heard from his illiterate parents many of the current folk-tales, and managed to learn his letters and to read books. In 1881 he entered a school for teachers at Jyväskylä, not so much with the idea of making teaching a profession as to become educated. His fame chiefly rests on *The Song of the Red Flower*, 1905, a novel which details the amours of a young man who works in guiding down the river the gigantic output of logs. Other novels and plays followed in rapid succession and he became the animating spirit of the Finnish League. Among other things he led a vast public movement to substitute genuine Finnish for Swedish family names. He then made a tour of Europe, including England, France, Italy, and Germany, to see all he could of old civilisations. He issued another fine novel, *The Fugitives*, 1908, sev. dramas, and a number of short stories. See lives by W. Söderhjelm, 1918, and A. Anttila 1921.

Pelto, see **FR.**

Pelusium, old city and port of Egypt, 20 m. E. of Port Said. From the Persian period it was an important fortress on the E. frontier of Egypt.

Pelvis, bony basin which supports the abdominal viscera and distributes the weight of the trunk to the two legs. It is formed by the sacrum, the coccyx, and the ossa innominate, or haunch bones; each of the haunch bones consists of 3 originally separate bones, grown together

in the adult; the ilium, ischium, and pubis. At the junction of these a socket is formed which takes the ball-end of the femur, or thigh-bone. The contained vessels for both sexes are the rectum and urinary bladder; for the male, the vesiculæ seminales and the prostate gland; for the female, uterus and ovaries. The female P. is, in consequence, broader but shallower, while having a greater capacity; the bones are more slender, the inlet more circular; it is in general modified suitably for the necessity of child-bearing.

Pelycosaurs, or Theromorphs, primitive synapsidan mammal-like reptiles found in the late Carboniferous and lower Permian of Texas and elsewhere. Some forms (e.g. *Dimetrodon*) had long spines down the back, probably connected by membranes to form a 'sail'; this was probably a heat-regulating device.

Pemba, is. off the E. coast of Africa, 30 m. NNE. of Zanzibar, to which protectorate it belongs. A fertile and beautiful is., Arabs call it Al-huthera, or the Green Is., its green hills abruptly rising from the sea. The climate is not suitable for continued residence by Europeans. The ruins of P. belong probably to the later Middle Ages, when the prosperity of the Arab and Persian settlements of the E. African coast was at its peak. A vigorous trade went on in slaves, ivory, and rhinoceros horn, for which latter there is still an insatiable demand in the Far East for its allegedly aphrodisiacal properties. The whole of the SW. is devoted to clove-growing. Besides the trade in cloves there is a trade in copra. Some 11 m. W. of the tip of Chaka is Messali, sometimes called 'Captain Kidd's Is.' owing to the tradition that Kidd buried his treasure there. Burton states that Kidd was here, but others aver that there is no evidence to that effect. The people still retain a kind of bull-fighting. Witchcraft and the cult of devil-worship still prevail in P., and sorcery and black magic have a hold on the bulk of the people. P. was sighted by Vasco da Gama on his epoch-making voyage from Lisbon to India in 1497. It shared the fortunes of the E. coast in its earlier hist.; in 1627 it was involved in the general rising against the Portuguese following a massacre of Christians at Mombasa. Area 380 sq. m. Pop. 100,000 approx., of whom 30,000 are Arabs. See J. E. E. Craster, *Pemba: the Spice Island*, 1913.

Pemberton, Henry (1694-1771), physician, chemist, and geometer, b. London, pupil and friend of Boerhaave at Leyden. He became prof. of physic at Gresham College, London. P. contributed papers to *Philosophical Transactions* (see vols. xxxii-lxii), one of these winning him Newton's friendship. He superintended the third ed. of Newton's *Principia*, 1726. P.'s works include *View of Newton's Philosophy*, 1728; *Lectures on Physiology*, 1733; and *Lectures on Chemistry and Physiology* (ed. by J. Wilson, 1771, 1779).

Pemberton, Sir Max (1863-1950), novelist, b. Birmingham. He was educ. at Merchant Taylors' and Cambridge. In

1885 he joined the staff of *Vanity Fair*, from 1892 to 1893 edited *Chums*, and from 1896 to 1906 *Cassell's Magazine*. The *Diary of a Scoundrel*, 1891, was his first novel, but his most famous books were *The Iron Pirate*, 1893, with its sequel *Captain Black*, 1911. Others of his books are *The Sea Wolves*, 1894, *The Impregnable City*, 1895, *Kronstadt*, 1898, *Pro Patria*, 1901, *My Sword for Lafayette*, 1906, and *The Great White Army*, 1915. In 1920 he founded the London School of Journalism, and in 1922 pub. a memoir of Lord Northcliffe, with whom he had been associated for many years. He was knighted in 1928, and in 1936 wrote *Sixty Years Ago and After*, his own reminiscences.

Pemberton SW. suburb of Wigan (q.v.), Lancs, England, forming 4 wards of the co. bor. It is engaged in cotton spinning and coal mining.

Pembrey, coastal vil. of Carmarthen, S. Wales, 5 m. from Llanelly. Pop. 1700.

Pembroke, Earl of, see AYMER.

Pembroke, Mary, Countess of (1557-1621). Eng. poetess, b. Ticknell, near Bewdley, was the sister of Sir Philip Sidney, and became the countess of Pembroke on her marriage with Henry Herbert, Earl of Pembroke in 1577. It was at her suggestion that Sir Philip Sidney wrote his *Arcadia*, and she was a patroness of Daniel, Ben Jonson, and other poets. She herself was the authoress of sev. poetical works and the translator of *A Discourse of Life and Death*, 1592, from the Fr. of P. Mornay. See life by F. B. Young, 1912.

Pembroke, William Herbert, third Earl of (1580-1630), courtier and patron of letters, b. Wilton, eldest son of Henry Herbert, second earl of Pembroke, whom he succeeded in 1601, educ. at Oxford. He was disgraced for an intrigue with Mary Fitton (q.v.). A patron of Ben Jonson, Massinger, Wm Browne, Inigo Jones, and others, he was also interested in the Virginia, NW. Passage, Bermuda, and E. India companies. P. was lord chamberlain of the royal household, 1615-25; lord steward, 1626-30; and chancellor of Oxford Univ. from 1617, Pembroke College being named after him. To him and to his brother Philip, the first folio of Shakespeare's works was dedicated.

Pembroke: 1. Seaport in the co. of Pembroke, Wales, on an inlet of Milford Haven. Its castle, in a good state of preservation, is an interesting building dating from Norman times. P. was formerly a gov. dockyard tn. It is now an R.A.F. flying-boat station and military garrison tn. Pop. 12,890.

2. Dist. of Dublin, Rep. of Ireland, on the SE. of the city. Pop. 34,500.

3. Cap. of Renfrew co., Ontario, Canada, on Lake Allumette in the Ottawa R. Pop. 13,910.

Pembroke College, Cambridge, founded in 1347 by Marie de St Pol, widow of Aymer de Valence, earl of Pembroke. Its chapel (the first college chapel in Cambridge) was converted into a library after the building of Wren's chapel (his

first work) in 1663. The college remained small until the later half of the 19th cent., but has always been famous for its bishops (Rotherham, Ridley, Andrewes) and its poets (Spenser, Crashaw, Gray, Smart).

Pembroke College, Oxford, founded in 1624 on the site of an anc. seminary known as Broadgates Hall, by King James I, at the expense of Thomas Tosdale and Richard Wightwick, named after the earl of Pembroke, then chancellor of the univ. Samuel Johnson was at P. See D. Maclean, *A History of Pembroke College, anciently Broadgates Hall*, 1897.

Pembrokeshire, maritime co. of S. Wales, westernmost co. of the principality, bounded on the S. by the Bristol Channel, and on the W. and N. by St George's Channel, adjoining the cos. of Cardigan and Carmarthen. The chief bays are Milford Haven and St Bride's (the coast of which is now largely National Trust property), and the smaller bays are Fishguard and Newport, all with good anchorages. A number of is. lie off the P. coast, including Skokholm, Skomer, Caldy, Ramsey, and Grassholm (qq.v.), and many rocky islets, among them the group known as the Bishops and Clerks, with a lighthouse. The shores on the S. are wild and precipitous, fronted by high cliffs. Inland the surface is undulating, with green hills alternating with fertile valleys. The prin. elevations are the Prescelly Hills (q.v.) in the NE. of the co.; the most important rivs. are the E. and W. Cleddau, which unite and form a navigable portion of Milford Haven. There are many prehistoric monuments. Coal is worked; agriculture, fishing, and woollen milling are the prin. industries. Haverfordwest (q.v.) is the co. tn.; Milford Haven (q.v.) is scheduled for development as a major oil port. The co. returns 1 member to Parliament. Area 614 sq. m.; pop. 90,900.

Pemmican, originally made by N. Amer. Indians and used as a food. It consisted of dried buffalo meat or venison, from which all fat was removed. This was made into a paste and afterwards formed into cakes. Present-day P. is manufactured and tinned in England by Messrs Bovril Ltd, who make it of fibrin of beef and fat. It is used extensively on expeditions both to the Arctic and Antarctic, and to mts in all parts of the world (especially the Himalaya), on account of its high protein and caloric values.

Pemphigus, class of skin diseases characterised by blisters or bullae (q.v.). An acute form, *P. nematorum*, sometimes occurs in newborn infants, and is due, usually, to a streptococcal infection of the skin. This type of P., although far less common than formerly, is highly infectious and can cause epidemiological problems in infant nurseries.

Pen (from Lat. *penna*, (quill-) feather). The modern pen had its origin in the reed or calamus, which is still used for the purpose in the E. The anc. Egyptians, like the Chinese and Jap. of the present day, used a brush for writing, while the

Romans and Greeks used the sharp point of the stylus to scratch their characters on waxen tablets. It is impossible to say when the quill-feather superseded the reed; there is no doubt that for quite a long period both the reed and the quill-feather were in use. St Isidore of Seville (c. 600) mentions both as being used in his time. At any rate, because of its suitability for writing on vellum (the main literary writing material of the Middle Ages), the quill-feather was the main pen of the Middle Ages, and, indeed, even of modern times down to the 19th cent. Turkey quills were most often used, but swan quills were much valued, and crow quills for fine lines. Owing to the loss of time involved in mending the points of quill nibs, various attempts were made to give durability to them by gilding (Watt in 1818), and by attaching to them horn or tortoiseshell tips (Hawkins and Mordan). The only satisfactory substitute, however, was found to be the complete steel nib, which was first introduced in London in 1803 by Wise, and came into general use about 1830, when Perry, Mason, and Gillott, of Birmingham, began to make them by machinery. Sometimes the steel is alloyed with silver, platinum, or rhodium, but this greatly increases the expense, while a gold nib with a ruby at the tip has been found to be of great durability and almost perfect for writing. The fountain pen with a reservoir in its stem and a gold iridium-pointed nib is now in general use, while the stylographic pen with a wire point instead of a nib is a development of an earlier pen used for writing music; ball-pointed P.s (though the basic idea was patented in the U.S.A. in 1888) are a recent development. The steel is prepared at Sheffield, but Birmingham is the centre of the pen trade in England. See W. Higgins, *Pen Practice*, 1948.

P.E.N. Club, The, founded in 1921 by C. A. Dawson Scott, Eng. novelist. The first president was John Galsworthy, who was succeeded in 1936 by H. G. Wells. It is a world association of writers, editors, and translators, with centres in most caps., and its aim is 'to promote and maintain friendship and intellectual co-operation between men of letters in all countries in the interests of literature, freedom of expression, and international good will.' International congresses are held annually; the first in London in 1923, subsequently in U.S.A., France, Germany, Belgium, Norway, Austria, Poland, Holland, Hungary, Yugoslavia, Scotland, Catalonia, Argentina, France, Czechoslovakia, England (in 1941 during the Second World War), Sweden, Switzerland, Italy, Denmark, England (1956), and Japan (1957). It has devoted much attention to problems of refugee writers and was appointed by the Home Office to advise on enemy alien writers during the Second World War. International presidents after Wells have been Jules Romains, Maurice Maeterlinck, Benedetto Croce, Charles Morgan, and André Chamson; Eng. presidents have been J. B. Priestley, Henry W. Nevins, and

Storm Jameson, Desmond MacCarthy, and C. V. Wedgwood. H.Q. in London; secretary of Eng. centre and of the International, David Carver.

Pen-name, see PSEUDONYM.

Penal Servitude, see PRISONS.

Penal Statute, one which imposes a pecuniary penalty or some other form of punishment for the breach of its provisions. It is a rule of law that a P. S. must be strictly construed, and must not be extended to any case which is not clearly within both the spirit and letter of the enactment. Action under P. S. must, where no time is expressly limited, be brought within 6 months of the cause of complaint. The term is in particular applied to anti-Catholic measures in England and Ireland during the 17th and 18th cents.

Penance (Lat. *paenitentia*). In ecclesiastical parlance this word is used for 4 distinct things: (1) a virtue, of which the chief acts or manifestations are contrition or sorrow for sin, and satisfaction or self-inflicted punishment in atonement for sin; (2) a censure, i.e. a punishment imposed by ecclesiastical law, and involving deprivation of spiritual goods; (3) the sacrament of confession (q.v.); (4) the satisfaction imposed by the priest in this sacrament.

Penang, Pulo Penang, or Prince of Wales Island, state of the Federation of Malaya (q.v.). Until 1946 it formed part of the Straits Settlements (q.v.); from 1946 to 1957, though part of the Malayan Union, and, subsequently, of the Federation of Malaya, as estab. in 1948. P. remained a Brit. settlement. In 1957 when Malaya achieved dominion status, the Brit. Crown's sovereignty over P. was withdrawn. P. is an is., situated off the W. coast of the Malay Peninsula, at the N. end of the straits of Malacca, about 360 m. N. of Singapore. It is 15 m. long by 8 m. broad, flat and fertile for over half its area, rising at 'the peak' to 2922 ft. The port and cap. is Georgetown, or P., on the E. coast. The prin. products, besides tin, which is dug at the base of the mt., are sugar, coffee, rice, pepper, cloves, nutmegs, coco-nuts, and areca nuts. Area 108 sq. m.; pop. 642,300. As an administrative area P. includes P. Is., the strip of mainland opposite known as Prov. Wellesley (q.v.), and, prior to 1935, the Dindings ter. It is the emporium for much of the trade of Sumatra and the Malay Peninsula. The is. was ceded to the E. India Co. by the rajah of Kedah in 1785. By the pirate-suppression treaty of Pangkor (confirming the cession of Pangkor Is. and the Sembilan Is. to Britain), the strip of ter. of the mainland opposite P., known as the Dindings, also became British and remained a part of the settlement of P. until its retrocession to the state of Perak in 1935. P. was made a separate presidency, of equal rank with Madras and Bombay, in 1805. In 1826 Singapore and Malacca were incorporated with it under Brit. gov., P. still remaining the seat of gov. (In 1936 the seat of gov. of the Straits Settlements was transferred to Singapore.) With the estab. of P. the

trade of Malacca passed to it. But when Singapore was founded P. in its turn had to yield first place to the port with the superior strategic position, and came to depend chiefly on the local trade. Once inconsiderable, that trade has become important with the development of tin-mining and rubber planting in the adjacent states, and the development of trade with neighbouring countries.

Penarth, resort of Glamorgan, Wales, 4 m. S. of Cardiff, with a fine esplanade and pier, and a coastal steamer service to the Bristol Channel. Pop. 18,870.

Penates, anct. Rom. gods of the household, who presided over the family life, and were worshipped at the family hearth. There were P. of public life also, who ruled the welfare of the State. *See also* LARES.

Penoil: 1. Name given to the small brushes used by artists, whether made of hog's bristles, camel's hair, fitch, or sable. The larger brushes are sometimes set in a tin tube, and the smaller are generally set in quills of different sizes. The well-known black-lead P. is made of black-lead, graphite, or plumbago. The finest plumbago is obtained from a mine in Cumberland. Some P.s are filled with coloured chalk instead of black-lead. The ever-pointed P. is an instrument for using cylindrical pieces of black-lead, which are forced forward in the P. just so far as to allow them to be used without breaking.

2. In optics, the name given to the rays of light which converge to or from a given point.

3. In geometry, a set of straight lines passing through a point; each line is called a ray of the P.

4. *See* FLAG, 2 *ad init.*

Penda (c. 577-654), King of Mercia (c. 632-54). With Cadwallon, he defeated and killed Edwin of Northumbria at Hatfield (632). P. also conquered and killed Oswald (q.v.) of Northumbria at Maserfield (641). This victory made P. the most powerful king in England. Finally, Oswy, King of Northumbria, killed P. in battle at Winwaed (654) (unidentified). Though P. himself was staunchly pagan, and the enemy of many Christian rulers, he does not seem to have objected when his son Peada was baptised (653) and introduced priests into the ter. he was ruling under his father. *See* Bede's *Ecclesiastical History*; *Anglo-Saxon Chronicle*; and F. M. Stenton, *Anglo-Saxon England*, 1943.

Pendant, long narrow flag, *see* FLAG; **PENNANT**.

Pendant: 1. In late Gothic or Tudor architecture, an ornament of stone, plaster, or wood, suspended from a fan-vault (as at Henry VIII's Chapel, Westminster) or a plaster ceiling or a timber roof-truss.

2. In Jacobean architecture, an ornament at the foot of the newel-post (q.v.) of a staircase.

Pender, Sir John (1815-96), manufacturer and director of cable companies, b. in the Vale of Leven. P. was engaged in the manuf. of textiles before he turned his attention to cables. He eventually

took an important part in financing and managing the many companies which arose when the success of the Atlantic cable had shown the world its practical utility. He promoted cable enterprise in all parts of the world, and subsequently controlled companies whose combined capital was over £15,000,000 and who owned 74,000 nautical m. of cables. He represented Wick Burghs in Parliament for sev. years.

Pendine, vil. of Carmarthenshire, Wales, situated on Carmarthen Bay. There is a fine stretch of sand, which has been used for motor-car speed tests. Pop. 250.

Pendleton, *see* SALFORD.

Pendulum. A simple P. is defined as a heavy particle suspended from a fixed point by a fine, inextensible, massless, rigid thread so that it is free to oscillate in a vertical plane. Although this is an ideal P., its motion is of great importance in the investigation of problems concerning real or compound P.s. When Galileo, according to tradition, timed the oscillations of a swinging lamp at Pisa by means of his pulse, he was observing an approximation to a simple P., and he discovered that the oscillations were isochronous—i.e. the time for one complete oscillation was always the same. Mathematical calculation leads to the formula $t = 2\pi\sqrt{l/g}$ for a complete oscillation of a simple P., where t is the time, l the length of the P., and g the acceleration due to gravity at the place where the P. is situated. Notice that the period is independent of the mass of the bob. This formula is true only for a small arc of swing. If ϕ is the half-angle of swing in radians, a good approximation to the time of an oscillation $t = 2\pi\sqrt{l/g(1 + \phi^2/16)}$. From this law knowing g at any place, we can construct a P. to beat any required time, or can determine what time a given P. will beat, or by arranging length and observing time we can find the value of g . This last is of great importance: $g = \pi^2$ when the P. beats secs., i.e. time for one half oscillation is 1 sec.; or $g = 9.8696$ times the length of the secs. P. this value of g must be increased by $\cos^2\theta/g/289$ ($\theta = \text{lat.}$) owing to centrifugal force of rotation of the earth. Thus at London, $g = 32.121$ ft per sec.² (Sabine); New York, 32.160 (Sabine); Edinburgh, 32.204 (Kater); Rawak, 32.088 (Frey-clinet); Spitzbergen 32.253 (Sabine). From this and other results it is found that gravity increases towards the poles and is least at the equator, largely explained by the spheroidal shape of the earth and its rotation. If $w = \text{loss of weight between equator and pole}$, $c = \text{centrifugal force at equator}$, both expressed as fractions of g at the equator, $d = \text{ellipticity of the planet}$, then $d + w = 2\frac{1}{3} \times c$ (Clairaut, 1742), whence $d = \frac{1}{296}$ approx.

The density of the earth was found by means of a P. by Maskelyne in 1774; again in 1832 at Arthur's Seat, Edinburgh, by determining the attraction from the vertical due to the mass of a mt; again by comparing oscillations at surface and

bottom of a mine by Airy in 1856. Foucault, in 1851, by means of a P., rendered the rotation of the earth visible. The P. appeared to alter its swing direction regularly; the law is: the total angle described by the plane of the P. in a day = $360^\circ \sin \theta$, where θ is the lat. If a simple P. swings, in a horizontal circle, instead of a vertical plane, describing a cone of semi-angle β , its period = $2\pi\sqrt{l \cos \beta / g} = 2\pi\sqrt{h/g}$, where l is the length of the generating line of the cone and h its height. No P. is mathematically simple, and the determination of its length is not easy.

Kater's pendulum; one form consists of a brass tube 4 ft long, 3 in. diameter, one end weighted. Parallel knife edges are inserted at right angles at equal distances from the ends and the whole apparatus is so adjusted that the times of swing will be equal and not far from 1 sec. when swung either end up. The length between the knife edges gives the length of the equivalent simple P. All P.s used in practice are compound; defined as a rigid body oscillating about a fixed horizontal axis. The time

of oscillation is given by the formula $t = 2\pi\sqrt{\frac{k^2 + h^2}{gh}}$, where k is the radius of gyration of the P. about an axis through its centre of gravity parallel to the axis of oscillation, and h is the distance between the centre of gravity of the P. and the point of suspension. Thus the length of the equivalent simple P. is $\frac{k^2 + h^2}{h}$.

Fig. 1 is a body (i.e. a compound P.) suspended at O, G its centre of gravity; K

FIG. 1

FIG. 2

a point in the line passing through OG such that if K be made the point of suspension the time of oscillation is not changed. K is called the centre of oscillation and also the centre of percussion (q.v.). The length OK equals the length of the equivalent simple P.

Blackburn's pendulum (Fig. 2) is a contrivance arranged for tracing, by means of ink trickling from a bob, various harmonic curves. The mass M is suspended

at S and S' from a string knotted to two others at K. The mass moves on a curved surface, the prin. curvature at the lowest points being 1/P.M and 1/K.M; its motion is therefore compounded of the two simple harmonic motions $2\pi\sqrt{PM/g}$ and $2\pi\sqrt{KM/g}$ for small oscillations.

Ballistic pendulum is a P. formerly used for measuring velocities, such as that of a bullet, and therefore for testing gunpowder. A mass of wood forms the 'bob,' and swings backwards when the bullet is fired into it, so that no jar is given to the pivot or point of suspension. The momentum in the bullet before entering the wood now belongs to the whole mass, of which it becomes a part. The amplitude of the displacement of the P. is a measure of the momentum of the bullet before entering the wood. The velocity is obtained from a formula involving a number of factors. The device was invented by Robins (1740) and has been improved. The gun itself may be suspended as a P. and the arc of recoil measured; small arms are thus tested by the 'gunéprouvette.' See also HOROLOGY.

See any standard book on dynamics. For elementary work: S. L. Loney, *Elements of Dynamics*, 1953. For more advanced work: A. S. Ramsey, *Dynamics*, Pt 1 1933, Pt 2 1944; J. H. Poynting and J. J. Thomson, *Properties of Matter*, 1947; and C. J. L. Wagstaff, *Properties of Matter*, 1953.

Penelope, wife of Odysseus and mother of Telemachus, who was a baby when Odysseus left for the Trojan war. In his long absence, P. was wooed by persistent suitors, but put them off with the excuse that she had to weave a robe for Laertes, her father-in-law, while she undid by night her work of the day. Odysseus returned in time to save her and kill these parasites. She is the type of wifely faithfulness.

Penetangore, see KINCARDINE.

Penge, urb. dist. and par. of Kent, England, 7 m. SE. of London, on the S. Region of Brit. Railways. The larger part of the Crystal Palace (q.v.) grounds is within the urban dist. Pop. 25,370.

P'enghu Islands, see PISCADORES.

Penguin, common name of the members of a family Spheniscidae, order Sphenisciformes, found only in the S. hemisphere, and characterised by the modification of the wings into paddles or flippers. The wing is long and has no covert or quill feathers, and always remains open. The feathers are tiny, with very broad shafts and but little vane or web. The legs of the birds are placed far back, and in the water the feet are stretched out straight behind and held motionless, the wings working rapidly as if being used in flight. The position of the legs causes the gait of the birds on land to be very awkward, but on snow slopes they are able to toboggan at a rapid pace, propelling themselves with the powerful legs assisted by the wings. They stand upright, and this characteristic, with their solemn bearing and many curious traits, often gives them a remarkably human appearance. They

are essentially aquatic birds, and their coming on shore is chiefly for the breeding season, when they assemble in rookeries, whose number is estimated as 750,000 at Cape Adare. The nest is often no more than a slight hollow in the ground, but some P.s, especially the Adélie P., put themselves to a great deal of trouble to collect stones, with which they bank the nest round, an occupation which frequently develops thieving habits. Two eggs are laid, and both birds, but chiefly the male, attend to their incubation. Both parents are very devoted to the young, one always staying to guard them, the other bringing them, often at great

A. F. Lewis

PENGUIN PROTECTING YOUNG

labour, from the sea crustaceans and other small animals, which the young take by pushing their beaks far down their parent's throat. When they are old enough to move away from the nest, the relationships often become hopelessly confused. The moult of P.s is remarkable in that the short, scale-like feathers are flaked off like the sloughing of a reptile's skin rather than the shedding of plumage. The emperor and king penguins possess a pouch, in the form of a feathered fold of skin near to the feet on the central surface, used to shelter the eggs and young. With the exception of a single tropical species which inhabits the Galapagos Is., and a few others, P.s are almost confined to the colder regions. Large rookeries have been found at very low latitudes. The largest species is the emperor P., which breeds far S. during the winter darkness. It is nearly 4 ft long, and the plumage is dark slate on the back and white on the underparts, with yellow spots on the head. The king P. occurs on Kerguelen Is., the Falkland Is., and others of about the same lat., 50° S. With it is generally found the Gentoo P., the feet of which, as well as the lower mandible and lower

part of the upper mandible, are bright yellow. The eggs are palatable, and are taken in great numbers by sealers and whalers. See also ANTARCTIC. See R. C. Murphy, *Oceanic Birds of South America*, 1936.

Penguin Books. This enterprise was founded in 1935 by Allen Lane (nephew of the famous Victorian publisher, John Lane of the Bodley Head) and his 2 brothers, John and Richard. Its original aim was to provide low-priced reprints of good fiction in large popular eds. The venture met with rapid success, and within 2 years more than 100 titles had been issued as Penguins at a price of 6d. a vol. In 1937 a complementary series, Pelican Books, was begun in order to develop the diffusion of knowledge through cultural and scientific books. This series includes a substantial and increasing proportion of vols. specially written as Pelicans. Many other separate series now appear under various Penguin imprints, among them the illustrated King Penguins, the Penguin Classics (in new translations), the Puffin Books for children, the Penguin Modern Painters (with colour plates), the Penguin Shakespeare, the Penguin Music Scores, etc. More than half the output of P. B. Ltd. consists of vols. written expressly for one or other of the series and not pub. in any other form. In its first 21 years of existence the total titles issued amounted to 2500, and the total output in this period was 200,000,000 copies.

Pengwern, see SHREWSBURY.

Peniakoff, Vladimir, see POPSKI'S PRIVATE ARMY.

Penicillin. The name is derived from the green mould or fungus *Penicillium* (Lat. a brush, referring to the appearance of the spore-bearing branches under the microscope); various species of *Penicillium* are common on decaying and damaged fruit such as oranges and on cheese. In 1928 a culture of *Staphylococcus* bacteria growing in the laboratory of Sir Alexander Fleming (q.v.) was observed by him to be contaminated with a colony of *Penicillium*, later identified as *P. notatum*. Fleming noted that the growth of the bacteria was retarded close to the mould, and subsequent experiments showed that the inhibitory action was exerted on other bacteria, such as the haemolytic *Streptococcus* and the organisms of pneumonia, gonorrhoea, and diphtheria. On the other hand, there was no effect, for instance, on the bacteria of tuberculosis, influenza, and *Bacillus coli*. During the Second World War the effective material P. was obtained in a relatively pure and stable form by the Oxford workers under Sir Howard Florey and Dr E. Chain, and was produced in the U.S.A. and in England for the treatment of service personnel and later of civilians. In 1948 the chemical composition of various forms of P. was pub., and attempts at synthesis have been made. Fleming's original strain of *P. notatum* remained the commercial source until 1945, when another strain was used. P. is particularly useful as an antibacterial agent, since it is non-poisonous even in large doses, in

contrast to such drugs as salvarsan and the sulphonamides. Other fungi have since been investigated to ascertain whether they contain similar substances; streptomycin, useful in tuberculosis, has been extracted by Waksman (1944) from *Streptomyces griseus*, and chloromycetin, also from a species of *Streptomyces*. Chloromycetin, synthesised in 1949, is proving of value in the treatment of scrub typhus and typhoid and other diseases, as is also aureomycin. Search for further antibiotics is continually in progress. It has been more extensive in the U.S.A. than anywhere else, with the

corpuscles are diminished in number. See also under ANTIBIOTICS.

Penicillium, a genus of fungi, class Ascomycetes, known as Green or Blue Moulds; about 100 species, cosmopolitan in origin. See PENICILLIN.

Peninsula, piece of land jutting out into, and almost surrounded by, the sea. It differs from a cape in that it is connected to the mainland by an isthmus.

Peninsula State, see FLORIDA.

Peninsular and Oriental Steam Navigation Company, commonly called The P. & O., was incorporated under that title in 1840. Since 1837 the Peninsular Steam Navigation Company running to Spain and Portugal had been in operation, and with the inauguration of a regular mail service by the company to India, the 'Oriental' was then added. Their first ship was the *William Farwell* of 266 tons, chartered for the purpose, as was the *Royal Tar*, built in 1832. Prior to the opening of the Suez Canal, passengers and cargo had to be transported across the isthmus to the steamer awaiting them at Suez, and the route, originally opened up by Thomas Waghorn, developed under P. & O. control to an extensive business with special Nile steamers, coaches between Cairo and Suez, with rest houses, and many thousands of camels for the cargo. The Australian mail service was started in 1852, and other routes extended to

China, Japan, and the Black Sea. The opening of the canal in 1869 naturally disrupted the whole elaborate organisation and caused difficulties over the mail contract; but the company continued to prosper, its vessels increasing gradually in size and speed. In the early 1900s they were exceeding 10,000 tons in size. In 1914 came fusion with the Brit. India Steam Navigation Company, who possessed one of the world's largest fleets, and later control of well-known lines like the New Zealand Shipping Company, the Union Steamship Company of New Zealand, the General Steam Navigation Company, the Hain Line, and the Strick Line.

To-day many P. & O. ships exceed 20,000 tons, like the well-known *Strath* class, the *Himalaya* of 28,000 tons, put into service in 1949, the *Arcadia* 29,734 tons and *Iberia* 29,614 tons, both delivered in 1954. Heavy war losses from 1939 to 1945 caused great delay in the resumption of normal services, but to-day, by means of a greater sea speed, the company is endeavouring to make up for its lack of ships by faster voyages. Cargo liners of 7000-9000 tons, each taking 12 passengers, are being run at 17 knots, whilst passenger ships are running at from 19 to 22 knots. On 1 Jan. 1956 the P. & O. had 30 ships in service totalling 411,750 tons. The tonnage of the P. & O. group of associated lines totalled over 2,000,000, with 141,315 tons still under construction. See Boyd Cable, *A Hundred Year History of the P. & O.*, 1837-1937.

Peninsular War (1808-14). The continental system (q.v.) of Napoleon had been

Reproduced by courtesy of Sir Alexander Fleming

PENICILLIN: THE ORIGINAL PLATE

The staphylococci planted on the plate had developed into the fully formed colonies seen at A. The mould C developed from a spore which fell on the plate after the colonies had grown up. The mould produced penicillin which destroyed the staphylococcus colonies in the area B; the nearest ones completely, and those farther out remain only as shadowy remnants.

result that the more recent discoveries are Amer. monopolies. The search is stimulated by the desire to find antibiotics which will be specific against those bacteria which are not susceptible to the present range of antibiotics, and by the fact that in course of time bacteria develop strains which are resistant to the antibiotics. Thus staphylococci, normally killed by penicillin, may become resistant to it. The bacteria of tuberculosis may become resistant to streptomycin, and so on. The most recent antibiotics to be discovered are terramycin, polymyxin, and erythromycin. Some antibiotics may be toxic to certain people. Streptomycin can attack the inner ear and cause deafness, and chloromycetin may cause a blood disease called agranulocytosis, in which the white blood

accepted by all the nations of Europe with the exception of Portugal, and Napoleon's schemes of oriental conquest required a maritime base. Therefore in Oct. 1807 the emperor concluded the secret treaty of Fontainebleau for the conquest and partition of that country with the King of Spain, no doubt planning the acquisition of the latter state also. In the following month the Fr. army under Junot seized Lisbon, and the Portuguese royal family sailed to Brazil. Before Mar. of the following year, Napoleon had dispatched nearly 100,000 more men into Spain, ostensibly to reinforce Junot; riots then broke out in Madrid against Charles IV, who abdicated in favour of his son Ferdinand VII. The latter, however, left Madrid for France, where he was held a prisoner, and Charles again occupied the throne, until on 5 May he surrendered the crown by the treaty of Bayonne to Napoleon, who bestowed it on his brother Joseph. This led to an insurrection in favour of Ferdinand VII., and in June 1808 Portugal appealed to England for aid. An expedition under Sir Arthur Wellesley sailed for Corunna on 12 July, and Joseph quitted Madrid and retired to the R. Ebro. The Eng. troops, assisted by the insurgents, defeated Laborde at Rolica and Junot at Vimiero, and the latter was compelled to sign the convention of Cintra at Torres Vedras on 30 Aug., by which he evacuated Portugal and retired to France.

Napoleon had meanwhile consolidated an alliance with the tsar, and decided to lead the grand army into Spain in person. This he did, and entered Madrid on 4 Dec. 1808; Spain was, however, by no means subdued, and extensive guerilla fighting took place. Sir John Moore (q.v.) conducted a well-planned diversionary movement, ending in a retreat to his ships at Corunna. Napoleon returned to France, and in the battle of Corunna on 16 Jan. 1809, the Eng. army was victorious, although it embarked afterwards, according to plan, and Sir John Moore was killed. There were now 3 theatres of war: in the E., in Portugal, and in Andalusia. In the first Lannes and Mortier besieged Saragossa, which surrendered 21 Feb., and St Cyr invested Gerona. In Portugal Soult occupied Oporto, but had to retire into Galicia; the English under Wellington won the battle of Talavera, but Del Parque was defeated by Soult, with Victor, Sebastiani, and Mortier, at Alba de Tormes. During the winter of 1809-10, Wellington built the lines of Torres Vedras, forming an invincible position between the Tagus and the sea. In 1810 Masséna moved against Wellington, but was checked at Busaco, and Wellington retired behind the lines of Torres Vedras. Meantime Ney had captured Ciudad Rodrigo and Almeida. In Andalusia the French took Granada, Málaga, and Seville, and besieged Cadiz. In 1811 Masséna, isolated by 'scorched-earth' tactics and the impregnability of the Torres Vedras position, retreated from his winter quarters at Santarém to Salamanca, pursued by Wellington, who

defeated him at Barrosa, and later (3 and 5 May), at the battle of Fuentes de Oñoro. Soult came to the assistance of Masséna and, though defeated at the battle of Albuera (16 May), obliged the allies to raise the siege of Badajoz. In 1812 Wellington had been reinforced, and captured Ciudad Rodrigo on 19 Jan., Badajoz on 6 April, and Almaraz Bridge on 17 May. After defeating Marmont at Salamanca (see ARAPILES, LOS), he entered Madrid and then besieged Burgos; Soult, however, raised the siege, and forced Wellington to retreat into Portugal. Meantime, in the E. of the country Suchet had captured all the towns save Alicante and Cartagena between 1810 and 1812, and had defeated Blake at Sagunto in 1811. In 1813 Wellington began to take the offensive, as the withdrawal of troops which was necessitated by the Fr. disaster in Russia left Joseph with only about 72,000 men against 100,000. Joseph was beaten at Vitoria on 21 June, and fled into France. Soult immediately returned from France to take command, but could not prevent Wellington from capturing San Sebastian (31 Sept.), crossing the Bidassoa into France (7 Oct.), and taking Pamplona (25 Oct.). From this time the hist. of the war is the gradual weakening and continued defeats of Soult; in Nov. the Novelle was crossed, in Dec. there was fierce fighting in front of Bayonne, and on 10 April the battle of Toulouse ended in Wellington's capture of the city, whilst on 18 April Soult signed a convention for the suspension of hostilities. Soult displayed great skill and admirable firmness and tenacity in this last campaign, and was beaten because opposed by a greater gen. who had better troops.

The reasons for Wellington's success, which are also the reasons for the Fr. failure, may be briefly summarised as follows: Wellington's line tactics proved the answer to the Fr. system of attack in heavy columns; his supply system was superior; the Fr. operations covered too large an area and were not sufficiently controlled by a central authority on the spot; Napoleon's system of conducting the war in Spain from Paris was fundamentally unsound; the guerillas greatly hampered the French. On the other hand, Wellington had to contend against lack of money, Sp. intrigues, and lack of equipment, particularly of engineers for siege work. The P. W. proved a continuous drain upon Fr. resources, as Napoleon himself admitted. Moreover, it gave a new hope to the defeated countries of Europe, in that Wellington proved the Fr. system of warfare to be by no means the invincible weapon it had for so long seemed to be. The best hist. of the war is C. W. Oman, *A History of the Peninsular War*, 1902-30. See also W. Napier, *History of the Peninsular War*, 1828-40; Lt-Col Garwood (ed.) *Wellington's Dispatches*, 1841; W. Tomkinson, *Diary of a Cavalry Officer*, 1894; A. I. Shand, *The War in the Peninsula*, 1898; J. B. Jourdan, *Mémoires du Maréchal Jourdan (guerre d'Espagne)*, 1899; F. Beaton, *With Wellington in the Pyrenees*, 1914;

and B. D'Urban, *Peninsula Journal*, 1930.

Penis, intromittent organ, or phallus, of the male animal, whereby the sperms, which later fertilise the eggs, are transferred to the vagina of the female during the mating process (coitus or copulation). A P. is present in some invertebrates, such as the common whelk, and particularly in parasites, as for instance the tape-worm, where it facilitates fertilisation inside the body of the host. Fertilisation is usually external in fishes and amphibians, so that a P. is absent, but in some fishes, such as the viviparous tropical species, and also the common dogfish, a copulatory organ occurs, though it is not usually known as a P. Amongst reptiles a paired P. is found in the snakes and lizards; in birds, such as the domestic fowl, the sperm is transferred by the juxtaposition of the cloacal apertures during coitus, and there is no P. In man, an example of the mammals, the P. is a cylindrical organ which terminates in the glans, the latter covered by the prepuce or foreskin: internally the P. contains 3 spongy masses: the 2 corpora cavernosa dorsally and the single corpus spongiosum ventrally. The corpora become engorged with blood and cause the erection of the P. in copulation; the corpus spongiosum is traversed by the urethra, the passage for the urine.

Penistone, mkt tn in the W. Riding of Yorks, England, on the R. Don, 13 m. NW. of Sheffield. Agriculture and the manuf. of steel goods are the chief industries. P. is the head of the P. parl. div., and also head of a co. council div. Pop. 6560.

Penitential Psalms, 7 psalms of a penitential character chosen from the O.T., i.e. Psalm vi, xxxii, xxxviii, li, cii, cxxx, cxliii, of which Psalm cii, *Miserere*, is the most striking. Their selection dates back to the 3rd cent. at least. They are frequently used as an act of private devotion.

Penitentiary (*Sacra Penitentiaria*), one of the tribunals of the papal court. The name *Penitentiarius* is also given to the cardinal who presides over this tribunal and to officials associated with it. The office of the P. is concerned with all questions relating to the confessional and private discipline. It deals with applications for the remission of eccles. censures, and for dispensations from the ordinary marriage laws of the Church, and with specially reserved cases of conscience. Meetings for the settlement of these cases are held monthly, and, if necessary, they are then referred directly to the Pope. See also PRISONS.

Penkridge, tn of Staffordshire, England, 6 m. S. of Stafford. It is generally accepted as the Rom. Pennocrucium. Pop. 2780.

Penley, William Sydney (1852-1912), actor, b. Margate; began life as a choir-boy, and then became clerk in a drapery business. In 1871 he went on the stage, and soon after achieved success as the foreman in Gilbert and Sullivan's *Trial by Jury*. His position steadily improved until he played the curate in *The*

Private Secretary, when he took his place as the leading London low-comedy actor. In 1892 he produced *Charley's Aunt*, and drew crowds to see the play and his delightfully humorous performance. The play brought him a fortune.

Penmaenmawr, seaside resort and urban dist. of Wales, in Caernarvonshire, on Conway Bay, 4 m. WSW. of Conway. To the W. of the tn rises the height of P. (1550 ft), on whose crest was, until 1920, a hill fort and Druidical remains. About 1 m. from the coast, at the foot of the Sychnant Pass, is the vil. of Dwygyfylchi, known locally as the 'Old Village'. Pop. of urban dist. 4218.

Penn, Sir William (1621-70), adm., b. probably at Bristol; served under Blake in the Dutch war, and was in command of the Blue squadron at the battle off Portland (1653). In the following year he was appointed gen. and commander-in-chief of the fleet designed to proceed against the Spaniards in the W. Indies. Together with Gen. Venables, he tried to atone for his failure to take Hispaniola by the capture of Jamaica from the Spaniards (May 1655), the inhab. falling an easy prey to his ragamuffin army of 8000 troops in 38 ships. Appointed naval commander-in-chief at Jamaica, he returned to England without leave and was imprisoned for a short term. He entered into negotiation with the Royalists, and at the Restoration was knighted, and made a commissioner of the navy. He had a command at the battle of Lowestoft (1665), but was not again employed on active service. There is a memoir by Granville P. and a portrait in the hist. gallery of the Institute of Jamaica (Kingston). See *Pepys's Diary*.

Penn, William (1614-1718), Quaker, founder of Pennsylvania, b. London, a son of Adm. Sir Wm P. He was educ. at Christ Church, Oxford, but was sent down from the univ. for non-conformity. He became a Quaker about 1667, and in the following year was imprisoned for publishing his *Sandy Foundation Shaken*. Released from the Tower in 1669 by his father's influence, he was perpetually persecuted for expressing his religious views. His father's death brought him a fortune and a claim against the Crown which he commuted for a grant of land in N. America, where he founded, in 1681, the colony of Pennsylvania for his persecuted co-religionists. He was in England from 1684 for 15 years and took an active part in religious controversy. His friendship with James II brought some advantages to the Quakers. The closing years of his life were clouded by financial difficulties and mental illness. His works were collected in 1726, and ed. with a jour. of his life, by J. Besse. See biography, 1872, by W. H. Dixon, who refutes the charges of scandalous conduct detailed by Macaulay; and lives by S. M. Janney, 1852; J. Stoughton, 1882; A. C. Thomas, 1895; Mrs C. Grant, 1908; J. W. Graham, 1916; and W. I. Hull, 1937; also H. M. Jenkins, *The Family of William Penn*, 1899, and L. V. Hodgkin, *Guthelma, Wife of William Penn*, 1947.

Penn, vil. and par. of Buckinghamshire, England, 2½ m. from High Wycombe. The church (13th cent.) has a 15th-cent. painted Doom. Penn is reputedly the home of the ancestors of Wm Penn, founder of Pennsylvania. Pop. 2350.

Penn, Lower, par. of Staffordshire, England, 3 m. SW. of Wolverhampton. Pop. 1650.

Pennalism, see FLAGGING.

WILLIAM PENN

Pennant, Thomas (1726-98), zoologist and traveller, b. Downing, Flintshire. He was educ. at Wrexham School and subsequently at Oxford. In 1766 he commenced the pub. of his first great work, the *British Zoology*. In 1765, during the progress of this work, P. made a tour on the Continent. P. in 1771 pub. a *Synopsis of Quadrupeds*. He followed the arrangement conceived by Ray, introducing the genera estab. by Linnaeus. The *Synopsis*, when enlarged, was repub. under the title of *A History of Quadrupeds*, 1781. After his return to England, P. commenced a work on *Indian Zoology* (2nd ed., 1790), of which 15 folio plates were publ. The next work which P. commenced was a systematic catalogue called the *Genera of Birds*, but it was never completed. His last great work was his *Arctic Zoology* (2 vols., 1784-7). He also wrote a number of works of travel, including *Tours in Scotland* (1771-5), and *Wales* (1778-81). See his *Literary Life*, 1793.

Pennant (a compromise between 'pendant' and 'pennon'), general name for most pointed flags which are long in the fly as compared with the hoist. A signal P. is 9 ft long, and tapers from 2 ft at the mast to 1 ft at the end. The nautical P. is a swallow-tailed flag, about twice as

long as it is broad, flown at the mast-head of a ship in commission. A broad P. is flown to show the ship of a commodore. The paying-off P. is a very long streamer with a bladder at the end, and is flown by a ship on its return to port. Special flags flown at church times, meal times, etc., are also called P.s. P.s were attached to a knight bachelor's lance; later they were used in Brit. lancer regiments, and on section-leaders' vehicles in armoured-car regiments. Brit. mail-carrying air-liners also carry P.s.

Pennatulæ, **Sea Pen**, or **Sea Rod**, genus of coral polyps of the order Alcyonaria. A fairly common Brit. species is *P. phosphorea*, so called from its phosphorescent character, though this is possessed by other species.

Pennell, Joseph (1857-1926), Amer. artist and author, b. Philadelphia. In 1884 he married Elizabeth Robins, with whom he collaborated in producing numerous books of travel and description, amongst which are *Our Sentimental Journey through France and Italy*, *A Canterbury Pilgrimage*, and *Our Journey to the Hebrides*. They were close friends of the artist Whistler, whose biography P. pub. in 1908. His *Life and Letters* were pub. by his wife in 1929.

Pennine Alps, important div. of the Central Alps, which extend from the Great St Bernard Pass eastward to the Simplon Pass, the Rhône forming their N. boundary. The name Pennine is not often applied to the W. portion, from the Little St Bernard Pass to Col Ferret, which is called the Chain of Mont Blanc. In the P. A. are the Comain dist., the Arolla dist., the Zermatt dist., and the Saas dist. Amongst the highest peaks found in the range are Mt Vélan (12,353 ft), Grand Combin (14,168 ft), Mont Blanc de Seillon (12,695 ft), Tête Blanche (12,300 ft), Dent d'Hérens (13,710 ft), Grand Cornier (13,020 ft), Matterhorn (14,690 ft), and Monte Rosa, of which the highest peak is the Dufourspitze (15,215 ft).

Pennine Chain, mt group of England, beginning to the S. of the Lower Tyne valley and extending to the middle of Derbyshire and the N. of Staffordshire. It is sometimes called the 'backbone of England,' but is more in the nature of a series of uplands than a chain of mts. The chief summits are Cross Fell (2930 ft), Wharfedale (2414 ft), Ingleboro (2373 ft), Pen-y-ghent (2273 ft), and Kinder Scout (The Peak) (2088 ft).

Pennisetum, genus of ann. and perennial grasses, some of which bear very decorative inflorescences with long awns or bristles, and an abundance of ornamental foliage. Perennial *P. latifolium* and annuals *P. villosum* and *ruppelii* are grown in gardens. *P. typhoides*, spiked millet, is an Indian cereal, and *P. ciliare* a valuable tropical fodder grass.

Pennon, see FLAG; PENNANT.

Pennsylvania, known as the **Keystone State**, one of the 13 original states of the U.S.A.; sends to Congress 2 senators and 30 representatives, and is the third largest in pop., which was estimated at 10,498,012

in 1950. It is about 160 m. wide and 362 m. long. Gross area 45,333 sq. m., of which 238 sq. m. is water surface (excluding Lake Erie). Harrisburg is the cap., and P. is bounded on the N. by New York and Lake Erie, on the E. by New York and New Jersey, on the S. by Delaware, Maryland, and W. Virginia, and on the W. by W. Virginia and Ohio. This state is one of the richest mineral regions in the world, and ranks second in the U.S.A. with a production worth \$1,186,212,000 in 1950. There are immense bituminous coalfields and also large fields of anthracite coal, which together form 80 per cent of the value of mineral products; the great oilfields lie in the W. of the state. Petroleum was first discovered in 1859; boring for it is one of the great industries of P., ann. production reaching 11,150,000 barrels in 1951. The state produces 30 per cent of U.S.A.'s steel, and large quantities of coke, pig-iron, and ferro-alloys, Pittsburgh being the centre of the smelting industry. Besides iron and steel products, there are electrical goods and equipment. The state as a whole comes next to New York in its industries, the ann. output reaching a value of \$10,500,154,000 in 1950. Other leading products are textiles, petroleum products, food, machinery, fabricated metal products, glass, chemicals, transportation equipment, paper, tobacco products, packed meats, electrical and household appliances, and aluminium products. The climate is healthy but subject to extremes of cold and heat. There are 15,000,000 ac. of forest land, and lumbering is a source of wealth in the N. In the S. and SW. are forests of hemlock and virgin beech. The great Cumberland valley is a fine farming dist. The farms are small but well tilled; hay is the chief crop, but wheat and other cereals are grown. Poultry farming is a source of wealth, and horses are raised in this state, and cattle, especially a fine though small breed of cows, similar to the Jersey cows in appearance. C. 15,000,000 ac. are in farm and range land, of which 6,600,000 ac. are in crops, the farmers being mainly those descendants of Ger. settlers famous as 'P. Dutch.' The Appalachian range crosses P.; a part of the Allegheny range, with Mt Davis (3,213 ft) as the highest summit, lies in the SW.; and between them and the Blue Ridge or Kittatinny Mts are fertile valleys. Slate, limestone, and marble quarries abound, especially in the dist. round Philadelphia. The R. Delaware drains the whole of the E. part of the state, and runs into Delaware Bay, the sea entering the riv. for 30 m., thus forming an immense estuary. Other rivs. are the Susquehanna, with tribs., West Branch and Juniata, and in the W. the Allegheny R. and the Monongahela unite, forming the Ohio.

The univs. and colleges include the univs. of P. (founded 1740) and of Pittsburgh (1787), P. State College (1855), Swarthmore College (Quaker) (1864), Carnegie Institute of Technology (1900), Temple Univ. of Philadelphia (1884),

Drexel Institute (1891), Lafayette College (1826), Bryn Mawr College for Women (1880), and Lehigh Univ. (1865).

Charles II gave to Wm Penn (q.v.) in 1681 large grants of land in this state, but the first settlers were Swedes, and once it was called New Sweden. The state took an active part in the revolution and the war of 1812, and also in the Civil war of N. and S., when its nearness to the field of action made its situation most dangerous. Had the battle of Gettysburg been a S. victory, the state would have been invaded by the S. army. Two famous strikes, in 1892 and 1902, had great economic influence on state affairs, and the panic of 1907 had an unfortunate effect in business quarters, and much money was lost and many banks failed.

The P. Railroad (q.v.) Company controls a considerable part of the railways of the state. Other railways are the Lehigh Valley, the Pennsylvania-Reading, and the Reading. In 1945 there were 9934 m. of steam railway and 2294 m. of electric. In 1947 there were 158 airports. There are 3 fine ports: Erie, on Lake Erie, with large domestic trade; Pittsburgh, conducting the Ohio R. trade; and Philadelphia. The prin. cities and their populations are: Philadelphia, 2,071,605; Pittsburgh, 678,806; Erie, 130,803; Scranton, 125,536; Reading, 109,320; Allentown, 106,756; Harrisburg, 89,540; Upper Darby, 84,951; Altoona, 77,177; Wilkes-Barre, 76,826; Bethlehem, 66,340; Chester, 66,039; Lancaster, 63,774; Johnstown, 63,232; York, 60,000; McKeesport, 51,500. See S. W. Pennypacker, *Pennsylvania in American History*, 1910; A. E. Martin and H. H. Shenk, *Pennsylvania History: Told by Contemporaries*, 1925; G. P. Donohoo, *Pennsylvania, a History*, 4 vols., 1926; A. Pound, *The Penns of Pennsylvania and England*, 1932; S. J. and E. H. Buck, *The Planting of Civilisation in Western Pennsylvania*, 1939; Federal Writers' Project (pub.), *Pennsylvania: A Guide to the Keystone State*, 1940; and O. S. Heckmann (ed.), *What to Read about Pennsylvania*, 1942.

Pennsylvania, University of, situated in Philadelphia, is said to have been founded by Benjamin Franklin in 1740, though it would be truer to say that he initiated the movements which led to its foundation. Housed in magnificent buildings with an endowment of \$17,500,000, it has over 9500 students and more than 800 profs. It comprises the College of the Univ. of P., School of Fine Arts, College of Liberal Arts for Women, the Engineering Schools (Chemical, Civil, Electrical, Mechanical, Metallurgical), Wharton School of Finance and Commerce, School of Education, Graduate School of Arts and Sciences, medical, legal, and dental schools. Its library of more than 700,000 vols. contains also a priceless collection of the papers of Benjamin Franklin.

Pennsylvania Railroad, one of the greatest Amer. railway systems, comprises within its general organisation a main line and 50 subsidiaries with a

total mileage of 10,239, of which 665 m. have been electrified. It was originally incorporated in 1846 for the purpose of building a line from Harrisburg to Pittsburgh within the state of Pennsylvania. This was completed in 1854 and then extended to Philadelphia in 1857. To-day it covers a vast ter. roughly bounded by the Atlantic Ocean and the Mississippi R., its main lines running N. of the Mason and Dixon line, although it also penetrates S. of it. The bulk of the pop. and of the industries of the nation are enclosed in the ter. it serves. Most of the big cities within that ter. are reached by one or more of its lines. The Pennsylvania was one of the first to introduce all-steel cars. Trains enter its terminals (from New Jersey) in New York by a tunnel under the Hudson R.

Penny, most anct. of Eng. coins. First mentioned in the laws of Ine, King of the W. Saxons, it weighed then about $\frac{1}{240}$ of the Saxon pound weight. The Romans similarly divided the *libra* into 20 *solidi*, and the *solidus* into 12 *denarii*, i.e. 1 *denarius* $\frac{1}{240}$ of a *libra* or pound.

No halfpennies were coined before the late 9th cent., and no farthings before the time of Edward I, the P. having its reverse divided up by a cross so that it could be broken into four parts. Under Edward VI silver farthings ceased, and silver halfpennies under the Commonwealth. In 1662 'milled' edges were introduced to guard against clipping. In 1672 halfpennies and farthings were struck in copper and P.s weighing 1 oz. avoirdupois in the same metal in 1797. These copper P.s had the value of $\frac{1}{32}$ oz. of silver, but the bronze P., introduced in 1860, had only about half this value. The Ger. *Pfennig* was also originally silver, and bore the same relation to the Ger. pound of silver as the Eng. P. to its pound. In the modern Ger. system the *Pfennig* is a small copper coin. P. is colloquially used for 'cent' in the E. U.S.A. See METROLOGY.

Penny Banks. These were first estab. about 1850, and have since become very numerous, rising from 200 in 1860 to sev. thousand. In 1878 they received legislative sanction to the investment of their funds, and in 1904 came under the control of the Savings Bank Act. Their object is to furnish easy means for the thrifty, and especially children in schools, to accumulate savings from slender resources. Many of these banks are now in touch with the Post Office Savings Bank (see SAVINGS BANKS, *Post Office Savings Bank*), and P. B. form a branch of the activities of practically all the missions. The Yorkshire Penny Bank is not controlled by the Savings Bank Act.

Pennyroyal (*Mentha pulegium*), fragrant prostrate mint which grows in damp places on Brit. moors. It bears ovate, nearly smooth leaves and axillary whorls of reddish-purple flowers.

Pennyweight, see METROLOGY.

Pennywort, common name given to sev.

plants. *Umbilicus rupestris*, family Crusulaceae, is Wall P., or Navelwort, native perennial of rocks and walls; *Linaria cymbalaria*, family Scrophulariaceae, climbing perennial, is also Penny-leaf, Mother-of-Thousands, Kenilworth Ivy; and *Hydrocotyle vulgaris*, family Hydrocotylaceae, a floating aquatic perennial, also known as White-rot; all found in Britain and Europe.

Penobscot. 1. Riv. of Maine, U.S.A., rising in Somerset co., and flowing E. into Chesuncook Lake, and then S. into P. Bay, an inlet of the Atlantic Ocean. It is about 350 m. long and is identified with the mythical riv. Norumbega (q.v.). It is navigable to Bangor.

2. Tribe of N. Amer. Indians of Algonquin stock. They sided with the French in the colonial war, but made a treaty with the English in 1749, on whose side they fought during the war of independence. About 500 now live on a reservation in Maine.

Penology. P. is the study of legal punishment as distinct from the study of the criminal, though the two subjects cannot be wholly separated, since punishments must have some relevance to the persons punished and no penal system can be effective that ignores the character of the criminal and the problems of the causation of crime. The impulse to punish wrongdoing is so deeply-rooted that many people accept the imposition on the law-breaker of penalties which involve varying degrees of unpleasantness without thought as to the purpose of State punishment.

Punishment has at different periods fulfilled varying purposes. In some primitive communities it has been imposed to satisfy the anger of an outraged god and so protect the community from his vengeance. At a later stage it took the place of private vengeance. By limiting the right of the individual to secure redress by his own initiative it stopped the continual blood feud and was in fact a means of lessening rather than increasing the punishment imposed on the evil-doer.

In modern states the 3 principles which have been advanced to sanction their penal systems have been the retributive, the deterrent, and the reformative. Retributive punishment has been justified on 2 grounds. Firstly, that it is necessary as an expression of the community's detestation of crime. But any legal sanction, even if it is wholly reformative in aim, does make it clear that the State is not prepared to countenance certain activities. Secondly, there is the argument that it is a natural moral law that suffering should follow wrongdoing. This thesis clearly implies the existence of moral forces, and these must be independent of State activity. It is therefore irrelevant to the problem of legal punishment. From a practical angle the argument against the retributive theory is that no penal system can strike a balance that would make the punishment proportional to the moral culpability of the offence, since no human being can weigh

up the temptations and difficulties of another, or evaluate how much suffering a given punishment will cause a given individual. But a retributive system loses its only possible justification if there is no due proportion between suffering and moral culpability.

The more widely held view to-day is that punishment, if it contains a sufficient element of suffering, will tend to deter people from crime. It accepts the point of view of the 19th cent. Utilitarians that behaviour is based on a reasoned calculation of the pains and satisfactions that will follow any given action. But it is now recognised that behaviour is much less determined by pure reason than used to be believed, yet the theory is still regarded as applicable to the criminal, who is least likely to make use of reason in determining behaviour. Whether he is violent or merely weak and inadequate, his behaviour is largely instinctive and emotional without thought for the future.

Recognising the limited deterrent value of punishment, modern penologists have come to lay greater stress on methods of rehabilitation as the best contribution a penal system can make to the welfare of the community. It does not follow from this that punishments will become less severe. Re-education takes time, and is likely to be associated with longer sentences. This is illustrated by the introduction of Corrective Training for habitual offenders (see CRIMINAL LAW) and the replacement of the comparatively short prison sentence by the long period of Borstal Training (see BORSTAL), and most offenders dread a long period of loss of liberty far more than a sentence that involves greater physical deprivation but is shorter.

The practical aspect of P. is concerned with the study of the techniques of re-education within the penal system and of the penal institutions and their results. Until recently there has been little knowledge of the relative merits of different penal methods. Even when the statistical results are known, which is not always the case, it is still not possible to judge without further information whether differences in the success rates are due to the relative merits of the various methods, or to differences in the type of offender with whom they deal. A beginning of a further growth of knowledge has been made by the development of prediction tables.

These tables embody the actual results of a large number of cases treated in a particular way. Given a large enough sample, it is possible to determine by analysis and statistical calculation what characteristics and experience make an offender dealt with in this manner a good or a bad risk from the angle of rehabilitation; the conclusions can be checked by applying them to another comparable sample. Though these tables deal only with averages, they have been found by experience to be more reliable as a basis for prognosis than the subjective judgments of the staff who have handled the offenders.

The pioneer work in this connection has been carried out in the U.S.A. by Sheldon and Eleanor Glueck, but a notable contribution has been made in Great Britain by H. Mannheim and L. Wilkins in a study of prediction applied to Borstal boys. Developments on these lines supplemented by individual studies should help to make our methods more scientific and less based on guess-work than is now the case. Mannheim and Wilkins have brought out of the realm of guess-work into the realm of ascertained fact that given 2 boys showing equal risks of failure, the open Borstal is likely to be more successful than the closed, whilst the Gluecks have shown that, contrary to general belief, the nature and seriousness of the offence show little or no correlation with the chances of rehabilitation. Such knowledge sheds new light on the problems of P. See also PRISONS.

See A. C. Ewing, *The Morality of Punishment*, 1929; Rt Rev. W. Temple, *Ethics of Penal Action*, 1934; Dr H. Mannheim, *The Dilemma of Penal Reform*, 1939, and (with L. Wilkins) *Prediction Methods in Relation to Borstal Training*, 1955; S. and E. Glueck, *After-Conviction of Discharged Offenders*, 1945; S. Hurwitz, *Criminology*, 1952; H. Jones, *Criminology and the Penal System*, 1956.

Penrhos College, school for girls founded in 1880 at Colwyn Bay, N. Wales, and situated on the coast directly overlooking the sea.

Penrhyn, see BETHESDA.

Penrhyn (Tongareva), largest and most northerly of the lagoon is. of the Cook Group. The lagoon measures about 108 sq. m., and vessels of considerable size can enter. Copra and pearl-shell are the main products. Pop. in 1954, 574.

Penrith: 1. Mkrt tn and urb. dist. of Cumberland, England, picturesquely situated 18 m. SE. of Carlisle. It was an important Rom. junction station (*Voreda*) and later the cap. of Cumbria. In the par. churchyard are the Giant's Grave (twin sculptured crosses of late Saxon date with hogback stones) and the Giant's Thumb (remains of a 10th-cent. rose cross). There are ruins of a 15th-cent. castle. Queen Elizabeth I co-ed. grammar school was re-estab. in the 16th cent. P. is the centre of an important agric. dist. mainly devoted to livestock rearing, and has a large cattle and sheep mkrt; industries include agric. implements and brewing. Pop. 10,520.

2. Tn of Cumberland co., New S. Wales, Australia, in the R. Nepean valley at the foot of the Blue Mts, 34 m. W. of Sydney. Pop. 18,790.

Penrose, Elizabeth, see MARKHAM, MRS. Penry, John (1559-93). Puritan, b. Breconshire, studied at both Oxford and Cambridge. He was the printer of the 'Martin Marprelate' tracts, which attacked the episcopal structure of the Church of England. He was forced to flee to Scotland in 1590, and on returning to England was condemned to death and hanged. See also MARPRELATE CONTROVERSY. See life by W. Pierce, 1923.

Penryn, municipal bor. of Cornwall,

England, on Falmouth Harbour, 2½ m. NW. of Falmouth. It ships granite and trades in coal, cement, grain, timber, etc. It has also boat-repairing yards and light engineering industries. Here is the site of the ant. Glasney College. Pop. 4232.

Pensacola, co. seat and port of entry of Escambia co., Florida, U.S.A., on P. Bay, an inlet of the Gulf of Mexico, 55 m. ESE. of Mobile. Fort Barrancas defends the entrance to its excellent harbour. P. is a shipping, fishing, and wood-processing centre. Products include paper, wood, naval stores, ramie fibre, temperature instruments, concrete blocks, tiles, and beverages. A nylon plant is near. There is a major naval air station here, one of the world's largest. P. navy yard is at Warrington near by. Pop. 43,480.

Penshurst, vil. and par. of Kent, England, about 4 m. SW. of Tonbridge. Sir Philip Sidney was b. at Penshurst Place (1554). The house, parts of which date from the mid-14th cent., was granted by Edward VI to Sir Wm Sidney in 1552, and it has ever since been the home of the Sidney family. The lofty baron's hall, dating from 1340, has a fine timbered roof supported by 10 life-size figures in wood. The Elizabethan long gallery is hung with family portraits. P. Place is rich in portraits, especially of the 16th and 17th cents. with many important examples of the early Eng. school, though in many cases the names of the painters are not known. Among the portraits are those of Sir Philip Sidney and of Dorothy Sidney, afterwards Lady Sunderland, to whom, under the name of Sacharissa, Edmund Waller addressed many verses. Pop. (of par.) 1554.

Pensions. For a brief hist. of old age P., see RETIREMENT. **PENSIONS**. Full details of contributions and rates of present retirement P. are given under NATIONAL INSURANCE ACT (1946). For Civil Service P., see *Digest of Pension Law and Regulations of the Civil Service*, issued by H. M. Treasury, 1952. For Naval, Military, and Air Force P., see *Services' Pay and Pensions*, Command Paper 9692, 1956. For pension schemes in the Commonwealth, see *Year Book of the Commonwealth of Australia*, *New Zealand Official Year Book*, *Canada Year Book*, *Official Year Book of the Union of South Africa*, etc. (ann.).

Pensions, Non-Contributory, Retirement, and Widows', see NATIONAL INSURANCE ACT (1946).

Pensions and National Insurance, Ministry of. The Ministry of Pensions was estab. in 1916 for the purpose of unifying the administration of pensions, grants, and allowances awarded in respect of disablement or death through service in the Armed Forces; in 1939 provision was made for compensation to be paid in respect of war injuries sustained by civilians and members of the merchant navy. The Ministry of National Insurance was estab. in 1945 to assume responsibility for the introduction of the national insurance and family allowances schemes. In general, the national insurance schemes cover the whole pop. over school-leaving

age and provide cash benefits for unemployment, sickness, maternity, retirement, and widowhood, and against the effects of industrial accidents and diseases. The Ministries of Pensions and National Insurance were merged in 1953.

Pennett, residential par. of Staffordshire, England, 2 m. SW. of Dudley. Pop. 7000.

Pentacle, **Pentangle**, **Pentagram**, **Pentagon** (obsolete), or **Pentalpha**, figure of 5 straight lines forming a 5-pointed star. Found frequently in early ornamental art, it was used as a mystic symbol by the Pythagoreans, and later by astrologers and necromancers in the Middle

PENTACLE

HEXAGRAM

Ages. Together with the sign of the cross, it came to be used on doorways and thresholds as a charm to keep away witches and evil spirits. It should be formed without a break in the drawing. The hexagram (2 interlaced equilateral triangles), also used as a mystic symbol, is often confused with it.

Pentacrinus, stalked sea lilies (Crinoidea, q.v.). P.s were particularly numerous in the early part of the Liassic period, and are represented by still living species. The joints of the stem are pentagonal in outline. P.s occur on the floor of the deep ocean.

Pentadesma Butyracea, see BUTTER-TREE.

Pentaglottis, family Boraginaceae; genus of perennial herbs, of which P. (synonym *Anchusa*) *sempervirens* is the Green Alkanet, the one European species, naturalised in Britain.

Pentagon, the world's largest office building, on the Virginia side of the Potomac R., Washington, U.S.A. It was built (1941-3) to accommodate the increase in Amer. Army Dept personnel, and cost about \$64,000,000. The building brought all 3 services beneath the same roof, and approximately 32,000 workers were employed there. It is 5 storeys high, simple in style, and built round a 5-ac. court, the perimeter of the building being nearly 1 m. There are 17 m. of corridors, and it possesses the largest private branch telephone exchange in the world. It is equipped with many cafeterias, a medical service, and a large library.

Pentamerone, II, or *Lo Cunto de li Cunti ovvero lo trattenimento de li Peccerille*, book of peasant fairy stories in Neapolitan dialect, collected and transcribed by Giambattista Basile, and pub. posthumously in 1637. This collection, the first of its kind, is divided into 5 days

each containing 10 tales, hence the name. The P. is of priceless interest to folklorists, retaining as it does all the freshness of the originals as heard from the lips of the people. The best ed. is that by B. Croce, *G. Basile ed il Cunto de li Cunti*, 1891. There is an Eng. trans. by Sir R. Burton, 1893.

Pentane (C_5H_{12}), hydrocarbon of the methane series, existing in 3 isomeric modifications. Two of these, viz. P. (boiling point $36^\circ C.$) and isopentane (boiling point $30^\circ C.$), occur in petroleum, and are colourless mobile liquids. The third, tetramethylmethane (boiling point $9.5^\circ C.$), is obtained by treating tertiary butyl iodide with zinc methyl. These isomers are volatile, inflammable liquids, which are, chemically, very stable. P. is one of the components of the petroleum ether, gasoline, petrol, etc., used as solvents for resins, oils, and caoutchouc, and for internal-combustion motors. P. is also used in the P. lamp as a standard in photometry.

Pentateuch, The (i.e. 'The Five Rolls,' though the Gk *teuchos* originally meant 'roll-case'). This name for the Five Books of Moses, the first 5 in the Bible, is first found in the 'Letter to Flora' of the 2nd cent. Gnostic, Ptolemy (Epiphanius *Adv Haer.* 33, 4, 1) and passed into Christian use; but among the Jews and in the O.T. and N.T. alike, these books are called 'the Law' (Torah), or the 'Law of Moses.' It was the constant belief until fairly recent times that the P. as a whole (though with slight modifications and additions, such as the account of the death of Moses in Deuteronomy) was the handiwork of Moses. During the 19th cent., however, the undoubted presence of doublets and repetitions in the narrative, accompanied by differences of style and a consistent variation in vocabulary, led critics (notably K. H. Graf and J. Wellhausen, q.v.) to analyse the P. into 4 distinct documentary sources, which had been combined and conflated by editors at different periods in Israel's hist. The present position in Pentateuchal criticism is one of flux, with a strong tendency in a traditional and conservative direction. See H. H. Rowley, *The Re-discovery of the Old Testament*, 1946; W. F. Albright, *The Archaeology of Palestine*, 1949; W. K. L. Clarke, *Concise Bible Commentary*, 1952. See also BIBLE; HEXATEUCH.

Pentecost, or Shavuot (Feast of Weeks), Jewish festival observed on Sivan 6 and 7, in the O.T. celebrating the end of the grain harvest 50 days after Passover, but also associated by the rabbis with the giving of the Ten Commandments on Mt Sinai. In ancient times first-fruits were then brought to the Temple. See also WHIT SUNDAY.

Pentland Firth, channel separating the Orkney Is. and Caithness, N. Scotland. It is 14 m. long and from 6 to 8 m. wide. There is a ferry, but strong tidal currents and whirlpools render navigation dangerous. The Pentland Skerries, 5 m. N.E. of Duncansby Head, include 2 islets, one of which has a lighthouse, and some rocks.

Pentland Hills, ridge in the Lowlands of Scotland, extending N.E. from the border of Lanarkshire, through Peeblesshire, through the centre of the co. of Midlothian and into the city of Edinburgh. The mean height is upwards of 1000 ft; the breadth 4 to 6 m. Scald Law (1898 ft) and Carnethy (1890 ft) are the highest peaks.

Pentobarbitone, see BARBITURATES.

Pentstemon, genus of perennial plants (family Scrophulariaceae), natives of N. America, bearing blue, purple, lilac, scarlet, rose, or yellow flowers, and of great value in the garden as border or rockery plants. They are raised from seed sown under cover in spring or from cuttings inserted in early autumn and kept through the winter in a cold frame. Hybrids between *P. cobaea* and *P. hartwegii* are the most popular garden sorts.

Penza: 1. Oblast in Central Russia, S.E. of Moscow, situated largely on the Volga uplands, in the black earth belt, and partly covered by oak forests. Area 16,700 sq. m., pop. c. 1,500,000, mainly Russians (since 17th cent.), also Moldavia and Tatars. Grain, potatoes, vegetables (Bessonovo onions), sunflowers, and hemp are grown, and cattle and hogs raised; there are also varied engineering, food, and textile industries. P. belonged to the Kazan Khanate, becoming Russian in 1552.

2. Cap., economic and cultural centre of the above. There are large precision and other engineering industries, also food industries. Important railway junction (4 lines). Pop. (1956) 231,000 (c. 1914, 80,000; 1920, 78,000; 1939, 157,000). Founded 1666 as a military and administrative centre. Old cultural centre of the black-earth belt (School of Horticulture founded 1822, School of Painting founded 1897).

Penzance, seaport and watering place of Cornwall, England, and centre of an important mrkt-gardening and agric. area, situated at the head of Mounts Bay, 8 m. ENE. of Lands End, and 20 m. WSW. of Truro. There are a good harbour and docks, and the climate is very mild. It is the nearest port (and only port of departure) to the Isles of Scilly, which are some 40 m. distant to the SW. P., with Newlyn, now incorporated in the bor., is a fishing centre; woollen yarns and cloths are manuf. also. St Mary's church was built in 1832 (the chantry of St Mary's was founded in 1284), on a site said to have been occupied by a castle built by the owner of the manor of Alverton. St Paul's church was built in 1843, in 13th-cent. style; St John's, in 1881, in the Early Eng. style; and the Rom. Catholic church was built in 1847. At P. is the museum of the Royal Geological Society of Cornwall; there is also a natural hist. museum, and in the Penlee Memorial Park is the art gallery. In front of the mrkt house (opened in 1838) is a marble statue of Sir Humphry Davy (1778-1829), the celebrated chemist, who was b. here. The name P. means 'holy head,' being derived from a chapel dedicated to St Anthony, which formerly

stood on a headland now forming the base of the old pier. In 1265 Madron par., including P., was appropriated by the Knights Hospitallers. In 1332 Edward III granted P. a weekly mkt and a fair of 7 days at the festival of St Peter. In 1512 Henry VIII gave P. a charter granting it ship dues on condition the tn maintained the quays in repair. The royal grant of its mkt was received in 1592 from Elizabeth I. Between 1595 and 1648 P. was pillaged 3 times. It was incorporated by James I in 1614. Three m. away in Mounts Bay is the world-famous St Michael's Mount, home of the St Aubyn family and often compared with Mt St Michel in France. The Mount is now owned by the National Trust. The bor. was extended in 1934; pop. 20,200.

Peonage, system of agric. labour prevalent in New Mexico and other parts of Sp. America; abolished by law in the former state in 1867. The name is derived from Middle Lat. *pedo* (from *pes*, foot). Originally a foot soldier, a *peon* came to mean a day labourer. The Indians, who hired themselves out to Sp. masters, or were bound to work for them because they were debtors or so-called criminal offenders, were called *peons*, but were really slaves.

Peony, see PAEONY.

'People.' Sunday newspaper, estab. in 1881, now owned by Odhams Press Ltd. It is independent in outlook, but politics are not an important feature. It features popular columnists and strong true-life series. The sale exceeds 4,750,000.

People's Banks, see under CO-OPERATION.

'People's Democracies,' the Communist regimes estab. after the Second World War in Poland, Hungary, Bulgaria, and other E. European countries. In these states the phrase is used, along with 'People's Republics,' as an official designation. The concept of democracy is very different from that held in W. Europe; 'people's' is intended to refer to the popular support on which these regimes are allegedly based. The 1956 revolutions in Poland and Hungary rejected Russian influence in or control of the Communist systems. Poland estab. a communist system under Polish control; Hungary revolted against both Russian influence and Communism itself. Popular support for Communism in other 'P. D.' was also questionable. Nor did the 'democracy' imply representative gov.; it referred to the *purpose* rather than the *method* of gov.: in theory, the 'P. D.' were run in the interests of the people; in practice, they were essentially authoritarian regimes run by bureaucracies.

People's High Schools (Denmark), see FOLK HIGH SCHOOLS.

People's Palace, see QUEEN MARY COLLEGE.

Peoria, city, cap. of P. co., Illinois, U.S.A., on Illinois R., the second largest city in Illinois, an air, rail, highway, and transportation centre and port of entry near a bituminous coalfield and in an extensive agric. area. P. is a grain and livestock mkt and distilling centre.

There are manufs. of farm and road machinery, food products, furnaces, washing-machines, hardware, tools, sheet-metal products, wire, caskets, cordage, bricks, tiles, pottery, chemicals, corn products, cotton goods, strawboard; and also feed and oil refineries. P. is the seat of Bradley Univ. Pop. 111,900.

Peperomia, family Piperaceae, genus of about 400 ann. or perennial herbs of tropical or sub-tropical regions. *P. marmorata*, *P. metallica*, *P. sanderi*, of S. America, and others are grown ornamental foliage pot plants.

Pépin, or Pippin, name of sev. Carolingian rulers, the more important of whom are:

Pépin the Elder, (d. 639), also known as *Pépin of Landen*, who was mayor of the palace to Dagobert I of Austrasia. He was canonised and 21 Feb. was dedicated to him.

Pépin le Gros, or *Pépin d'Héristal* (d. 714), when Dagobert II d. (679) P. ruled Austrasia, subject to Thierry III, King of Neustria. During Thierry's reign he revolted, and by the victory of Testry (687) P. became master of the greater part of W. France and was recognised as *major domus* (mayor of the king's palace), which gave him power to rule the state. As mayor he ruled under Thierry, Clovis III, Childeric III, and Dagobert III. On the death of P. his son, Charles Martel (q.v.) succeeded to the mayoralty.

Pépin le Bref (the Short) (741-68), King of the Franks, was the younger son of Charles Martel and the father of Charlemagne. From 741 to 747 P. and his elder brother, Carloman, ruled conjointly under the puppet king, Childeric III.; but in 747 Carloman entered a monastery, in 751 Childeric was compelled to abdicate, and P., with the aid of the Pope, was crowned first Carolingian King of the Franks. In 754 he aided the Pope against Aistulf, King of the Lombards; he forced Aistulf to give up Ravenna to the Pope, and by this act, which is known as the 'donation of Pépin,' laid the foundation of the temporal power of the papacy. He himself was made a 'patrician of Rome.' The rest of his life was spent in wars against the heathen Saxons, whom he tried to convert at the sword's point, against the Duke of Aquitaine, against Bavaria, and against the Saracens, from whom he recovered Narbonne.

Pépin (d. 810), son of Charlemagne, was crowned King of Italy by Pope Adrian in 781. He fought against the Avars, Slavs, and Saxons, drove the Saracens out of Corsica, and conquered Venice.

Pépin I (d. 838), son of Louis the Pious, was crowned King of Aquitaine at the age of 14. With his brothers he twice revolted against his father, and finally replaced him on his throne.

Pépin II (d. 870), son of the above, whom he succeeded as King of Aquitaine. He allied himself with Lothaire and took part in the battle of Fontenoy (841). He was deposed in favour of Charles the Bald by the treaty of Verdun, and until his imprisonment at Senlis (864) waged perpetual war against Charles.

Peploe, Samuel John (1871-1935), painter, b. Edinburgh, educ. at Edinburgh Collegiate School and Univ. At the age of 20 he took up art, and studied in Paris and Edinburgh. His early pictures included still-lives experimenting with tones and sparing use of colour, and portraits whose dark backgrounds derived from Hals and Rembrandt. From 1905 his still-lives and Scottish landscapes acquired a luscious creamy quality; this, however, ended abruptly in 1910. In that year he married and went to France for 3 years. He was greatly influenced by Cézanne and the Post-impressionists, and his paintings of Cassis and Antibes began his third style, experimenting in bright colour planes, which he brought to his many later paintings of Iona. He was associate of the Royal Scottish Academy 1917, and full member 1927.

Pepper, John Henry (1821-1900), chemist, b. Westminster, associated with the optical illusion known as 'Pepper's ghost' (highly illuminated objects placed before plate glass so as to appear as if among less brilliantly lighted objects behind the glass), originally invented by Henry Dircks in connection with a piece by Dickens. P. was educated as a chemist, and studied analytical work in various laboratories. He wrote on scientific subjects in a popular fashion. Among his works are *The Boys' Playbook of Science*, 1878, and *The True History of Pepper's Ghost*, 1890.

Pepper, one of the most important spices: it is derived from a creeping vine (*Piper nigrum*) which is a native of the moist, low-country forests of Ceylon and S. India and has also been introduced into Malaya, Siam, as well as into Indonesia, and Borneo. Both 'black' and 'white' pepper are obtained from the same plant. P. contains an alkaloid (piperine), a volatile oil, an acid resin, together with starch, gum, and albumin. The ash in ground black P. should not exceed 5 per cent, in white P. 3 per cent. Rice, linseed meal, bone dust, and other adulterants may be readily detected by the microscope. See also CAPSICUM.

Peppercorn Rent, nominal rent, in theory involving the ann. payment from lessee to lessor of one peppercorn; it was used in connection with long leases as a device for giving a leasehold the practical effect of a freehold.

Peppermint (*Mentha piperita*), small, slender, glabrous mint of the family Labiatae, with stalked serrate leaves and short spikes of flowers, the calyx of which is often red. The flowers are gathered in Aug., and after drying are distilled to yield the oil of P., which enters into the composition of P. water, the spirit of P., and P. cordial. Its medicinal value is as a stimulant and as a carminative.

Pepperwort. The Brit. P.s are species of *Lepidium*, a cruciferous genus. See also PIPERACEAE.

Pepsin, enzyme elaborated in the body by the gastric tubules. It has the property of causing chemical changes by which the proteins of the food material are converted into peptones. The P.

itself does not participate in the formation of the final products, and it cannot act except in conjunction with hydrochloric acid, which is also secreted by certain gastric glands. P. is also produced commercially by drying the mucous lining of the stomach of a pig or calf. If such an extract is added to food kept at the body temp., the proteins of the food are peptonised, and the resulting compound constitutes a food easily assimilated by persons of weak digestion. See ENZYMES; PROTEINS.

Pepul, see BO-TREE.

Pepys, Samuel (1633-1703), administrator and diarist, b. London, son of John P., a tailor. References in his diary show that S. P. was educ. at St Paul's School in London and at Magdalene College, Cambridge. In 1659, through the influence of his father's cousin, Sir Edward Montagu (later Earl of Sandwich), he entered the public service as a clerk of the exchequer, becoming clerk of the council in the same year, and began his *Diary*. In July 1660 he became a clerk of the Privy Seal and clerk of the 'Acts of the Navy.' He joined in the social life of the time, and managed to make a fortune out of the perquisites of his office; at the same time he made himself a thorough master of his business, and was a zealous reformer of abuses. In 1673 he became secretary for the affairs of the navy, and in the same year became M.P. for Castle Rising, exchanging his constituency for that of Harwich in 1679. A popular but erroneous estimate of P. is as 'a painstaking departmental official.' But in truth, P. carried out, at the Admiralty, in the teeth of opposition, drastic and far-reaching reforms. In 1679 the Admiralty Commission was dissolved and replaced by men wholly incompetent for their work. P. and Sir Anthony Deane, his close friend and former commissioner of the navy, having become involved in the unpopularity of the Duke of York, were accused of being Papists and were arrested and imprisoned in the Tower. They were acquitted, but after their release they had the mortification of being impotent spectators while the navy, in Anthony Deane's phrase, 'went to ruin.' And to P. a ruined navy meant a ruined England. Things went from bad to worse. From the 76 ships and 12,000 men of 1679 the navy dwindled to 24 ships and 3000 men by 1684, with empty yards, depleted stores, and sailors on the point of mutiny on being defrauded of their pay. P. urged, first on Charles II and then on James II, the project of a special commission for the recovery of the navy. James acceded, and P. overcame one difficulty after another, brought back Sir Anthony Deane from his retirement to assist, and in less than 3 years the effective strength was increased by 92 ships and the spirit and discipline of the men were restored. It is worthy of record that an Admiralty minute of 1806 spoke of P. as 'a man of extraordinary knowledge, of great talent, and the most indefatigable industry.' In 1689 a new charge of selling information to France led to his

retirement. His library was left to Magdalene College, Cambridge, where his *Diary* remained until 1819, when the Rev. J. Smith began to decipher it, and it was pub. by Lord Braybrooke in 1825. This *Diary* remains one of the most vivid and minute authorities for the events of the Restoration period, of the manners and scandals of the court, and of P.'s own interests and weaknesses. An ann. P. commemorative service is held at St. Olave's, Hart Street, where he was buried. He pub. *Memoirs of the Navy*, 1690.

SAMUEL PEPPYS

The original MS. of the *Diary* is preserved in Magdalene College, Cambridge, to which P. bequeathed it, together with other papers; it is in 6 vols., containing upwards of 3000 pages, closely written in Shelton's system of shorthand, which P. doubtless adopted lest his jour. should fall into unfriendly hands during his life or be rashly pub. after his death. These facts are stated in the preface to the original and partial ed. of the *Diary* produced by Lord Braybrooke. Other eds. followed in 1828, 1848-9 (enlarged), 1854; a fuller ed. was pub. in 1875-9 by Mynors Bright, and in 1893-9 came H. B. Wheatley's practically complete ed. See H. B. Wheatley, *Samuel Pepys and the World he Lived in*, 1880, 1905; Sir F. Bridge, *Samuel Pepys, Lover of Music*, 1903; P. Lubbock, *Samuel Pepys*, 1909; E. H. Moorhouse, *Samuel Pepys, Administrator, Observer, Gossip*, 1909; J. R. Tanner, *Samuel Pepys and the Royal Navy*, 1920, *Mr Pepys: an Introduction to the Diary, together with a sketch of his later life*, 1925, and (ed.) 2 vols. of the correspondence of Pepys, 1926-9; A. Ponsonby, *Samuel Pepys*, 1928; and lives by J. Drinkwater, 1930, and A. Bryant, 1933-5.

Perak, most northerly of the states of the Federation of Malaya (q.v.), on the W. coast of the Malay Peninsula. Area 7980

sq. m. From Kelantan (q.v.) and from Pahang (q.v.) on the E. it is separated by the main range of granite mts that forms the backbone of the peninsula. The R. P. (170 m. long), the chief riv., flows between 2 parallel ranges (7000 ft.) which traverse the state from N. to S. The chief exports are tin and rubber. Taiping is the cap. Iron ore, wolfram, kaolin are among the minerals besides tin. Rubber is the prin. commercial crop. Other crops are tea, the oil-palm, and rice, grown almost exclusively by Asiatics on small holdings. There are airports at Ipoh, Taiping, and Sitiawan. P. is ruled by a dynasty that claims descent from the last Malay Sultan of Malacca (q.v.). From 1650 onwards, the Dutch tried to obtain a monopoly of the tin exported from P., establishing near the mouth of the P. R. sev. factories, which the Malays destroyed. In 1765 the sultan made a treaty with the Dutch. Brit. influence began in the 19th cent. A treaty with Penang (q.v.) in 1818 secured to Brit. subjects the right to free trade in P. In 1826 the sultan ceded to the British the Dindings and the is. of Pangkor as posts for the suppression of piracy, and agreed to rely solely on the protection of Great Britain. Anarchy prevailed for a time owing to fighting between rival Chinese factions over the tin deposits and, in 1874, Sir Andrew Clarke, governor of the Straits Settlements, induced the P. chiefs to sign the Pangkor Treaty, and to accept a Brit. resident whose advice should be taken on all questions other than those concerning Muslim religion and custom. By an Act of 1934 the ter. of the Dindings was restored to P. In Dec. 1941 the state was overrun by the Jap. invaders and held till the surrender of 1945. The present Sultan of P. succeeded to the throne in 1948. His seat is at Bukit Chandau. He was an official guest at the coronation of Queen Elizabeth II in 1953. Pop. 1,186,000.

Perambulation, see BOUNDS, BEATING THE.

Perambulator, see BABY CARRIAGE.

Perameles, see BANDICOOT.

Percentiles, see MENTAL TESTS.

Perceval, Sir, hero in one of the legends of the Arthurian cycle. According to the oldest version, P. was the son of a widowed mother brought up in obscurity, but fired with a love of knightly deeds by an accidental meeting with Arthur's knights. This legend probably first became confused with the legend of the Holy Grail in the romance of *Perceval le Gallois*, begun by Chrétien de Troyes, continued by Wauchier de Denain and Gerbert, and finished by Manessier (see GRAIL). It is this version which is used in by far the finest setting of the legend, the last of his operas. For the Welsh theory see Sir J. Rhys, *Studies in the Arthurian Legend*, 1891; for the P. legend, as distinct from the Grail, see *Syr Percyvelle of Galles* (ed. J. Halliwell), 1884; 'Peredur, Son of Eyrwau,' in the *Mabinogion* of Lady C. Guest, 1879;

W. W. Newell, *Legend of the Holy Grail*, 1902; J. L. Weston, *Legend of Sir Percival*, 1906; J. D. Bruce, *Evolution of Arthurian Romance to 1300*, 1923-4; W. Gother, *Parzival und der Gral in der Dichtung des Mittelalters*, 1925; and E. G. Gardner, *The Arthurian Legend in Italian Literature*, 1930.

Perceval, Spencer (1762-1812), statesman, educ. at Harrow and Trinity College, Cambridge; he practised at the Bar until 1796, when he entered Parliament. He held office under Addington, and was chancellor of the Exchequer under Portland (1807). He became Prime Minister in 1809, and was assassinated on 11 May 1812 in the lobby of the House of Commons by John Bellingham, a merchant, who attributed his bankruptcy to the gov. measures. See life by Sir Spencer Walpole, 1874.

Perch (*Perca fluviatilis*), common Brit. type of a large family of spiny-finned fishes. It prefers still waters, and only in them is it able to spawn. The greatest weight of *P. fluviatilis* on reliable record is 10 lb. It is a bright-looking fish, and very conspicuous from above by the vertical, dark bars extending from the back down the sides. It is rough to the touch. The flesh, though firm and white and free from a muddy flavour, is not appreciated in Britain as it is in Russia and elsewhere.

Perch (measure), see METROLOGY.

Perch, Climbing, or *Anabas scandens*, fish which is noted for its ability to travel overland by means of its spines. It was believed to climb trees by the same organs, and has been found up trees in India, but it is placed in the branches by such birds as crows and kites.

Percheron Breed, see HORSE.

Perchloric Acid (HClO_4) is prepared by distilling strong sulphuric acid with potassium perchlorate under reduced pressure. It is a colourless, volatile, strongly fuming liquid (sp. gr. 1.782 at 15°C.), and is a powerful oxidising agent, a drop of the liquid instantly decomposing if dropped upon wood or charcoal, sometimes explosively. The salts of this acid are the perchlorates, all of which are soluble in water. Potassium perchlorate is prepared by heating the chlorate. $4\text{KClO}_3 = \text{KCl} + 3\text{KClO}_4$. The salt is purified from the chloride by crystallisation, the solubility of the perchlorate being about 0.7 part in 100 parts of water at 0°C.

Perceval, Arthur Ernest (1887-), Brit. gen. Educ. at Rugby, Lieut.-Gen. P. served in the First World War with the Beds. and Essex Regts. and in 1919, then a captain, took part in the N. Russian expedition. From then until 1936 he held a series of regimental appointments. In 1936 he was given a staff appointment in Malaya, which he held until 1938, when he became a Brigadier at Aldershot. He served with the B.E.F. in 1939-40, and in 1941 was sent out to Malaya as G.O.C. He commanded the Brit. forces during the Jap. invasion and was captured when Singapore fell in 1942. He retired from the Army with the rank of Lieut.-gen. in

1946. He wrote *The War in Malaya*, 1949.

Perceival, John (1834-1918), headmaster and bishop. Son of a Westmorland farmer, he had a strenuous boyhood. In his twenty-first year he won an open scholarship at Queen's College, Oxford, of which later he was a fellow. P. accepted a post as master at Rugby (1860) and in 1862, on the recommendation of Frederick Temple (q.v.), he was appointed first headmaster of Clifton College, which was then a struggling foundation. P., who shared Arnold's views, soon raised the college to be one of the great public schools. When looking for a master for the modern side of the school, he chose the poet and divine, Thomas Edward Brown (q.v.). His success was due in no small measure to his large-heartedness and public-spirited character, and his ascendancy over the parents was as great as that over the boys. He was also a prime mover in the foundation of Somerville College. In 1879 he left Clifton to become president of Trinity College, Oxford; though too impatient for reforms, he left a strong impress on the college. He was also a pioneer of the Univ. Extension movement. In 1886 he accepted the headmastership of Rugby, and in 1895 the bishopric of Hereford. A strong Liberal, his opinions on eccles. and political questions were not necessarily shared by the diocesan clergy, and P. was almost too earnest an advocate of all that appealed to him. See life by W. Temple, 1921.

Percussion, or *Tapotement*, mode of diagnosis in medicine, which, as its name implies, involves tapping and the eliciting of sounds. It was used by Corvisart for examining cases of heart disease, and was developed by Laennec. Other physicians have made it of great value in diagnosing lung, heart, and abdominal diseases, and in delineating the margins of solid and hollow organs. The affected part is tapped with the three first fingers, or with a small rubber-tipped hammer, or, more usually, the fingers of one hand are laid flat and close on to the body surface and are tapped by the second finger of the other hand. Hollow organs give a resonant note and solid organs a dull, flat note.

Percussion, Centre of, see CENTRE OF PERCUSSION.

Percussion Caps, originally small copper cylinders holding a detonating powder, e.g. a mixture of fulminate of mercury with powdered glass, antimony, sulphide, and potassium chlorate. These can be exploded by percussion, and so are used in firearms. See FULMINATES; FIREARMS. Modern caps omit the potassium chlorate, as it is the prime source of corrosion in weapons.

Percussion Instruments. All musical instruments played by being beaten are called P. I., including all varieties of drums, bells, cymbals, triangles, castanets, gongs, etc., also some in which the percussion is produced by the intermediary of a keyboard, such as the celesta. These last instruments, as also bells, xylophone, and kettledrums, produce

notes of definite pitch; others produce sound without pitch and thus, strictly speaking, merely a kind of refined and organised noise.

Percy, Anglo-Norman family. Its head, Wm de P., accompanied the Conqueror to England, and received large estates in N. England. The wealth and importance of the P.s was greatly increased by marriage with the heiress of Brabant, whose arms they subsequently used. One of the family assisted in obtaining Magna Carta, and the ninth lord (the first to be summoned to Parliament) signed the barons' letter to the Pope (1301). His great-grandson became marshal of England under Richard II, and was made earl of Northumberland (1377). He distinguished himself against the Scots, and took Berwick. When Bolingbroke assumed the crown, with the title Henry IV, he created the earl constable of England. In the fourth year of that reign, the earl and his son, Sir Henry P., nicknamed Hotspur, defeated the Scots at Halidon Hill, and took the earl of Douglas prisoner. Later the earl rebelled against the king, and put Hotspur at the head of his troops; but Hotspur was slain at the battle of Shrewsbury in 1403; upon which P. made his submission and received the royal pardon. Later, however, he collected another army, but was defeated and slain in Yorkshire in 1408. Henry V restored the title to a son of Hotspur. The second earl was slain at the battle of St Albans in 1455; and the third at Towton, in 1460. The fourth earl was murdered while trying to collect a subsidy on behalf of Henry VII, the fifth and sixth earls d. in 1527 and 1537 respectively. The seventh was beheaded in 1572, the eighth found shot in the Tower, 1585. The ninth earl spent 15 years imprisoned in the Tower. The tenth earl fought first against Charles I and then helped in the Restoration. The P. family is now represented only in the female line, the male line having died out with the eleventh earl, who left an only daughter who married the Duke of Somerset, the title Duke of Northumberland (created in 1766), then passing through their son Algernon to his son-in-law, Sir Hugh Smithson, who became duke in 1766. His son Hugh took the name of P.; from him the present tenth duke is descended. Baron Percy of Newcastle (1887-1958) was a son of the seventh duke. As Lord Eustace P. he was an outstanding President of the Board of Education, 1924-29, and was created Baron P. in 1953 in recognition of his public services. See G. Brennan, *History of the House of Percy* (ed. W. A. Lindsay, 1902).

Percy, Esmé (1887-1957), actor and theatrical producer, b. London, studied at the Brussels Conservatoire and first appeared with F. R. Benson's company at Nottingham in 1904. His début in London was in *Romeo and Juliet* in 1905 and in New York in *The Red Planet* in 1932. He played many prominent roles and is remembered for his interpretation of the leading parts of many of

Shaw's plays, with Charles Maodons's Bernard Shaw Repertory Company in London and the provs.

Percy, Thomas (1729-1811), scholar, antiquary, and poetical collector, b. Bridgnorth, Shropshire. Educ. at Christ Church, Oxford, he became Bishop of Dro-more, Ireland, in 1782. The friend of Johnson and Goldsmith, he pub. trans. from the Icelandic, a new version of the Song of Solomon, 1764, *The Household Book of the Earl of Northumberland in 1512*, 1768, and a trans. of Mallet's *Northern Antiquities*, 1770. His most popular and famous work was the *Reliques*

BISHOP PERCY

of *Ancient Poetry*, 1765, which was composed of old heroic ballads and songs, together with a few modern imitations by the editor. This work, which was warmly and justly praised by the critics, was chiefly obtained from an old folio MS., together with additions from the Pepys collection at Cambridge, the Ashmole Library at Oxford, the Brit. Museum, and works of early poets. The collection was of great value to our literature, recalling the public taste to the rude energy, picturesqueness, and passion of the old chivalrous minstrels and Elizabethan songsters. The work inspired Sir Walter Scott's *Minstrelsy of the Scottish Border*. See A. C. C. Gausson, *Percy, Prelate and Poet*, 1908, and T. Shearer and A. Tillotson, *Percy's Relations with Cadell and Davies*, 1934.

Percy Anecdotes, originally pub. in 40 monthly parts, commencing in 1820, were compiled by 'Sholto and Reuben Percy, brothers of the Benedictine Monastery of Mount Benger.' This was really a pseudonym. 'Reuben Percy' was Thomas Byerley, the first editor of the *Mirror*, and 'Sholto Percy,' Joseph Clinton Robertson, he founder and first editor of the *Mechanics' Magazine*. The name originated from the fact that the 2 authors used to meet and talk over the book at the Percy coffee house, in Rathbone Place.

Perdiccas, 4 Macedonians:

Perdiccas I was a native of Argos in the 8th cent. bc. With 2 of his brothers he conquered a large part of Macedonia and founded the Macedonian dynasty.

Perdiccas II reigned in Macedonia from about 454 to 413 bc. During the Peloponnesian war he allied himself first with the Athenians and then with the Spartans, betraying both parties.

Perdiccas III reigned in Macedonia from 364 to 359 bc. Aided by the Athenian Iphicrates, he overthrew the regent Ptolemy. Later he made war against the Athenians, and fell in battle against the Illyrians.

Perdiccas IV, one of the most famous Macedonian generals under Alexander the Great, whom he accompanied into Asia. He became chief minister of Alexander's successor, Arrhidaeus; but his rivals, Antipater, Antigonus, Craterus, and Ptolemy, conspired against him. While marching against Ptolemy he was murdered at Memphis by his own soldiers (321 bc).

Pereda, José María de (1833-1906), Sp. novelist, b. Polanco, near Santander. After a few years in the artillery he retired to his country estate. His novels, written in excellent and virile style, are pictures of the follies of his contemporaries, more particularly descriptions of persons and places of his native Santander. His novels include *Escenas Montañesas* (2 series, 1864, 1871); *Sotileza*, 1884, a story of the sailors and fishermen, of Santander; and *Peñas Arriba*, 1894, about a small mountain village. His *Don Gonzalo González de la Gonzalera*, 1879, is a politico-social satire. See J. M. de Cossío, *La obra literaria de Pereda*, 1934; J. Camp, *J. M. Pereda, sa vie, son œuvre et son temps*, 1937; R. Gallón, *Vida de Pereda*, 1944.

Peregrine Falcon, see GALLON.

Pereira, José Maria dos Reis, see RÉGIO, JOSÉ.

Pereira, tn of W. Colombia, cap. of the dept. of Caldas, 40 m. by rail from Manizales. It is a centre of the coffee and livestock industries. Pop. 31,000.

Perakop (anc. Gk Taphros), vii. (until 1925 tn) on P. Isthmus between Crimea and mainland. There are traces of Gk fortifications. It was a Tatar fortress from the 15th cent., and has been Russian since 1783. There was heavy fighting here in 1920 (Russian Civil War), 1941, and 1943-4.

Père-Lachaise, Fr. cemetery, well known because of the great number of celebrated persons buried in it. It is at Ménilmontant, in E. Paris, and was opened in 1804 on an anc. property of Père la Chaise, confessor of Louis XIV. It contains the tomb of Abélard (q.v.) and Héloïse.

Perennials are plants with roots that are able to live for a number of years by storing up a supply of reserve food. Usually the part above ground dies down. Trees and shrubs store their reserves in the parenchyma of the cortex and medullary rays in the stems. See GARDENING.

Pereyaslav-Khmelnitskiy (until 1943

Pereyaslav), tn in the Kiev Oblast of the Ukraine, 42 m. S.E. of Kiev. It has been known since 907, and was cap. of P. principality 1054-1239. The Ukrainian Cossack assembly in P. acknowledged the supremacy of the Tsar of Muscovy in 1654. Pop. (1935) 17,000.

Pérez de Ayala, Ramón, see AYALA, RAMÓN.

Pérez de Guzmán, Fernán (1378-c. 1460), Sp. poet and chronicler, nephew of Ayala (q.v.). Among his works are *Crónica del rey Juan II* (pub. 1779); *Generaciones y semblanzas* (pub. in 1779), an account of the illustrious men of his time, in terse and brilliant style; *Loores de los claros varones de España*, a rhymed chronicle. His poetical works consist mainly of hymns and moral pieces.

Pérez de Montalbán, Juan (1602-38), Sp. dramatist, b. Madrid. Under the influence of his friend, Lope de Vega, he wrote *Orfeo*, 1624. His prose *Vida y purgatorio de San Patricio*, 1627, was the foundation of Calderón's play. The best known of his plays is *Los Amantes de Teruel*, 1638. He wrote the first biography of Lope de Vega.

Pérez Galdós, Benito, see GALDÓS.

Perfectibility of Christians, doctrine held by the Wesleyan Methodists (see METHODISM) of a Christian perfection attainable in this life. It is not a perfection of justification, but a perfection of sanctification, which John Wesley, in a sermon on Christian Perfection, from the text Heb. vi. 1, 'Let us go on to perfection,' earnestly contends for, as attainable in this life by believers. Theosophists and Buddhists generally believe that absolute perfection can (under certain very stringent conditions) be attained to in the course of the one life.

Perfectionists, see BIBLE COMMUNISTS.

Performance Tests, see MENTAL TESTS.

Performing Animals (Regulation) Act. Every person who trains or exhibits performing animals must hold a certificate of registration issued by a local authority. Registration with any local authority is valid throughout the country. Offences against this Act or the Protection of Animals Act may result in the cancellation of registration.

Performing Right Society, association of composers, authors, and publishers of copyright musical works, estab. in 1914 to collect fees for the public performance of such works, and to restrain unauthorised performances thereof. The constitution is that of a company limited by guarantee.

It makes no profits for itself, pays no dividends, and charges its members no agency commission, no entrance fees, and no subscriptions. All fees collected, and all receipts from other sources, are distributed among the composers, authors, and publishers concerned, in proportion to the extent of public performance of their works. No expenses are deducted from the fees beyond the cost of administration, which is less than 10 per cent of the gross sum collected. By virtue of affiliations with some 30 similar societies in other countries the society is able to grant to those concerned with public performances

of copyright music in the Brit. Isles and overseas Brit. ters. comprehensive licences which cover a repertoire comprising not only the works of its own members, but also those of members of the affiliated societies, numbering more than 75,000 composers, authors, and music publishers of all nationalities. The same affiliations ensure the protection of P. K. S. members abroad. The society's policy and administration are controlled by a board of directors elected by the members from among their own number. The board (unpaid) consists of 12 representative Brit. composers and authors and an equal number of music publishers. The operations of the society extend only to musical works. It is not concerned with the performance of non-musical plays or sketches, or with operas, musical plays, or other dramatico-musical works when performed in their entirety by living persons on the stage.

Perfumery. Perfumes are the essences, obtained from plants chiefly, to which the flowers, leaves, etc., owe their fragrant odours; the art of P. deals with the extraction and properties of those essences and their preparation in convenient form for toilet purposes or industrial use. Gum resins have been in use from very ancient times; they are widely used as fixatives in perfume compounds to give a uniform smell throughout to the finished blend, and to retard the volatility of the odorous components, thus rendering the perfume more tenacious. The true perfumes are essential or volatile oils (Fr. *otto*), contained in minute sacs in the leaf, as in mint; in wood, as in sandalwood; in bark, as in cinnamon; in seeds, as in nutmeg; in rind of fruit, as in lemon; in petals of flowers, as in rose and lavender; or, as in the case of orris, in the rhizome. The extraction of the oil is performed in several ways. The process known as *enfleurage* consists of exposing the flowers in contact with purified lard or with fine olive oil in suitable frames, whereby the fatty substances take up and become impregnated with the essential oil. Like the process of maceration, *enfleurage* depends for its efficacy upon the remarkable property which fats and oils possess of absorbing odours. In other cases the aroma is caught in pure olive oil contained in felt placed above the flowers. Jasmine and tuberose are best prepared by *enfleurage*. In the process of maceration, warm oil or melted fat is prepared, and the blossoms infused for several hours. Rose, orange, and acacia are best prepared by maceration, the jonquil and violet by the combined processes. The oils and fats produced are treated with pure absolute alcohol, which absorbs the essential oils and is decanted. In other cases the flowers are placed in water in a still, when the oils are carried off with the steam and collect on the surface of the water, from which they are siphoned off. This is the method employed with woods, barks, seeds, etc. Oil may in some cases, where it is present in large quantities, as in lemon and orange peel, be pressed out. The amount of perfume obtained varies

with the species of flower and also with the season. More than one odour may be obtained from the same plant; in the case of the orange, the fruit yields Portugal oil, the flower a distinct odour, neroli, and the leaves, *petit grain*. The essential oils are all soluble in alcohol (usually acetone free), and this solution, care being taken that the alcohol is itself odourless, forms the usual 'scent.' Sometimes the oils and alcohol are distilled together. The best perfumes, however, are produced by steeping the pomades and oils from the *enfleurage* process for several weeks at a gentle warmth. In the case of ambergris, castor, civet, musk (q.v.), etc., the oils are formed into a tincture by solution in alcohol. Several terms are in common use. *Extrait* is a strong solution of the oils in alcohol after the process of infusion. They may be simple or blended. *Essence* is a weaker solution. *Essences* may be the volatile oils themselves, or strong solutions of them. The terms *bouquet* and *rosegay* are applied to blended perfumes which have no one distinctive flower odour. Of animal perfumes there are only 4 in use: musk, civet, ambergris, and castor (castoreum). All are extremely powerful; musk, for example, will impart odour to polished steel, though it will itself lose all fragrance within a year. Civet is even more potent than musk, and both are insupportable when strong. Castor is reddish-brown, and is used in the dilute state. Ambergris from the whale has a musky odour. They are all used in very dilute states, or merely to provide a base for bouquets.

Artificial Perfumes and Flavours. Synthetic chemistry has been successful in the preparation of artificial substances with practically the same perfumes and other characteristics as the natural products; in other cases products with similar perfumes but in many respects different. Terpineol, one of the commonest aromatic synthetics used in P., is the basis for lilac, lily, and many other compounds, the proportion being as much as 10-50 per cent in lilac. It is made synthetically by the action of diluted acids on oil of turpentine with continued stirring for many hours to yield terpin hydrate and afterwards terpineol. Oil of cassia is mainly cinnamic aldehyde, $C_9H_7CH=CHCHO$, which may be prepared from benzaldehyde or by heating the formate and cinnamate of calcium together. Vanilla, from the pod of the vanilla bean, can now be synthesised in the laboratory. Coumarin, the perfume of tonka beans, prepared from *o*-cresol, through salicylaldehyde; anisic aldehyde is a substitute for the perfume obtained from hawthorn. From the esters and others other substitutes are prepared; from xylene through its *meta*-tertiary-butyl derivative: Xylol Musk (trinitro-tert.-butyl-m-xylene) with a musky odour is produced and used in soap manu. Bromostyrolene is a substitute for hyacinth oil; from naphthalene the methyl ether of naphthol, $C_{10}H_7(OCH_3)$, or nerolin, is produced as a substitute for neroli oil; other substitutes for this are methyl anthranilate from benzoic acid and

the ethyl ether of naphthol, bromelia; niobe oil is substituted by the synthetic methyl benzoate; jasmine oil by benzyl acetate from benzene. Other synthetic perfumes of great importance are the aldehydes ranging from C_6 to C_{18} . A few examples are: C_6 , hexyl aldehyde (fruity note); C_8 , decyl aldehyde (orange-like odour); C_{11} , methylnonylacetic aldehyde (when diluted smells of oranges and amber); C_{11} , peach aldehyde (gives a lasting odour of ripe peaches); C_{12} , strawberry aldehyde (powerful smell of strawberries); C_{12} , raspberry aldehyde (raspberry odour and used as such in flavouring). These possess, in concentrated form, a very powerful odour and should be used in 1-10 per cent solution. Sometimes as little as 1:10,000 can alter the original note of a perfume blend.

As perfumes such substitutes are quite satisfactory, but as flavours they are rather to be deprecated, since they replace, though probably the main active constituent, none of the secondary organic constituents and micro-organisms present. Beyond the general use as scents, perfumes are in use in various powders and dentifrices, in the manu. of tobacco, as well as for flavours in some cases. In recent years much attention has been paid to methods of synthesising some of the more complex natural perfumes such as musk and violet perfumes. Mention may be made of Ruzicka's work on musk and irone (1926-47). See also ATTAR and EAU DE COLOGNE. See G. Plesse, *Art of Perfumery*, 1862; also trans. of K. Khristov, *Rose Industry of Bulgaria*, 1890; E. Sagarin, *The Science and Art of Perfumery*, 1946; Y. R. Naves and G. Masuyer, *Natural Perfume Materials*, 1947; and T. F. West, H. J. Strausz, and D. H. R. Barton, *Synthetic Perfumes*, 1949.

Perga, anct city, the ruins of which are situated in the prov. of Konia, Asiatic Turkey, 12 m. NE. of Adalia. An important city of Pamphylia, it was famous for the worship of Artemis and was visited by St Paul on his first missionary journey.

Pergamino, tn of Argentina, in the dept of Buenos Aires, 141 m. from the city of Buenos Aires and 65 m. S. from Rosario. It is an important railway centre, and sev. branches of the Bartolomé Mitre Railway radiate from the tn. There is an agric. research station. Pop. 31,000.

Pergamum, or Pergamus. The former is by far the most usual form in the classical writers, though the latter is more common in Eng., probably on account of its use in our version of the Bible, Rev. ii. 13. (1) The citadel of Troy, and used poetically for Troy itself; the poets also use the forms Pergama and Pergamia. (2) Celebrated city of Asia Minor, the cap. of the kingdom of P., and afterwards of the Rom. prov. of Asia. The kingdom reached its greatest extent after the defeat of Antiochus the Great in 190 BC, when the Romans bestowed upon Eumenes II the whole of Mysia, Lydia, both Phrygia, Lycaonia, Pisidia, and Pamphylia. It was under the same king that there was

founded at P. the celebrated library which for a long time rivalled that of Alexandria, and the formation of which occasioned the invention of parchment, *charta Pergamena*. On the death of Attalus III in 133 BC, the kingdom, by a bequest in his will, passed to the Romans. Among the celebrated natives of the city were the rhetorician Apollodorus and the physician Galen. The altar of Zeus and the statue of the dying Gaul were fine examples of stonework. The modern name is Bergama. See E. V. Hansen, *The Attalids of Pergamum*, 1947.

Pergola (It.), an arbour or walk covered with creepers; and constructed of trellis-work; or of brick piers or wooden posts, with wooden joists over them.

Pergolesi, Giovanni Battista (1710-36), It. composer, b. Jesi near Ancona. His parents were poor, and he seems to have been sent to Naples to study at the Conservatorio dei Poveri, under the patronage of Marchese Pianetti, where his masters are said to have been Mattei, Greco, and Durante. In 1731 a kind of stage oratorio of his was performed, and in the following winter his first opera, *Salustia*. In 1732-4 P. was *maestro di cappella* to the Prince of Stigliano at Naples, for whom he wrote cantatas and chamber music. In 1734 he took a similar post in the household of the Duke of Maddaloni. A Mass performed with success in Rome led to the commission for an opera there, but *L'Olimpiade* was a failure in 1735, and he returned to Naples in very poor health. He went to Pozzuoli in Feb. 1736 in the hope of recovering, but was in the last stages of consumption and d. there on 16 Mar., leaving Masses, the famous *Stabat Mater* and other church music, secular cantatas, oratorios, some instrumental works, and 9 operas, 3 of which, including *La serva padrona* are only comic *intermezzi* to be performed between the acts of a serious opera. A great deal of music attributed to him after his death is now known to be spurious, so that his output is far smaller than had long been believed, but nevertheless astonishing enough for a composer who suffered from ill-health and died at the age of 26.

Perl, Jacopo (1561-1633), It. composer, b. Rome and fl. at Florence, where he was an intimate of the coterie of artists and writers, patronised by Counts Bardi and Corsi, who sought to revive the Gk drama. In music this group of progressives discarded counterpoint and cultivated melody and the harmonic aspect of music. P., with Caccini, experimented in musical declamation to a suitable accompaniment, and thus became the earliest composers of recitative. They may also be claimed to have been the world's first operatic composers. P.'s opera *Dafne* (1597) is lost, but his *Euridice* (1600) is extant.

Perl, see PARI.

Periander, statesman of Corinth (q.v.), son of Cypselus, whom he succeeded as tyrant 625 BC, and reigned 40 years, to 585 BC. His rule was mild and beneficent at first, but afterwards became oppressive. He was commonly reckoned among the

Seven Sages. He was responsible for the foundation of Macedonian colonies, and was a patron of literature and art.

Perianth, strictly the envelope or non-essential parts of a flower, even when these parts are clearly separable into calyx and corolla, but commonly used where calyx and corolla so closely resemble one another as not to be distinguishable, as for instance in the tulip and other Liliaceae. The function of the P. is to protect the stamens and pistil from wind and rain until after pollination. Usually it is brightly coloured to indicate to insects the presence of nectar. It is absent from a number of wind-pollinated plants, e.g. grasses and willows.

Pericarditis, see **CARDITIS**.

Pericardium, see **HEART**.

Pericarp, the rind or shell of fruits (q.v.).

PERICLES

Pericles (c. 490-429 BC). Athenian statesman, son of Xanthippus and Agariste. His father commanded the Athenian fleet at Mycale in 479. P. received his higher education under the sophist and musician Damon, and the philosopher Anaxagoras (q.v.), who became his closest friend. By 469 P. was regarded as leader of the democratic party in opposition to Cimon (q.v.). In 461, through the medium of his friend Ephialtes, he carried a measure to restrict the power of the Areopagus, and secured the ostracism (q.v.) of Cimon. P. likewise enjoyed the confidence of his fellow citizens as a military commander, and his most outstanding successes in this field were the recovery (446) of Euboea, which had revolted from Athens, and the reduction of Samos (440). After the death of

Cimon (449) the aristocratic party was led by Thucydides, son of Melesias; but on the ostracism of Thucydides in 443 P. was left without a rival. He spent the years 440-432 beautifying Athens (q.v.) with public buildings. Meanwhile his enemies did their best to destroy his reputation; but failing in this, they attacked him through his friends. Pheidias, Anaxagoras, and P.'s mistress Aspasia were all denounced. The great sculptor went into exile after a trumped up charge of impiety; the philosopher was ordered to pay a heavy fine and to leave Athens; Aspasia also was accused of blasphemy, and was saved only through the entreaties of her lover. On the outbreak of the Peloponnesian war (431), which P. had long foreseen, he urged the Athenians to rely wholly upon their sea-power; and their neglect of that advice led to ultimate disaster. At the end of the first year's campaign P. delivered the celebrated funeral oration which forms perhaps the most memorable statement of Athenian values and aspirations (Thucydides, ii). In the summer of 430 plague broke out in Athens, carrying off his two sons Xanthippus and Paralus, and most of his intimate friends, besides demoralising the people. P. died in the following year. Renowned for his dignified bearing and splendid eloquence, he was also a man of unimpeachable honour and courage. Under his leadership Athens attained the zenith of her artistic glory, of her imperial greatness, and of her commercial prosperity. See also **GREECE, History**; **PELOPONNESIAN WAR**. See Thucydides, i and ii; A. R. Burn, *Pericles and Athens*, 1949.

Peridotites are coarsely crystalline, ultra-basic igneous rocks, occurring generally as intrusive masses. They contain little or no feldspar, but consist chiefly of olivine (peridot), with augite, enstatite, diopside, and magnetite. In composition they approximate to some meteorites. Special varieties have received distinctive names, such as picrite, dunite, serpentine. Although holo-crystalline when fresh, the rocks are generally altered, the altered rock being known as serpentine.

Périers, Bonaventure des, see **DES PÉRIERS, BONAVENTURE**.

Périgee, position in the orbit of the moon (or sun) that is nearest the earth. See **APHELION**; **APOGEE**.

Pérignon, Dom Pierre (1638-1715), Fr. Benedictine monk, born at Ste-Menehould. He is the reputed originator of sparkling Champagne (see **CHAMPAGNE WINES**; **ÉPERNAY**).

Périgord, dist. of France, in the N. of the anct prov. of Guyenne (q.v.). It was united to the Crown by Henry IV in 1589. It now forms part of the depts of Dordogne and Lot-et-Garonne.

Périgueux, Fr. tn, cap. of the dept of Dordogne, on the Isle. It is the seat of a bishopric, has Rom. remains, and many anct buildings, including a Romano-Byzantine cathedral. There are railway workshops, tanneries, and food-canning factories, and a trade in truffles, grain, and wine. Pop. 41,000.

Perihelion, point in the orbit of a comet or planet (including the earth) at which it is nearest to the sun. See APHELION.

Perim, is, in the strait of Bab-el-Mandeb, 1½ m. from the coast of Arabia, and 96 m. W. of Aden, from which it is administered. The British occupied it in 1857 because of the Suez Canal and it remained a coaling station until 1936. There is no fresh water and little vegetation.

See also ADEN.

Perineum, that part of the external floor of the pelvis (q.v.) which lies between the anus and the vulva in the female and between the anus and scrotum in the male. It is a tough sheet of ligaments and muscles.

Perinthus, see under HERACLEIA.

Period and Periodicity. The word *P.* is often used in a limited sense to denote a definite length of time, e.g. a *P.* of hist. In its wider sense it denotes a continuous cycle of events which continually repeat themselves in a definite order. Thus take 3 events A, B, and C, A always occurring before B, and B before C, and then A, B, C again. The time, say, which elapses between the performance of A and its next performance is called the *period* of the events, which are termed *periodic*. Thus the succession of days may be termed periodic, the beating of the heart and breathing may also be termed periodic. The revolution of the astronomical bodies is treated as periodic. These illustrations are not *strictly* periodic owing to influences which vary in their action, but for all practical purposes they may be considered so. In electricity the term is applied to the repetition of an alternating voltage; in mechanics to the phases of a vibration or oscillation. The abstract science of mathematics supplies us with strictly periodic events. Thus in trigonometry the sine function goes through a series of values as the angle increases from 0° to 360°, and is then repeated in the same order from 360° to (360 × 2)°, and again to (360 × 3)°, the period in this case being 360°. This idea of periodicity, or the state of being periodic, is of paramount importance in the study of mathematics, simplifying the subject in a remarkable degree. The idea underlies all the theories of wave motion in sound, light, and electricity.

Periodic Functions, see FUNCTION.

Periodic Law. Newlands (1864) in formulating his 'law of octaves,' pointed out that if the chemical elements are arranged in order of their atomic weights, every eighth element shows strong resemblance. Lothar Meyer stated that 'the properties of the chemical elements are periodic functions of their atomic weights,' being led to this conclusion by a study of atomic volumes and chemical properties of elements. Mendeléeff boldly enunciated the P. L. to cover the observed data. The so-called law has been extremely useful in the correction of inaccurate atomic weights (e.g., beryllium) and as a stimulus towards the discovery of new elements (see GALLIUM). Exceptions to the law were suspected (e.g. tellurium and

iodine); the position of hydrogen was uncertain, etc. Recent work has shown that the law should be: 'The properties of the chemical elements are periodic functions of their atomic numbers' (q.v.). (See CHEMISTRY and ELEMENT.)

Periodic System, see CHEMISTRY.

Periodicals, see MAGAZINES and NEWSPAPERS.

Periostitis, inflammation of the periosteum or fibrous membrane investing the greater part of the surface of the bones. It may be due to injury or infection. In acute infective cases swelling and suppuration occur with considerable constitutional disturbance, and septicaemia may follow. Chronic *P.* may be due to infection from syphilis, tuberculosis, actinomycosis, or may be arthritic in origin. Osteitis (q.v.) and osteomyelitis (q.v.), affecting respectively the bone substance and the bone marrow, are conditions which may be associated with *P.* Any abscess formation must be drained surgically and, fortunately, antibiotic therapy nowadays has assisted considerably in reducing the severity of this disease.

Peripatetic (Gk *Peripatētikos*, walking about), name given to an ancient philosophical sect; so designated, it is said, from the circumstance of its founder, Aristotle, being accustomed to deliver his doctrines while walking in the grove of the Lyceum in the suburbs of Athens. Aristotle had a series of successors who taught his doctrines with some modification. The Peripatetic philosophy was introduced into Rome probably by Carneades, and from that time, or at least from the time of Sulla the dictator, it continued to be studied by a few learned men of leisure. See ARISTOTLE.

Peripatus, genus of worm-like, many-legged creatures, whose structural features suggest an intermediate character between worms and the higher Arthropods. They are found in Australia, Tasmania, New Zealand, S. America, and Africa, but are absent from Madagascar. They bear a number of short fat legs, and on the head are a pair of antennae and 2 simple eyes. From papillae at the sides of the mouth slime is emitted in jets to catch the prey and also for defensive purposes. See ONYCHOPHORA.

Periphrasis (Gk *peri*, around, *phrasein*, to declare), or circumlocution, means saying a thing in a roundabout way, e.g. 'The answer is in the negative,' for 'No.' As a figure of speech it may be used to give impressiveness to a thought, as in the lines:

'The very source and fount of day
Is flecked with wandering isles of night.'

-which is Tennyson's way of saying that there are spots on the sun. It may also be used for euphemism (q.v.), as in Mrs Browning's phrase describing Cowper's madness, 'Discord fell on the music of his soul.' See also FIGURE or SPEECH.

Peripteral, in Gk architecture, a temple surrounded by one row of columns.

Periscope, instrument that came into

prominence during the First World War, when it was necessary for submarine and trench observers to see without being seen. The diagram shows a toy P. consisting of 2 plane mirrors, A and B, each mounted at 45° to the axis of the tube in which they are fixed. An aperture enables light from an object to travel along OA to the mirror, where it is reflected to strike the mirror B. The light is reflected from

PRINCIPLE OF THE PERISCOPE

sight can be elevated for the observation of aircraft. The firm of Barr & Stroud Ltd. have brought the instrument to a high degree of perfection, in that they have made a P. with a tube of a few in. in diameter give an appreciable field of view with clear vision; they have produced binocular as well as monocular types, also they designed and manufactured the specially small P.s used on the midget submarines which crippled the *Tirpitz* in the Second World War. Submarine P.s may have means of estimating the course, speed, and distance of ships and may act as torpedo-directing telescopes. As they have necessarily a large number of optical parts, the use of anti-reflection films ('blooming') has effected a considerable increase in light transmission. See P. in *Dictionary of Applied Physics*.

Perissodactyla, one of the orders of hoofed quadrupeds, characterised by the possession of an odd number of toes on the hind foot, and by the presence of a third trochanter in the femur or thigh bone. There are 3 living families of P.: (1) Equidae or Horses; (2) Tapiridae or Tapirs; and (3) Rhinocerotidae or Rhinoceroses. In addition, there are a number of extinct forms. When horns occur in this sub-order they are always in the middle of the skull. See H. F. Osborn, *The Extinct Rhinoceroses*, 1898, and 'Monograph of the Titanotheres', *U.S. Geological Survey*, 1928.

Peristalsis, rhythmical wave-like muscular contractions which occur in certain hollow organs under the control of the involuntary nervous system and propel the contents along, e.g. in the alimentary canal during digestion and in the womb during childbirth.

Peristyle (Lat. *peristylum*, Gk *peristulos*, from *peri* about, and *stulos*, a pillar or column), in classic architecture, a range of columns around a building or courtyard; less correctly, a courtyard surrounded by columns.

Peritoneum, serous membrane, the largest in the body, forming a double-walled sac completely closed in the male. The visceral layer clothes all the viscera of the abdominal and pelvic cavities, and the parietal layer lines the inner walls of the abdomen, the space between the layers being filled with a film of fluid. The various organs or parts are enclosed in folds or *ligaments* of the P.; the *mesenteries* connect the vertebral column with the intestines; the greater and lesser *omenta* are also folds of P. Blood and lymph vessels are carried in the connective tissue of the membrane, which has a layer of pavement-shaped epithelial cells, between which are numerous openings through which the fluid, indistinguishable from lymph, escapes when in excess into the lymphatics. The great omentum contains some adipose tissue, which, when present in excess, causes abdominal corpulency; the omentum also acts as the 'abdominal policeman' by sealing off and localising infection. The serous fluid may also accumulate in certain diseases (see *CIRRHOSIS* and *LIVER*), and this condition is known as ascites (q.v.).

See also under **PERITONITIS**.

Peritonitis, inflammation of the peritoneum (q.v.). It occurs in the acute and chronic form, and may be local or general. The onset is sometimes difficult to distinguish from colic. Commencing with a local pain, it spreads all over the abdomen and becomes intense; the breathing is shallow and rapid, the pulse rapid, the temp. raised, and vomiting is an early symptom. The knees are often drawn up, the abdomen is rigid, and the face pinched, drawn, and anxious; cold sweats, thirst, and diarrhoea are other symptoms after the abdomen becomes swollen, due to fluid. P. is caused by infection of the peritoneum from pyogenic bacteria. The source of the infection is usually an abdominal organ such as an appendix, stomach, or gall bladder. P. is at first localised, but if left untreated it spreads and becomes generalised, leading to pus formation and a severe degree of toxæmia. Common causes of P. are infection from appendicitis and from the perforation of any part of the alimentary canal. Thus a gastric ulcer may perforate and the septic contents of the stomach leak out and infect the peritoneum. Penetrating abdominal injuries are another cause of P. A subacute form of P. is caused by tuberculosis (q.v.). Treatment consists in removing the cause of the infection and giving antibiotics.

Perityphlitis (Gk *peri*, around, *tuphlos*, blind), inflammation of the peritoneum (q.v.) or serous membrane, of the appendix and caecum, or blind portion of the large intestine. The term formerly included all those cases of intestinal inflammation now known as appendicitis (q.v.).

Perivale, see EALING.

Periwig, see WIG.

Periwinkle, or **Winkle** (*Littorina*), genus of pectinibranchiate gastropods found on most shores, where they feed on marine vegetation. Some occur at low-water mark, and others on rocks where the sea rarely reaches them. The common P. (*L. littorea*) is a popular article of diet, and some 2000 tons of it are consumed annually in London alone. This species hatches its young from jelly-like eggs laid on seaweed, but *L. rudis*, another Brit. species, retains its young until they have reached a considerable stage of development. The shell of P. is thick, spiral, few-whorled, and top-shaped, with a circular mouth or aperture.

Periwinkle (*Vinca*), hardy perennial herbs or sub-shrubs (family Apocynaceae). The large P. (*V. major*) and the lesser P. (*V. minor*) are handsome blue-flowered plants of considerable value for adorning shady positions in gardens where few flowering plants will grow. A number of handsome varieties with variegated leaves and purple or white flowers have been introduced.

Perjury, crime of wilfully making a false statement on oath as a witness (or interpreter) in a law court, such statement being *material* to the question in issue and made deliberately or without belief in its truth. It is for the judge to decide whether the statement was material, and for the jury to say whether the intention of the accused was to deceive. There can be no conviction for P. as a general rule upon the evidence of one witness alone as to the falsity of the accused's statement; there must be either 2 witnesses to contradict the accused, or one to contradict together with some other evidence materially corroborating the contradiction. The whole law of P. was consolidated in the Perjury Act of 1911. Penalties according to gravity of the P. range from fines to 7 years' imprisonment. The term *false swearing* applies to false oaths not taken in the course of judicial proceedings, e.g. false declarations with reference to marriages, births, or deaths, in bankruptcy matters, by a voter, etc. Such false oaths are punishable as P.

Perkin, Sir William Henry (1838-1907), chemist, b. London and educ. at the City of London School and the Royal College of Chemistry. He turned his knowledge of chem. to commercial uses. He is best known for his researches in the direction of dyes and coal-tar colourings, and sev. processes were invented by him. He may be said to have founded the coal-tar colour industry. See *Journal of the Chem. Soc.*, 69, 596, (1896), 'Origin of the Coal-Tar Colour Industry'.

Perkin Warbeck, see WARBECK, PERKIN.

Perlis, state of the Federation of Malaya (q.v.); formerly one of the Unfederated Malay States under Brit. protection, it lies on the NW. coast of the Malay Peninsula. Area about 310 sq. m. with a coast-line of 13 m. P. is bordered on the W. by a range of mts running N. and S., which separates it from the Siamese prov. of Setul; on the E. it is bordered by another Siamese prov. and by the state of Kedah; and on the S. by Kedah. Padang Besar on the main trunk line to Bangkok is the frontier railway station between Siam and Malaya. Striking features of the landscape are the isolated limestone hills which rise steeply from the plain. The P. R. is the only one of any size, and is navigable by small craft as far as Kangar, the cap. The present rajah of P. was b. in 1920 and succeeded to the throne in 1945. Rice and tin are the chief products and exports. Until 1821 P. was subject to Kedah, but when in 1841 Siam allowed the Sultan of Kedah to reassume the gov., P. was made an independent state under an Arab rajah. In 1905, at the request of the rajah, a European adviser was appointed to advise him in the finances and general management of the state. By a subsequent treaty, between Britain and Siam, his duties were transferred to a Brit. adviser of the Malayan civil service. By a treaty of 1930 between Britain and P. the latter agreed to continue under the protection of Great Britain as suzerain and to accept a Brit. adviser. Pop. 85,200.

Perlitic Structure, structure found in volcanic glasses, such as obsidian. By the contraction (on cooling) of the homogeneous mass, a system of reticulated and spiral cracks has been set up, giving the rock a finely globular character.

Perm', see MOLOTOV.

Permalloy, see NICKEL.

Permanent Court of International Justice, see INTERNATIONAL COURT OF JUSTICE.

Permanent Debt, see PUBLIC DEBT.

Permanganic Acid (HMnO₄) is obtained in the form of purple crystals by evaporating its aqueous solution under reduced pressure. The aqueous solution itself is made by the addition of dilute sulphuric acid to barium permanganate and filtering off the precipitated barium sulphate: Ba(MnO₄)₂ + H₂SO₄ = 2HMnO₄ + BaSO₄. P. A. is an unstable, compound readily decomposing to form manganese dioxide, water, and oxygen: 4HMnO₄ = 4MnO₂ + 2H₂O + 3O₂. It is very reactive and has powerful oxidising properties.

Permian, name given to the lower div. of the New Red Sandstone, which is derived from Perm in Russia, where the strata are well developed. The Brit. P. strata consist of red sandstones, concretionary limestones, shales, marls, volcanic and limestone breccias, and beds of gypsum and rock-salt. These strata are in general found connected with the areas of Carboniferous rocks, either fringing the coalfields conformably or resting unconformably on the Millstone Grit or Carboniferous Limestone. On the

E. side of the Pennines the P. rocks occupy a narrow stretch of country from the Tyne through Durham and York to the Trent. The P. on the W. side of the Pennines occurs in the Vale of Eden. In the midlands a coarse breccia rests upon a lower series of cornstones and sandstones, and is overlain by sandstones and marls. This breccia is believed to be due to torrential deposition. In Devon and Scotland the rocks are made up of breccias and sandstones, while those of N. Ireland are mainly marls and fossiliferous magnesian limestones. The fossils of the P. are chiefly Palaeozoic in type. The invertebrates include Brachiopods, Lamellibranchs, and Gastropods, which become stunted in the higher beds and finally disappear. The Amphibia, as in the Carboniferous period, belong to the Labyrinthodontia. Fishes such as *Palaeoniscus* also occur, and reptiles appear for the first time in these beds, e.g. *Proterosaurs* and *Parisaurus*. The flora of the P. is closely allied to the Carboniferous. *Pecopteris* and *Odontopteris* ferns of Carboniferous genera are common, as also are lepidodendrons and calamites. Cycads first appear in the P. rocks, and the strata contain characteristic plants such as *Psaronius* and *Walchia*. The P. of India and the S. hemisphere is characterised by *Glossopteris* and other Mesozoic types. In Germany the P. receives the name 'Dyassic', being made up of 2 groups, the Zechstein and Rothliegendes, the former having a bed of rock-salt at Spereberg which is 4000 ft thick. A vast area of P. is found in the Permian in Russia, and near the Urals the beds are of marine type. In Carinthia and Sicily the entire series is marine, containing a rich and peculiar fauna which is also found in the salt ranges of the Punjab. The *Glossopteris* flora of the P. of S. India, S. Africa, and Australia is often so abundant as to afford seams of coal. The existence of boulder beds in these rocks is evidence of glaciation in P. time. In N. America a fresh-water series is found in the Alloghenies and Appalachian and a marine development in Texas. The P. period was one of great earth movement, which brought about the isolation of the coalfields. Continental conditions prevailed over the S. hemisphere, and inland seas were formed over W. Europe from which beds of gypsum and rock-salt were derived. See R. L. Sherlock, *The Permian-Triassic Formations*, 1948.

Permittivity. When two charges, q_1 and q_2 , are placed a distance r apart in a medium, the force between them is $q_1 q_2 / r^2$. The constant ϵ is the absolute P of the medium, and if ϵ_0 is its value for a vacuum (or free space), the ratio ϵ / ϵ_0 is known as the dielectric constant or relative P . See DIELECTRIC.

Permutations and Combinations. The possible arrangements of n things taken r at a time are called *permutations*, and their number is expressed algebraically in the form $nPr = n(n-1)(n-2) \dots (n-r+1)$. The special case of the number of possible arrangements of n things taken n at a time, i.e. the number of ways in which n

things can be arranged, becomes $nPr = n(n-1)(n-2) \dots 3.2.1$. This expression is called *factorial n* and is written $n!$ or n .

The possible groups of n things taken r at a time, irrespective of the arrangements within the groups, are called *combinations* and are expressed algebraically as nCr , which is equivalent to $\frac{n!}{r!}$. The relation between nCr and nPr is seen from the fact that each group of r combinations is susceptible to $r!$ permutation within itself. For simplicity in calculation, when r is more than half n it is useful to realise that for each group of r things selected from among n things there is a corresponding group of $(n-r)$ things, so that $nCr = nC_{n-r}$. Proof,

$$nCr = \frac{n!}{r!} = \frac{nPr \cdot (n-r)!}{r!(n-r)!} = \frac{n!}{r!(n-r)!}$$

$$nC_{n-r} = \frac{n!}{(n-r)!} = \frac{nPr \cdot r!}{(n-r)!r!} = \frac{n!}{r!(n-r)!}$$

Pernambuco, state of NE. Brazil, on the Atlantic coast. The coast regions are low-lying, while the inland areas rise in a plateau. The former, known as Matos, are the forest regions. The chief products of the state are sugar, fruit, tobacco, cotton, coffee, all of which, with rum and rubber, are exported. The average yield of sugar from the P. cane is 65 tons per hectare, or 2½ ac. Maize, manioc or cassava, and other foods are cultivated for local consumption by the labouring classes. The chief port and cap. is Recife (q.v.), this name being used for the whole port, including São Antônio and Boa Vista. Area 37,458 sq. m. Pop. 3,395,185. P. wood is a variety of Brazil wood, which as a dye wood is exported in large quantities. This variety is the product of *Caesalpinia echinata*. The Sp.-Brazilian trade with the wealthy sugar prov. of P. was at its height in the first quarter of the 17th cent., when the Sp. and Portuguese crowns were united, and before the renewal of the Dutch war drove Sp. shipping from the S. Atlantic.

Pernettya, a genus of small evergreen shrubs, family Ericaceae, native to S. America; *P. mucronata* and varieties are esteemed for their profuse pink berries in autumn gardens.

Pernau, see PÄRNU.

Perov, see PÄRNU.

Perón, Juan Domingo (1895-), Argentine politician and dictator, b. near Lobos, a tn S. of Buenos Aires (q.v.). Educ. at military schools, he became a lieutenant at 20, and had further training in Germany. Between then and 1943 he was little heard of outside his own country; but on 4 June of that year he led a party of young Nationalist military officers in a successful coup d'état against President Ramón Castillo. From that time he was the power behind the president, although for a time he held no conspicuous office. In 1944, however, President Farrell appointed him to be war minister and then vice-president. In Feb. 1946 he was elected president on the Labour party platform and inaugurated in the following

June. With the help of his wife, Eva (d. 1952), P. had soon estab. himself as a demagogic, nationalist dictator. The press was rigidly controlled, the constitution subverted, and foreign business interests attacked. The living standard of the poorer people was raised by P., but the economic basis of his policy was unsound, and resulted in inflation and discontent. After the death of his wife, P.'s policy veered to an attack on the Catholic Church, and in the result discontented clericals and radicals combined with influential elements in the armed forces to bring about his fall. A characteristically worded attack on the opponents of his regime was made by P. at Santa Fé in Sept. 1948, with prin. reference to the opposition of the Radical party to proposals for the reform of the constitution which had been passed by the 'Peronista' majority in Aug. 1948. He identified his opponents as 'all who are rich, those who do not work, those who are professional politicians, and those who defend the interests of foreign capitalistic trusts,' adding that though for the past 2 years he had called for 'peace and co-operation' he would 'speak with a firm voice on the day I order them' (his opponents) 'to be hanged.' P. was overthrown by a revolution in 1955 (see ARGENTINA, History), and he at present (1957) lives in exile in another part of S. America. He still enjoys considerable influence in Argentina, however. See Fleur Cowles, *Peron's Argentina*, 1952; G. I. Blanksten, *Peron's Argentina*, 1953; T. Owen, *Peron: His Rise and Fall*, 1957.

Péronne, Fr. tn in the dept of Somme, 22 m. SSW. of Cambrai. It was the scene of the signing of a treaty forced by Charles the Bold of Burgundy on Louis XI in 1468, and was captured by Wellington in 1815 and by the Germans in 1871. In the First World War it was twice in Ger. hands, and was almost completely destroyed; it was afterwards rebuilt. There is a woollen industry. Pop. 4000.

Perosi, Lorenzo (1872-1956), It. priest and composer, b. Tortona. He studied music at the Conservatory of Milan. He became choirmaster at St Mark's, Venice, in 1894, and afterwards director of the Sistine Chapel in Rome in 1898. In 1905 he was nominated perpetual master of the Pontifical Chapel. Most of his music is sacred, his fame resting principally on his masses and oratorios. See studies by A. Damerini, 1924; A. Pagliarunga, 1952, and M. Gliński, 1953; also Z. Musmeci, *Don Lorenzo Perosi e le sue opere*, 1932.

Pérotin, Perotinus Magnus (12th cent.), Fr. music scholar, see FRENCH MUSIC.

Pérouse, La, Jean François de Galaup, Comte de (1741-88), Fr. navigator, b. near Albi. He served with distinction during the war with England (1778-83), especially on the E. coast of Canada and in Hudson Bay, where he captured Forts Prince of Wales and York (1782). In 1785 he set out from Brest to discover the NW. passage and also to explore the NW. coasts of America and the NE. coasts of Asia, as well as the China and

Japan seas, the Solomon Is., and Australia. He reached Mt St Elias in Alaska and visited the Hawaiian Is., discovered Necker Is., and then crossed over to Asia, where after exploring the coasts of Japan, Korea, and Chinese Tartary, he discovered La P. Strait between Saghalien and Yezo. In 1788 he sailed from Botany Bay, after which all trace of him was lost until 1828, when wrecks were discovered N. of the New Hebrides by Dumont d'Urville. They were brought back to France, and are in the marine museum of the Louvre. See M. Mureau, *Voyage de la Pérouse autour du monde* (4 vols.), 1797.

Pérouse Island, La, see LORD HOWE ISLAND.

Pérovno, tn in the Moscow Oblast of central Russia, an industrial suburb 6 m. SE. of Moscow. It has engineering and chemical industries and sov. research institutions, mainly in agriculture. In the 1930's it absorbed Kuskovo (q.v.). Pop. with Kuskovo (1956) 132,000 (1926, 24,000; 1939, 78,000).

Perowne, John James Stewart (1823-1904), divine and scholar, b. Burdwan, Bengal. Bishop of Worcester from 1891 to 1901. He was a biblical scholar and exegetist and wrote a work on the Book of Psalms. He lectured on theology at Trinity College, Cambridge, and ed. the *Cambridge Bible for Schools*. He was made canon of Llandaff in 1869, and dean of Peterborough in 1878. Other works of his were *The Labours and Strength of the Christian Ministry*, 1857; *Immortality*, 1869; and *The Doctrine of the Lord's Supper*, 2nd ed., 1887. He also ed. the *Letters and Remains of Bishop Thirlwall*, 1877.

Perpendicular Architecture, see ENGLISH ARCHITECTURE.

Perpetual Cure, see CURATE.

Perpetual Motion has been sought by many earnest experimenters in the past, in spite of its scientific impossibility. A P. M. machine would be one that moved and continued to move for ever without receiving any supply of energy from an external source. The requirements of such a machine are either that it shall be perfectly frictionless, or if friction is present, that the machine shall create energy in order to overcome the friction. The first requirement, complete absence of friction in a real machine, is impossible, and the second violates the law of conservation of energy, which states that the total energy of an isolated system is constant; it can neither be increased nor decreased. In other words, energy can neither be created nor destroyed (see, however, ENERGY). The only hope of discovery of P. M. lies in the discovery of an exception to the law of conservation of energy, and although no scientific law is dogmatic, this law is based on the reliable and patient experiments of generations of scientists. The interconvertibility of mass and energy in no way invalidates the arguments against the possibility of P. M. The required 'creation' of energy would be at the expense of the mass of the machine, which could not therefore

continue for ever. Many examples of attempts to produce P. M. are given in E. da C. Andrade's book, *Engines*, 1928.

Perpetuity. Eng. law regards as null and void any tying-up of property, real or personal, beyond the period of a life or lives in being and 21 years (together with a further period for gestation, where, in the particular case, it actually exists) afterwards. In other words, any marriage settlement, will, or other instrument providing for the future destination of property must ensure that the property shall in any conceivable event ultimately vest in possession within the above-stated period: e.g. a gift by will in trust for X for life, and after his death to such of his children as shall reach 21 years of age to vest in them respectively at that age, is valid; but to A for life, and after his decease to such of his children and grandchildren as shall reach 21, is void as a P.; for though any children of A must, if they reach 21, necessarily do so within 21 years of A's death, some of the grandchildren might not. Any limitation void as a P. fails altogether, and hence, in the above example, the whole devise to the class made up of both children and grandchildren would fail. See also LIMITATION OF ESTATES; LAND LAWS.

Perpignan, Fr tn, cap. of the dept of Pyrénées-Orientales, on the Têt. It was the anct cap. of Roussillon (q.v.), estab. on the site of the Rom. Ruscino, where the E. route to Spain crosses the Têt. It is the seat of a bishopric. There is a vast citadel, partly by Vauban (q.v.) enclosing the castle of the Kings of Majorca. The fine Gothic cathedral was begun in 1324, and there are many other anct buildings. P. is an important commercial centre for wine, fruit and vegetables, and manufs. textiles and paper. Pop. 70,050.

Perranzabuloe, par. of Cornwall, England, 51 m. NW. of Truro. Here is 'St Piran's Oratory,' built in the 5th cent., discovered in 1835 after being buried in sand for centuries, and now enclosed in a concrete shell for preservation. About 1150 a second church was built here, but was also enveloped, and the present par. church was erected (1804) more than 2 m. inland, largely from parts removed from the second church. Perranporth, the prin. centre of pop. in the par., is noted for its 3-m. stretch of sandy beach. Pop. 3300.

Perrault, Charles (1628-1703), Fr. writer, b. Paris. In 1651 he became a member of the Paris Bar, and under Colbert was appointed controller-general of the royal buildings. In 1671 the influence of Colbert procured for him an entrance into the Fr. Academy, where he introduced sev. important reforms. His name was first made well known by his famous controversy with Boileau regarding the comparative merits of the ancients and moderns. P. contributed to the quarrel in a poem entitled *Le Siècle de Louis le Grand*, which, read before his confrères of the Academy in 1687, was intended to prove that modern authors were superior to the ancients. It was

followed by *Parallèles des anciens et des modernes* (4 vols. 1688-97), and *Hommes illustres du siècle de Louis XIV* (1696), containing 200 critical biographies. But the work that has far more than any other preserved his name is his fairy tales collected as *Contes de ma mère l'Oye*, 1697. The individual titles are *La Belle au Bois Dormant*, *Petit Chaperon Rouge*, *La Barbe Bleue*, *Le Chat Botté*, *Les Fées*, *Cendrillon*, *Riquet à la Houppe*. P. has no claim to the invention of the subjects; but his skill in adjusting style to matter could not easily be rivalled, much less exceeded.

See P. Saintyves, *Les Contes de Perrault*, 1923.

Perrault, Claude (1613-88), Fr. architect, b. Paris, brother to Charles. He was by profession a physician, but abandoning this became the architect of the Louvre, his colonnade (1664) ranking among the finest buildings of the 17th cent. He also designed the Observatory at Paris, c. 1667, trans. Vitruvius's *De Architectura*, 1673, and helped his brother in the writing of his *Mémoires*. See A. Hallays, *Les Perrault* (2nd ed.), 1926.

Perret, Auguste (1874-1954), Fr. architect, b. Brussels. He was a pioneer of reinforced-concrete construction. After studying at the Ecole des Beaux Arts, Paris, he began practice c. 1897 with his brother Gustav, b. 1876. Their chief works were the Casino at St Malo; the Champs Elysées Theatre, Paris; remarkable churches at Raincy (1922) and Montmagny (1925) near Paris; the Museum of Public Works and the National School of Music, both in Paris; and Mariagnan Airport, 1947. P. was awarded the R.L.B.A. Royal Gold Medal, 1948.

Perrin, Claude Victor, see VICTOR.

Perrin, Jean Baptiste (1870-1942), Fr. physicist, b. Lille, noted for his studies of the structure of matter and the equilibrium of sedimentation. In 1924 he received the Nobel prize for his work on these subjects. His works include *Traité de chimie physique* (vol. 1), 1903; *Les Atomes*, 1913; and *Les Éléments de la physique*, 1930.

Perron, in architecture, a platform outside the entrance-door of a building, with steps leading up to it, often in a double flight.

Perry, Matthew Calbraith (1794-1858), Amer. naval officer, b. Newport, Rhode Is., U.S.A. As commander of the *Fulton*, the earliest steam warship (1837), he is sometimes called the 'father of the steam navy' of America. In 1843 he commanded the African Squadron organised to put down the slave trade, and in 1846-7 he served in the Mexican war, in which his squadron seized Frontera, Tabasco, and Laguna. But his chief title to fame is that he led an expedition in 1853 to Japan and negotiated a treaty which in effect reopened communication between that country and the rest of the world after 250 years of isolation. This treaty between Japan and America, which was signed on 31 Mar. 1854, granted America trading rights at Hakodate and Shimoda. It was ratified at Shimoda on 21 Feb.

1855. His report, pub. by the gov. in 1856, was entitled *Narrative of the Expedition of an American Squadron to the China Seas and Japan*.

Perry, Oliver Hazard (1785-1819), Amer. naval captain, who held various commands during the war of 1812. He had charge of the Lake Erie squadron, and defeated Capt. Robert Barclay, who had served with Nelson, at the battle of Lake Erie. P. took an important part in the operations of Detroit, and at the battle of the Thames. He was honoured by the thanks of Congress. He commanded the *Java*, 44 guns, in 1816-17, and cruised in the Mediterranean. In 1819, while in command of a small fleet on a mission to Venezuela, he d. of yellow fever.

Perry, alcoholic liquor which is manufactured from certain varieties of pears as cider is from apples. It is sweet and of a pale colour, and contains from about 3 to 8 per cent of alcohol. It is made chiefly in England in the cos. of Gloucester, Hereford, Worcester, Somerset, and Devon.

Perryville, vil. in Boyle co., Kentucky, U.S.A., the scene of Gen. Braxton Bragg's unsuccessful campaign against Union forces under Gen. D. C. Buell. Near by is P. Battlefield State Park.

Perse School, Cambridge, was founded in 1615 under the will of Stephen P., fellow of Gonville and Caius College. It is now a direct grant school governed under a scheme of 1910 (amended 1918 and 1921). A girls' school was estab. in 1881.

Persea Grattissima, see AVOCADO PEAR.

Persecution, attempt to suppress obnoxious opinions, chiefly in the field of religion, by temporal punishment, sometimes including the death penalty. The early Christians underwent much P. from the Jews, and the Rom. Gov. The number of P.s suffered under the Rom. emperors is usually somewhat artificially reckoned as 10: under Nero, AD 64; Domitian, 85; Trajan, 107; Hadrian, 135; Marcus Aurelius, 165; Septimius Severus, 202; Maximinus, 235; Decius, 249; Valerianus, 257; Diocletian, 303. Others omit Hadrian and insert Aurelian, 275. When Christianity became the state religion there was much P. of the Catholics by the Arians, and by the Catholics of the various heretical sects. In the Middle Ages P. was freely used as a weapon against the spread of heretical and subversive opinions, as in the case of the Cathari and Albigenses. The Protestant reformers used the same methods. The cases of Servetus at Geneva, and of the Quakers in New England, are classic examples. The Jews (q.v.) have suffered severe P.s throughout Europe at different times, millions being massacred under Hitler's regime. The most terrible P.s carried out in this cent. have, however, been conducted by Communist regimes against their political opponents, against deviationists from the strict party line, and against those who, however faithful, have fallen into disfavour for any reason, and who become convenient scapegoats.

Perseid Meteors, popularly designated as 'sparks from St Lawrence's gridiron,' are a swarm of meteors moving round the sun in a retrograde and elongated orbit. This orbit is intersected by that of the earth about 10 Aug. each year, with the result that a shower of 'shooting-stars' comes from a *radiant* in the constellation Perseus. An intermittent display of Perseids continues for about 3 weeks before and after that date, showing that the swarm must be about 30,000,000 m. in width. It was shown in 1866 by the It. astronomer, Schiaparelli, that the orbit of the P. M. is probably identical with that of Tuttle's comet (1862) and that the meteors are the cometary debris striking the earth's atmosphere. See METEOR.

Persephone, see PROSERPINA.

Persepolis, anct city of Persia, 40 m. NE. of Shiraz, now in ruins, became the cap. of the Persian Empire under Darius I. Considerable ruins remain from Darius, Xerxes, and Artaxerxes. Alexander, on his march through Persia, spent 4 months in P. Towards the end of his stay the city was burnt; Alexander, as the story goes, setting fire to the palace with his own hand at the end of a revel, at the instigation of the courtesan Thais, 331 BC. Some, however, suppose that the burning of the city may have been deliberately ordered. See also PERSIA, *Antiquities*, PERSIAN ART. See E. F. Schmidt, *The Treasury of Persepolis*, 1939.

Perseus, son of Zeus and Danaë (q.v.), the daughter of Acrisius, King of Argos. Polydectes, King of Seriphos, in love with Danaë, sent P. on the quest for the head of Medusa the Gorgon (q.v.). He got this with the help of Athena and Hermes. On his way home P. rescued Andromeda from a sea-monster and married her. Returned to Seriphos, he found that his mother had taken refuge in a temple to escape the attentions of Polydectes, whom he promptly turned to stone with the Gorgon's head. He then took his wife and mother to Argos, whence he travelled to Larissa and accidentally killed Acrisius (q.v.) with a discus. Thus was fulfilled the prophecy made before his birth. P. was successively King of Argos and Thyrus; the foundation of Mycenae (q.v.) is attributed to him. See E. S. Hartland, *The Legend of Perseus*, 1894-6; and J. M. Woodward, *Perseus: a Study in Greek Art and Legend*, 1937.

Perseus, anct N. constellation (between Taurus and Cassiopeia) rich in astronomical interest; see also NOVAE, and PERSEID METEORS. In the head of Medusa (in the W. of P.) is the well-known short period variable Algol or β Persei (q.v.).

Perseverance of Saints, doctrine necessarily resulting from the predestinarian doctrines of Luther and Calvin (q.v.). It is supported by other doctrines too, those of election, the atonement, intercession, and mediatorial dominion of Christ, imputed righteousness and regeneration; and also by quotations from Scripture, which declare eternal life to be

always connected with believing, and encourage the believer to depend on the faithfulness, love, and omnipotence of God. To the objection that it might tend to make men careless concerning virtue and holiness, its advocates reply that P. of S. is perseverance in holiness, giving no encouragement to a confidence in final salvation which is not connected with a present and even an increasing holiness.

PERSEUS HOLDING THE HEAD OF
MEDUSA

Statue by Benvenuto Cellini.

Pershing, John Joseph (1860-1948). Amer. soldier, b. Laclede, Missouri; the commander-in-chief of Amer. Forces in France in the First World War. He was the son of a foreman platelayer on the railway. On leaving school at Kirksville he worked in a general store, and after successfully competing in an examination for cadetships to the U.S. Military Academy he was posted to the 6th U.S. Cavalry. He was then assigned as military instructor at the univ. of Nebraska, and, later, as teacher of tactics at the U.S. Military Academy. Having served in Cuba and the Philippines, he was promoted brig.-gen. in 1906 and major-gen. in 1913; when the U.S.A. broke off diplomatic relations with Germany early in 1917, P. was given command of the Amer. forces. He found himself in disagreement with the allied commanders as to the distribution of his troops. But so grave had the military situation become during the great Ger. offensive on the Somme and Lys in Mar.-April 1918 that he was compelled for a time to place his

troops unreservedly at Foch's disposition. P. conducted 2 major operations. In Sept. 1918 in one battle he 'fattened' the famous salient at St. Mihiel (q.v.) which the Germans had held throughout the war. He then wished to advance on Metz, but was overruled by Foch and assigned the difficult terrain of the Meuse-Argonne, where the battle raged through the autumn months until, on 7 Nov. 1918, Amer. troops were in sight of Sedan. On 1 Sept. 1919 the administration showed its appreciation of his services by making him a full gen. of the Amer. Army, a rank which had only been held by 4 men before, Washington, Grant, Sherman, and Sheridan. In 1921 he became chief of staff of the army, and retired in 1924. P.'s greatest quality was resolution; as a strategist he had little subtlety, nor did he at first appreciate the resilience of the Ger. defensive system. His organising ability was great, and his confidence unshakable. His own story has been told in his book, *My Experiences in the World War*, 1931.

Pershore, mrkt tn in the co. of Worcester, and 9 m. SE. of the city of that name, on the Avon. It contains 2 churches, that of St Andrew's, small and anct, and the church of the Holy Cross, in Norman and Early Eng., with a lofty square tower. This church is the only remaining portion of the anct abbey-church of the same name. The inhab. are chiefly employed in manufacturing agric. implements, and in raising fruits and vegetables for the markets of the large manufacturing tns in the vicinity. Pop. 4500.

Persia (Iran), kingdom of W. Asia, comprises 628,000 sq. m., and extends some 1400 m. from NW. to SE. and some 875 m. from N. to S. It is bounded in the W. by Turkey and Iraq, in the SW. and S. by the Persian Gulf and the Gulf of Oman, in the E. by Baluchistan, Afghanistan, and the U.S.S.R., and in the N. by the U.S.S.R. and the Caspian Sea. The name changed from Persia to Iran in 1935, reverted to Persia in 1942, and is now again Iran. P. consists mainly of a tableland ringed by high mts, with narrow lowland strips bordering the Caspian Sea and the Persian Gulf, the former varying from 10 to 70 m. in width. The Zagros Mts extend in an arc from Armenia to Baluchistan in a series of parallel ranges trending from NW. to SE. In the NW., which is stony, undulating country with the main centres of pop. in the larger riverine tracts, are a number of downthrow basins, including that of Lake Reza'iyeh, which covers 20,000 sq. m., and numerous volcanic cones, such as Mt Savalan (14,000 ft). From the mts of Kurdistan, the Diyala and Karkheh rive. flow into the Tigris. In the central part of the Zagros, extending to Bandar Abbas, the dominant feature is folding, not faulting as in the NW., and the drainage follows a complicated pattern; sev. peaks rise to over 13,000 ft, notably in the Bakhtiari country. The valleys are mostly covered with vegetation, and in parts are wooded; cultivation is possible

where water is available; the bulk of the pop. of this region is, however, pastoral. To the SW. of the central Zagros lies a flat alluvial plain watered by the Karun R., which is joined below Shushtar by the Ab-e Dez. The Karun, which enters the Shatt ul-Arab at Khorramshahr, is navigable to Ahvaz by ocean-going steamers. The SE. part of the Zagros consists of a plateau of an average elevation of 6000-7000 ft rising from a narrow coastal plain; from Bandar Abbas to Jask the direction of folding is from N. to S. At the E. end of the Zagros is the Jaz Murian basin, the lowest part of which has an elevation of

Sanandaj. The Gorgan R., rising in Khorasan, enters the E. end of the Caspian Sea after a course of some 200 m. On the E. side of the central plateau, between the Kopet Dag and the Zagros, lies an irregular highland region of barren jagged peaks, drifting sand, and great extremes of climate, and to the S. of it the basin of the Helmand R., which formerly grew much grain. The central plateau contains a number of closed basins, the lowest parts of which have an elevation of 2000-3000 ft, except in the SE., where they fall to 1000 ft. The Dasht-e Kavir and the Dasht-e Lut

A ROAD IN KHORASAN PROVINCE

E.N.A.

1000 ft. The Jaz Murian is divided from the central plateau by a ridge of high land with an average height of 4000 ft with Mt Baznan (11,000 ft) and Mt Taftan (12,000 ft), a dormant volcano, in the E. The SE. Zagros is a desolate country of bare rocks and sand-dunes, with cultivation, mainly date groves, only where water is available. The N. highlands run between the Caucasus and the Hindu Kush, and consist of the Elburz and the Kopet Dag. The Elburz rise in a series of steep narrow folds from the S. borders of the Caspian Sea, which is 88 ft below sea-level; the highest peak, the volcanic cone of Mt Damavand, rises to over 18,000 ft. The N. slopes of the Elburz are well-wooded up to 7000-8000 ft with deciduous forests; close to the Caspian shore is a zone of sand dunes and lagoons. The Kopet Dag to the E. of the Elburz joins the Parapamisan range in Afghanistan. The Safidrud R. enters the Caspian Sea E. of Rasht after a tortuous course of nearly 500 m. from near

deserts stretch across the central, E., and SE. part of the plateau. The fauna of P. is predominantly Palaearctic, except in Baluchistan and on the shores of the Persian Gulf, where Indian and Indo-African forms are found. On the plateau the fauna includes wild boar, foxes, jackals, badgers, hares, leopards, wolves, ibex, moufflon, bears, wild asses, frogs, toads, tortoises, lizards, some snakes, and game birds of great variety. The climate is one of extremes, great variations in rainfall, and high winds, especially in the SE. Summer temps. are high, with, on the plateau, a rapid fall of temp. at night; the winters are cold. The mean day maximum in July at Tehran is 99° F., Mashhad 92° F., and Kerman 101° F.; in Sistan the temp. may rise to over 120° F. and in the region of the Persian Gulf over 125° F. has been recorded. The average Jan. temp. on the plateau is 35° F. in the N. and NW. and 45° F. in the S. and E. In the NW. temps. below 0° F. are not unusual. Heaviest

rainfall is in the NW. Zagros and on the N. side of the Elburz. In the W. the Caspian littoral has an ann. average rainfall of 50-60 in., but only 20 in. in the E. The Kopet Dag and the SE. Zagros have under 10 in. On the plateau rainfall varies between 9 in. in Tehran, approximately 5 in. in Isfahan and Kerman, 7-8 in. in Khorasan, and 2½ in. in Sistan. In the N. (the Caspian provs. excepted) the maximum rainfall is in Mar., but in the S. in Dec. to Jan. Heavy snowfalls are common on the plateau in winter. The air is dry on the plateau, but on the Caspian and the Persian Gulf humidity is high, having a winter maximum in the former region and a summer maximum in the latter. The prevailing winds are NW. and SE. The main crops grown on the plateau are wheat, barley, millet, maize, lucerne, pulses, cotton, tobacco, opium, sugar beet, vegetables, fruit of different kinds, and vines; various gums are also cropped. Rice is grown in Gilan and in small quantities elsewhere where abundant irrigation water is available, notably Lenjan (near Isfahan), Mianduh, and parts of Khuzistan; dates are grown in S. P. Silk is produced mainly in the Caspian provs. Irrigated farming is the dominant type of cultivation, and, except in the Caspian littoral, water is the limiting factor, whether irrigated or dry farming is practised. Irrigation is by rivs., underground channels (*qanat*), and wells. Dry farming is practised on the Caspian littoral for crops other than rice, in considerable areas of Azerbaijan, and to a lesser extent in Khorasan, Kurdistan, and Pers. Stock-raising is important, especially among the semi-nomadic tribes.

POPULATION. The census taken in 1956 put the total pop. at 18,944,821. It is irregularly distributed, being concentrated mainly in the large riverine tracts, riv. and mt valleys, and on the inside slopes of the Zagros and Elburz. The density over the country as a whole is under 25 to the sq. m. The main tns are Tehran, the cap., with a pop. which has grown rapidly in recent years to 1,513,200, Tabriz (290,000), Isfahan (254,900), Mashhad (242,200), Abadan (226,100), Shiraz (169,100), Kermanshah (125,200), Ahvaz (119,800), Rasht (109,500), Hamadan (100,000), Qum (95,500), Reza'iyeh (67,600), Yazd (66,500), and Qazvin (66,400).

Oil. The Khuzistan oil deposits lie on the W. flank of the Zagros. Oil occurs in dome-like anticlines, which are among the largest oil structures in the world. The first of the 6 fields in this area to come into production was the Masjid-i Sulaiman field, where oil was found in 1908; commercial production started in 1912 and was increased after 1918. The Haft Kel field was developed in 1928, and other fields during or after the Second World War. A pipeline goes from Masjid-i Sulaiman to the oil refinery in Abadan, which by the end of the Second World War had an ann. capacity of 25,000,000 tons. A smaller field has been developed at Naft-i Shah, which lies close to Naft Khaneh on the Iraqi side of the frontier,

and from it oil is taken by pipeline to a refinery at Kermanshah. The oil deposits of S. P. were formerly exploited by the Anglo-Persian (later Anglo-Iranian) Oil Company, which took over in 1909 the concession granted to W. K. D'Aroy in 1901 by Muzaffar ud-Din Shah. The Brit. Gov. acquired a controlling interest in 1914. The concession was granted for 60 years; its area originally covered all P. except the 5 N. provs.; 16 per cent of the net profit was to be paid in royalties to the Persian Gov. After the world slump of 1929-30, the price of oil fell and profits declined. In 1932 Reza Shah denounced the concession. The matter was referred to the League of Nations, but eventually settled by negotiation between the company and the Persian Gov. Adjustments were made in royalty payments, the concession area was reduced from 480,000 sq. m. to 100,000 sq. m. in SW. P., and the concession was renewed till 1993. During the Second World War special arrangements with regard to royalty payments were made to prevent them falling below a certain figure; in 1948 negotiations were opened with the A.I.O.C. for a revision of the royalty terms. The negotiations failed, and in April 1951 the oil industry was nationalised and the A.I.O.C. expropriated. Production ceased pending a settlement of the dispute. Negotiations for the settlement of the oil dispute were eventually reopened, and an agreement was signed in Sept. 1954 between the Persian Gov., the National Iranian Oil Company, and an international consortium formed by the Gulf Oil Corporation, Socony Vacuum Oil Company Inc., Standard Oil Company (New Jersey), Standard Oil Company of California, and the Texas Company (each 8 per cent), Royal Dutch Shell (14 per cent), Compagnie Française des Pétroles (6 per cent), and Brit. Petroleum (40 per cent). In the first 11 months of the new agreement P. received over £26m. from the operation of its oil industry in Khuzistan. Payments for 1956 were £54.3 million. The production of crude oil rose in the following year to 34,800,000 tons. In 1957 an agreement was signed between the N.I.O.C. and an It. company for the exploration and development of oil in Makran and the Zagros mts and off-shore oil in the Persian Gulf. Agreements were signed in 1958 with various Amer. companies and the Canadian Sapphire Co.

MINERALS. Other than oil, deposits include gold, silver, lead, copper, antimony, nickel, cobalt, zinc, manganese, borax, ochre, potash, iron, and coal. Copper is worked at Anarak, near Yazd. The main coal mines are at Shomshak and Zirab. Red oxide is produced at Hormuz Is. Salt pits are numerous. P. was formerly noted for its turquoise and other precious stones, the former being worked at Nishapur. All sub-soil rights belong to the State.

INDUSTRY. After oil the main industry is the textile industry. Locally grown cotton is supplied by the State to the mills, the main concentration of which is at

Isfahan; Shahi, where the mills are state-owned, Tabriz, Yazd, Shiraz, Kerman, and a few other towns also have mills. There is a state-owned silk factory at Chalus. Fabrics of many kinds are also made as home industries. The manufacture of carpets is largely carried on as a home industry. The State runs a number of sugar-beet factories, a fruit- and meat-canning factory at Shahi, plants for cleaning rice and tea, and, in Tehran, a tobacco factory, cement factory, soap factory, a copper refinery, and various other industrial undertakings. There

to Kermanshah was constructed by the Brit. Expeditionary Force in Iraq, and in S. P. the Brit. forces constructed a motor road from Borazjan to Shiraz. Under Reza Shah road building was energetically prosecuted. The road system was further improved during the Second World War, and there are some 17,000 m. of roads of various types. After the war the road system fell into disrepair, but is now being repaired and extended under the supervision of the Ministry of Roads and the Seven-Year Plan organisation. Motor-bus services connect the large towns.

Imperial Embassy of Iran

THE ALBURZ OIL WELL IN QUM

is a glass factory in Tehran, and a number of match factories and soap factories in different parts of the country. The main centres of the tanning industry are Hamadan, Tabriz, and Tehran. There is a steel works at Karaj. The Caspian fisheries, formerly exploited by a Russo-Persian firm under a concession which expired in 1953, are run by the State, which also owns a fish-canning factory in Bandar Abbas.

COMMUNICATIONS. Trade routes between E. and W. have since early times passed through P.; during the 18th and 19th cents. the roads decayed. A road from Rasht to Tehran via Qazvin was constructed by a Russian company under a concession granted in 1893. A Brit. company improved the old mule track from Isfahan to Ahvaz (the Lynch Road) under a concession obtained in 1897. In 1918 a metalled road from Khanagín

Motor transport has largely replaced pack animals. The Trans-Iranian Railway (total length 865 m.) from Bandar Shah, on the Caspian Sea, to Bandar Shapur, on the Persian Gulf, was officially inaugurated in 1938. The line runs via Tehran, Qum, Arak, and Ahvaz; branch lines to Tabriz, Mashhad, and Kerman are under construction. A railway line runs from Tabriz to Julfa and from Zahedan to Mirjawa. The main ports are Bandar Shah and Pahlavi on the Caspian Sea, and Khorramshahr, Bandar Shapur, Bushire, and Bandar Abbas on the Persian Gulf. Aerial transport was instituted in 1926, and run till 1932 by the Ger. Junkers firm. Iranian Airways now operates services between the prin. tns. Air France, K.L.M., and various other companies run services to Tehran. Telegraphic communication in P. began about 1860, and the lines operated by the

(Brit.) Indo-European Telecommunications Company were an important link in communications between Europe and India; the company withdrew almost completely from P. in 1931. The telegraph system, run by the State, now covers about 11,300 m.: telephones are controlled by sev. small companies, but principally by the Société Anonyme de Téléphones Perso. There are also stations for wireless telegraphy. The Tehran broadcasting station was opened in 1940, the first of a network to be distributed over the whole country. Postal services are operated by the State throughout the country.

GOVERNMENT. Constitutional parl. gov. was set up in P. under the royal proclamation issued by Muzaffar ud-Din Shah on 5 Aug. 1906. This and the Fundamental Laws of Dec. 1906 and the Supplementary Fundamental Laws of 7 Oct. 1907 are the basic documents of the Persian Constitution. The legislative power is vested in the National Consultative Assembly, which is elected by universal male suffrage for a period of 4 years and numbers 136 members. The country is divided into constituencies, some of which are plural; Jews, Zoroastrians, and Armenians have special representation. The internal grouping of the National Consultative Assembly is not based on political parties. The National Consultative Assembly alone has power to impose, reduce, or abolish taxes, make appropriations, approve loans, and grant concessions. Its other rights include the initiation of legislation, direct representation to the Shah, and, in certain circumstances, the demanding of the dismissal of a minister or ministers. Treaties and covenants are subject to the approval of the National Consultative Assembly, with the exception of treaties which for reasons of state and the public advantage must be kept secret. Provision was made in the Fundamental Laws for a Senate, but this was not convened until 1950. It consists of 30 elected members and 30 members nominated by the Shah. Its members hold office for 6 years. Bills, except financial bills, are referred from the National Consultative Assembly to the Senate for approval. Measures after approval by both chambers receive the royal assent and then have the force of law. The constitution was amended in 1949 to give the Shah power to dissolve one or both chambers, subject to his stating his reason and simultaneously ordering new elections so that the new chamber or chambers could convene within 3 months. Dissolution may not be ordered twice for the same reason. The executive power appertains to the Shah, who is, however, exempted from responsibility, all laws and ordinances being carried out in his name by ministers and state officials. Gov. is by cabinet, which is outside, but responsible to, the legislature. The appointment and dismissal of ministers are effected by royal decree, the Prime Minister being appointed on the recommendation of the National Consultative Assembly. The cabinet includes ministers of the interior, finance,

war, justice, foreign affairs, agriculture, health, education, commerce, labour, national economy, posts and telegraphs, and roads, and may include also ministers without portfolio. The minister of court is not a member of the cabinet. Laws, drafted in the ministries concerned, are laid by the responsible minister before the National Consultative Assembly for acceptance or rejection. Administratively the country is divided into 11 provinces (*ostans*), each under a governor-general, and 3 independent governorates. These are subdivided into *shahrestans*, centred upon some important tn, with a governor in each, and further subdivided into *bakhsh's* and *dehestans*. The majority of tns under the law of 1930 have elected municipal councils and levy municipal taxes.

Muhammad Reza Pahlavi, the present Shah, married in 1939, when crown prince, the sister of Farouq (then king of Egypt), Fawzieh, by whom he has one daughter. He divorced Queen Fawzieh in 1948, and in 1951 married Queen Soraya whom he divorced in 1958. There is no heir apparent; all the Shah's surviving brothers are automatically excluded from the succession by the constitution as amended in 1925 to exclude from the succession anyone with Qajar blood.

DEFENCE. The armed forces, of which the Shah is Commander-in-Chief, consist of the army, navy, and air force. For administrative purposes they come under the ministry for war. The Conscription Act of 1925 introduced compulsory military service, which is normally for a period of 2 years, except for univ. graduates, who serve for 1 year. The main garrisons are in Tehran and the prov. caps. A U.S. military mission is attached to the army, which is in the process of reorganisation. The navy comprises a number of gunboats on the Persian Gulf and the Caspian Sea. A small air force is attached to the army. A staff college, officers' training college, and a number of schools are run by the ministry of defence. Internal security in the tns is the responsibility of the police, and in the rural dists. of the gendarmerie, both of which are under the ministry of the interior.

JUSTICE. Prior to the constitution there were 2 systems of law, the religious law (the *shari'a*) and customary law (*urf*). By the Law of the Principles of the Organisation of Justice of 1912, which laid the foundations of the present system, the courts were classified as general or special in accordance with the Supplementary Fundamental Laws of 1907. During the reign of Reza Shah the *shari'a* courts fell into disuse. The main general courts are the dist. courts, above which are the courts of first instance, the prov. courts of appeal, and the court of cassation in Tehran. The Law of the Principles of Civil Procedure was reformed in Jan. 1953. A civil code was promulgated during the early years of the reign of Reza Shah. As regards personal law it is based on the *shari'a*; in other matters it is strongly influenced

won over to the Mazdakite movement, a heretical movement which derived its support largely from the socially disaffected classes. He was deposed but regained his throne in 498 or 499. He was succeeded by Khusraw I (Anushirawan, 531-79), who put down the Mazdakite movement and restored the power of the empire. Under Khusraw II (590-628) the war with Rome was renewed, Armenia was retaken, and in 610 Khusraw II reached the Bosphorus, took Antioch, Damascus, Jerusalem (611), and Gaza (616); he invaded Egypt, and marched up the Nile to the borders of Ethiopia; and a Sasanian gen. besieged Constantinople. Heraclius counter-attacked, liberated Asia Minor, invaded Armenia, and seized Ctesiphon. Khusraw II fled and was assassinated. The decline of the empire after Khusraw II was rapid. Princes who were puppets in the hands of the military leaders followed each other to the throne in rapid succession. With the accession of Yazdigird III (632-51) peace was concluded with Rome. Meanwhile the Arabs had begun to erupt from Arabia. The Sasanian empire, exhausted by war and taxation, was in no position to resist their advance effectively. The battles of Qadisiya (637) and Nihavand (642) were decisive. Yazdigird fled and was assassinated near Marv in 651. P. became incorporated in the dominions of the caliphs and was ruled from first Medina, then Damascus, and finally Bagdad (c. 750). The pop. was converted to Islam. The appeal of the Abbasid propaganda, which had resulted in the estab. of the Abbasid caliphate and the transfer of the cap. to Bagdad, had been largely to the Persians and the Shi'ites (q.v.), although the movement had relied on the Yemenite Arabs for its main support. The estab. of the Abbasid caliphate, however, failed to satisfy the hopes of its Persian supporters, and a series of politico-religious revolts broke out in P. Under Mahdi (775-85) and Hadi (785-6) Persian influence increased and Persians played an important part in the administration. Under Harun (786-809) (see HAROUN AL-RASCHID) semi-religious revolts broke out again, and on his death civil war broke out between his sons, Amin and Ma'mun. The latter had been viceroy in the E., and largely by means of the support he received from the E. he succeeded in establishing himself as caliph in 813. During his rule (813-20) his gen., Tahir, estab. a dynasty in Khorasan. In the provs. bordering the S. shore of the Caspian Sea there had been sporadic revolts, and c. 864 an Alid dynasty was estab. in Tabaristan, to be eventually overthrown by the Samanids (q.v.). The Tahirids were in due course defeated in 872 by Ya'qub b. Laith, the Saffarid, who had risen to power in Sistan. The Saffarids were in turn defeated by the Samanids, the centre of whose domains was Transoxania. Under Ima'ul (892-907) the Samanids extended their power over the greater part of P. The W. provs. were lost under his successors to the Buyids, who had risen to power under the Ziyarids of Gurgan, c.

930; in the E. the Samanids were eventually succeeded by the Ghaznavids. The Buyid, Mu'izz ud-Dawla, entered Bagdad in 945, and reduced the caliph to the position of a puppet. The Buyids, although they were Shi'ites, allowed the caliphs to continue in office, but from this period onwards, until the overthrow of the caliphate by the Mongols in 1258, the caliph ceased to exercise effective sovereignty, and merely acted as the titular head of Sunni Islam, legitimating the authority of the various rulers. The Buyids estab. branches in various provs., including Fars, Iraq, and Kerman. They were much subject to internecine strife, and their domains eventually fell piecemeal to the Ghaznavids, Seljuqs, and others. The founder of the Ghaznavid dynasty was the Turkish slave, Sebuktigin, who was appointed governor of Khorasan in 994 by the Samanid, Nuh. Sebuktigin was succeeded by his son, Mahmud (998-1030) (see MAHMUD OF GHAZNA), who is chiefly famous for his expeditions to India. Mahmud's court became the centre of the Persian literary revival which had begun under the Samanids; Firdawsi (q.v.) wrote the *Shahnama* during his reign. Mahmud's son and successor, Mas'ud (1030-40), was defeated at the battle of Dandegan (1040) by the Ghuzz Turks, under the leadership of the Seljuqs (q.v.). One of these, Tughril Beg, entered Bagdad in 1055 and was proclaimed sultan. The migration of the Ghuzz Turks into Persia under the Seljuqs altered the balance of pop. in Persia, the Turkish element becoming from then onwards important. Under the rule of the Great Seljuqs the main lines of the administrative and economic structure of the country, which lasted in its essentials down to the 20th cent., were laid, the most important institution being the land assignment. Tughril Beg was succeeded by Alp Arslan (1063-72) and Malikshah (1072-92), under whom the dynasty reached its height. The last of the Great Seljuqs, Sanjar (1117-57), was overthrown by renewed invasions of Ghuzz from Central Asia. The Great Seljuqs were followed in Persia by a number of succession states, including the Seljuq dynasties of Iraq and Kurdistan (extinguished 1194), and Kerman (extinguished 1187), the Atabegs of Azarbaijan (1136-1225), the Salgharids of Fars (1148-1287), and the Khwarazmshahs (c. 1127-1231). The Khwarazmshah, Ala ud-Din Muhammad (1199-1220), reduced the greater part of P. to his obedience. During his reign the Mongols of Genghis Khan (q.v.) appeared on his N. borders; his son, Jalal ud-Din Mangubirni, was finally defeated by them in 1231. The final conquest of P. by the Mongols did not take place until some years later under the grandson of Genghis Khan, Hulagu, who founded the Ilkhan dynasty of P. Hulagu entered Bagdad in 1258 and brought the Abbasid caliphate to an end. The Ilkhans ruled first as vassals of the Great Khan in Qaraqorum, but with the accession of Hulagu's son, Abaqa (1265-81), they broke away and

ruled as a Persian dynasty. Internal weaknesses became apparent during the reign of Abu Sa'id (1316-35); after his death the empire began to disintegrate, the Jalayirs establishing themselves in Iraq and Azarbaijan, the Muzaffarids in Fars, the Sarbadarids in Khorasan, and the Karts in Herat. These various dynasties were extinguished by Timur (Tamerlane) (q.v.), who invaded P. in a series of campaigns between 1381 and 1387. The empire founded by Timur disappeared in W. P. and Iraq on his death, falling first to the Turkomans of the Black Sheep and then to the Turkomans of the White Sheep; the E. part of Timur's empire disintegrated on the death of Shahrukh in 1447, passing into the hands of the Uzbeks.

The beginning of the 16th cent. saw the foundation of the Safavid Empire, when P. once more became a political unit. The Safavids traced their descent from the seventh imam, Musa al-Kazim (d. 799). The name of the dynasty is taken from their ancestor, Shah Safi ud-Din, the leader of a dervish order in Ardebil. The foundations of the Safavid state were laid by Shah Isma'il (1502-24), who, at the head of a confederation of Turkoman tribes, defeated the White Sheep Turkomans in 1502, made Tabriz his cap., and conquered P., advancing to Herat in the E., and establishing in the W. a common frontier with the Ottoman Empire on the Euphrates. He estab. Shi'ism as the official religion of the country. In 1514 Selim the Grim defeated Isma'il at the battle of Chaldiran, entered Tabriz, and took Diyar Bakr. There were subsequently many wars over the Turko-Persian frontier provs., and dists. changed hands frequently. Bagdad was conquered and Mesopotamia annexed to the Turkish Empire in 1638. The Perso-Turkish wars were embittered by religious antagonism between the Shi'ite Safavids and the Sunni Ottomans. The N.E. frontier was contested by the Uzbeks, and Afghanistan was alternately part of India and part of P., until it became independent under the Durrani dynasty in 1747. Shah Abbas (q.v.) moved the cap. from Qazvin, where it had been under Shah Tahmasp, to Isfahan. During the Safavid period various European embassies reached P. Rivalry became acute during this period between the Brit. and the Dutch in the Persian Gulf. In the early 16th cent. 'factories' were estab. by the E. India Company in the Persian Gulf. Under the successors of Shah Abbas the Persian empire declined. In 1717 the Sadruza revolted in Herat and declared themselves independent; the Uzbeks raided Khorasan; and the Arabs of Muscat seized Bahrain, which had been conquered by Shah Abbas. In 1721 the Afghans under Mahmud seized Kerman, and in 1722 defeated the Persians outside Isfahan. Turkey thereupon seized Tiflis, Tabriz, and Hamadan, and Peter the Great occupied Shirvan and Gilan. Nadir Shah Afshar (q.v.) eventually evicted the Afghans in 1729 and restored Tahmasp II to the throne. In 1732 he

deposed Tahmasp in favour of his infant son, Abbas III, and in 1736 assumed the crown himself. Nadir Shah succeeded in freeing P. from her enemies and in restoring her power temporarily. The rule of his successors, however, ended in anarchy. Eventually Karim Khan Zand estab. his supremacy and ruled from 1750-79 over all P. except Khorasan. On his death Aqa Muhammad Khan Qajar (d. 1797), after another period of anarchy, founded the Qajar dynasty.

Having estab. himself as the most powerful ruler of P., Aqa Muhammad Khan attempted to curb the Russian advance. He demanded that the Georgian tsar, Heraclitus, who had entered into an agreement with the Empress Catherine in 1783, should return to his position as a vassal of P. When the demand was refused, Aqa Muhammad Khan invaded Georgia and sacked Tiflis (1795). In the following year Russia marched against P. in retaliation, but on the death of the Empress Catherine the Russian forces retired, retaining possession only of Baku and Darband. Aqa Muhammad Khan was succeeded by his nephew, Fath Ali Shah (1797-1834). Russian expansion in the Caucasus was resumed and war broke out again between P. and Russia. Meanwhile the British and French were severally seeking treaties with P. A political and commercial treaty was concluded with P. by Malcolm on behalf of Britain in 1800. Its main purpose was to ensure that the Shah did not receive Fr. agents and would do his utmost to prevent Fr. forces entering P. In view of the defeat of Napoleon in Egypt the treaty was not ratified. Subsequently the French made proposals to P. for an alliance against Russia; in 1807 the Treaty of Finkenstein was concluded, and a Fr. military mission was sent to P. A counter mission was sent from India under Malcolm 'to detach the court of Persia from the French alliance, and to prevail on that court to refuse the passage of French troops through the territories subject to Persia, or the admission of French troops into the country.' If that could not be achieved, it was to prevail upon P. 'to admit English troops with a view to opposing the Fr. army in its progress to India, to prevent the creation of any maritime post, and the establishment of French factories on the coast of Persia.' A mission from Whitehall under Harford Jones arrived almost simultaneously. Malcolm returned to India, and Harford Jones negotiated a preliminary agreement with P. in 1809. Following on this agreement, Malcolm came on a third mission in 1810, bringing with him 2 officers to assist in the reorganisation of the Persian army. In 1812 the war with Russia was resumed. The Brit. envoy sought to restore peace but failed. The war ended with the Treaty of Gulistan (1813), by which P. ceded Georgia, Qara Bagh, and 7 other provs. Brit. policy continued to be exercised by the possibility of a Russian advance through P. on India, and in 1814 the Treaty of Tehran, based on the preliminary agreement of

1809, was concluded. By this treaty all European armies were to be prevented from entering P. if hostile to Great Britain, and Great Britain undertook to provide troops or a subsidy in the event of unprovoked aggression on P. When war broke out again with Russia in 1825, the treaty remained inoperative because P. was technically the aggressor. The Russian war was concluded by the Treaty of Turkomanchai (1828), by which P. ceded Erivan and Nakhjivan and agreed to pay an indemnity, and was prohibited from having armed vessels on the Caspian Sea. During the reign of Fath Ali Shah war also broke out with Turkey, and was concluded by the Treaty of Erzerum in 1823. In the E. Fath Ali Shah endeavoured to restore Persian control over Khoraasan and Afghanistan, and in 1830 an expedition set out under Abbas Mirza, with Russian encouragement. Quchan and Sarakhs were reoccupied. Herat was besieged, but on the death of Abbas Mirza the siege was raised. After the accession of Muhammad Shah in 1834 the Afghan war was resumed, again with the encouragement of Russia, whose influence had increased at the Persian court since the Treaty of Turkomanchai. Herat was besieged again in 1837; but when the Shah was threatened with Brit. intervention, Brit. policy having by this time come to regard Afghanistan as an important link in the defence of India, the siege was raised. In 1847 the Treaty of Erzerum with Turkey led to the delimitation of the Turko-Persian frontier. In 1844-5 the Babi sect was founded (see BABISM).

Muhammad Shah d. in 1848. His son, Nasir ud-Din, who succeeded him, was faced by various movements of insurrection, one of which, in Mashhad, was not put down until 1850. Three Babi revolts broke out between 1848 and 1850, and the leader of the sect, the Bab, was executed. In 1852 an attempt on the life of the Shah by 3 disaffected Babis led to fresh persecutions. Russian influence meanwhile increased, P. being used by Russia to further her designs against Afghanistan and Turkestan. The seizure of Herat by P. led to the Anglo-Persian war of 1856-7. After the Brit. occupation of Kharg Is. and military operations on the Karun R., Herat was evacuated, and the war terminated by the Treaty of Paris in 1857. Internally changes were beginning to take place in P. In 1851 the first modern school, in which European sciences were taught, was opened. In 1862 an agreement was concluded for the Anglo-Indian telegraph line to connect India with England via P. The original line through Turkey was eventually superseded by the Indo-European telegraph, which went through Russia, and was in operation in 1872. Nasir ud-Din visited Europe in 1873, 1879, and 1889. In 1882 the Persian Cossack Brigade was formed. It was officered by Russians, who were nominated by the general staff of the military dist. of the Caucasus army, but were subject to the Persian minister of war. In 1888 the Karun R. was

declared open to international navigation. Messrs Lynch Bros. estab. a steamer service between Muhammerah and Ahvaz. In 1889 the Imperial Bank of Persia was founded, with the exclusive right to issue bank-notes. It operated under a concession which it had acquired from de Reuter, a naturalised Brit. subject, who had been given permission to found a Persian state bank when an absurdly wide concession granted to him in 1872 had been withdrawn. In 1889 the Banque des Prêts de Perse, a subsidiary of the Russian State Bank, was opened. In the same year Russia obtained the first option of a railway concession, and this in the following year was changed into an agreement prohibiting all railways in P. In 1891 a tobacco concession was granted to a Brit. subject. This concession met with the resistance of the Persian people, who were convinced that the rights of P. were being sacrificed by this and other concessions. Strikes and riots broke out; and in 1892 the Shah was forced to rescind the concession. In 1891 a Perso-Russian tariff treaty was concluded, which led to an increase in Russian trade in P. In 1896 Nasir ud-Din was assassinated. He was succeeded by his son Muzaffar ud-Din. During the latter years of Nasir ud-Din poverty and misgov. had increased. The severity of his rule, however, had, for the most part, prevented public manifestations of discontent. Small groups of people had met in secret during his reign to study liberal ideas current in W. Europe. After the accession of Muzaffar ud-Din the numbers of these groups increased, and they began openly to disseminate liberal ideas. Their efforts were reinforced by the activities of Persian communities outside P. Financial troubles beset the rule of Muzaffar ud-Din from the beginning. Negotiations for a Brit. loan were entered into but proved abortive. In 1898 a number of Belgians were appointed to reorganise the customs, and in 1900 a loan was obtained from the Russian Banque des Prêts and guaranteed by the customs receipts, except those from the customs of Fars and the Gulf Ports, which had already been pledged to guarantee a loan raised to compensate the concessionaires of the tobacco concession. The Shah then set out on his first tour of Europe. In 1901 a Brit. subject, d'Arcy, was granted the right to prospect for and exploit oil. In 1902 a second Russian loan was negotiated, and a concession granted to Russia for the construction of a road from Julfa to Tehran; various advances were made and subsidies granted by Russia to P. in the immediately succeeding years. In 1902 the Shah made his second European tour. In 1903 a new customs tariff was concluded with Russia, which led to a further increase in Russian trade with P. The new tariffs caused discontent and riots. A movement for the dismissal of the Belgian customs officials failed; another Belgian, M. Nans, was appointed Director of Customs (1903) and Minister of Posts (1904). In 1905 the customs tariff was

enforced with greater severity. Opposition to the gov. spread and disturbances took place. A number of merchants and members of the religious classes took refuge (*hast*) in Tehran and at the shrine of Shah Abd ul-Azim, demanding the dismissal of the unpopular Prime Minister, Ain ud-Dawla. After some 6 weeks the Shah promised to accede to their demand for an advisory body, to consist of representatives elected by the religious classes, the merchants, and the landed proprietors, and to be presided over by the Shah (Jan. 1906). When this promise was not fulfilled the religious leaders began to denounce the rule of tyranny. Riots ensued; the bazaars were closed; and there was an exodus of the religious classes, merchants, and artisans to Qom. 12,000 persons meanwhile took refuge in the Brit. legation. In face of the intransigence of the Shah and his advisers, the reform party eventually demanded a constitution, and in Aug. 1906 their demand was granted. Elections proceeded, and on 7 Oct. 1906 the National Assembly was opened.

Muzaffar ud-Din d. in 1907, and was succeeded by his son, Muhammad Ali. In that year the Anglo-Russian Convention dividing P. into spheres of influence was announced. The convention contained a mutual undertaking to respect the integrity and independence of P.; Great Britain gave an undertaking not to seek or support others seeking political or economic concessions in an area in the N.; Russia gave a similar undertaking with regard to an area in the S.; in a central area both powers were free from such restraint, and existing concessions were to be maintained. The main object of the British Government in concluding the convention was to limit Russian encroachment. The conclusion of the convention nevertheless caused great resentment in P. The country, meanwhile, was in a disturbed condition, and a number of revolts broke out, including an attempt by the Shah's brother, Salar ud-Dawla, to secure the throne. From the beginning Muhammad Ali sought to overthrow the National Assembly, and in Dec. 1907, with the help of the Cossack Brigade, he made an abortive attempt to destroy it. The provs. and local councils rallied to the defence of the constitution. Their triumph, however, was short-lived. Relations between the Shah and the National Assembly continued to be strained. In June 1908 the Shah proclaimed martial law, and sent an ultimatum to the National Assembly threatening to bombard it, a threat which was carried out some days later by Colonel Liakhoff, the commander of the Cossack Brigade. Many of the leading constitutionalists (or nationalists as they were called) were captured and executed. Resistance was continued by the nationalists in Tabriz for some 10 months, until Russian forces entered the city on the grounds of facilitating the entry of provisions and of protecting foreign consulates and subjects. The resistance of Tabriz gave the nationalists elsewhere

time to reorganise. Risings took place in the provs., notably at Rasht and Istahan, and finally the Bakhtiari marched on Tehran. Muhammad Ali was deposed, and Ahmad Shah placed on the throne with a regency in July 1909. Considerable bodies of Russian troops remained in N. Persia, and in 1911 the ex-Shah made an abortive attempt, with Russian encouragement, to regain the throne. Salar ud-Dawla rebelled again in 1911 and 1912. The financial situation had meanwhile further deteriorated, and in 1911 an American, Morgan Shuster, was appointed treasurer-general. In the same year the gendarmerie was reformed under Swedish officers. Shuster's appointment met with Russian opposition, and at the end of the year a Russian ultimatum was presented to the Persian gov. for his dismissal; when Russian troops began to march on Tehran the Persian Gov. capitulated, Shuster was dismissed, and the constitution suspended. In the following year Russian troops bombarded the shrine of the Imam Riza at Mashhad. The Anglo-Russian Convention thus failed in its major purpose. Russian influence continued to increase throughout P. and internal conditions to deteriorate. On the outbreak of the First World War P. proclaimed her neutrality, but this was, in fact, violated variously by herself, the Central Powers, and the Entente.

P. suffered from encroachments in the NW. and W. by Turkey and Russia. In 1915 Russia occupied Urumia. In Khuzistan there were Brit. operations to protect the Anglo-Persian Oil Company's pipeline, the d'Arcy concession of 1901 having been acquired by the company in 1909. After the fall of Kut there was a Turkish invasion in the SW. Ger. agents were meanwhile active in S. and Central P., and the Swedish officers of the gendarmerie virtually acted on behalf of the Germans. Bushire was occupied by the British in 1915, but later in the year the Brit. consulate in Shiraz was forced to surrender to enemy forces. In 1915 the Russians landed at Enzeli, advanced on Qazvin, and conducted successful operations in the neighbourhood of Hamadan, Qom, and Kashan. In E. P. a cordon was estab. by the Entente with locally recruited levies. In the following year the struggle between Russia and Turkey ebbed and flowed in W. P.; in S. P. the South Persian Rifles were formed under Brit. officers. In 1917 the Qashqa'i tribe rose in S. P. in favour of the Central Powers, and hostility to Britain increased throughout the country. The Qashqa'i were in due course defeated; and after the recapture of Kut and the occupation of Bagdad by Brit. forces, the Turks evacuated Kermanshah. The abdication of the tsar in 1917 was followed by the disorganisation and demoralisation of the Russian troops in P., who gradually withdrew, plundering as they went. With the collapse of Russian resistance the possibility of an advance by the Central Powers through S. Russia was feared. To forestall such an eventuality the

Dunsterville Mission set out for Tiflis in Jan. 1918. It was unable to get through at the first attempt because the Bolsheviks were in control of Enzeli, and a Persian rebel, Kuchik Khan, was active in Gilan. Subsequently the latter was defeated and the Dunster Force set out for Baku. Another force under Lt-Gen. Malleson was sent to Transcaspia. In the first instance it was charged with the task of taking over the section of the E. Persian cordon vacated by Russia. It finally withdrew from Transcaspia in 1919. Thus, at the end of the war, a state of disorder prevailed in P. In an attempt to remedy this the Anglo-Persian Agreement was signed in 1919. This agreement recognised the independence and integrity of P., and provided for military advisers, a loan, and co-operation for the improvement of communications. A revision of customs tariffs was also envisaged. In 1920 Armitage-Smith was engaged as financial adviser. Meanwhile in April 1920 the Bolsheviks again invaded Enzeli and occupied Rasht, and a revolutionary gov. was set up in N. P. under Kuchik Khan.

In 1921 a successful *coup d'état*, organised by Reza Khan, an officer of the Cossack Brigade, and Sayyid Zia ud-Din Tabataba'i, took place. One of the first actions of the new gov. was to conclude the Perso-Soviet Treaty of 1921, by the terms of which the Soviet Gov. declared all treaties and concessions concluded with P. by the Tsarist gov. to be null and void, but made it a condition that these concessions should not be ceded to a third power by P. Under Article VI the U.S.S.R. was permitted 'to advance her troops into the Persian interior for the purpose of carrying out the military operations necessary for its defence' in the event of a third party attempting 'to carry out a policy of usurpation by means of armed intervention in Persia, or if such a Power should desire to use Persian territory as a base of operations against Russia...'. As explained in a letter from the Russian diplomatic representative in P. to the Persian minister of foreign affairs, this was intended to apply to attacks by partisans of the Tsarist regime and its supporters among foreign powers. Meanwhile the new National Assembly refused to ratify the Anglo-Persian Agreement of 1919, which had also been unfavourably received in France and the U.S.A. The active measures taken by Sayyid Zia ud-Din to create an orderly administration quickly aroused opposition. Reza Khan quarrelled with him and overthrew him. The former had meanwhile as Minister of War begun to pacify the country; the movement of Kuchik Khan in Gilan collapsed owing to internal dissensions and the withdrawal of Bolshevik support. In 1923 Reza Khan became Prime Minister, and finally in 1925 Ahmad Shah was deposed and the crown of P. conferred on Reza Khan as Reza Shah Pahlavi. By 1926 the pacification of the country had been virtually achieved. Communications were im-

proved and financial reforms were carried out. In 1922 an American, Dr Mills, had been appointed Administrator-General of the Finances, and the mission of which he was the head gradually succeeded in centralising the financial administration of the country, in balancing the budget, and in reviving the economic life and trade of the country; a beginning was also made on the Trans-Iranian railway, and provision made for the estab. of a National Bank. By 1926, however, there was mounting tension between the mission and Reza Shah, who, with the army, was increasingly diverting the revenue of the country away from the normal channels, and in 1927 Dr Mills was dismissed. Reza Shah next turned his attention to foreign affairs. In 1927 a claim to Bahrain was revived, but was rejected by H.M. Gov. This claim has since been repeated from time to time. In the same year the Caspian Fisheries Concession was given to a joint Soviet-Persian company. In 1928 the capitulations (q.v.) were abolished. Various measures followed designed to normalise relations between Great Britain and P. Thus, the duties which Great Britain had hitherto performed in the Persian littoral of the Persian Gulf in connection with light and quarantine duties were handed over to P. In 1931 the Indo-European Telegraph Company withdrew almost completely from P.; and in 1935 the Brit. coaling stations at Basidu and Henjam were transferred to Bahrain. In 1932 Reza Shah denounced the Anglo-Persian Oil Concession. The question was referred to the League of Nations, but was settled by negotiations between the company and the Persian Gov. By an agreement signed in 1933 the concession area was reduced to 100,000 sq. m. in S. and SW. P., and the royalty payment increased; in return the Persian Gov. extended the concession till 1993, and undertook not to cancel or modify the concession unilaterally and to submit to arbitration any disputes which the parties could not settle themselves. In 1937 the Sa'dabad Treaty, a mutual pact of friendship and non-aggression, was signed between P. (Iran), Turkey, Afghanistan, and Iraq.

In internal affairs Reza Shah pursued a policy of extensive modernisation. The army was expanded and conscription was introduced; new civil service laws were passed; the administration of justice was reformed; the system of education was reorganised; women were unveiled (1936); industrialisation was encouraged; communications were improved, and the Trans-Iranian railway was built; foreign trade was made a state monopoly (1931); this and the general organisation of Persian trade fitted in with Ger. economic methods, and in the years immediately preceding the Second World War Ger. commercial and political influence in P. increased. The outward forms of constitutional gov. were preserved by Reza Shah, but in fact he imposed a dictatorship upon the country, the effect of which was increasingly felt in

all aspects of the life of the country. On the outbreak of the Second World War P. declared her neutrality.

After the collapse of the Rashid Ali movement in Iraq and the defeat of the Vichy forces in Syria by Brit. and Free Fr. forces, the Brit. and Russian Govs. turned their attention to the dangerous situation which was arising in P. through the large number of Ger. nationals in that country. P.'s safety was a vital interest of Great Britain and Russia alike, particularly by reason of Brit. interests in the Anglo-Persian oilfields and of the proximity to P. of Russia's great oilfields in the Caucasus. The danger was the more obvious from the pressure of the Ger. invading armies through the Ukraine and the possibility that, at any moment, Germany might, if thwarted in the Ukraine, attempt to force a passage to P. through Turkey (Anatolia). In the summer of 1941 the two allied govs. requested the Persian Gov. to reduce the number of Ger. nationals in the country. On 24 Aug., having failed to get satisfaction, they demanded the expulsion of all Ger. nationals except such as were essential to the Persian economy and harmless to the allies. The Persian Gov. failed to comply, and on 26 Aug. Soviet forces crossed the Persian frontier and advanced in the direction of Tabriz and Ardebil; Brit. forces landed at Bandar Shapur and another column advanced from Khaniquin toward Kermanshah. A perfunctory resistance only was offered. After 2 days hostilities ceased.

On 10 Sept. the Persian Gov. accepted the Brit. and Soviet armistice terms. These included the closing of the Ger., It., Hungarian, and Rumanian legations, and the handing over to the Brit. and Soviet authorities of Ger. subjects. On 16 Sept. Reza Shah abdicated in favour of his son, Muhammad Reza. In Jan. 1942 a Tripartite Treaty of Alliance was concluded with Great Britain and the U.S.S.R., whereby Great Britain and the U.S.S.R. undertook jointly and severally 'to respect the territorial integrity and sovereignty and political independence of Iran' and 'to defend Iran by all means at their command from aggression.' The Persian Gov. undertook to co-operate with the Allied powers in every way possible in order to enable them to fulfil their undertakings, and to give the Allies, for certain military purposes, the unrestricted right to use, maintain, and guard, and, in cases of military necessity, control, all means of communication in Persia; to assist in obtaining material and recruiting labour, and to establish a censorship. The Allied powers were permitted to maintain land, sea, and air forces on Persian ter., but their presence was not to constitute a military occupation. The Allied forces were to be withdrawn not later than 6 months after all hostilities between the Allied powers and Germany and her associates had ceased. The Allied powers undertook not to interfere in the internal affairs of P. and jointly 'to use their best endeavours to safeguard the economic existence of the Persian

people against the privations and difficulties' resulting from the war.

P. declared war on Germany on 9 Sept. 1943. After the Tehran Conference President Roosevelt, Marshal Stalin, and Winston Churchill issued a declaration (1 Dec.) in which their 3 govs. recognised Persian assistance, undertook to give P. economic aid where possible, and confirmed their desire for the maintenance of Persian independence, sovereignty, and territorial integrity. Allied objects were achieved in respect of the use of Persian communications, but P. was in practice divided into 2 zones, and Soviet action made effective administration by the Persian authorities impossible in the N. zone. In the summer of 1943 Amer. non-combatant technical troops, who were introduced as part of the Brit. forces, took over from the Brit. the administration of the Trans-Iranian railway from the Persian Gulf to Tehran; from Tehran to the N. it continued to be run by the Soviet authorities. Meanwhile P.'s internal situation deteriorated. Amer. advisers were appointed in 1942 and 1943 to the Dept. of Food, the Ministry of Finance, the gendarmerie and police; a military mission was appointed in 1942. Dr Millspugh, who became Administrator-General of the Finances in 1943, met with opposition from various internal quarters, and was unable to secure Soviet co-operation; he resigned in Feb. 1945. In 1943 and 1944 the Royal Dutch Shell, Socony Vacuum, and Sinclair Oil Companies, and the Soviet Gov. (1944), asked for oil concessions. The Persian Gov. announced in Sept. that the grant of oil concessions must wait till the end of the war, and in spite of Soviet pressure refused to give way on this point. From this period onwards Soviet pressure on P. became more open. In the autumn of 1945 Persian security forces were prevented from entering Azarbaijan and the Caspian provs., and in Dec. the Tudeh party, which had been formed in 1943 and become increasingly an instrument of Soviet policy, was reformed as the Democrat party and set up an autonomous gov. in Azarbaijan. About the same time there was a Kurdish movement for autonomy in Mahabad, also with Russian encouragement. The Persian Gov. protested against the Soviet actions, and finally had recourse to the Security Council in Jan. 1946. The council approved direct negotiations by the 2 parties. The Prime Minister went to Moscow, but failed to reach an agreement. On 2 Mar. the Tripartite Treaty expired; Soviet forces remained, although the evacuation of Brit. and Amer. forces had taken place. The Persian Gov. brought the matter to the notice of the Security Council. Finally, after the Soviet Gov. had extracted an oil agreement from the Persian Prime Minister, Qavam, during a visit to Moscow, the evacuation of the Soviet forces was completed (9 May). Negotiations then began between the Democratic party of Azarbaijan and the Persian Gov. In July 1946 a general strike was organised by the Tudeh party in Abadan. By

Sept. a confederacy of tribes in the S. was demanding autonomy such as that in Azarbaijan and had gained control of most of Fars. Partly in response to this pressure the gov. was reformed, and finally Persian forces marched on Azarbaijan. The Democrat party collapsed, as also did the Kurdish movement. The authority of the Central Gov. was re-established. A new National Assembly was convened, and in Oct. it ruled that the Soviet oil agreement was null and void, and forbade the grant of oil concessions to foreign govts. A period of Soviet-Persian tension ensued. In Oct. 1947 a Perso-Amer. military agreement was signed, providing for a U.S. military mission to co-operate with the Persian minister of war in 'enhancing the efficiency of the Iranian army.' This provoked an exchange of notes with the U.S.S.R., who protested vigorously. In 1949 a member of the Tudeh party made an attempt on the Shah's life. The party was thereupon declared illegal. A constituent assembly met in April and amended the constitution to enable the Shah to dissolve the National Assembly and the Senate by decree. In 1950 P. received a loan from the Export and Import Bank of Washington, and a grant under the Point IV allocation. In 1948 a Seven-Year Plan for economic reconstruction, based on a report of a mission of U.S.A. engineers, was pub., and Overseas Consultants Incorporated were invited to act in an advisory capacity. In 1950 their contract was terminated; the plan, however, continued in existence. In 1949 a Supplemental Agreement with the Anglo-Iranian Oil Company, by which the total payments to P. would have been considerably raised, was initialled. In Nov. 1950 the Oil Commission of the National Assembly reported against it. Opposition to the agreement, led by Musaddiq, supported by the National Front, the mulla, Kashani, and the Fidayani Islam, was complicated by the highly unsatisfactory economic and political conditions which prevailed in P. The Prime Minister, Razmara, was assassinated in Mar. 1951. In April a Bill for the nationalisation of the oil industry was passed and in the same month Musaddiq became Prime Minister. The Brit. Gov. and the Anglo-Iranian Oil Company, severally, filed petitions with the International Court, the former asking it to declare P. bound by the 1933 agreement, and the latter asking it to nominate an arbitrator. The Persian Gov. refused to recognise the Court's jurisdiction. Great Britain referred the matter to the Security Council in Oct. 1951. Repeated efforts by the company, Great Britain, the U.S.A., and the International Bank to find a solution failed. The anti-Brit. campaign in P. meanwhile increased in virulence. Early in 1952, following a demand from the Persian Gov., all Brit. consulates in P. were closed. U.S.A. military aid to P. was suspended in Jan. but resumed in April in view of assurances given by Musaddiq. In Jan. 1952 Point IV aid was increased. In May

there were renewed protests from Russia at U.S.A. military aid. In July after a brief constitutional crisis Musaddiq returned to office as Prime Minister with increased power. In July the International Court ruled that it had no jurisdiction in the case brought by Britain. In Aug. Musaddiq was given full powers in economic, banking, judicial, administrative, military, and financial matters for 6 months, which period was subsequently extended. On 30 Aug. a joint proposal by Churchill and Truman to solve the oil dispute failed, and on 22 Oct. P. broke off diplomatic relations with Great Britain. In 1953 P.'s internal affairs deteriorated and opposition to Musaddiq grew. In June Eisenhower informed Musaddiq that no further U.S. aid would be forthcoming unless the oil dispute was settled or submitted to a neutral international body. In Aug. there was an abortive *coup* and the Shah fled the country. Three days later, Zahedi, who had received an imperial *firman* appointing him Prime Minister a few days before the *coup*, came forward as the leader of the movement against Musaddiq, assumed control, and arrested Musaddiq, who was later tried and sentenced to 3 years for treason. The new gov. asked for and received financial help from the U.S.A. Means for a settlement of the oil dispute were meanwhile explored. In Dec. Anglo-Persian diplomatic relations were resumed. Negotiations were begun in 1954 for a settlement of the oil dispute, and finally in Sept. a new agreement was signed between the Persian Gov., the National Iranian Oil Company, and an international consortium formed by 7 leading oil companies, and the Brit. Petroleum Oil Company (formerly the Anglo-Iranian Oil Company). Internally during 1955 and 1956 P.'s efforts were mainly devoted to reviving the economy of the country. The second Seven-Year Plan Law, passed in 1956, envisages an expenditure of \$936 million over seven years (starting 1955), to be financed from oil revenues. In Oct. 1955 P. joined the Baghdad Pact (q.v.). In June 1956 the Shah visited the U.S.S.R.

ANTIQUITIES. From the SW. of P. come the bronze ornaments and arms, called after the place where they were found, the Luristan bronzes, and from Elam come cuneiform inscriptions. Sev. empires ruled over P., and each had its cap. or caps., some of which are still hidden under mounds of earth. In the Achæmenid towns, Persepolis and Pasargardæ, the palace was built on an artificial platform, and many of the walls were covered with bas reliefs; these and the capitals of the columns are quite distinctive. Susa has been excavated and fine pottery found. The ruins of sev. Sasanian palaces have been found; they were built of brick like the greatest existing example of such work, the arch of Ctesiphon, which is in Iraq. In some bridges the lower courses are Sasanian, though the upper works may be later. Some 30 rock-cut tombs, like the Naqsh-e Rostam, belong to this period. Weaving must

have been an important industry, for the Achaemenid palaces needed harings; little Sasanian work has survived, but the sculptures give an idea of the patterns which were copied by Byzantine workers. Sculpture in the round was not unknown, for a broken statue of a king lies in a cave. Recent excavations at a prehistoric site in Azerbaijan revealed a stratified sequence of material, chiefly pottery, dating from the beginning of the 3rd millennium to about 1000 BC. A number of previously unknown types were found, as well as varieties like the earliest material found at Ur, in the Aegan, and in Minoan Crete. At Behistun, E. of Kermanshah, is the inscription in 3 languages set up by Darius (521-485 BC) which gave the clue to the decipherment of the cuneiform script.

LANGUAGE AND LITERATURE. The Persian or Iranian language forms a sub-branch of the Indo-Iranian or 'Aryan' main branch, belonging to the Indo-European (q.v.) linguistic family. The most important common characteristics of the language making it differ from Sanskrit, belonging to the other sub-branch of the Indo-Iranian main branch, are as follows: change of the original *s* into the spirant *h*; change of original aspirants, such as *gh*, *dh*, into corresponding medials; *k*, *t*, *p* before a consonant changed to spirants *x* (*k*h), *θ* (*t*h), *φ* (*p*h); and the development of soft sibilants. Persian may be distinguished into Old Persian, used on the monuments of the Achaemenid dynasty (middle 6th cent. to the second half of the 4th cent. BC); Middle Persian of the Parthian or Arsacid period (250 BC-AD 225), and of the Sasanian period (AD 225-651), terminated by the Arab conquest; with the growth of semi-independent dynasties in P. in the 9th cent. AD. Modern Persian began to flourish.

The ancient Persian inscriptions were written in cuneiform character, which, however, was not a natural development from the Sumero-Assyro-Babylonian cuneiform writing (q.v.), but an artificial creation—probably drawn up on official order—externally based on the neo-Babylonian cuneiforms, and—as a system of writing being a quasi-alphabet—suggested by the already widely circulating Aramaic alphabet (see ALPHABET). This early Persian writing, which was the official script of the Achaemenid dynasty, and was employed from the middle of the 6th cent. BC until the destruction of the Persian Empire by Alexander the Great, consisted of 41 symbols. Four of them were ideograms (for 'king', 'province', 'country', and 'Avra-Mazda') and one a sign of div. between words; three vowels (*a*, *i*, *u*); 13 consonants (*k*h, *t*h, *p*, *b*, *f*, *y*, *l*, *s*, *z*, *sh*, *thr*, *h*) having either the value of a pure consonant or a consonant + *ā*; 10 symbols for consonants (*k* or *g*, *t*, *n*, *r*) in two forms: (1) pure consonant or consonant + *ā*, (2) consonant + *u*; 4 symbols for consonants (*dh* and *v-u*), also in two forms, but (1) pure consonant or consonant + *ā*, (2) consonant + *i*; 6 symbols for consonants (*d*, *m*) in three forms: (1) pure consonant or

consonant + *ā*, (2) consonant + *u*, (3) consonant + *i*.

The early Zoroastrian Scriptures were called *Avesta*, a term which comes from the Middle Persian or Pahlavi (q.v.) form *avistak* (or, as some scholars prefer to read, *apastak*) or the Pzand form *avasta*; the Sanskrit term is *avista*. The origin of this word is uncertain. The *Avesta* literature was composed in a dialect now called 'Avestic' or simply 'Avesta'; its original home is unknown. The *Avesta* literature is a complex collection of writings, containing the liturgies, the 'law', solemn invocations, prayers, and so forth, and is still in use amongst Parsees in India and in P. The script of the *Avesta*, known as the Pzand or the *Avesta* alphabet, is a cursive writing of 50 signs, probably an artificial creation based on the local scripts. These books, with their later commentaries, constitute the bulk of pre-Islamic Persian literature.

Under the Arsacids the Gk tongue appears to have been widely used, but after the rise of the Sasanians Persian again became cultivated, and inscriptions and literature in the Pahlavi language have come down to us. Pahlavi, or rather Middle Persian, consists of Parsik of the Sasanian inscriptions, of Pahlavi of the later Zoroastrian literature up to the 9th cent. AD, and of the SW. Iranian dialect known from texts found in Turfan (E. Turkestan). They are written in Pahlavi scripts, which seem to have been a natural development from local cursive Aramaic scripts.

Modern Persian is a direct descendant of the S.-central middle-Persian dialect, but the Arabic conquest brought such a revolution in the material and spiritual life of the Persians that, to mention only one sphere of cultural life, although it did not change the fundamental structure of the language, it influenced it enormously. The Pahlavi script was forced to give way to the Arabic (although the pronunciation of some Arabic letters has been changed, and new letters were created for representing the sounds *p*, *ch*, *sh*, and *g*), and a knowledge of the Arabic language became indispensable to the converts to Islam, for religious worship and the correct reading of the Qur'an were impossible without it. In consequence Arabic speech and writing have so largely influenced modern Persian that numerous Semitic words have become part and parcel of this language. Daqiqi, who began the famous *Shah-nama* ('Book of Kings'), employs about 40 Arabic words in a thousand lines of Persian poetry, and even the great Firdawsī (see below), who represents a national spiritual reaction against foreign influence, uses a certain number of Arabic words. Besides, many Persian savants in the early centuries of the Islamic period wrote in Arabic, which remained the language of science and philosophy until the Mongol conquest (see above), and of religion until modern times. Much of the best of Arabic literature was the work of Persian writers.

Modern Persian begins as a literary language in the early 9th cent. One of the

earliest neo-Persian literary documents is a fragmentary poem attributed to 'Abbas of Merv, perhaps of AD 809, but the first great modern poet was Rudaki (d. c. AD 954). With him began what may be called the court poetry of modern P. He was followed during the 10th to the 16th cents., among others, by Firdawsi (q.v.), (d. 1020), who wrote the *Shah-nama*, the national epic of P., which incorporates the heroic legends of early Iran, Anwari (d. between 1189 and 1191), 'Omar Khayyam' (q.v.) ('Omar ibn Ibrahim al Khayyam') of Nishapur, a free-thinker, poet, astronomer, and mathematician (d. c. 1123), Nizami (d. c. 1203), Khaqani (d. 1190-1200), Sa'di of Shiraz (d. 1291), Jalal ud-Din Rumi (b. at Balkh in 1207, d. at Konya in 1273), Hafiz (d. 1389), and Jami (d. 1492). A later poet, of epic fame, is Hafiz of Jam (d. 1521), and later still is Hafiz of Isfahan, known as the singer of sweet songs (d. 1784). 15th-cent. poets of importance are Qa'ani (Mirza Habibullah) of Shiraz (d. 1533), Yaghma, and Mirza Surush, whose elegant work almost equals that of the classic poets. The earliest Persian prose work is the abridged trans. of the *Universal History* of Abu Ja'far Muhammad b. Jarir at-Tabari (d. 923) by Bal'ami (d. 996). From the 11th cent. onwards a number of Mirrors of Princes, including the *Qabus Nama* of Kay Ka'us b. Iskander (composed 1082), hist., including the *Tarikh-i Mas'udi* of Abu'l Fazl Muhammad b. Husayn al-Bayhaqi (d. 1077), part only of which is extant, scientific works, such as the *Danish Nama-i Ala'i* of Avicenna (d. 1037), religious works, such as the *Kimya us-Sa'adat* of Ghazali (d. 1111), and biographical dictionaries, such as the work of Dawlatshah (d. 1487), were written. One of the most celebrated prose works is the *Gulistan* of Sa'di (see above). The 13th and 14th cents. are also notable for the historical works of Juwayni and Rashid ud-Din Fazlullah (d. 1318). In mystic poetry the outstanding work is the 13th cent. *Mathnawi* of Jalal ud-Din Rumi (see above). There is also an abundant Persian literature belonging to Muhammadan India. Persian drama has hitherto been confined mainly to religious passion plays and translations from European works. Poetry remains to-day the most flourishing form of literature. The verse-forms are restricted with few exceptions to: (1) the *rubai'* or quatrain; (2) the *ghazal*, a poem in couplets, interlocked by a single rhyme at the end of each couplet; (3) the *qasida*, a dedicatory poem, similar in form to the *ghazal*, but longer; and (4) the *mathnawi*, an epic or narrative poem in rhymed couplets. The recent revival of literature in P. has taken the form of hist., eds. of the classics, and poetry. Interest in novels is restricted mainly to trans. of European works, generally Fr. In the period immediately following the grant of the constitution numerous newspapers and periodicals were founded. During the reign of Reza Shah their numbers declined, but since 1942 there has again been a great increase.

Numerous Persian dialects exist; Kurd-

ish is spoken in Kurdistan, and Luri by the Lurs and Bakhtiars. Turkish dialects are spoken in Azarbaijan, and the Hamadan area, and by the Qashqa'i tribes in Fars, and the Turkoman tribes. Arabic dialects are spoken in parts of Khuzistan.

Persian Architecture, see ARCHITECTURE, 1(b).

Persian Art. Persia's artistic heritage is rich and various. Forming the highway between W. and central Asia, the Iranian plateau was from the first exposed to the influence of the outside world, whether through trade or foreign invasion. In its art Persia has constantly proved its power to absorb the artistic ideas of alien civilisations and to adapt them to its own purposes.

Evidence of Persia's artistic achievements extends to the prehistoric period. During the fourth millennium BC the earliest inhab. were producing a type of painted pottery wholly original in design. When the Iranian peoples settled in Persia at the beginning of the first millennium BC, an artistic tradition was already estab. The fine bronze castings—weapons, horse trappings, and household utensils—recovered from tombs belonging to a war-like people settled in the mountainous dist of Luristan in W. Persia were among the antecedents of Achaemenid art.

The empire of Cyrus and his successors was the heir of the Assyrian and Babylonian empires; nor is it surprising that the arts of these two empires should have had a decisive influence on Achaemenid art, which was an imperial art dependant on the patronage of the imperial court. It is known to us mostly from the imposing ruins of the successive caps. of Pasargadae, Persepolis, and Susa. The palaces, constructed on a monumental scale, belong to the 'trabeate' type of architecture and owe much to the forms of Egypt and Greece. A striking feature is their sculptural decoration executed for the most part in relief. The main purpose of the sculptures was to memorialise the person and majesty of the Great King who is portrayed in the company of his counsellors, armies, and subject peoples or in single combat with a lion or some fabulous beast signifying symbolically his victory

over the forces of evil. An almost monotonous repetition of figures in no way detracts from the skill of observation displayed by the sculptor. Some idea of the Achaemenid craftsman's skill can be gained from the carved gems, seals, and vessels of precious metals of which examples have been revealed by the archaeologist.

British Museum

A STONE RELIEF FROM PERSEPOLIS
Height 3 ft 1 in.

The conquest of the Persian empire by Alexander the Great intensified the process of the Hellenisation of art which can already be observed towards the end of the Achaemenid period and continued into the Parthian period. Under the rule of the Sasanian dynasty, P. A. once again asserted its independence by a deliberate revival of Iranian artistic idioms. Such architectural innovations as the dome set on squinches and the vault—made possible by the use of bricks—were introduced; while the great reliefs carved in rock faces are worthy successors of the Achaemenid sculptures. Metalwork, both silver and bronze, and silk weaves have survived from this period; and examples of the latter found their way to Europe, with the result that Sasanian motives were introduced into the art of the W. The influence of Sasanian art even extended to central Asia and China.

With the coming of the Arabs, P. A. had to be adapted to the needs of the

religion of Islam. Yet it succeeded in retaining its distinctive character, and even exercised a considerable influence on other countries of the Muslim world. In religious architecture, the Persians seem to have been the first to adopt the mosque based on a cruciform plan in which great niches are set into each of the 4 sides of the court. Another feature of Persian buildings, both secular and religious, is the application of polychrome

The combination of line and colour in a harmonious composition is seen at its best in the carpet—probably Persia's greatest artistic achievement. Centuries must have gone to the perfecting of the art of rug knotting, although the earliest surviving carpets date from the 16th cent. The carpets of this and the following cent. are among the finest ever produced. Some, especially those made in factories under royal patronage, depict

decoration on interior and exterior surfaces by means of glazed tiles, variegated courses of bricks, carved stone, and stucco. These techniques are skilfully used to emphasise structural features.

Sculpture of human and animal forms in the round is virtually unknown in the Islamic world, since Islam is hostile to this particular type of representational art. P. A. of the Islamic period is primarily an art of surface decoration. Designs were abstract and geometric or composed of floral ornament in which the arabesque plays a prominent role. Arabic script—one of the most decorative in the world—is often introduced into the design. Various Chinese motives, too, found their way into the decorative repertory of Persia.

hunting scenes and were woven from cartoons designed by skilled artists: others were decorated with flowers, while a group from S. Persia has boldly drawn from the Caucasus region of NW. Persia, and is decorated with highly stylised floral and animal ornament, brilliant in colour and daring in conception. Rug weaving survives to this day among the nomad peoples of Persia.

Silk weaving, already a well-established industry in the Sasanian period, continued throughout the Middle Ages and culminated in the complex and exquisite weaves of the 16th and 17th cents.

The Persian potters of the 12th and 13th cents. were producing glazed wares technically and artistically far ahead of any other country with the exception of

China and the Islamic countries of the Near E. Persian pottery combines brilliance of colour with decoration perfectly adapted to the form of the vessel. Particular mention should be made of painting in metallic lustre and underglaze painting. There was a remarkable revival of pottery at the end of the 16th and in the 17th cent.

Some measure of Persia's artistic genius is offered by the MS. miniatures which are well represented in the libraries and museums of Europe and America. Large-scale painting, such as frescoes, was practised at least as early as the Parthian period, but a few fragments only have survived. The art of the miniaturist dates from the 13th cent., and reached maturity in the 15th cent. under the rule of the Timurid dynasty, when the miniaturist combined with the scribe, illuminator, and bookbinder in producing some of the finest books ever seen. The miniatures were regarded as adjuncts to the general decorative scheme as much as paintings in their own right. The subjects illustrated were taken from epics, romances, and hist. At its best, the Persian miniature is executed in a firm yet delicate line and with a wonderful understanding of colour harmony. The artist is content to evoke a mood rather than to strive after the presentation of the interplay of action and emotion. Within these limits, his vision transforms the material world into one of exquisite form and fantasy.

Persian Cat, see CAT.

Persian Gulf, inlet from the Gulf of Oman, running northwards from the Strait of Ormuz. It covers an area of c. 97,000 sq. m., with a total length, from the coast of Oman to the head of the Gulf, of c. 600 m., and a breadth varying from 180 m. at its widest point to 29 m. at the Strait of Ormuz. On the N. side the Persian plateau rises steeply to 3000-6000 ft. The Shatt ul-Arab, formed by the union of the Tigris and the Euphrates, flows into the head of the P. G., at which is situated Fao; farther N. on the Shatt ul-Arab, is Basra. The P. G. is extremely shallow. Deep soundings range from 40 to 50 fathoms, the greatest line of depth being nearer the Persian coast than the Arabian; the S. shore, round to and beyond the Shatt ul-Arab extending to Bushire, is shallow and shelving, making it impossible for ships of 5000 tons or more to approach within 5 m. of the shore. The P. G. is complicated by a maze of shoals and reefs, and is the home of the pearl oyster, for which it was famed from early times. It contains a number of is., among them Bahrain, Qishm, and Hormuz. The climate is exceedingly hot and relative humidity high. From early times an important trade route has lain through the P. G.; the main emporium was Basra, which was superseded by Siraf in the 13th cent.; later the main centre of commerce was transferred to Qais, and in the 14th cent. to Hormuz. The Portuguese were the first European nation to secure a footing in the P. G., Albuquerque taking Hormuz and a

number of tns on the Oman coast in the early years of the 16th cent. The Eng. East India Company estab. a factory at Jask in 1619. Hormuz was taken from the Portuguese by the Persian Gov. with the help of the East India Company in 1622, after which Gombroon (Bandar Abbas) became the centre of Brit. trade in the P. G. The Dutch East India Company also estab. factories at Bandar Abbas. By the middle of the century the Dutch had attained to commercial superiority in the area, but by the end of the century their influence was on the wane. Brit. influence grew throughout the 18th and early 19th cents. The prevalence of piracy in the P. G. forced the East India Company, and later the Brit. Gov. and the Gov. of India, to attend to its suppression, and led to the estab. of Brit. protectorates of the Shaikhdoms of the P. G. The Arabian shore of the P. G. belongs partly to Saudi Arabia, and partly to the sovereign shaikhdoms of Kuwait, Bahrain, and Qatar and the smaller shaikhdoms of Trucial Oman, all of which are under Brit. protection. The main air route to the E. passes along the S. shore of the P. G. The importance of the area has been greatly enhanced by the discovery of large reserves of oil in the neighbourhood of the Arab shore of the Gulf. See Sir A. Wilson, *The Persian Gulf*, 1928; and *The Middle East* (pub. under the auspices of the Royal Institute of International Affairs), 3rd ed., 1958.

Persicaria, see POLYGONUM.

Persimmon, see DATE PLUM.

Persius Flaccus, Aulus (AD 34-62), Lat. poet, b. at Volaterrae. Together with Lucan he was a pupil and friend of the Stoic Cornutus. His extant works consist of 6 short satires. See the edition by J. Conington (1893), and the verse trans. (with the *Satires* of Juvenal) by W. Gifford in Everyman's Library.

Personal Property, in Eng. law, comprises all chattels or movables such as jewels, money, documents, furniture, and personal effects or belongings as opposed to real estate (q.v.) or interest in land (see under PERSONALTY; REALTY; INCORPORAL HEREDITAMENTS; and HEREDITAMENTS). Leaseholds or chattels-real (q.v.) are, as their secondary name implies, a hybrid species of property; for though derived out of real estate, they have been ranked as personality and always devolve in intestacy as such (see DISTRIBUTION, STATUTES OF). P. P. is said to be either in action or in possession, as to which distinction see CHOSE IN ACTION. In Scots law the classification into heritable and movable property is almost parallel to the Eng. real and personal.

Personality, in philosophy, denotes that a substance is constituted a person, that is, a substance perfectly subsistent, master of its own acts, and incommunicable. A human person, therefore, is neither the body nor the soul, but the rational being arising from the substantial union of both. It is an individual able to direct itself by its intelligence and will, and is accordingly the proper object

of attribution of its acts. It is the person who eats, walks, talks, speaks, loves. While the reality of self has been denied by Hume and Bradley, modern philosophers have been principally concerned with 4 questions regarding the person: (1) Whether and how it knows itself; and the general opinion is that it knows itself by perception, i.e. by that species of awareness which we have of the existence of particulars, by a direct cognitive relation to them, and not by description. (2) The relation of P. to time; and it is agreed by most that the identity of the person persists through time, whatever theory of time be held. (3) Whether P. be simple or compound. The definition given above involves the simplicity of P. (4) Whether P. involves self-consciousness. Opinion on this is divided, though it would appear that differences are largely differences of terms, and it is safe to hold that the person is at all times fundamentally self-conscious.

P. in psychology (q.v.) has a somewhat wider connotation, signifying those collections of attributes or qualities which vary from person to person, rather than those which distinguish personal from non-personal existence. For P. in the God-head see TRINITY. See also HALLUCINATION; HYPNOTISM; ILLUSION; MEMORY. See A. Binet, *Alterations of Personality*, trans., 1896; T. A. Ribot, *Diseases of Memory*, trans., 1882; C. A. Mercier, *Psychology, Normal and Morbid*, 1901; C. G. Jung, *Psychological Types or the Psychology of Individuation*, 1923; R. Martin, *Alfred Binet*, 1925; F. L. Bertrand, *Alfred Binet et son oeuvre*, 1930; C. R. Stockard, *The Physical Basis of Personality*, 1931; F. Aveling, *Personality and Will*, 1931; M. B. Greenbie, *Personality*, 1933; and V. M. Bechterev, *General Principles of Human Reflexology: the Objective Study of Personality*, 1933.

Personalty, synonymous with personal property (q.v.). The div. into reality and P. is traceable to a time when legal process was not sufficiently advanced to secure to a person wrongfully deprived of property other than freehold land its specific recovery as opposed to an action for damages against the person; but action to recover land was said to be a real action (Lat. *res*, thing), because the law issued process of execution against the thing demanded instead of putting the claimant off with damages.

Personation, see ELECTIONS.

Personification is the figurative endowment of things or qualities with human attributes, as in Milton's lines:

'Sport that wrinkled Care derides,
And Laughter holding both his sides'

or Kipling's:

'If you can meet with Triumph and
Disaster
And treat those two impostors just the

Expressions like 'the cruel sea' or 'a frowning sky' are sometimes described as personal metaphors (see METAPHOR). An extreme form of personification is the

pathetic fallacy (q.v.). See also FIGURE OF SPEECH.

Personnel Selection, see MENTAL TESTS.
Persons, Robert, see PARSONS.

Perspective. The method of drawing by radial projection to show the apparent size and shape, or eye appearance of an object, is called linear P. It considers all points in a view as sending straight rays of light to the eye, the actual condition of things which produces the photograph in a camera. Since all lines converge to the eye, if 2 be drawn from the top and bottom of a telegraph post a 100 yds distant, smaller and smaller posts would fit the lines the nearer they approach the eye, and posts of the same size would overrun them, thus appearing larger, the distant post much smaller. Hence the great rule of P.: receding parallel lines converge to a point on the horizon, or eye level. 'Aerial' P. has no mathematical basis, and deals with the eye effect of brightness and colour and other accidents due to atmosphere. See W. L. Wyllie, *Nature's Laws and the Making of Pictures*, 1903; G. A. T. Middleton, *The Principles of Architectural Perspective*, 1903; R. V. Cole, *Perspective*, 1921; V. Cornish, *Scenery and the Sense of Sight*, 1935; F. Medworth, *Perspective*, 1936; and works by L. W. Miller (1887) and H. A. James (1888).

Perspiration, see DIAPHORETICS; SKIN.

Persulphuric Acid or Perdisulphuric Acid ($H_2S_2O_8$), acid formed at the anode by the union of the ions HSO_4 , during the electrolysis of moderately strong sulphuric acid. The pure acid forms colourless crystals that are stable up to $60^\circ C$. It is dibasic, and its salts have the general formula $M_2S_2O_8$. The potassium salt is obtained by the electrolysis of a strong solution of potassium hydrogen sulphate. The persulphates are stable salts in the solid state, but aqueous solutions evolve oxygen and pass into sulphates. Both acid and salts are oxidising agents and give no reaction with barium chloride. Permonosulphuric acid or Caro's acid has the formula H_2SO_5 , and is prepared by the action of sulphur trioxide upon anhydrous hydrogen peroxide: $H_2O_2 + SO_3 = H_2SO_5$. It forms white crystals melting at $45^\circ C$. and is a powerful oxidising agent. The acid finds commercial use in the dye industry.

Perth, James Eric Drummond, sixteenth Earl of (1876-1951), diplomat, b. Fulford, near York, and educ. at Bedford Grammar School and Eton. He entered the Foreign Office in 1900. Private secretary to under-secretary of state for foreign affairs, 1906-8 and 1908-10, he was the *précis*-writer to the foreign secretary, 1908 and 1910-11. One of Asquith's private secretaries, 1912-15, and private secretary to the foreign secretary, 1915-19, from 1919 to 1933 he was the first secretary-general to the League of Nations; Brit. ambas. to Italy, 1933-9; he was chief adviser on foreign publicity at the Ministry of Information, 1939-40. He became a Scottish representative peer in 1941. He succeeded to the earldom in 1937.

Perth: 1. City, royal burgh and co. tn

of Perthshire, Scotland, formerly called St Johnstoun, 43 m. NNW. of Edinburgh, beautifully situated on the banks of the R. Tay. The riv. is spanned by 2 fine bridges, and along its banks are 2 public parks known as the N. and S. Inches. Reputed to have been founded by Agricola in AD 70, it is believed to have been occupied by the Romans for 320 years. The oldest building of P. is the cruciform church of St John, of the 13th and 15th cents. The city was the scene of the murder of the Duke of Cornwall by his brother, Edward III of England (1336), and of the battle between the clans Qubele and Chattan described in Scott's *Fair Maid of Perth*. Here Knox preached his famous Reformation sermon. There are many manufs., distilleries, iron foundries, dye-works, glass-ware, and gaugo glasses. Pop. 40,800.

Australian News and Information Bureau
ST GEORGE'S TERRACE, PERTH,
AUSTRALIA

2. Cap. of W. Australia, on the Swan R., near its mouth, 12 m. NE. of the port of Fremantle. It has 2 cathedrals (Rom. Catholic and Anglican), a free univ., an observatory, a branch of the royal mint, and many substantial public edifices. There are many parks, racecourses, and sports grounds, etc., near by. Founded in 1829, it was created a municipality in 1856, and its more rapid growth commenced following the discovery of gold in 1893 at Kalgoorlie. Since then its expansion has been based on the export of primary products, such as wool, wheat, fruit, timber, dairy produce, and also gold. Pop. (with suburbs) 359,000.

3. Cap. of Lanark co., Ontario, Canada, on the R. Tay, 141 m. SW. of Montreal; it has manufs. of machinery, woollens, etc. Pop. 5060.

Perth Amboy, port of Middlesex co., New Jersey, U.S.A., at the mouth of the Raritan R. (bridged). It has an excellent harbour and manufs. bricks, terra-cotta, corks, drain pipes, and chemicals. Settled in 1683, and named after the Earl of Perth, it was the cap. of East Jersey 1686-1702, then alternate cap. Pop. 41,300.

Perthshire, inland co. of Scotland, bounded on the N. by Inverness-shire and Aberdeenshire, S. by Kinross, Clackmannan, and Stirling, E. by Fife and Angus, and W. by Argyll and Dunbartonshire. The co. includes such famous places as Scone, where the Scottish sovereigns were crowned (the Coronation Stone was removed to Westminster in 1296); Dunsinane, where Macbeth was defeated in 1054; and Killcrankie, scene of Dundee's great victory in 1689. There are many remains of prehistoric stone circles and standing stones, and sev. Rom. sites of great interest, notably at Ardoch near Braco. Dunkeld Cathedral was founded in 1107, and Dunblane Cathedral in 1240. P. is partly highland and partly lowland; in the N. are the Grampians (q.v.), amongst the highest elevations being Ben Lawers (3984 ft) and Ben More (3843 ft), while in the S. are the Ochil and the Sidlaw Hills. The prin. rivs. are the Tay (the longest riv. in Scotland), the Earn, and the Forth. Lakes are numerous, and include Lochs Tay, Earn, and Katrine. The scenery of the Trossachs (q.v.), wild and picturesque, has been immortalised in Scott's *The Lady of the Lake*. Large areas of the co. are uncultivated, but are given over to sheep and cattle rearing, and afforestation. In the lowland portions of the co. agriculture flourishes. Woollen and tartan materials, cotton goods, and linen are manufactured, and the Tay salmon fisheries are important. In recent years hydro-electricity has been greatly developed. Perth (q.v.) is the co. tn. and among the small burghs are Blairgowrie and Rattray (joint burgh), Crieff, and Pitlochry. P. and Kinross constituency forms 2 parl. divs., each returning 1 member. Area 2494 sq. m.; pop. 128,000. See T. H. Marshall, *History of Perthshire*, 1849.

Pertinax, Helvius, Rom. emperor from 1 Jan. to 28 Mar., AD 193, was reluctantly persuaded to accept the purple on the death of Commodus. But having attempted to check the licence of praetorian troops, he was slain by the latter, who then put up the empire for sale.

Perturbations, deviations from the main mathematical orbits of motion of the heavenly bodies due to smaller or irregular attractions. A periodic perturbation is an inequality produced in the orbit due to the temporary nearness of an attracting body. The solar system having a settled 'average system' of orbits with calculable disarrangements due to alteration of relative positions, periodic P. are temporary disturbances which pass and recur. They are of very great use in determining mass, density, and distance. Secular P. are changes in the elements of

orbits (see ORBIT), which continue in the same direction for centuries; they are themselves periodic in long cycles of scores of thousands or hundreds of thousands of years. One of sev. important secular P. is the alternate increase and decrease in the eccentricity of the earth's orbit; at the beginning of 1955 its value was 0.0167280, and it decreases by 0.0000004 each year, so that the earth's orbit is slowly becoming more circular. This decrease will continue for 24,000 years but will not reach zero, and then will begin to increase. Although Lagrange and Laplace found that P. in the solar system are oscillatory so that our system is stable, Poincaré's work suggested that this need not necessarily be true. While this question cannot be decided at present, it is possible that in an immensely long period of time the present conditions may not be preserved, and some of the planets may gradually disappear from the sun's attraction, while others may be drawn in by and finally fall into the sun. Lunar P. are of particular importance to us; they are: (1) effect on the length of the month; (2) the revolution of the line of apsides; (3) the regression of the nodes; (4) the evection; (5) the variation; (6) the ann. equation; (7) the secular acceleration of the moon's mean motion; besides many others, theoretically infinite, but about 70 of importance.

Pertwee, Roland (1885-), playwright, b. Brighton. He studied art, but later became an actor and then a writer. His plays are his most serious work, the most successful being *Interference*, 1927, in which he collaborated with H. Dearden. Others are *Seen' Reason*, 1913, *Swank*, 1914, *The Return of Imry*, 1914, *Falling Upstairs*, 1914, *Early Birds*, 1916, *Ten Minutes Tension*, 1917, *Hell's Loose*, 1920, *Pursuit*, 1930, *Pink String and Sealing Wax*, 1943, and *School for Spinners*, 1947. He has also written sev. novels, and an autobiography, *Master of None*, 1940.

Peru, republic of S. America, bounded on the W. by the Pacific Ocean, N. by Ecuador and Colombia, E. by Brazil and Bolivia, S. by Chile. It includes the basin of the Ucayali, with a large portion of the basin of the Marañón or Amazon as far as the Javari trib. The Pacific coast rises steeply for 150 m. inland to the plateau (which vary between 6000 and 12,000 ft.) and ranges of the Andes. Area 514,059 sq. m. Pop. (1950, estimated) 7,800,000 (exclusive of the pop. of forests, which is estimated at 500,000). Of the total pop. half were of European origin and nearly half Indian, the remainder Asiatics (c. 40,000) and Negroes (c. 30,000). Lima, the cap., had a pop. of 835,500. Other tns are Callao, Arequipa, Cuzco, Iquitos, Chiclayo, Trujillo, Chíncha, Ica, Sullana, Cerro de Pasco, Huancayo, Huaraz, Ayacucho, and Piura. The area of the republic was long a matter of uncertainty owing to boundary disputes with Chile and Bolivia. Since 1883 Chile had retained the provs. of Arica and Tacna, and all attempts at settling the dispute had failed. In 1929 Tacna was returned to P. and Arica was kept by Chile, but P.

received 6,000,000 Amer. dollars' compensation, and some 6 sq. m. in the neighbourhood of the port of Arica were also ceded.

NATURAL DIVISIONS. P. falls naturally into 3 clearly defined and diverse regions: (1) The coastal strip, between the Pacific and the Maritime Cordillera, a sandy desert intersected by fertile valleys and now itself largely made fertile by irrigation. It is about 80 m. wide, and produces sugar and many other crops. (2) The vast triple chain of the Andes, 250 m. wide, with its great plateaux, and rich valleys, grazing land, coffee plantations, and mineral wealth. (3) The Montaña of the E. Andean slope, with its tropical forests and rivers, but little explored. Of the total arable area of 29,500,000 ac., only 3,600,000 are under active cultivation. In the arid coast region the gov. has brought under irrigation over 60,000 ac. during the last few years, and more is envisaged—e.g. around Trujillo.

CLIMATE and RACE. P. is in the lats. of the SE. trades, which blow in warm and moisture-laden off the Atlantic, precipitate some of their rain in passing over the pampas, but discharge the body of it on the E. slopes of the Andes, and descend cold and dry on the W. side. Hence there is little or no rainfall on the coastal strip of P. On the Pacific near shore the prevailing wind is parallel to the coast or away from it. In Lima the extreme summer maximum temp. is 82°, winter minimum 56°, the corresponding means being 66° and 59°; but the city climate is made depressing by frequent formation of a cloud-cap. The Puna is cold, the lower Montaña is typically tropical, but the higher region is delightful. Light malaria, *paludism*, is common, but yellow fever and plague are rare. The people of pure Sp. blood are not numerous, having so intermingled with the Indians that they are now mestizos or people of mixed race, but their language is Sp., and the higher classes have much culture. Negroes and Asiatics together form about 1 per cent of the pop. The bulk of the pop. of the uplands, who are known as Cholos, are descended from the original Quechuas and Aymaras of the Inca Empire. They are strong and hardy, and make excellent miners, and the greater part of the work of the country is done by them. Many of them are small peasant proprietors.

OCCUPATIONS, PRODUCTION, AND COMMERCE. About 80 per cent of the pop. is dependent on agriculture, mainly with the help of irrigation. The chief agric. products are, in the order named, cotton, sugar, wool, hides, skins, coffee, and rice. In the coast region sugar, cotton, maize, alfalfa, and various fruits are grown. Peruvian cotton is of very high quality. Here also is the more modern and energetic life of the country. Callao, Chimbote, and Paita have good harbours, Chimbote being a port and processing centre for minerals, Paita for cotton. The Lobitos oilfields have a commercial outlet at Tumbes, and Salaverry is the port of Trujillo and the sugar dist. A new port

has been developed at Matarani. The forests of the dept of Loreto have plantations of the coco shrub, and in this remote place the sugar-cane, cotton, coffee, grapes, figs, oranges, pineapples, and bananas grow abundantly, but trade is hampered by lack of transport. Mollendo, one of the worst ports, is the outlet for Arequipa, the Títicaca dist., and the Montaña. Huancavelica is the centre of the quicksilver mines. The uplands are the home of the potato. Lake Títicaca (q.v.), with Lake Poopó and the R. Desaguadero, is a good waterway. Coffee is produced chiefly in Chanchamayo, Perené, and Paucartambo. Cocoa is extending in Perené. Coca is chiefly grown in Otuzco for the Indian pop., and cocaine is manufactured in Lima, Callao, and Utuzco, chiefly for export. Dyes, cinchona, and other medical plants are found; alpaca, sheep, and llama wool is exported. Rubber is shipped from Iquitos on the Amazon. The gathering of wild rubber, once the most important industry in the Amazon region, was stimulated under pressure from the U.S. Gov., which agreed to take all surplus rubber for 5 years from 1942. Copper and petroleum (which is nationalised) are the chief minerals exploited. The chief copper mine is at Cerro de Pasco, the highest in the world at an elevation of over 14,000 ft. It has been operated for 3 centuries. P. is one of the world's largest sources of vanadium. Other minerals exported include antimony, lead, tungsten, and bismuth. Gold is widely found, but transport and labour difficulties hinder mining. There are large iron deposits.

In 1947 the imports were valued at 1,091,957,000 soles, and the exports at 1,092,943,000 soles (the gold sol was until 14 Nov. 1949 worth 47.50 cents (U.S.A.), or 17.38 to the £ (i.e. 1s. 1d.). This was the first unfavourable trade balance in Peruvian hist. In 1956 the trading figures amounted to 6,934,473,000 and 5,917,262,000 soles respectively. The exchange rate is now 64 to the \$. Imports are cotton and woollen goods, electrical goods, arms and munitions, dyes, machinery, etc. Exports include cottons, hides, copper bars, petroleum, sugar, wool, mineral concentrates, and precious metals. In 1954 P. exported to the U.K. goods valued at 214,338,000, and U.K. imports to P. were valued at 26,542,000. In 1955 the estimated revenue and expenditure of P. balanced at 3,885,500,000 soles. The total debt of P. (1953) amounted to 1,592,830,000 soles, of which the internal debt was 889,271,000. Brit. investments in 1953 amounted to 231 m., yielding £600,000. Amer. direct investments in 1950 were \$140 m. Amer. holdings of Peruvian dollar bonds in 1953 were \$76,232,000.

COMMUNICATIONS. There are about 24,061 m. of roads suitable for motor traffic. The central highway over the Andes was completed in 1935; the rich E. part of P. was made accessible by the Callao-Huánuco-Pucallpa highway, opened in 1943; Lima was linked with Iquitos by the Lima-Pucallpa highway,

completed in 1944. There are good railways, which are carried to remarkable heights, Cerro de Pasco being served by a broad-gauge railway. P. has 2350 m. of railway. Since 1942 the administration of posts, telegraphs, and wireless service has been in the hands of the gov. There are 6 gov. and over 50 other radio stations. Private stations were suspended in 1942. Air mail and passenger services are fully developed.

GOVERNMENT. P. is governed by a president, who is elected for a term of 6 years, a senate of 42 members, and a chamber of deputies of 149 members, one-third renewable at general elections every 2 years. Voting is compulsory for all adult literate nationals. Women gained full franchise in 1955. The executive power is vested in the president. Under the constitution of 1933, as amended in 1939, he is advised by an economic advisory council of specialists in various fields. The president exercises his executive functions through a cabinet holding office at his pleasure. The 24 depts of P. are divided into 124 provs., each dept being administered by a prefect and each prov. by a sub-prefect. Dr Manuel Prado was elected new Constitutional President after the elections of 17 June 1956.

JUSTICE. There is a supreme court at Lima composed of 11 judges and 5 fiscals, and 19 superior courts. The judges of the supreme court are chosen by Congress from lists of names presented by the gov.; those of the superior courts and of the minor courts by the gov. from lists of names presented by the supreme and superior courts respectively.

DEFENCE. Military service is compulsory and universal, but, ordinarily, only a limited number of the yearly quota of conscripts is called up for active duty with the colours. The term of service is 2 years in the active army, 10 years in the reserve, and 20 years in the National Guard. The authorised estab. of the army in 1940 was 2000 officers and about 30,000 other ranks. Aviation, civil and military, is controlled by the Ministry of Marine and Aviation. The U.S. Gov. sent 50 aeroplanes on Lease-Lend terms in 1942. The Peruvian Navy includes 2 obsolete cruisers (1906) of 3200 tons with 6-in. guns, 2 destroyers, 5 submarines, and 8 riv. gunboats. There is a naval cadet school near Callao and a submarine base on San Lorenzo Is., opposite Callao.

EDUCATION, LITERATURE, AND RELIGION. Education is well run in P. and is free and compulsory. The system is highly centralised. In 1952 there were 12,190 elementary schools, and 104 secondary state schools giving 5-year courses. About 150 secondary schools were conducted by religious orders and other bodies. There are also rural schools for Indians, commercial and industrial schools, etc. Besides 2 excellent univs. at Lima, there are 3 others, at Arequipa, Cuzco, and Trujillo. Few of the S. Amer. reps. equal P. in culture and literature. Felipe Pardo y Allaga (d. 1868) was a brilliant man of letters and the author of sev.

sparkling comedies. Manuel A. Segura (d. 1871) was also a distinguished dramatist. Among many poets Pedro Paz Soldán y Unanue (d. 1895) was the chief in the 19th cent. Ricardo Palma (1833-1919) was an important writer of Peruvian hist.; José Santos Chocano (c. 1875-1934) was in his day perhaps the most powerful of all Sp.-Amer. poets. Religious liberty exists, but the Rom. Catholic faith is protected by the State. A decree of 1929 allowed only Rom. Catholic religious instruction in schools. There is a Rom. Catholic archbishopric at Lima, dating from 1545, and 18 bishops and vicars-general.

HISTORY. P. was conquered (1531-41) by Francisco Pizarro, and remained under Sp. rule till 1821. The country enjoyed an uneventful and prosperous hist. Lima was the centre of Sp. viceroyal rule and trade, and in every respect the chief city of the New World. Here, in 1551, was founded the univ. of San Marcos, the first on the Amer. continent. From early times Jesuit missionaries were at work, spreading culture and enlightenment. The War of Independence lasted some 3 years, and the Spaniards were finally defeated at Ayacucho (1824). When P. became independent, for a long time its record was one of perpetual civil strife. By the middle of the century prosperity was being estab., but it was shattered by a disastrous war with Chile (1879-83). The nitrate fields of Tarapacá, which were the main subject of dispute, were lost, and Arica and Tacna were also retained by the victors; as shown above, that matter was afterwards settled. Financially P. was ruined, and in 1890 the Peruvian Corporation took over the foreign debt in return for a 66 years' lease of railways and many other valuable concessions. Boundary disputes between S. Amer. states are, however, a frequent source of armed conflict, and in 1932 Peruvian filibusters from Iquitos occupied Letícia on the Colombian frontier, demanding a revision of the treaty settlement ratified by P. in 1927. The Peruvian Gov. supported the filibusters and broke off diplomatic relations with Colombia. The League of Nations, on Colombia's appeal, pronounced against P.; after a few months' skirmishing and bombing, a League commission was appointed to administer Letícia, until a settlement was reached between the 2 countries at Río de Janeiro in 1934. In 1939, 88 per cent of the electorate approved amendments to the constitution of 1933 by which proportional representation was abolished and general elections replaced by a renewal of one-third of the chamber biennially. In 1941 fighting took place between Peruvian and Ecuadorian troops for some weeks over a boundary dispute respecting the region N. of the Marañón from the Pongo de Manseriche, which, however, was settled. P. broke off diplomatic relations with the Axis powers on 24 Jan. 1942, and the U.S. Gov. made a loan to P. of \$20m. for defence purposes. A trade treaty was also concluded with the U.S.A. for the

disposal of Peruvian cotton and rubber surpluses. P. declared war on Germany and Japan in Feb. 1945. Though taking no active part in the war, the country supplied valuable raw materials to the Allies. P. became a foundation member of the United Nations.

ANCIENT CIVILISATION. Archaeological remains of the country take us to much earlier forms of culture than those of the Inca. Geographically P. can be divided into 3 zones, the Coast, the Sierra, and the Montaña. The most discussed problem of Peruvian archaeology is whether the cultural priority goes to the prehistoric culture of the Sierra or to that of the Coast zone. According to J. C. Tello, the priority is to be given to the 'autochthonous' people of the Sierra, to the culture of Early Tiahuanaco and Chavin. According to him, archaeological traces of the Chavin culture may also be found at Lambayeque, Ancón, and Paracas. On the other hand, M. Uhle distinguishes the following 5 phases of pre-historic Peruvian cultures, of which the first 3 are in the Coast zone: (1) S. valleys: Early Nasca or Nasca I and the 2 Inca (q.v.) periods; (2) central valleys: Proto-Lima (Nievería) and Recuay; (3) N. valleys: Early Chimu or Chimu I (Trujillo) and Late Chimu or Chimu II (Chanohán); (4) the Sierra, with the cultures of Chavin and Tiahuanaco I, followed by Tiahuanaco II; and (5) the Inca or Cuzco culture. The chronological problems are still open. Uhle dates the Coast cultures from AD 700, the Sierra culture from 500 to 1000, and the Inca culture, in its zenith, from 1300 to 1500. According to other scholars (e.g. E. Seler), the 2 cultural groups (Coast zone and the Sierra) were roughly contemporaneous. The Inca Empire fl. from the first Inca, Manco Capac (Capac) (about AD 1000), till Pizarro's arrival and the defeat and death of Atahualpa in 1532. It extended over P., Bolivia, and Ecuador, and its influence extended even to the Gran Chaco. The cap. was at Cuzco (q.v.), and Quito was another important centre. A complete system of roads was estab. It is their buildings which make the Incas chiefly worthy of admiration, of which the most remarkable are at and around Cuzco, including the great fortress of Sacsahuaman, the Temple of the Sun, the palaces of Huayna Capac and of Pachacuti. The ruins of Machu Picchu (q.v.) are of great beauty, and it is believed that the city was the traditional Tampu-tocco, cradle of the Incas. A road was opened in 1948 by which access to the site is gained. The ruins consist mainly of most remarkable monoliths, some nearly 20 ft high, which were fitted into their place by workmen who knew no mechanical contrivance and used no mortar. The Incas had great proficiency in astronomy, as we find from the remains of their observatories. Bronze and copper cutting tools were used, but iron was unknown. Skilled and beautiful metal work in gold and silver, pottery, and textile fabrics have been preserved.

Religion. There are temples of the sun and moon; their 'unknown God,' a supreme spirit, all-pervading, was worshipped without idols or human sacrifices. The image of the Creator was represented at Cuzco by a large flat plate of fine gold, of an oval or elliptical form. The sacred fire of the sun was attended by vestal virgins. Manco Capac, the first legendary Inca, was, according to legend, born of a virgin and came as a redeemer of mankind and a teacher of civilisation.

Agriculture was advanced, and the system of terrace culture was admirably adapted to the mts. Land was held on a communal system, one part being reserved for the sun temples and priests, another for the Inca, and a third for the people. Each Indian was given a measure of land, and, as soon as he had a family, a further allowance was given to each member. Idleness was punished. Poverty and destitution were unknown, the old and infirm being cared for by their neighbours.

The Inca Gov. estab. storehouses as a precaution against famine and to secure that the common produce of the people's labour should be equitably distributed. In all respects, as far as we know it, the social and political system was admirable. The gov. was a benevolent despotism, interfering with the lives of its subjects at every turn with sumptuary laws and all manner of regulations in the minutest matters of daily life, and such a system was well suited to the docile nature of the people. Conquered peoples were well treated and induced to join in the Incan system. Garcilasso, the Sp. chronicler to whom we are indebted for the greater part of our knowledge of the Inca regime, declares that no anc. kings, whether of Asia, Africa, or Europe, have ever shown such wise and benevolent treatment of their subjects.

Peru Balsam, see BALSAM.

Perugia: 1. Prov. of Italy, in N. Umbria (q.v.). It is in the Central Apennines (q.v.), and from the centre of the prov. the broad and fertile valleys of the Tiber (q.v.) and the Teverone run respectively SW. and SE. In the W. is Lake Trasimene (q.v.). Cereals, wine, oil, and fruit are produced, and coal and iron are found. The prin. tns include P., Foligno, and

Assisi (qq.v.). Area 2,445 sq. m. Pop. 588,000.

2. (anc. Perusia) It. city, cap. of the prov. of P., and chief tn of Umbria, built on a hill commanding the Tiber valley, 80 m. N. by W. of Rome (q.v.). Originally an Etruscan city (see ETRURIA), it was taken by the Romans in 40 BC and by Totila (q.v.) in the 6th cent. In the Middle Ages it was frequently devastated in wars with neighbouring tns. It came under the rule of the popes in 1534 (see CHURCH, STATES OF THE). There is a 14th-15th-cent. archiepiscopal Gothic cathedral. The old exchange, the *Collegio del Cambio*, and the *Palazzo Comunale* contain many notable works of art, including frescoes by Perugino (q.v.) and his school. The univ. dates from 1200. There are considerable Etruscan remains in the neighbourhood. Textiles, chemicals, lace, and machinery are manuf., and there is a large trade in agric. produce, wine, and oil. Pop. (tn) 38,100; (com.) 96,900. See W. Heywood, *History of Perugia*, 1910, and M. Symonds and L. Duff-Gordon, *Perugia*, 1898 (Medieval Towns Series).

Perugia, Lake, see TRASIMENE, LAKE.

Perugino, Pietro, properly Pietro Vannucci (?1446-1523), It. painter, one of the masters of the Umbrian school, b. Città della Pieve, near Perugia. He is said to have been a pupil of Florentine di Lorenzo and probably an assistant to Verrocchio. His first public work was the execution of the frescoes in the Palazzo Comunale in Perugia (1475). In 1480 he was one of the group of artists chosen by Sixtus IV to embellish his newly finished Sistine chapel, and painted the 'Delivery of the Keys to St Peter,' a work which particularly shows his method of bringing out in accurate perspective, and with true feeling of the value of distance, the effects of space and atmosphere, a method which his pupil Raphael (q.v.) carried to perfection. P. led a wandering life: in 1449 he painted the noble frescoes in the Collegio del Cambio of Perugia, but after 1502 he worked mostly at Florence. His 'Virgin and Child, with Sts Michael and Raphael,' and 4 other works are in the National Gallery. See lives by G. C. Williamson, 1900, and F. Canuti, 1931.

Perusia, see PERUGIA.

Peruvian Bark, or **Jesuit's Bark**, bark of various trees of the genus *Cinchona*. See CINCHONA; CINCHONA BARK ALKALOIDS.

Peruwelz, tn in the prov. of Hainaut, Belgium, 12 m. SE. of Tournai, near the Fr. border. It is engaged in manufs. of leather, ropes, knitted goods, and footwear. Pop. 7800.

Peruzzi, Baldassare (1481-1536), It. architect and painter, b. near Siena. His early work was in imitation of Pintoricchio (q.v.), but later he was influenced by Raphael. In 1509 he designed the Villa Farnesina in Rome, for which Raphael painted the frescoes. In 1520 he was appointed architect of St Peter's, in succession to Raphael, and may have designed the Orsini, Lante, and Orsoli palaces at Rome; as well as the Albergo Palace at Bologna. Among his paintings

at Siena is the famous 'Augustus and the Sibyl,' in the church of Pontegiusta. Becoming city architect at Siena on the sack of Rome in 1527, in 1532 he returned to Rome, where he built the Vidoni and Orsini palaces, and his architectural masterpiece, the Massimi Palace. See biographies by A. Donati, 1879, and W. Kent, 1925.

Pesaro (anc. *Pisaurum*), It. tn and bathing resort, cap. of the prov. of P. e Urbino (q.v.), 37 m. NW. of Ancona (q.v.). It is on the Adriatic coast, at the mouth of the R. Foglia. There was severe damage during the Second World War. P. has a 15th-cent. ducal palace, a cathedral, and a musical lyceum, founded by Rossini (q.v.), who was b. here. There are silk, engineering, majolica, and sugar industries, and a trade in figs, wine, oil, cheese, and wax. Pop. (tn) 28,900; (com.) 56,300.

Pesaro e Urbino, prov. of Italy, in the N. Marches (q.v.). It is generally mountainous and contains some high ridges of the Apennines (q.v.), but has a wide, undulating coastal plain on the Adriatic in the E. The chief rvs. are the Metauro (q.v.), Foglia, and Cesano. Cereals, fruit, wine, and silk are produced, and iron is found. The prin. tns include Pesaro, Urbino, Fano, and Fossombrone (qq.v.). Area 1117 sq. m. Pop. 334,000.

Pescadores, or P'enghu, group of about 12 basaltic is., off the W. coast of Formosa, China Sea. They were ceded by China to Japan in 1895, and returned to China in 1945. Since 1949 they have been occupied by Chiang Kai-shek's refugee gov. in Formosa. Millet and rice are grown and there are good fisheries. Area 50 sq. m. Pop. about 70,000. See FORMOSA.

Pescara, **Fernando Francesco d'Avalos**, Marquis (c. 1489-1525), Neapolitan gen. in the service of Spain. At the battle of Ravenna (1512) he was taken prisoner by the French, but was soon ransomed; he served in the war in Lombardy (1515) and was severely wounded at Pavia (1525). He was placed in command of the army of Italy, and was approached by Morone to join the Duke of Milan's party in a plot against Charles V. P., however, betrayed the conspiracy to Charles.

Pescara: 1. Prov. of Italy, in E. Abruzzi e Molise (q.v.). It is mainly mountainous, and has high peaks of the Central Apennines (q.v.) in the S. There is a short coastal plain on the Adriatic, and there are fertile riv. valleys; the chief rvs. are the Tavo and the P. Area 475 sq. m. Pop. 246,000.

2. It. tn and bathing resort, cap. of the prov. of P., on the Adriatic, 42 m. ENE. of L'Aquila (q.v.). It is a modern tn divided into 2 parts (P. proper, and Castellamare Adriatico) by the P. riv. Pop. (tn) 56,900; (prov.) 64,000.

3. Riv. of Italy, rising in the Central Apennines and flowing generally N.E. across Abruzzi e Molise to the Adriatic at P. On 5 May, 1944, during the Second World War, R.A.F. dive bombers smashed the great P. dam, 12 m. SW. of Chieti (q.v.), thus putting out of action

the hydro-electric works which supplied current to the railways of a great part of Central Italy. Length 40 m.

Pesohiera, It. fort. tn, in Veneto (q.v.) at the S.E. corner of the Lake of Garda (q.v.). Pop. 2500.

Pescia, It. tn, in Tuscany (q.v.), 11 m. ESE. of Pistoia (q.v.). It has a 14th-cent. cathedral and an anc. castle. Textiles, oil, hats, and paper are manuf. Pop. (tn) 10,200; (com.) 20,500.

Peseta, silver coin, the standard unit of currency in Spain, containing 100 centesimos; coins and notes of different values are issued.

Peshawar, city of W. Pakistan, formerly cap. of NW. Frontier Province. P. stands close to the foot of the Khyber Pass into Afghanistan, and has for centuries been a centre of the transit trade between the Indian sub-continent, Afghanistan, and Central Asia. The bazaars do a brisk trade and are thronged with tribesmen from distant places. It is an old city, and was once a Buddhist centre with a huge *stupa*, now in ruins. Having been in Muslim occupation since about AD 1000, it was taken by the Sikhs in 1833 and by the British in 1849. The Islamic College, instituted in 1915, has now become the Peshawar Univ. The country immediately around P. is noted for the excellent fruit grown, including apples, peaches, and pears.

Peshkov, see GOR'KİY.

Peshwa, or **Peishwa**, anc. head of the Mahrattas (q.v.). The title was annulled by the British in 1818, owing to the continued hostility of the Mahrattas, and their ter. was annexed.

Peso, name of the monetary unit of sev. Lat. Amer. countries, Paraguay, Colombia, Mexico, the Argentine, etc. It is usually divided into 100 centavos. Following Brit. devaluation of sterling in 1949, the Argentine Gov. readjusted the exchange rate of the P. in relation to the £ from 13.53 to 9.40. See also METROLOGY.

Pessimism, attitude of mind, which, confronted by the prevailing irrationality, misery, and worthlessness of life, despairs of finding any real happiness, dignity, purpose, or beauty therein. Often the world-weariness expressed by, for example, Homer and Sophocles, is in fact but a transient subjective mood. Usually, as for instance in the Heb. Koheleth, in the Gospel, and in some forms of Pantheism (e.g. Brahmanism), the sense of frustration is transcended by a loftier estimate, and it is seen that 'God will bring every work and secret thing . . . into judgment.' When this view is not taken P. results. P. finds its earliest systematic development in Buddhism wherein consciousness can convey only suffering. The existence not only of a supreme Goodness but also of a supreme absolute Being is denied, and the only refuge offered is that of self-alienation from all desire, hope, and aesthetic sentiment. In this final comatose indifference, when one has realised the vanity and futile nothingness of life, and has overcome susceptibilities to all emotional stimuli, Buddhism finds the

greatest expression of human wisdom; it is praiseworthy because it anticipates death, the great relief from all wretchedness. Buddhism is thus the origin of all modern European P. Epicureanism is closely related to Buddhism, since it regards happiness as accidental in life, existing as a temporary negation of sorrow rather than as a positive emotional or rational circumstance. P. appears in the W. with David Hume's *Treatise of Human Nature and Discourse*; but its chief modern exponents are Schopenhauer (q.v.) and von Hartmann (q.v.). The P. of Nietzsche (q.v.) is only incidental to his opti-

by winning a national literary prize. He wrote at first in English (*Aninous*, 1918; *35 Sonnets*, 1918; *English Poems*, 1921) and then pub. a large number of poems in short-lived literary periodicals under his own and 3 different names (Alberto Caeiro, Ricardo Reis, Avaro de Campos), which we might call pseudonyms, but which he believed to correspond to distinct aspects of his personality. He contrives to render the conflict of the poet's inner world in all its facets; the squalor of existence, the frustrated quest for the absolute, the corrosive influence of time, and a pagan lust for life are recurrent

PESTALOZZI CHILDREN'S VILLAGE AT TROGEN

mistic ideal of the Superman. Schopenhauer perceives in life only a blind will, an irresponsible and unguided force, which works heedlessly in all directions, and so causes the incongruities, the irreconcilable conflicting impulses of which existence consists. He advocates suicide and deprecates love as helping to propitiate misery. Von Hartmann prefers the expedient of continuing as things are until mankind has been educated to perceive the significance of oblivion and to take the necessary action. See also STOICIS. See J. Sully, *Pessimism, a History and a Criticism*, 1877; E. M. Caro, *Le Pessimisme au 19^{ème} siècle*, 1878; H. Oldenburg, *Buddha* (trans.), 1882; A. Schopenhauer, *Die Welt als Wille und Vorstellung*, 1883-6; C. R. E. von Hartmann, *Philosophie des Unbewussten*, 1884; and H. Diels, *Der antike Pessimismus*, 1921.

Pessoa, Fernando (1888-1935). Portuguese poet, probably the greatest since Camões (q.v.), b. Lisbon and educ. in S. Africa, where he distinguished himself

themes in his poetry, where the emotional element is always superseded by the intellectual. See *Collected Works*, 1951-5; J. G. Simoes, *Vida e obra de F. Pessoa*, 1951.

Pest, see BUDAPEST.

Pestalozzi, Johann Heinrich (1746-1827), Swiss educational reformer, b. Zürich. He studied theology, law, and scientific agriculture, not putting his educational views into practice until he was of middle age. In his attempt to educate his own child 'according to Nature' after the manner of Rousseau's *Emile*, P. discovered the value of the fundamental principles of his master while rejecting his extravagances. In 1775 he gathered together a number of destitute children, to whom he proposed applying his theories; the scheme proved a financial failure, but when adapted in 1798 to an orphan asylum at Stans, in 1799 at Burgdorf, and in 1805-25 to the institute which he founded at Yverdon (Neuchâtel), his ideas were spread through

the various foreign teachers who came to him and influenced the whole course of modern education. He wrote *Abendstunde eines Einseitlers*, 1780; *Lienhardt und Gertrud*, 1781; and *Wie Gertrud ihre Kinder lehrt*, 1801. See also EDUCATION. See works on P. by Krüsi, 1875; G. Seyffarth, 1881; De Guimps, 1889; and Pinloche, 1901; also the book compiled in Switzerland under an official committee on the centenary of P.'s death, trans. into Eng., 1928, as *Pestalozzi and His Times*.

Pestalozzi Children's Village, new vil. in the canton of Appenzell, Switzerland, named after Johann Heinrich Pestalozzi (q.v.), the Swiss educational pioneer. It was founded in 1946 for war refugee children from various countries. The children live in pleasant modern houses, and the groups are educ. by the teachers of their respective nationalities. In 1956 Hungarian refugees were accepted. There are plans for a similar vil. in the Chiltern Hills in England.

Petacci, Clara, see MUSSOLINI.

Pétain, Henri Philippe Benoni Omer Joseph (1856-1951), Fr. soldier and statesman, b. Cauchy-la-Tour (Pas-de-Calais). Educ. at St Cyr, 1876-8, he became a Lieutenant in the Alpine Chasseurs, and later a captain attached to the general staff of the 15th Corps at Marseilles. He was successively military governor of Paris, instructor at the École Normale de Tir at Châlons, 1902, and assistant-instructor at the School of War, 1906. Although his fame as instructor was great, he was not made colonel till 1912, when he was placed at the head of the 33rd Infantry at Arras. At the opening of the First World War he was made a temporary brig. gen. commanding the 4th Brigade, part of the 1st Army Corps. After being in the retreat from Belgium, 1914, P. was placed in command of the 6th Div., which fought at the Marne, and was soon afterwards in command of the 33rd Army Corps, which covered Arras. In 1916 Joffre placed him in command of the army formed to relieve Verdun. P. soon fulfilled the promise with which his name was to be associated for the next quarter of a century: 'Ils ne passeront pas!' Before the middle of Mar. the Ger. advance was decisively checked. In April P. surrendered this command to Nivelle, and took command of the armies of the centre. In May 1917 he became commander of the armies in the N. and NE. In July 1918, the supreme command of British and French being now vested in Foch, P. was entrusted with the general attack by all Fr. forces. Marshal, 19 Nov., 1918, P. became a member of the Academy, 1929. Vice-president, Council of War, 1920-30, was on Council of National Defence from 1931, and war minister in Doumergue's Gov., 1934. After the Sp. civil war he became Fr. ambas. to Spain. In May 1940 Reynaud called him

into his cabinet as vice-premier, but by this time P. had become convinced that Ger. victory was inevitable, and was soon urging an immediate Fr. capitulation in order to secure the most favourable possible terms for France, rather than fight on to total collapse. On 16 June he formed a cabinet, and asked Hitler for an armistice, but it was not until 25 June that he told the Fr. people of its humiliating terms. After this he became 'chief of the Fr. state', abolished the republican constitution, and substituted a dictatorial system of gov. for that part of France which remained unoccupied until the allied landings in N. Africa towards the end of 1942. His real authority was never great, however, Laval and the Germans being the controlling force. Though by the end of the war P.'s name was spoken of with detestation by the great majority of Frenchmen, it is clear that between 1940 and 1942 many people in Vichy France believed that he had saved them from a considerably worse fate by his action in treating with the Germans. After 1942 P.'s position as head of the state was more nominal than ever, all effective authority having passed to Laval and Admiral Darlan. He had retired from the active political scene by the end of 1943. When the allied invasion of Europe began he appealed to Frenchmen to remain quiescent. Under Ger. threats P. left Vichy and was taken to Belfort and later to Sigmaringen. In April 1945 he voluntarily returned to France, where he was arrested and interned. On a charge of treason he was tried and sentenced to death, this being commuted to life imprisonment. He was taken to the Isle d'Yeu, off the Vendian coast, where he d. He protested at his trial (and there seems little reason to doubt his sincerity) that his conduct had been actuated by his desire to serve his country in the way he believed best for it; on sentence he declared: 'The French people will not forget. They know that I defended them as I did at Verdun.' See G. Suarez, *Le Maréchal Pétain, 1914-40*, 1940; P. L. Michel, *Le Procès Pétain*, 1945; A. Fabre-Luce, *Le Mythe Pétain*, 1946; P. Farmer, *Vichy Political Dilemma*, 1955; H. Lüthy, *The State of France* (Eng. trans.), 1955; and A. Werth, *France, 1940-45*, 1955.

Petasites, a genus of 14 species of perennial herbs with rhizomatous roots or stems, family *Compositae*, and found in Europe, Asia, and N. America. *P. fragrans*, Winter Heliotrope, and *P. hybridus*, Butterbur, are found in Britain, sometimes becoming troublesome weeds.

Petch, see PEC.

Petchora, see PECHORA.

Peteorde, see PETWORTH.

Peter, St, one of the 12 apostles, and first Bishop of Rome, b. at Bethsaida, on the W. side of the lake of Genesareth; during the period of Christ's ministry his residence was at Capernaum. He was married, but we are not told whether or not he had children. His name was at first Simon (or Symeon, Acts xv. 14), which was changed by our Lord into

Cephas, an Aramaic word signifying a stone or rock, in Greek, *petra*, whence Peter. In conjunction with Andrew, his brother, he followed the occupation of a fisherman. Both were disciples of John the Baptist (John i. 40 ff.), by whom they were taught that Jesus was the Messiah. While following their occupation on the sea of Galilee, Jesus called them to be His disciples, promising that he would make them 'fishers of men.' P. received from Christ the 'commission of the keys' and the first place in the apostolic college. The earliest account of the Resurrection (1 Cor. xv. 5) tells of Christ's appearing 'first to Cephas, then to the twelve,' and the early chapters of Acts show how P. continued in his position as leader. It was he who punished Ananias and Sapphira. He converted Cornelius, a Rom. centurion, the first Gentile to be admitted into the Church without circumcision. It is supposed that he afterwards preached through Pontus, Galatia, Cappadocia, Asia Minor, and Bithynia. The tradition that he then came to Rome is now generally admitted, not only by Rom. Catholics but also by the best Protestant authorities. Here he is said to have suffered death under Nero, being crucified head downwards. See W. M. Taylor, *Peter the Apostle*, 1900; A. S. Barnes, *The Martyrdom of St Peter and St Paul*, 1933; A. T. Robertson, *Epochs in the Life of Peter*, 1933; and L. C. Douglas, *The Big Fisherman* (life in novel form), 1949.

Peter, First and Second Epistles of. These two epistles must be considered quite separately. 1 Pet. was written to Gentile Christians of Asia Minor from Rome ('the Church that is in Babylon,' v. 13), and all the evidence is in favour of its having been written, as it claims, by the prince of the apostles and about AD 63 (after Eph. and the end of St Paul's first captivity in 62). See commentaries by C. Bigg, 1901; E. G. Selwyn, 1946; L. J. Radcliffe, 1953.

With 2 Pet. the case is different. There are no certain quotations from it before the letter of Origen, who accepted it as Petrine, though recording the fact that it was disputed. So, too, with Jerome and Eusebius. Lack of quotation is, however, a weak argument, for the epistle is not particularly quotable. A more serious difficulty arises from the difference in style from 1 Pet.; but if, as is most probable, 1 Pet. owes its style to an amanuensis, 2 Pet. may owe its to another. Its use of Jude is no more difficult than 1 Pet.'s use of Rom., Eph., and Jas. Besides this there is a close connection in thought between 1 and 2 Pet., both of which draw upon a common stock of ideas. There is, however, no attempt in one epistle to imitate the other, such as might be expected of a forger: and 2 Pet. explicitly claims to be the writer of 1 Pet., and refers to 'our most dear brother Paul.' See commentaries by C. Bigg, 1901; J. Chaine, 1939; Little (in C. Gore's *New Commentary on Holy Scripture*), 1928; H. Willmering (in *A Catholic Commentary on Holy Scripture*), 1953.

Peter I, the Great (1672-1725), first Russian emperor, youngest son of Tsar Alexis Mikhaylovich (q.v.). When P.'s half-brother Fëdor III (q.v.) d. in 1682 without issue, the P.-... of Moscow and the prin. Boyars (q.v.) decided that P. should be the tsar rather than his older but incompetent half-brother Ivan. The latter's older sister Sophia, however, organised a coup by the palace guards which resulted in the coronation of Ivan and P. as joint tsars, with the appointment of Sophia as regent. The next 7 years P. spent in a vil. near Moscow with his mother. Physically and

PETER THE GREAT
After Kneller

mentally far in advance of his years, and receiving no systematic education, P. picked up a mass of knowledge and technical skills, mainly from foreigners in Russian service who lived in a suburb nearby—particularly the Swiss Lefort, the Scotsman Patrick Gordon, and the Dutchman Timmerman. In 1689, having received information of a plot by Sophia against him, P. forced her to resign and sent her to a convent, where she d. in 1704. P. left nominal precedence to Ivan, but in fact ruled the country himself. P.'s first care on assuming the gov. was to form an army disciplined according to European tactics, in which task he was greatly aided by Gordon and Lefort. He also strove to create a navy and a merchant fleet. P., thinking the possession of a portion of the Black Sea would best supply the required facilities of accessible sea-board and port, declared war against Turkey, and took the city of Azov after a long siege in 1696. Eager for knowledge, he left Russia in April 1697, in the train of an embassy of which Lefort was the head. In the guise of an inferior official of the embassy he visited the 3 Baltic

provs., Prussia, and Hanover, reaching Amsterdam, where he worked for some time as a common shipwright. To his other studies he added the study of astronomy, natural philosophy, geography, and even anatomy and surgery. On receipt of an invitation from William III, King of England, he visited that country, and for 3 months, spent partly in London and partly in Deptford, laboured to amass all sorts of useful information. He left England in April 1698, carrying with him Eng. engineers, artificers, surgeons, artisans, artillerymen, etc., to the number of 500. He was about to visit Venice also, when the news of a formidable rebellion of the soldiery recalled him to Russia; but before he arrived Gen. Gordon had already crushed the revolt. P.'s wife, suspected of complicity in the conspiracy, was divorced and shut up in a convent.

In 1700 P. entered into an alliance with the Kings of Poland and Denmark to make a combined attack on Sweden. Taking advantage of the Swedes being employed elsewhere, he quietly appropriated a portion of Ingria, in which he laid the foundation of the new cap., St Petersburg, 1703, which in a few years became the Russian commercial depot for the Baltic. In the long contest with Sweden the Russians suffered a series of defeats, but then P. totally routed the Swedish king at Poltava, 8 July, 1709. He next prepared for war with the Turks, who at the instigation of Sweden had declared war against him. In this contest P. lost his previous conquest, the port of Azov and the ter. belonging to it. In 1712 he married his mistress, Catherine (see CATHERINE I.). At the end of 1716 and beginning of 1717, in company with the tsarina, he made another tour of Europe. Soon after this time he ordered the execution of his son Alexey for suspected treason, but Alexey d. before sentence could be carried out. In 1721 peace was made with Sweden. In 1722 P. commenced a war with Persia and compelled the shah to hand over the 3 Caspian provs. along with the tns of Derbent and Baku. P. introduced many reforms, the most important of which were the abolition of the Moscow Patriarchy and its replacement by a synod subordinated to the tsar; the reform of the central gov., with the setting up of specialised gov. depts; the reform of prov. administration, with the appointment of prov. governors; the introduction of a properly organised military and civil service open to any suitable person irrespective of origin; and financial reforms, including the introduction of a poll tax. After the end of the Northern War in 1721 P. was proclaimed emperor, and in 1722 promulgated a new law of succession, which enjoined that each monarch should nominate his own successor. P. did much to develop Russia's trade and industry, and encouraged scholarship. Though personally cruel and barbaric in many of his habits, he was indeed a great monarch, who transformed Russia and brought her into the concert of the great European powers. See E. H. Sumner, *Peter the Great and the Russian Empire*, L., 1950.

Peter II (1715-30), Emperor of Russia, grandson of Peter the Great. He succeeded to the throne in 1727 on the death of Catherine I; the country was ruled by the Supreme Privy Council. Died of small-pox.

Peter III (1728-62), Emperor of Russia and Duke of Holstein, b. Kiel. He succeeded his aunt Elizabeth, 1762, and immediately returned to Frederick the Great all the Prussian provs. conquered by Russia during the Seven Years' War. Weak-minded and futile, he happened to follow good advice in issuing the famous Edict freeing the gentry from state service. He was overthrown by a conspiracy of the Guards in favour of his wife, Catherine II. He is believed to have been put to death by Catherine's favourite, Orlov.

Peter II (1813-51), prince of Montenegro, ruled from 1830 to 1851. A statesman and a reformer, he was also a poet of some distinction. He was the last of the Vladikas, or prince-bishops.

Peter I, Karageorgević (1844-1921), King of Serbia, b. Belgrade. He was the son of Alexander Karageorgević, and grandson of Czerny Djordji (q.v.), who had headed the Serbian insurrection of 1804 against the Turks. In 1883 he married Princess Zorka, daughter of the King of Montenegro. He was proclaimed King of Serbia (1903) after the murder of Alexander Obrenović and crowned in 1904. In the First World War he shared in the disastrous Serbian retreat across Albania in 1915, and only returned to the cap. in Nov. 1918, being invited, shortly afterwards, to accept the crown of Yugoslavia, the triune kingdom of Croats, Serbs, and Slovenes. See also SERBIA.

Peter II (1923-), King of Yugoslavia 1934-45. On the assassination of his father, P. ruled under his uncle's (Prince Paul) regency. The latter planned to join the Axis powers in 1941, but P. led a revolt and assumed power. The Ger. invasion compelled him to seek refuge in England, where he married Princess Alexandra of Greece in 1944, by whom he has 1 son, Prince Alexander. Conflict with other allied govts. was caused by P.'s support of Mihailovich (q.v.) and his hostility to Tito (q.v.), and in 1945 the new Yugoslav regime abolished the monarchy. P., who had gone to Egypt as a result of his disagreement with the Allies, had his property confiscated and was deprived of his nationality.

Peter Canisius, see PIETER DE HONDT.

Peter Damian, St (1007-72), It. ecclesiastic. In 1035 entered the hermitage of Fonte Avellano, near Gubbio, a severe and ascetic estab., of which he became head in 1043. He soon went into political life, entering upon a correspondence with the Emperor Henry III, and in 1049 writing to Pope Leo IX, *Liber Gomorrhianus*, in which he denounced the vices of the clergy. In 1058 he became a cardinal and Bishop of Ostia, and gained a signal victory for papal authority at the Council of Milan in 1059. Declared a Doctor of the Church in 1828; his feast is on 23 Feb. His collected works, which

are mainly directed the marriage of the cl. 4 vols. at Rome, under Cardinal Cajetan, in 1606-15.

Peter Lombard, see **LOMBARD**.

Peter Martyr, St (1206-52), a Dominican, b. at Verona; canonised in 1253. He was remarkable for his zeal against heretics, against whom he worked vigorously as Grand Inquisitor in Lombardy. He was murdered near Como by Catharists. His feast is on 29 April.

Peter Martyr (Vermiglio) (1500-62), Protestant divine. He was in succession Abbot of Spoleto, prior of a convent in Naples, and later prior of a rich abbey at Lucca. Becoming imbued with Protestant views, and fearing for his life, he refused to attend a council at Genoa and fled to Pisa and then to Zürich. Afterwards he became prof. of divinity at Strasburg. In 1547, at the invitation of Cranmer, he came to England and was appointed to the chair of theology at Oxford. On Queen Mary's accession he returned to Strasburg, and in 1556 went to Zürich.

Peter of Abano (Petrus Abanus) (1250-1316), b. Abano Bagni (q.v.). Studied first at Padua; went to Constantinople to study Greek, and afterwards to Paris, studying medicine and mathematics. Travelled in England and Scotland, but in 1303-4 was recalled to Padua to be prof. of medicine; his reputation was great and his fees high. With astronomy he studied astrology, and made some pretence to magic. In 1306 this study brought him before the Inquisition as a magician, but he cleared himself. In 1314 he was invited to Treviso, where he went. Next year another accusation was brought against him and he came up for trial; he d., however, before judgment was given. The inquiry continued after his death; he was found guilty and his body was burned. He wrote sev. works on philosophy and medicine, and made translations of ant and Arabic medical writers. He was the most learned physician of his time. His best works were his *Conciliator differentiarum*, an attempt to reconcile all differences between Arabic and Gk medical thought, and his *De venenis*, an important treatise on toxicology.

Peter of Blois, or **Petrus Blesensis** (c. 1135-c. 1205), Fr. cleric and writer, b. at Blois. He studied law at Bologna. He became tutor to the future William II of Sicily, and came to England c. 1172. He was made first, chancellor to the see of Canterbury, and then appointed to the archdeaconry of Bath. On the death of Henry II P. remained in the employment of Queen Eleanor, and afterwards was appointed archdeacon of London. His letters are historically interesting from the notices they contain of contemporary events and manners.

Peter the Cruel, see **PEDRO THE CRUEL**.

Peter I Island, in the Antarctic, is 9 m. long, 4 m. wide, with a height of 4000 ft. It was the first land to be discovered S. of the Antarctic Circle, by Capt. F. von Bellinghausen of the Imperial Russian Navy in 1821. It was explored by

Norwegian expeditions in the 1820s, and now belongs to Norway. See L. Christensen, *Such is the Antarctic*, 1935.

Peter the Great Gulf (Bay), or **Golden Horn Bay**, wide inlet of the sea of Japan, on the coast of Russian Far East, stretching from the Tumen R. (Korea frontier) to Cape Povorotnyy. Vladivostok, a terminus of the Trans-Siberian Railway, is its chief port.

Peter the Hermit (c. 1050-1115), a soldier of European birth, but whose bp. is unknown, lived for some time as a hermit in Palestine. Returning to the W., he preached the first crusade, in which he fought. Afterwards he founded the monastery of Neumoutier in Flanders. See **CRUSADES**.

Peter the Venerable, or **Peter of Montboissier** (c. 1092-1156), Fr. monk, and Abbot of Cluny from about 1122 to his death. In about 1130 he wrote his *Epistola seu Tractatus adversus Petrobusianos* against the disciples of Peter of Bruys and Henry of Lausanne, whom he charged with preaching heresy in the S. of France. He took part in the council of Pisa (1134), and is said to have been influential in securing the papal throne for Innocent II. P. is noted for befriending Abélard in his last days.

Peterborough: 1. City and municipal bor., situated in the administrative co. of the soke of P., mainly in Northants but partly in Hunts, England, on the R. Nene, 42 m. NE. of Northampton. It is a bishop's see and has a fine cathedral, begun in 1117, formerly the church of a Benedictine monastery. Architectural styles range from the Norman to the Perpendicular period, and prior to the Reformation it was considered one of the most magnificent in the kingdom. The first monastery was founded in the 7th cent., but was totally destroyed by the Danes in 870. In 972 a new monastery, founded by Æthelwold, Bishop of Winchester, was endowed by Edgar the Peaceful, and, fortified by Abbot Kenulph, it acquired the name of Burgh. The second church was destroyed by fire in 1116, and in the following year the building of the third church began. The 3-arched W. front was completed in the reign of John, and many additions and alterations to the building were made almost up to the time of the surrender of the monastery in 1539, when the church was selected as one of the 6 cathedrals to be refounded from monastic churches in 1541 by Henry VIII, on the advice of Cranmer. The city was created by letters patent of Henry VIII on 4 Sept. 1541. Before the dissolution there had been a small mesne bor. dating back to the Norman era, the tn growing up round the monastery. Both tn and monastery were sacked by Hereward the Wake and the Danes in 1071, and the abbey tenants shared in the peasants' revolt during the reign of Edward II. The remains of Catherine of Aragon, wife of Henry VIII, lie in the cathedral, and those of Mary, Queen of Scots, lay buried here for a quarter of a century. In 1643 the cathedral was despoiled by Cromwell and

his soldiers, who destroyed most of the monuments and stained glass.

Formerly the powers of local gov. in P. were divided between the dean and chapter as lords of the manor, whose steward presided over a court leet held in and for the city, and a rival parochial authority, holding certain tn estates, known as the feoffees and governors of the tn lands and stock, but in 1874 the city became a municipal corporation. It is now governed by a mayor and corporation, comprising 9 aldermen and 27 councillors. There is a separate co. council for the soke of P., estab. in 1888, with 10 aldermen and 32 councillors. The Justices for the soke of P. have by long-standing commissions (especially preserved by the Justices of the Peace Act, 1949) full powers of Judges of Assize, though in practice do not exercise their rights in the most serious classes of cases. The Marquess of Exeter, who is hereditary lord paramount, also holds the office of *custos rotulorum* for life by a grant from the Crown and is chairman of the justices in quarter sessions, though he has appointed the P. co. court judge as his deputy to preside at the sessions.

P. grew up as, and remains, the marketing centre for an important agric. area. It is a busy railway tn (being a junction of the N.E. and Midland regions), and has large workshops for the manuf. of railway plant. It has now become an industrial centre, the chief trade being engineering, including in particular the manuf. of diesel engines, ovens and catering machinery, turbines, marine auxiliaries, and pumps. There are important manufs. of bricks in the adjoining areas of Fletton, Whittlesey, and Eye, and in the city at Dogsthorpe. Cattle and corn mrkts are held weekly: the well-known Bridge Fair is held annually during the first week in Oct., and a famous agric. show and the Royal Foxhound Show in July. P. formerly sent 2 members to Parliament, but now forms part of the P. div. in the cos. of Northants and the soke of P. Pop. 53,412.

2. City of Ontario, Canada, administrative centre of P. co., on the Otonabee R. 70 m. N.E. of Toronto and 28 m. N. of Lake Ontario. It is an important manufacturing centre, with over 100 industries employing 10,000 persons, with ann. production valued at more than \$120 million (1952). It has the largest cereal mill in the Brit. Commonwealth (Quaker Oats) and the largest electrical apparatus plant (Canadian General Electric). It specialises also in the manuf. of canoes and boats, motors for watercraft, and clocks and watches. Other products include dairying equipment, yarns, rugs and carpets, woven labels, locks and hardware, food beverages, meat products, canned foods, electrical motors, and finished wood products. The largest deposit of nepheline, used in the manuf. of glass, in the world is being mined N. of the city, and the refined product is shipped to the glass industry over the world. It is the centre of a beautiful lake dist. which annually attracts thousands of visitors from the

U.S.A. and Canada for summer recreation. It is on the Trent Canal, an inland waterway, joining Lake Ontario with Georgian Bay, and the largest liftlock in the world is at P. It is the chief commercial centre for central Ontario, and its stores supply a marketing area containing more than 150,000 persons. Much of the electrical power is developed near by along the Otonabee R. Pop. 40,489.

3. Tn of S. Australia, 70 m. from Port Augusta, an important railway junction, connected by rail with Adelaide and other tns. Pop. 3000.

Peterborough and Monmouth, Charles Mordaunt, third Earl of (1658-1735), sailor and soldier. He began his adventurous life at 17 by serving in the Eng. Mediterranean fleet against the Barbary corsairs. He went to Holland in 1686, returning 2 years later with William of Orange. On the accession of William, P. was in succession made privy councillor, first lord of the treasury, and earl of Monmouth. He was one of the Council of Nine appointed to advise Queen Mary during William's absence in Ireland (1690), and in the following year served with distinction in Flanders. In 1697 he was imprisoned in the Tower for his suspected connection with Fenwick's plot, but on the death of William he regained favour. His greatest achievement was his campaign in Spain during the Sp. War of Succession, when he took Barcelona. His conduct caused much controversy in England, however, and he was recalled in 1707. Later he served in various diplomatic posts. He was a patron of literature and the arts.

Peterhead, seaport and burgh of E. Aberdeenshire, Scotland, in Buchan dist., on the N. side of P. Bay. The national 'harbour of refuge' was begun by convict labour (1886) and the S. breakwater was completed by 1921. Work on the N. breakwater is now nearing completion. There is a submarine cable between P. and Egersund in S. Norway. Keith Inch, out off by the harbour from the tn proper, has fish-curing (chiefly herring) establs. White fishing has developed since 1945. The celebrated 'P. red granite' is quarried. Shipbuilding, granite-polishing, woollen manufs, precision engineering, and fish and vegetable canning are among the chief industries. Pop. 12,800.

Peterhof, or **Petergof**, see **PETRODVORETS**.

Peterhouse College, Cambridge, founded in 1284 (the earliest of Cambridge colleges) by Hugo de Balsham, Benedictine Bishop of Ely. The beautiful par. church of St Mary the Less, 1362 (formerly St Peter), was used as the college chapel. The Hall is in plan, and structurally in part, that built by the founder. The Perne Library, 1632, includes a bequest made by Dr Andrew Perne, master 1553-89, and the present chapel was consecrated in 1632.

Peterloo Massacre, name given to the happenings of 18 Aug. 1810 in Manchester. On that date a large body held a meeting in favour of parl. reform, under the leadership of Henry Hunt. The magistrates

ordered the meeting to be broken up by the military, including sev. troops of horse; as a result 11 lives were lost and about 500 people were injured. The meeting took place in St Peter's Field (now the site of the Free Trade Hall), hence the name Peterloo (in imitation of Waterloo). See D. Read, *Peterloo*, 1957.

Peteromys, see FLYING-SQUIRREL.

Peters, or **Peter**, **Hugh** (1598-1660), Puritan, educ. at Trinity College, Cambridge. He emigrated to Holland and then to New England, estab. a colony at Saybrook, Connecticut, and was a co-founder of Harvard College. He became the minister of the first church at Salem, Massachusetts. P. returned to England in 1641 to represent Massachusetts Bay Colony, and served with the forces of Cromwell and Fairfax as an army chaplain. He took part in parliamentary politics and pub. many pamphlets, and, in 1660, at the Restoration, was executed for his part in the execution of Charles I. P.'s acts of kindness to some of the Royalist clergy are recorded in Walker's *Sufferings of the Clergy*.

Peters (**Peeters**), **Jan** (1625-77), Flem. marine painter. The 'Port of Oran' is his masterpiece, and his 'Destruction of the English Fleet at Chatham, 1667,' is at Amsterdam.

Peter's Pence, also called **Romescot**, **Rom-feoh**, tax or tribute imposed by the Pope on the Eng. at the beginning of the 10th cent., of a penny for every hearth or house, payable at Lammas Day (1 Aug.). From England the practice spread to other countries of Europe. The anti-papal feeling in England which, in the reign of Edward III, produced the Statute of Provisors, and in Richard II's the Statute of Praemunire, did not alter the fact that the Pope received an ann. sum of £200 as composition for P. P. during that period, although the tribute was temporarily stopped for a short time in the reign of Edward III. The payment of P. P. and other papal exactions was finally forbidden by an Act passed in 1534. P. P., revived by Pius IX, is now paid as a voluntary offering by Rom. Catholics throughout the world.

Petersburg, city and port of entry of Virginia, U.S.A., on the Appomattox R., 22 m. S. of Richmond. Cotton, silk, tobacco, flour, textiles, optical goods, luggage, and machinery are manufactured, and there are fine granite quarries. During the Amer. Civil War P. was almost the last stronghold of the Confederate Army, being defended by 9 m. of fortifications. Against P. Gen. Grant entrenched the Federal Army, and the siege lasted 9 months from July 1864. The Federal losses before P. amounted to some 10,000. The present pop. of P. is 35,054.

Petersburg, St, see Leningrad.

Petersen Coll., see ARC-SUPPRESSION COLL.

Petersfield, urban dist. and mkt tn of Hants, England, 16 m. NNE. of Portsmouth. It has a mediæval church. Bedale's school, a co-educational estab., and Donal Junior School are near to P. Pop. 6949.

Pethick-Lawrence, **Lady Emmeline** (1867-1954), leader of the women's suffrage movement, b. Emmeline Pethick in Bristol; educ. at private schools in England, France, and Germany. After social work for sev. years, she joined the Pankhursts (q.v.) in the militant Women's Social and Political Union in 1906, and worked with them till 1912; in 1914 she joined the newly-formed United Suffragists. She was imprisoned 5 times for suffragist agitation. In 1901 she married F. P. Lawrence (later Lord P.-L., q.v.), editor and part owner of the London evening paper, *Echo*. In 1913 she became joint editor with him of *Voices for Women*. She was invited to America in 1914 to promote the Women's International League for Peace. While there, she helped to inaugurate the campaign which led to the political enfranchisement of Amer. women. She was Labour candidate for Rusholme, Manchester, in 1918. She wrote *My Part in a Changing World*, 1938.

Pethick-Lawrence, **Frederick William**, first Baron (1871-), politician, educ. at Eton and Trinity College, Cambridge, became a barrister. He ed. the *Echo* (1902-5), the *Reformer's Year Book* (1904-8), and the *Labour Record and Review* (1905-7). In 1901 he married Emmeline Pethick, assuming her surname, and was prominently associated with her in the feminist movement, being imprisoned in 1912 for his activities in that connection. Elected Labour M.P. for W. Leicester 1923-31, he was financial secretary to the Treasury. He took part in 1931 in the Indian Round Table Conference in London. As secretary of state for India, 1945-7, he visited India as a member of the Cabinet mission and took part in the independence negotiations. He was created a baron in 1945. His autobiographical *Fate has been Kind* appeared in 1943, and he has written on economic matters.

Pethidine, synthetic drug with the formula $C_{17}H_{17}O_2N \cdot HCl$, used as an analgesic and as a substitute for morphine, though it is less powerful than the latter. It is useful in childbirth. The dose is 1-1½ gr. (10-100 mg.) by intramuscular injection. P. has a mildly euphoric action, and addiction to it is rapidly acquired. Its issue to midwives for use in obstetric cases is strictly controlled.

Petiole, leaf stalk of a plant. It is usually cylindrical and narrow, though occasionally it is elaborated into very remarkable forms, such as the pitchers of pitcher plants.

Pétion, or **Péthion**, **de Villeneuve**, **Jérôme** (1753-94), Fr. revolutionary, b. Chartres. He was prominent as a member of the Jacobin Club and associate of Robespierre. Chosen mayor of Paris (1791) in preference to La Fayette, he then became Girondist deputy to the Convention (1792-3), but was accused of being an accomplice of Dumouriez and proscribed. The exact manner of his death is unknown, but his body was found near St Emilion in June 1794.

Pétis de la Croix, **François** (1653-1713).

Fr. orientalist, b. Paris, son of François (d. 1695). He became prof. of Arabic at the Collège Royal, Paris (1692). He trans. *Histoire de la Sultane de Perse et des Vénitiens*, from the Turkish tales of Chelikh-Zadeh, 1707, *Mille et un jours*, 1710-12, and *Histoire de Tamerlan* (Tamerlane), 1722, from the Persian.

Petit Brabançon, see GRIFFON BRUXEL-LOIS.

Petitio Principii, in formal logic, that species of false reasoning which consists in tacitly assuming the proposition to be proved as a premise of the syllogism by which it is to be proved, or, in other words, in taking the conclusion itself as one of the premises. The nature of this fallacious argumentation is popularly expressed in the phrases 'begging the question' or 'reasoning in a complete circle.' This kind of fallacy frequently occurs in long arguments and in verbose metaphysical writings. Again, it is an easy pitfall for those who employ a mixture of Saxon, Lat., and Gk words in formulating definitions which on investigation turn out to be mere identical propositions; thus 'Consciousness must be immediate cognition of an object, for I cannot be said really to know a thing unless my mind has been affected by the thing itself.'

Petition of Right (1628), document embodying parl. demands and presented to Charles I in 1628 by the Commons. In view of certain unconstitutional practices of Charles, the Commons met and resolved themselves into a Committee of Grievances to consider 'the liberty of the subject in person and estate,' especially in matters of taxation. Wentworth and Pym were the prin. authors of the P., though the views expressed in the final draft were far more extreme than Wentworth's, and probably helped to drive him over to the king's party. The king eventually signed it in June.

Petition of Right, constitutional means by which alone, until 1947, the subject could obtain legal relief against the Crown, for the legal impeccability of the sovereign, coupled with the fiction that the courts are his or her own, made it impossible for the subject to sue by an action at law. A P. of R. was presented to the Crown through the Home Office, which transmitted it to the attorney-general. Relief by P. of R. could be claimed only for money due under a contract, or for restitution of or compensation for property of which the Crown had obtained possession; but never for a tort (q.v.) alleged to have been committed by the king. Where a tort had been committed by a Crown servant in the course of his employment (e.g. injuries caused by the negligence of a post-office van driver), he had to be sued personally, although, in practice, the Crown would usually pay any damages awarded against him. The P. of R. procedure is now obsolete, as under the Crown Proceedings Act, 1947, gov. depts can be sued on their contracts and for the torts of their servants.

Petitions. The right of petitioning the Crown and Parliament has been exercised

from the earliest times. But for many centuries it was restricted to P. for redress of private and local grievances, and the remedies sought have since been provided by courts of equity and by private Acts. The practice of petitioning on political subjects came into vogue during the period of the Great Rebellion, many P., signed by large bodies of people, being presented both to Charles I and the Long Parliament; and it was probably the intimidation exercised by numerous petitioners in the Long Parliament that led to the Act of 1661 against 'tumultuous petitioning.' This Act provided that no petition (unless the contents had been previously approved by 3 justices of the peace or a grand jury) should be signed by more than 20, or delivered by more than 10, persons. By the Bill of Rights the right of the subject to petition the king was expressly sanctioned; but the Commons for a long time showed themselves intolerant of a free expression of opinion, and jealous of interference with their functions. The 1661 Act has long been practically a dead letter, and when a petition is presented, its conditions are not usually complied with.

Petitot, Jean (1608-91), Fr. painter in enamel, b. Geneva. In England he met Van Dyck (c. 1634), who introduced him to Charles I. P. painted portraits of the king and his court, and made miniature copies of many of Van Dyck's pictures. A portrait of the Duchess of Southampton (1642) in the Duke of Devonshire's collection is considered his masterpiece. At Paris he enjoyed the patronage of Louis XIV. The Louvre 'Gallery of Apollo' contains many of his works. See E. Stroehlin, *Petitot et Bordier*, 1905.

Petits Chevaux, see ROULETTE.

Petkov, Nicolai (1889-1947), Bulgarian politician, b. near Sofia, a lifelong member of the Agrarian party. A strong opponent of Nazism, P. was one of the founders of the Fatherland front (see BULGARIA, *Historical*), signing the Moscow armistice which brought Bulgaria into the war on the side of the Allies (Sept. 1944). When the Fatherland front was formed, P. became deputy Premier, but resigned in Aug. 1945 and went into opposition, thus incurring the enmity of the Communists, who had previously been his colleagues. He was arrested in June 1947 and charged with complicity in a military conspiracy, which he strenuously denied. The conduct of the trial led to a strong protest by Britain and the U.S.A., but P. was sentenced to death. After his execution the Agrarian party was dissolved.

Petőfi, Sándor (1823-49), national poet of Hungary, b. Kis Kőrös, married Julia Szendrey, 1847. Although he wrote some longer poems, his best work is in his shorter lyrics. Such poems as *At the end of September*, *At the end of the village*, and the patriotic *Up, Hungarian*, rank high in European literature. His death at the battle of Segesvár (1849) is foreshadowed in *One Thought Troubles Me*. Among his chief collections of lyrics may be mentioned *Pearls of Love*, 1845; *Starless*

Nights, 1845; and *Clouds*, 1846. Among Eng. translations are: Bowring's *Translations from A. Petřst*, 1866, and *Sixty Poems* by E. B. Piere and E. Delmar, Budapest, 1948.

Petra, ruined city of Jordan, situated in the dry bed of the Wadi Musa, on an ancient caravan route some 115 m. SSW. of Amman, usually approached from the E. through a narrow gorge (the Siq). P. was the cap. of the Nabataeans (see NABATAEI); some Biblical scholars have seen P. as the Edomite city of Sela (II Kings xiv. 7). It lies in a steep-sided basin, and contains over 750 tombs and tomb-temples, their façades cut in the living rock, constructed chiefly between 100 BC and AD 100. Among the most impressive are the beautiful Khazne Faraoun ('Pharaoh's Treasury') dating from early Christian times, and El Deir ('The Monastery'), which was probably used primarily as a temple. There is an amphitheatre (c. 1st cent. AD) and some remains of the Rom. city. The Nabataeans successfully repelled the Seleucids and the Ptolemies, but were incorporated in the Rom. Empire in AD 106. With the exploitation of Palmyra (q.v.) as a caravan centre P. declined in importance, and by the end of the 3rd cent. it was largely abandoned. In the 5th cent. it became a small Christian see. During the Crusades small Frankish forts were built in the area. Burckhardt rediscovered P. in 1812 and was amazed by the reds, browns, purples, and ivory of its sandstone. See G. and A. Horsfield, 'Sela-Petra,' in *Quarterly of Palestine Dept. of Antiquities*, vols. 7, 8, 1938-9; M. A. Murray, *Petra*, 1939.

Petrarch (Francesco Petrarca) (1304-74), It. poet and leader of the revival of learning, b. Arezzo. In 1312 he went with his parents to Avignon, the seat of the papal court. He began to study law at Montpellier, and subsequently at Bologna, but the profession was repugnant to his poetic temperament, and to his passionate admiration for classical literature, in which Cicero and Virgil were his chief models. In 1326 he returned to Avignon and was ordained, but his interests and mode of life continued to be secular. In 1327 he for the first time saw Laura, who was the ideal love of his life. She died in 1348, and is only known by the sonnets (*Canzoniere*); who she was is wholly uncertain, and the early biographies never refer to her. She was the chief inspiration of P.'s sonnets, which were his greatest contribution to It. literature, and moulded the lyric poetry of the Renaissance. At Avignon he came under the protection of the Colonna family, whose service he entered. After 1333 he travelled widely, but he soon sought the retirement he loved best at Vaucluse, near Avignon. Here he conceived the project of his poem, *Africa*, written in Latin, on the subject of Scipio Africanus. He wrote most of it in 1339. In 1340 he received invitations from the univ. of Paris and from the senate of Rome to accept the laurel crown of the poet. The coronation of P. took place on the Capitol at Rome on 8 April 1341. He was the first to receive

the honour of this revived rite on the Capitol. His latter years were spent at Milan, Venice, and finally Argus, near Padua. He had many benefices of which he enjoyed the income, and was the favoured correspondent of popes, kings (especially of Robert of Naples), and of statesmen, as well as the friend of Boccaccio. The house at Arezzo in which he was born was regarded as a sacred place. He was anxious to bring about the return of the papal court from Avignon to Rome, and to restore Rom. independence.

PETRARCH

P.'s chief title to fame was his passion for the recovery of ancient literature, which he believed to have the power of restoring antique virtue, culture, and social order to a degraded age. He urged the rulers of his day to copy Camillus, Scipio, and the heroes of Rom. hist. He knew no Greek, his Latin was stiff and showed little true scholarship, but he inspired the new feeling towards ancient studies, and more than any one man determined the bent of the intelligence of the young towards antiquity, his influence at Padua Univ. being remarkable. He warred against the medieval conception of life, especially against all terrifying superstitions, and against astrology. He died, leaving many illegitimate children, at Argus, a small town in the Euganean hills, where he is buried. His *Letters* (in Latin) fill 5 vols. He wrote *De remediis utriusque fortunae*; *De viris illustribus*; *Carmen Bucolicum*; *De contemptu mundi*; *Libri rerum memorandarum*. His It. poetry, which greatly influenced Eng. and Fr. love poetry, consists of the sonnets, *Canzoniere*, or *Rime in vita e morte di Madonna Laura*, and the allegorical *Trionfi*, or *Triumphs of Love, Death, Chastity*, etc. A complete ed. of P.'s works (*Edizione Nazionale*) is in course of pub. at Florence (first vols. pub. 1926). See F. de Sanctis, *Saggio*

Critico sul Petrarca, 1869; P. de Nolhac, *Petrarque et l'humanisme*, 1892, 1907; M. F. Jerrold, *Francesco Petrarca*, 1909; E. H. R. Tatham, *F. Petrarca*, 1925; U. Bosco, *Francesco Petrarca*, 1946; E. H. Wilkins, *The Making of the Canzoniere and Other Petrarchan Studies*, 1951.

Petrassi, Goffredo (1904-), It. comp. poser, b. at Zagarolo near Rome, studied at the Conservatorio di Santa Cecilia there and came under the influence of Casella and Hindemith. In 1939 he became prof. of composition at his former school. His church music and choral works are particularly important, but he has also written 2 operas, 2 ballets, incidental music for *The Birds* of Aristophanes, film music, orchestral and chamber works, and songs. See P. D'Amico, *Goffredo Petrassi*, 1942.

Petrel, oceanic birds, including the albatross, diving P., flat-billed P., Shearwater P., and fulmar P., all of which have a hooked bill, rudimentary hind toes, and tubular nostrils. The Storm-Ps or 'Mother Carey's Chickens,' are put into the family Hydrobatidae. The plumage of the stormy-petrel (*Hydrobates pelagicus*) is smoky brown with a broad band of white above the tail. Marine crustacea constitute the natural food, but the bird has acquired the habit of following ships to collect the fragments that fall. It is able to run lightly over the surface of the water with the aid of its wings, and this habit has given it the name of P. after St Peter.

Petri, Olaus (1497-1552), Swedish reformer, b. Örebro; from 1525, with his brother Laurentius, he laboured to spread Lutheranism throughout Sweden. They also trans. the Bible into Swedish. From 1531 to 1533 P. was chancellor to Gustavus Vasa and preacher at Stockholm (1539). He was condemned to death (1540) for refusing to reveal a plot of which he had learnt in the confessional, but was pardoned and allowed to continue as pastor at Stockholm (1543). He left, besides religious writings, a mystery play and *Svenska krönika* (see ed. of 1860). Strindberg dramatised his life. See also J. Schück, *Olaus Petri*, 1893.

Petrieleu-Haşdeu, Bogdan, see HASDEU.

Petrie, Sir William Matthew Flinders (1853-1942), Egyptologist, b. Charlton. He was befriended by Amelia Edwards, the founder of the Egypt Exploration Fund; surveyed the Giza pyramids in 1880, and excavated Tanis and other sites for the Egypt Exploration Fund during 1884-6. He then left the Egypt Exploration Fund and excavated independently from 1887 to 1895. He inaugurated the chair of Edwards Professor of Egyptology, Univ. College, London, in 1894-1933, and founded the Egyptian Research Account in 1894, renaming it the British School of Archaeology in Egypt, in 1906. In 1933 he transferred his activities to Palestine. In addition to ann. vols. describing his excavations, P. pub. many books, scientific and popular, and amassed the best teaching collection of Egyptian antiquities in the world at Univ. College, London, though his most important finds are in the

Cairo Museum and in museums in England and America. D. at Jerusalem.

Petrifaction, the process by which the fossilised remains of animals or plants are replaced by minerals such as calcite, silica, iron pyrites, or calcium phosphate. If the mineral-bearing waters infiltrate slowly into the minute cellular cavities, the finest structural details of an organism may be perfectly preserved. But frequently it is only the gross external shape of the original fossil which remains after P.

Petrissage, see MASSAGE.

Petrodvorets (until 1944 **Peterhof**), tn in Leningrad Oblast, U.S.S.R., on S. shore of Gulf of Finland. It is famous for its 18th-19th cent. imperial palaces and parks with majestic fountains and cascades. Ruined during the German occupation 1941-3, partly rebuilt.

Petrograd, see LENINGRAD.

Petrographic Province, term used in geology to denote a portion of the earth's crust within which the igneous rocks formed at one period of geological time appear to be genetically related and share certain features in common. The volcanic is. of the Pacific made up of basaltic lavas with occasional trachyte lavas provide an example of a P. P. Another P. P. is the Tertiary Arcto-Brit. P. extending from NW. Britain through the Faeroes and Iceland to E. Greenland; this P. P. is marked by extensive sheets of plateau basalt and by central volcanoes from which acid and basic rocks were extruded. It is generally supposed that the igneous rocks of any P. P. owe their origin and thence their resemblances to some deep-seated cause. Certain kinds of P. P. are frequently associated with certain kinds of geological event; thus alkaline lavas appear in regions remote from orogenic belts; the Tertiary to recent vulcanicity in the Rift Valleys of Africa provides an example of this.

Petrography, see PETROLOGY.

Petrokrepost' (until 1611 **Oreshek**, then **Nöteborg**, 1702-1944 **Shlissel'burg**), tn in the Leningrad Oblast of NW. Russia, situated where the Neva leaves Lake Ladoga. It has an old fortress used from the 18th cent. as a political prison. P. was founded in 1323 by Novgorodians, and 1611-1702 was Swedish; it was occupied by the Germans 1941-3. Pop. (1932) 8500.

Petrol (Gasoline, Motor Spirit, Aviation Spirit), fuel obtained by refining natural petroleum (q.v.), and used for internal-combustion engines in motor vehicles and aircraft. Some use has also been made of it as a heating fuel and illuminant. Various grades of P. are manuf. for different purposes, incorporating different proportions and types of the hydrocarbons derived from crude petroleum, as well, sometimes, as certain materials not obtained from crude petroleum, such as benzole (from coal) and alcohols. The constituents of a P. rarely fall outside a boiling range of about 30-300° C. The crude oil from which a particular P. is obtained may have some effect upon its composition, but often impurities carried

over from the crude may be particularly undesirable, such as sulphur in aviation spirit, and may have to be removed by special refining processes. Comparison between certain features of a typical aviation and a typical motor spirit are given below:

	100-octane aviation spirit	Motor spirit
Specific gravity	0.724	0.733
Per cent carbon	85.1	85.5
Per cent hydrogen	14.9	14.4
Per cent sulphur	0.01	0.1
Boiling range	42-170° C.	37-185° C.

Aviation spirit has, however, a higher proportion of low boiling-point constituents. Much importance is attached to the prevention of 'knocking' or 'pinkings' in P. engines, which may be affected by the composition of the fuel. Aromatic hydrocarbons have a high anti-knock value. It is usual, however, to add tetraethyl lead (q.v.) for this purpose. In addition to its resistance to knocking, an important characteristic of a P. is its calorific value (i.e. its ability to produce heat as a result of combustion). The most valuable P. constituents from this point of view are the paraffin hydrocarbons, which are also the most stable and are consequently used as the main constituent of motor and aviation fuels. About one-third of the U.K.'s consumption of petroleum products is in the form of P., the total amount of aviation and motor spirit used in 1955 being just under 8 million tons.

Petrol Rationing came into force in the U.K. at midnight of 22 Sept. 1939. The basic ration for private motorists was abolished altogether on 1 July 1942, after which allowances were granted only in cases of genuine need. This basic ration was restored in 1945 soon after the war in Europe ended. It was again abolished in 1947, but was restored not long afterwards. Petrol rationing, however, did not end until May 1950. Owing to the Suez crisis it was reintroduced 'as a temporary measure' in Dec. 1956 and ended in May 1957.

Petroleum (Rock Oil), natural oil composed of hydrocarbons existing at various places in the earth's crust. The existence of P. has been known for many cents, but it is only within the last 100 years that its uses have been appreciated to any extent. P. and the products derived from it are now used in numerous ways: as fuels for power, heating, and lighting, as lubricants, and as the source of a wide range of chemical products such as solvents, detergents, plastics, synthetic rubber and fibres, fertilisers, insecticides, and weed-killers. One form of P., bitumen (q.v.), has been used since the earliest times as mortar for building and for caulking boats. P. occurs in certain geological formations, but the best supplies are from carboniferous, Silurian, and from Tertiary formations, intermediate strata providing much less. Various theories as to the genesis of P. have been advanced, such as (a) by the

action of steam on carbides, (b) by the decomposition of the remains of marine organisms. The latter theory has gained general acceptance. As deposits of organic material formed at the bottom of the sea, layers of sand and sediment gradually buried them. In the course of

time they thus became subjected to considerable pressures, as well as to the action of anaerobic bacteria and the influence of changing temps. The oil produced by this process tended to migrate from the beds where it was formed to regions of lower pressure. In some places P. is found at the earth's surface in the form of seepages, in others it is found trapped at greater or lesser depths in porous formations sealed off by caps of impervious rock. In the places where these seepages occurred, the P. was collected in very early days by the local inhab. for domestic use. It has been suggested that the burning fiery furnace into which Shadrach, Meshach, and Abed-nego were cast by Nebuchadnezzar was nothing more than a seepage that had become ignited. In cases where the P. has become trapped below the earth's surface, wells (see OIL WELLS) are sunk. There were hand-dug wells in Burma in the 13th cent., and the economic possibilities of the P. recovered were at least partly developed.

The first well dug by other than hand power was drilled by Edwin Drake in Pennsylvania in 1859. Drake struck oil 69 ft below the surface, using a steam engine driving a punching tool. Originally this percussion method of drilling was used almost exclusively, but it has now been practically entirely superseded by the rotary method. Many other improvements in the techniques of drilling for P. have been made since that time. The wasteful 'gusher' has been almost eliminated as a result of efficient control methods. Exploratory wells with depths of as much as 20,000 ft have been dug in the search for new deposits. In certain parts of the world, such as the Persian Gulf and the Caribbean Sea, successfully producing wells have been drilled under the sea without any direct contact with the land.

When oil has been struck the pressure below ground will generally cause the P. to flow to the surface at first, but as it is drawn off pumping usually becomes necessary. The P. is then piped, often over great distances, to storage to await refining or, if no local refining facilities are available, to a water terminal where it may be loaded on to tankers for transportation to distant refineries.

Crude P. varies not only in texture and thickness, but also in colour and smell. In colour it ranges from green or yellow

to brown or black, while it may have an acid, unpleasant smell or be practically odourless. Crudes usually contain hydrocarbons of 3 main types, namely paraffins, naphthenes, and aromatics. In addition to any or all of these there may be present small quantities of impurities such as compounds containing oxygen, nitrogen,

Middle E. Nevertheless the U.S.A. still has the largest production of any individual country. Total world production of P. rose from 280,500,000 tons in 1938 to about 795,000,000 tons in 1955. Comparative figures for the main producing countries in these 2 years are given below (in thousands of metric tons).

	1938	1955
U.S.A.	170,700	362,700
Venezuela	28,100	113,200
U.S.S.R. (estimated)	30,100	70,000
Kuwait	—	54,800
Saudi Arabia	100	47,500
Iraq	4,400	33,700
Canada	900	17,600
Iran	10,400	16,200
Mexico	5,500	12,900
Indonesia	7,400	11,700

chlorine, and especially sulphur, from which crude P. derives its characteristic smell. According to the relative proportions of different types of hydrocarbons which it contains, a crude is described as paraffinic, naphthenic, or aromatic. Although P.s with differently composed hydrocarbon contents can often be found within the same region, sometimes even within the same oilfield, one type will usually be characteristic of a certain locality. Pennsylvania crude is a noteworthy example of the many varieties with a high paraffin content. Naphthenic crudes are found in the Caucasian region of the U.S.S.R., notably at Baku. Naphthenic P.s are also referred to as 'asphalt-base' P.s, since their residue after distillation is largely composed of complex asphalts. Borneo is significant as a region rich in highly aromatic crudes. Important factors in the description of a P. are density, viscosity, surface tension, specific heat, vapour pressure, flash point, colour, refractive index, optical activity, and heat of combustion. Few types of crude P. can be used without first being submitted to various refining processes (see CRACKING OF PETROLEUM and PETROLEUM REFINING.) The P. leaves the refinery in a number of different forms. The main demand for P. products is as fuels. These include various grades of gasoline (see PETROL) for motor-cars and aircraft; kerosene, used as an illuminant and as fuel for tractors and jet aircraft; diesel oil for the propulsion of motor ships and vehicles; propane and butane (gaseous fuels usually refrigerated and marketed in liquid form); and fuel oil for heating purposes. Other products include lubricating oils and greases; bitumen for road surfacing and building construction; paraffin waxes for the manuf. of candles, etc.; white spirit, used in paint manuf., and other industrial spirits; and numerous chemical compounds, the range of which has been referred to above. For many years the U.S.A. was the producer of by far the greater part of the world's P. supplies. In the years leading up to the Second World War large oilfields with low production costs were developed in the

Apart from the U.S.S.R. the largest producer among European countries is Rumania, with an estimated output of 8,000,000 tons in 1955. Production in the U.K. is negligible, but oil is worked in commercial quantities near Raking in Notts, and other sites have been developed. There is also a cent.-old shale oil industry in Scotland, where oil is extracted from shale after the rock has been brought to the surface (see SHALE OIL).

An intensive search for fresh reserves of oil is maintained all over the world. At the end of 1955 the total known reserves amounted to some 26,000,000,000 tons, of which two-thirds were located in the Middle E. See also ASPHALT; FLASH POINT; PETROL. See The Shell Petroleum Co. Ltd, *The Petroleum Handbook*, 1931, 1948; L. Gurwitsch and H. Moore, *The Scientific Principles of Petroleum Technology*, 1932; P. H. Frankel, *Essentials of the Petroleum Industry*, 1946; W. E. Pratt and D. Good (ed.), *World Geography of Petroleum*, 1950; E. N. Tiratsoo, *Petroleum Geology*, 1951; *British Industries: Oil*, 1953; Institute of Petroleum, London, *Modern Petroleum Technology* (2nd ed.), 1954; J. H. van der Have and C. G. Verver, *Petroleum and its Products*, 1957.

Petroleum Acts. Legislation on the subject of petroleum falls broadly into 2 categories: laws relating to the safety measures to be observed in the storage, carriage, and use of petroleum, and those concerned with ownership of petroleum resources and their exploitation.

The earliest statutes dealing specifically with petroleum date from the 1870's and were concerned with safety precautions and the issue of licences for keeping quantities of inflammable spirit. Existing legislation was consolidated by the Petroleum (Consolidation) Act, 1928, which contains a number of provisions concerning the conveyance of petroleum spirit, and gives the minister concerned wide supervisory powers, including the right to make regulations and to institute inquiries where death or injury occurs as the result of petroleum explosions or fires. Under the Act petroleum spirit is not to be kept without a licence, the

appropriate licensing authorities being the dist. councils. Special provisions are laid down for the labelling of vessels for storing petroleum. Harbour authorities and canal companies are enjoined to make by-laws relating to the carriage of petroleum within their jurisdiction, and masters of vessels carrying the spirit must give due notice before entering harbour. The Petroleum Act provides that courts of summary jurisdiction may issue warrants for search or seizure where infringements of the Act are involved, and defines the powers of such inspectors as may be appointed by the minister under the Act. Notice of accidents involving licensed premises and of coroners' inquests held as a result of petroleum fires are to be given to the minister. Schedules to the Act provide licensing authorities with guidance in the matter of licence fees, and in regard to methods and apparatus for testing spirit for flash point, etc.

Legislation with regard to the production of petroleum in Great Britain was enacted in 1907 and 1918. The Petroleum (Production) Act, 1934, consolidates these enactments. The property in petroleum found in Great Britain is vested in the Crown. Licences to search for and produce petroleum and natural gas may be issued by the appropriate minister. The Act provides for certain powers of compulsory acquisition of land necessary for the implementation of a licence. The minister is empowered to make regulations in respect of licences and to inspect plans for proposed workings. By the Ministry of Fuel and Power Act, 1945, ministerial responsibility for matters relating to petroleum was transferred from the president of the Board of Trade to the minister of fuel and power.

Petroleum Refining. Crude petroleum is rarely suitable for immediate use as a fuel. Certain types found in Borneo and Texas have been used as boiler fuel and even in tractor engines, but in order to obtain the most efficient product for any purpose, it is necessary to refine the crude obtained from the earth. The exact composition of mineral oil varies from place to place (see PETROLEUM), and refinery processes have to be adapted to suit the various raw materials. The primary process of fractional distillation, however, is invariably applied.

The hydrocarbons of which crude petroleum is composed boil at different temps. On boiling they gasify, just as water turns into steam, and on cooling below their boiling point revert to their liquid state. Fractional distillation separates the components (or fractions, as they are called) of the crude into hydrocarbons of various boiling-point ranges. Crude petroleum is heated to a temp. of, say, 300° C. and is pumped, mostly in the form of vapour, into a fractionating column, a tall cylindrical metal tower, divided into compartments by a series of horizontal trays. As the mixture of vapours rises through the tower it passes through compartments gradually decreasing in temp. As they reach temps. slightly below their own boiling points the

various vaporised fractions condense into the trays and leave the column. In this way the least volatile (heavy) vaporised fractions leave the column in the form of gas oil or diesel oil only a little above the vapour intake. Kerosene and white spirit condense higher up the column, and the lightest fractions, including gasoline, propane, and butane, together with the small amounts of natural gas generally found dissolved in crude petroleum leave the top of the column still in gaseous form. These light products are then

Iraq Petroleum Co. Ltd
ZUBAIR MULTI-STAGE SEPARATORS AT
ZUBAIR DEGASSING STATION

passed through a condenser and gas separator, and the resultant 'straights run' gasoline is fed back to the upper trays of the fractionating column to assist in controlling the temp. The lower condensation products are reheated in 'strippers' after leaving the column, and any lighter fractions which have been condensed too soon are fed back as vapour. In the column the process of condensation is assisted by the use of 'bubble-caps' in the floors of the compartments. These force the rising gases to bubble through the liquid which has collected on the trays. The least volatile material, which has not vaporised on being pumped in, falls to the bottom of the column, where it is reboiled to ensure that it contains no volatile material. It is then pumped away as heavy fuel and used either for blending into fuel oil, or as a feedstock for other refining processes.

The essence of the distillation process is that, unlike 'cracking', it does not subject the petroleum hydrocarbons to any chemical change. The heavy fuel residue from primary distillation has so high a boiling point that chemical decomposition occurs if it is vaporised by boiling in the ordinary way. The boiling point, however, decreases with reduction in pressure below the normal atmospheric level. The heavy fuel is accordingly distilled in a similar plant in which the material is maintained under low pressure conditions by means of steam ejectors or vacuum pumps. The products obtained from this so-called vacuum distillation include gas oil, used as feedstock for cracking plant, fractions from which lubricating oils may be manuf., and bitumen as a heavy residue.

The various distillation products seldom correspond exactly with market requirements, and distillates usually need to be blended with other petroleum products before a marketable grade is obtained. In order to use up unwanted distillation products and to produce suitable blending components, modern refineries employ various 'cracking' processes (see CRACKING OF PETROLEUM) by which the chemical composition of the hydrocarbons in the feedstocks is changed. Other processes involving chemical change, in which smaller molecules are combined to build up more complex compounds (the reverse, as it were, of cracking), are polymerisation, alkylation, and isomerisation. Other refinery processes which play an important part in the production of marketable fuels include the extraction of impurities such as sulphur compounds (especially undesirable in aviation gasolines). Other components which may be found undesirable are aromatics (in kerosine illuminants) and petroleum waxes (in lubricating oils). All these undesirable materials may be removed by the use of appropriate solvents.

It is important that the world should be able to refine all the crude petroleum it produces. At the end of 1955 it was estimated that the total refining capacity of all countries was approximately 874,000,000 tons of crude per year. The U.S.A. had the greatest individual refining capacity of some 420,000,000 tons. Other important refining countries are the Soviet group, Curaçao, Canada, the U.K., and France. U.K. refineries at the end of 1955 had an ann. capacity of 29,700,000 tons.

Petrology, Petrography, or Lithology, science or study of the rocks, is concerned with their chemical and mineralogical composition, their macroscopic and microscopic structure, and their systematic classification. In the field the geologist can determine the mode of occurrence of a rock and learn something of its character with a pocket lens and some simple chemical tests. In the laboratory, by means of sp. gr. determinations and the use of the blowpipe, the value of metalliferous rocks can be quickly estimated. By chemical analysis a more exact estimation of the composition of the rock

can be made, and from a knowledge of its bulk composition it can be suitably classified. The examination of thin slices of rocks under the microscope is one of the most important of petrographic methods. Rock sections can be made which are less than $\frac{1}{500}$ in. thick. Mounted

on thin glass slides (with a medium such as Canada balsam), these rock sections are examined under a microscope fitted with polarising and analysing prisms. The mineralogical constitution of the rock can then be determined the constituent minerals being distinguished by their appearance under ordinary and polarised light, their refractive index, pleochroism, birefringence, and crystalline form, etc. As well as observing the minerals of the rock in their microscope sections, by the use of liquids of varying densities, the minerals can be separated and obtained pure from the crushed rock. This method is dependent on the characteristic sp. grs. of the sev. minerals.

The rocks of the earth's crust are classified as sedimentary, igneous, and metamorphic. The first type are rocks which have been formed on the earth's surface by the accumulation of detritus and fragmental volcanic material, by organic agency, or by chemical action and the evaporation of saline solutions. This last includes the secondary cementing of fragmental rocks, and the deposits of rock salt, gypsum, etc. As a group the sedimentary rocks show a stratified, bedded, or laminated appearance, and, except in some chemical and organic deposits, a fragmental or 'clastic' structure. It is in these rocks too that fossil remains are to be found. These stratified rocks are treated petrologically under four groups: (1) Coarser detrital deposits ('arenaceous'), forming sandstones, quartzites, etc.; (2) The finer detrital deposits or 'argillaceous' rocks (clay, slate, marl, etc.); (3) The 'calcareous' rocks, consisting of carbonate of lime (limestone); (4) 'Pyroclastic' rocks, consisting of fragmental volcanic material (tuffs and *halfeintas*). Coal, peat, and lignite are of organic origin.

Igneous rocks, formed by the consolidation of molten magmas, are generally vitreous or crystalline, and differ from one another in character, according to the composition of the magma and to the conditions of consolidation. The composition of the rock is indicated by the essential minerals, although, under different conditions of solidification, magmas of similar composition may give rise to different mineral aggregates. In any genetic classification, however, the essential minerals necessarily are important.

The two prin. groups of igneous rocks are the extrusive rocks formed by the outpouring of magma at the earth's surface through volcanic vents and fissures, and the intrusive rocks formed by consolidation of the molten material in cavities and fractures within the earth. Both extrusive and intrusive rocks have a great range of composition, ranging from acid (silica-rich) types through

intermediate to basic and ultrabasic types poor in silica and rich in iron and magnesium.

Metamorphic rocks are those formed by the alteration of pre-existing rocks (either sedimentary or igneous) under the influence of heat, pressure, or percolating solutions. *See also* IGNEOUS ROCKS AND METAMORPHISM.

See F. H. Hatch, *Textbook of Petrology*, 1902; A. Holmes, *Petrographical Methods and Calculations*, 1921; N. L. Bowen, *The Evolution of the Igneous Rocks*, 1928; F. F. Grout, *Petrography and Petrology*, 1932; P. G. H. Boswell, *On the Mineralogy of Sedimentary Rocks*, 1933; F. H. Hatch, and A. K. Wells, *Petrology of the Igneous Rocks*, 1937; F. H. Hatch and R. H. Rastall, *Petrology of the Sedimentary Rocks*, 1938; A. Harker, *Metamorphism*, 1939; and W. H. Twenhofel and S. A. Tyler, *Methods of Study of Sediments*, 1941.

Petromyzon, *see* LAMPREY.

Petronius, Galus, companion of Nero, under whom he was considered the leader of fashion (*elegantiae arbiter*). The influence which P. thus acquired excited the jealousy of Tigellinus (q.v.), and being accused of treason he put an end to his life by opening his veins (Tacitus, *Annals*, xvi. 18, 19). He is said to have dispatched in his last moments a letter to the prince, taunting him with his brutal excesses. It is generally agreed that he is the author of the work, portions of which have come down to us, bearing the title *Petronii Arbitri Satyricon*. A sort of comic romance, often licentious, but frequently keen in its satire, it contains the most interesting specimens of contemporary Latin slang, which are surpassed only by the *graffiti* discovered at Pompeii. The best ed. is that by W. D. Lowe (1905), with useful notes and a trans. in Eng. prose. There is also a text and trans. by M. Heseltine, 1913.

Petropavlovsk: 1. Tn in the N. Kazakhstan oblast of the Kazakh S.S.R., on the Trans-Siberian Railway, 170 m. W. of Omsk. Formerly a caravan centre, it has meat-packing, tanning, and agric. machinery industries. Pop. 120,000.

2. Tn on the E. shore of Kamchatka peninsula in the Russian Far East, cap., economic, and cultural centre of Kamchatka Oblast. It is an important fishing port. Founded 1740 by Bering as administrative, naval, and trading base. Bombarded and seized by allies 1854. Pop. (1956) 58,000 (7500 in 1934) Russian.

Petropolis, tn and summer cap. of Rio de Janeiro, Brazil, in the beautiful Serra da Estrêla, 28 m. N. of Rio de Janeiro. It was the cap. of the state from 1894 to 1903, and houses the Imperial Museum. It manufs. silk, cotton goods, and cigars. The hotel Quitandinha is among the most expensive ever built. An inter-Amer. defence conference was held in P. in 1947. Pop. 62,000.

Petrov Affair. On 13 April 1954, Menzies (q.v.) announced that Vladimir Petrov, third secretary at the Soviet Embassy in Canberra, had asked for and been granted political asylum. Six days later Petrov's wife left Sydney by air with

a Soviet escort, on her way to Moscow, but at Darwin she asked for, and was given, political asylum. The Soviet Gov. then broke off diplomatic relations with Australia. Petrov's allegations of a spy-ring involving Australian citizens led to the setting up of a Royal Commission to investigate the matter. Evatt (q.v.) was counsel for some of those indicted by Petrov; but in Sept. 1954 the Commission withdrew its permission for him to appear as such, stating that his obligations as counsel conflicted with his duties as Opposition leader. Evatt's conduct over the P. A. cost him the support of many members of his party, especially of the 'Catholic wing,' and touched off a campaign to depose him from the Labour leadership. This continued intermittently, but unsuccessfully, through 1955 and 1956, seriously weakening the party. Petrov's disclosures in 1955 about Burgess and Maclean led to the issue of a Brit. Gov. White Paper on the subject (*see* BURGESS and MACLEAN CASE). *See* Vladimir and Evdokia Petrov, *Empire of Fear*, 1956.

Petrovgrad, *see* ZRENJANIN.

Petrović Niegros, *see* DANILO I.

Petrovsk, *see* MAKHACHKALA.

Petrovsk-Port, *see* MAKHACHKALA.

Petrozavodsk, tn in NW. Russia, on the Omega Lake, 190 m. NE. of Leningrad, cap., economic, and cultural centre of Karelian Autonomous Rep. (q.v.). It has engineering works (timber industry equipment). There is a branch of the U.S.S.R. Academy of Sciences and a univ. (founded 1940). Pop. (1956) 118,000 (1926, 27,000, 1939, 70,000). Founded 1703 as a cannon foundry, tn 1777.

Petrucchi, Pandolfo, *see* SIENA.

Petrus Damiani, St, *see* PETER DAMIAN, ST.

Petrus Lombardus, *see* LOMBARD, PETER.

Petsamo, *see* PECHENGA.

Petticoat Lane, former name for Middlesex Street, which runs N. from Aldgate High Street, in the bor. of Stepney, London. Originally called Hog Lane, it was settled by Huguenot silk weavers at the same time as Spitalfields (q.v.) near by. Later it passed through a period of squalor and crime, but since Jewish immigration into Whitechapel has been noted for the Sunday-morning clothes and general market. The name P. L. was officially discontinued c. 1830, but is still popularly used.

Pettie, John (1839-93), subject painter, b. E. Linton, East Lothian. He shared a studio with Orchardson (q.v.) for a time, and was elected R.A. in 1874. His colour schemes are effective and his figures well handled. His works include 'The Drumhead Court-martial', 1865; 'The Body Guard', 'An Arrest for Witchcraft', 1866; 'A Challenge', 'A Death-Warrant', 1879; 'The Vigil', 1884; 'The Chieftain's Candlesticks', 1886; 'Two Strings to her Bow', 1887. *See* life by M. Hardie, 1908.

Pettigo, vil. of co. Donegal, Rep. of Ireland, 17 m. E. of Ballyshannon, centre for Lough Derg (q.v.), 4½ m. Pop. 400.

Petty, William, *see* LANSDOWNE, FIRST MARQUESS OF.

Petty, Sir William (1623-87), statistician and political economist, b. Romsey, Hants. He studied at Leyden and Paris and later taught anatomy and chemistry at Oxford. He supervised the redistribution of forfeited lands in Ireland for the Commonwealth and was made surveyor-general there after the Restoration. From 1660 he devoted his time to statistical studies, and was one of the founders of the Royal Society. *See* C. H. Hull (ed.), *Economic Writings of Sir W. Petty*, 1899; and Marquess of Lansdowne (ed.), *Correspondence*, 1928.

Petty Bag Office, defunct office of the old court of chancery (*see* CHANCERY), the clerk of which had the duties of drafting parl. writs of *scire facias* (q.v.), *congé d'élire* for bishops, and, indeed, all original writs passing under the great seal and commissions of sewers, lunacy, and the like. Some of these writs, says Stephen, were originally kept in a *hamper* (whence the name 'hamper office') in contradistinction to those which were kept in a little sack or bag (whence the name P. B. O.); the hamper contained writs and returns relating to the business of the subject, while the bag contained those in which the crown was mediately or immediately concerned. All the duties formerly belonging to the clerk of the P. B. O. with respect to writs and letters patent are now, by the Great Seal Offices Act, 1874, vested in an official called the clerk of the crown in chancery or his officers; while the other duties appertaining to that office, e.g. enrolment, sealing, and issuing of documents and writs, and other matters relating purely to the administration of justice, are now performed by the senior clerk of the crown office dept. of the central office of the high court. *See* Halsbury's *Laws of England*.

Petty-Fitzmaurice, **Henry**, **Henry Charles Keith**, and **William**, *see* LANSDOWNE, third, fifth, and first MARQUESS OF.

Petty Officers in the R.N. are analogous to the non-commissioned officers in the army, a chief petty officer ranking with a sergeant-major and a petty officer with a sergeant. In the executive and engineering branches they rise through the ranks by merit and examination, and are responsible to their superior officers for the proper care of sev. portions of the ship, of groups of men and machinery. All artisan ratings automatically acquire the rate of petty officer as soon as they are qualified in their particular sphere.

Petty Sessions, *see* SESSIONS OF THE PEACE.

Petunia (from *petun*, Brazilian name for tobacco, to which plant the P. is allied), genus of ann. or perennial herbs (family Solanaceae), with attractive funnel-shaped flowers of a great variety of colours. They are specially valuable in hot, dry beds and borders.

Petuntse or **China-stone**, the fusible feldspathic material mixed with kaolin in manuf. of hard-paste porcelain (q.v.).

The word means 'little bricks,' given to the material because it is sent to the potter from the quarry in this form.

Pétursson, Hallgrímur (1614-74), Icelandic poet, one of the greatest hymn writers of Christendom. There are 2 incomplete Eng. translations of his (50) *Passion Hymns*, the crown and the glory of Icelandic religious literature, and a number of trans. of his great funeral hymn, which since 1662 has been sung at every Icelandic funeral. *See* Arne Möller, *Hallgrímur Pétursson's Passionssalmer* (in Danish).

Pétursson, Sigurdur (1759-1827), Icelandic judge and poet, the first notable Icelandic playwright, a humorist at a time when few of his countrymen wrote in that vein.

Petworth (anct *Petoedro*), par. of Sussex, England, 9½ m. WNW. of Arundel. P. House, associated with the families of Percy, Seymour, and Wyndham, was rebuilt between 1686 and 1696; it has one of the best private collections of pictures in England, including 20 of Van Dyck's portraits, and some excellent carving by Grinling Gibbons. In 1947 it was acquired by the National Trust from the third Lord Leconfield. Pop. (1931) 2500.

Peucedanum, family Umbelliferae, genus of herbs, perennial, ann., or biennial. *P.* (formerly *Anethum*) *graveolens* is the common dill, an annual, native to Europe, known to Hippocrates and Dioscorides as a herb. *P. sativum* is the parsnip, cultivated for its root.

Peutinger Map, medieval copy of a Rom. road map made in the latter half of the 4th cent. AD, which was in the library of Conrad Peutinger, a scholar and antiquary of Augsburg, upon his death in 1547. It is now in the National Library, Vienna. The map, which is more strictly a diagram of road routes, covers the Rom. Empire from Spain and Britain in the W. to India in the E. The Brit. portion is largely incomplete, but it is important as the earliest known map of Rom. Britain. It is thought that the map was brought to Europe from a monastery in Jerusalem, and that it was copied from the original in the 13th cent.

Pevensey, par. and vil. of Sussex, England, on the Eng. Channel, 6 m. NNE. of Eastbourne. P. Castle contains 3 fortresses: the Rom. fortress of *Andurida*, a stone keep built by Robert of Mortain, and a fort round the keep built in the 13th cent. The Rom. portion, a fort of the Saxon shore, was built in the second half of the 3rd cent. and garrisoned until the end of the 4th cent. P. was the landing-place of William the Conqueror, 1066. It is a corporate member of the Cinque port of Hastings. Pop. 800.

Peveril, or **Peak Castle**, *see* CASTLETON. **Pews**, enclosed seats in churches. Though by no means general, church seats were in use in England some time before the Reformation, as is proved by records as old as 1450 speaking of such seats by the name of *pups*. They were originally plain fixed benches, all facing E., with partitions of wainscoting about

3 ft high, and sides of the width of the seat, panelled or carved, the sides sometimes rising above the wainscoting and ending in finials or poppies, or else ranging with it and finished with a moulding. After the Reformation, P. grew into large and high enclosures, each containing several seats, lined with baize, and fitted with doors, desks, and cushions. By the law of P. in England, all church seats are at the disposal of the bishop. It appears that by common law every parishioner has a right to a seat in the church, and the churchwardens are bound to place each one as best they can. The renting of P. has now become less common.

Pewsey, tn. of Wilts, England, and the centre of the fertile Vale of P. and of the 'mother' of W.-country carnivals, held each year during the third week of Sept. Pop. 2250.

Pewter, alloy in which tin is always the main constituent and lead usually the other, though various other metals have been used as secondary ingredients. P. was formerly used for making drinking-vessels, plates, etc. The oldest known is Rom., but Eng. P. from medieval times until the 18th cent. was a superior product and is still favoured by collectors. According to law it must not contain any free lead (to avoid lead poisoning), which is easily soluble in acid liquors. The eutectic proportion of tin is therefore the minimum, i.e. 67 per cent. In France vessels containing over 18 per cent of lead may be confiscated. See M. Bell, *Old Pewter*, 1906; C. A. Markham, *Pewter Marks and Old Pewter Ware*, 1909; H. J. L. Masse, *Pewter Plate* (2nd ed.), 1910; H. Jenkins, *The Pewter Collector*, 1921; and H. H. Cottrell, *Old Pewter: its Makers and Marks*, 1929.

Peziza, a genus of cup fungi, class Ascomycetes, about 50 species, usually found in clusters on decaying wood or organic matter.

Pezza, Michele, see DIAVOLO, FRA.

Pfalz, see PALATINATE.

Pfalzburg, see PHALSBURG.

Pfennig, Ger. coin, since 1871, representing the one-hundredth part of a mark. Before the First World War 1- and 2-P. copper coins were current; in 1915 from pieces of 5 and 10 P.s were issued; in 1916 aluminium pieces of 1 and 50 P.s were coined, and later even zinc coins of 10 P.s. Thereafter nickel coins were issued.

Pfitzner, Hans (1869-1949), Ger. composer, b. Moscow, studied at Hoch's Conservatory at Frankfurt on Main, and after various teaching and conducting posts became prof. at Stern's Conservatory in Berlin in 1897. His output, especially of songs (106), is large, and includes choral works, orchestral music, several concertos, and chamber music; but he made his mark especially with 5 operas, one of which, *Palestrina*, produced in 1917, has kept the Ger. stage.

Pforzheim, Ger. tn in the Land of Baden-Württemberg (q.v.), on the Enz, 23 m. WNW. of Stuttgart (q.v.). It lies on the N.W. border of the Black Forest (q.v.), and is an important centre of road and rail communications. There is an

11th-cent. church and another which is partly 13th cent. The tn has important jewellery and watch-making industries, and has a goldsmiths' training school. Pop. 66,000.

Phaeacians, or **Phaeacae**, according to *Odyssey* vi-viii dwelt on the is. of Scheria (Corcyra or Corfu?). They were visited by Odysseus on his return from Troy to Ithaca. The Cyclopes had driven them from Hyperia their first home. Alcinoüs, father of Nausicaä, was their ruler. They lived in undisturbed happiness and peace, had ships that needed no human guidance, but became types of gluttony and luxury. See A. C. Merriam, *Phaeacians of Homer*, 1880; L. Cottrell, *The Bull of Minos*, 1955.

Phaedon, or **Phaedo**, Gk philosopher of the 4th cent. BC, a disciple of Socrates; b. Elis. Taken to Athens as a prisoner of war (c. 400 BC), he became intimate with Socrates, who procured his release. He was present at the death of Socrates, as related in Plato's famous dialogue called by his name. After this he returned to Elis and founded the Elian school, later merged in the Eretrian.

Phaedra, see HIPOLYTUS.

Phaedrus, Athenian of the 4th cent. BC. He was a friend of Plato, one of whose most famous dialogues is named after him and contains a noble passage on the Forms as objects of mystical contemplation.

Phaedrus, Rom. fabulist of the 1st cent. AD, originally a Macedonian slave, perhaps liberated by Augustus. Under Tiberius he suffered from the hostility of Sejanus, but lived to see his overthrow (AD 31), and probably d. in Claudius's reign. The *Fabulae Aesopiae* in iambic verse ascribed to him were first pub. by Pithoens (1596). The latest edition is that by J. P. Postgate (1919). See R. Ellis, *The Fables of Phaedrus*, 1894.

Phaestus, ant. Cretan city 25 m. SW. of Candia. From 1900 excavations have revealed a magnificent palace, with a smaller one at Hagia Triada 2 m. distant.

Phaëthon (Greek for shining), son of Helios and Clymene. To prove his descent and gratify his ambition he persuaded his father to let him drive the chariot of the sun, but failing to control the fiery horses, he came too near the earth. Zeus killed him with a thunderbolt and hurled him into the Eridanus (Po). See G. Knaack, *Questiones Phaëthoneae*, 1885, and Bangert, *De Fabula Phaëthontea*, 1885.

Phaeton, most commonly an open 4-wheeled carriage drawn by 1 or 2 horses; there are varieties known as pony, mail, and spider P.s.

Phagocytosis (Greek *phagein*, to devour; *kutos*, cell) the process of ingestion of undesirable material by certain cells, the phagocytes. In the higher animals the majority of these cells are the white corpuscles, or leucocytes, in the blood. They resemble amoebae in their mode of movement and in their ability to ingest and digest many kinds of bacteria. On this account Metchnikov (q.v.) introduced the theory of P. to explain immunity

to disease. If the germs were rapidly ingested, disease might be prevented, and animals with active phagocytes would thus be naturally immune. If ingestion were slow, the disease would run its course, but might eventually be combated by P. Metchnikov distinguished 2 kinds of phagocytes, the small ones in the blood, and the larger ones in blood and in certain tissues such as endothelial cells and connective tissue. As a result of the research activated by his theory, phagocytes are now distinguished according to their function. Some ingest parasites; others flock to the surface of exposed wounds and help to form a protective covering; others force their way through the walls of capillaries in injured tissues, remove dead matter and injurious bacteria, and form the pus sometimes accompanying inflammation. Other phagocytes secrete products that kill the bacteria, while yet others may resorb the tissues of tumours, cysts, and of grafts. P. has been recognised in many animals. It was first observed by Metchnikov in the larvae of starfish and in the common water 'flea' (*Daphnia*). During metamorphosis the cells of tails of tadpoles first undergo dedifferentiation and are then removed by P. In sponges phagocytes ingest obstructing and injurious particles and eject them into the water currents.

Phai-phô, see FAIFO.

Phalarocorax, large, web-footed bird. See CORMORANT.

Phalanger, see CUSCUS.

Phalanx, name given to the formation of the heavy infantry of the anct Grecian armies. It consisted of a series of parallel columns of men standing close one behind the other, and capable of penetrating and resisting almost any other formation. The Spartan P. was the original of this formation, and consisted of soldiers standing from 4 to 8 men deep. The Macedonian P., the last of this formation, was 16 men deep. The soldiers were armed with swords and 13-ft pikes. They were flanked by light infantry and cavalry. The Romans defeated the P. by a combination of missile attacks and harassing tactics.

Phalaris, tyrant of Agrigento (Agrigento) in Sicily (c. 570-554 BC). He perished in an outbreak of popular fury roused by his monstrous cruelty. P. is celebrated for the brazen bull in which he is said to have burned his victims alive, and to have made the first experiment on its inventor, Perillus. The epistles bearing his name were shown by R. Bentley (*Dissertation*, 1699) to be forgeries of the 2nd cent. BC.

Phalarope (*Phalaropus*), genus of birds which includes 2 species that sometimes occur in Britain. The red-necked P. (*Lobipes lobatus*) breeds mostly in polar regions, and also in the Orkneys, Shetlands, Hebrides, and W. of Ireland. It is about the size of a sandpiper, and its winter plumage is leaden grey and white, ruddy patches appearing on the neck in summer. The grey P. (*P. fulicarius*) is rather larger.

Phalerum, in anct geography, a seaport of Attica, Greece, the port of Athens up to c. 475 BC, when the Piræus (q.v.) to the W. replaced it. It is on a bay 3½ m. S. of Athens, now frequented as a bathing-place.

Phallus, representation of the male generative organ, used at certain Dionysiac festivals in anct Greece, as a symbol of the powers of procreation, and an object of common worship in the nature-religion of the E. It had many names, e.g. Linga, Joni, Polleat, etc. The Phoenicians attributed its introduction into their worship to Adonis (see TAMMUZ), the Egyptians to Osiris, the Phrygians to Atys, the Greeks to Dionysus. The common myth concerned a god deprived of his virility, perhaps an allusion to the sun, which in autumn loses its fructifying influence. The procession in which it was carried about by Phallophoroi was called Phallagogia, or Periphallia, and the hymn sung called the *Phallickon Melos*. Aristotle traces the origin of comedy to the ribaldry and jokes at those festivals. Before the temple of Aphrodite at Hierapolis stood 2 phalli, 180 ft high, upon which a priest mounted annually to remain there in prayer for 7 days. The P. was an attribute of Pan, Priapus, Silenus, and Hermes, see HERMAE.

Phalsbourg (Ger. Pfalzburg), Fr. tn in the dept of Moselle, an anct fortress. Pop. 3100.

Phanerogamia, **Phanerogams**, or **Flowering Plants**, one of the great divisions of the vegetable kingdom, consisting of plants which have flowers with stamens and ovules, and after fertilisation, seeds containing an embryo; now called Sperminophytes (q.v.).

Pharaoh, Anglicised Hebrew form of the ordinary title of the Egyptian kings meaning 'Great House.'

Pharisees (Aramaic, *Perishin*, 'separated'), religious sect among the Jews, first heard of in the latter half of the 2nd cent. BC, but probably descended from the Chasidim or 'Pious' (Assideans), who passively resisted Antiochus Epiphanes at the beginning of the Maccabean revolt. The name was perhaps at first given them in derision, because of their exact observance of the Law, which distinguished them from the ordinary Jews, for many of whom it was an impossibility on account of their having a whole-time occupation. The Pharisaic scribes developed a minute casuistry to apply the Law to every detail of life, but in doing so, at the same time found ways of evading many grave moral obligations, for which Christ stigmatised them as hypocrites. At their best, however, they were inspired by a genuine spiritual ideal, though an impossible one for fallen man, to achieve perfection in God's service by obedience to a formal code. They accepted the doctrine of the Resurrection of the Body, a late development in Judaism, in which they were opposed to the conservative but sceptical and worldly Sadducees. They were opposed to the increasing secularism of the high-priesthood, and were characterised

by the stress they laid upon the eternal and unchanging nature of the law, and upon the separation between Israel and the Gentile races. They did much service to their people by their uncompromising patriotism and by their opposition to the liberal opinions of the Sadducees; but they rapidly became the slaves of formalism, and their very servitude rendered them overweening in their pride as the only observers of the law. See R. H. Charles, *Religious Development between the Old and the New Testaments*, 1914; and A. Deane, *The World Christ Knew*, 1944.

Pharmaceutical Society of Great Britain, was founded 1841 and granted Royal Charter of Incorporation 1843. Its constitution was revised by the granting of a Supplementary Charter, 1953, and the coming into operation of the Pharmacy Act, 1953. The objects of the Society under its charter are to advance chemistry and pharmacy; to promote pharmaceutical education and the application of pharmaceutical knowledge; to maintain the honour and to safeguard and to promote the interests of the members in their exercise of the promotion of pharmacy; and the provision of funds for benevolent purposes. Until 1933 membership of the Society was voluntary but restricted to persons registered as pharmacists. The Pharmacy and Poisons Act, 1933, ended the voluntary nature of the Society, and membership became an automatic consequence of registration as a pharmacist. The membership in 1956 was 26,000. The P. S. keeps the statutory Register of Pharmaceutical Chemists and the statutory Register of Pharmacies (approximately 15,300). It has the statutory duties of examining students and enforcing the various Pharmacy Acts governing the sale, distribution, disclosure of composition, and labelling of poisons and medicines. In 1842 it founded a school of pharmacy, which in 1948 became the School of Pharmacy of the University of London.

The P. S. has a library of approximately 28,000 volumes, together with a collection of about 6000 pamphlets, manuscripts, etc., and a museum of *materia medica* (q.v.) and historical material. It publishes the *Pharmaceutical Journal* (weekly), the *Journal of Pharmacy and Pharmacology* (monthly), the *British Pharmaceutical Journal*, the *Extra Pharmacopoeia* (Martindale), the *British Veterinary Code*, and, on behalf of the General Medical Council (q.v.), the *British Pharmacopoeia*. See also CHEMIST and DRUGGIST, or PHARMACIST.

Pharmacist, see CHEMIST AND DRUGGIST.

Pharmacognosy, or *Materia Medica*, knowledge of drugs, particularly as regards their origin and their condition in the unprepared state; *pharmacy* (q.v.) is the compounding and dispensing of drugs as medicines, whereas *pharmacology* (q.v.) is the scientific study of drugs and their mode of action. Formerly most drugs were obtained from natural sources, especially plants, as for instance digitalis

from the foxglove, ergot from a fungus which parasitises rye, and cocaine from the leaves of the coca plant. Nowadays many drugs are prepared synthetically, though natural products are still important. See T. I. Williams, *Drugs from Plants*, 1949.

Pharmacology, in its widest aspect, is the science concerned with change effected in the function of living material either by the direct action on it of chemical compounds or by their effect on its environment. P. is now generally restricted to the science dealing with the effect of drugs on man. The first treatise known on P. was that of Dioscorides (c. AD 60), and on it all subsequent pharmacopoeias have been founded. It was trans. and extended by the Arabs and Persians, who were the authorities on P. in the Middle Ages, and who made some attempts at classification according to the action of the drug. Little advance in P. was made in Great Britain until the 17th cent., when a series of pamphlets was pub. describing the action of drugs from America and the Far E. Amongst the drugs described were ginseng, salap, and ipecacuanha. In the 18th cent. Anton Stoerck of Swabia investigated and advocated the use of emetics and certain alkaloids; Purkinje experimented on himself to test camphor, belladonna, stramonium, and turpentine; François Magendie (1783-1855) made medical use of compounds of bromide, iodine, and of morphine, strychnine, and other alkaloids. The 19th and 20th cents. have witnessed the discovery of new drugs and the sifting of old ones. Many have been removed from the pharmacopoeias as a result of the critical tests made to determine their efficacy. In Germany, U.S.A., and England numerous experiments have been made to discover the effect of various drugs on animals and the maximal and minimal doses. This work has yielded valuable information, but the results must be used with caution, for the effect of a drug on man may be very different from its effect on other animals. The action of drugs on the endocrine organs has been fully investigated.

Since rational treatment of disease must depend on knowledge both of the disease and of the drug and its action, P. is dependent on pathology, chem., and physiology (q.v.). Investigation of the action of drugs is made difficult by the fact that drugs acting in very different ways may apparently produce the same effect. The heart, for example, may be accelerated either by drugs paralysing the vagus nerve fibres or by drugs exciting the sympathetic fibres. Difficulties arise also in connection with the classification of drugs. That at present adopted is based on both chemical and physiological considerations, for attempts to use either separately, or to use a botanical classification, result in grouping together drugs either of different constitution, or of different action, or both. The method of administration of the drug and the size of the dose are also included in the study of P. See MEDICINE; MATERIA

MEDICA; PENICILLIN; PALUDRINE; SULPHONAMIDES. See W. E. Dixon and W. A. M. Smart, *Manual of Pharmacology*, 1936; J. A. Gunn, *Introduction to Pharmacology and Therapeutics*, 1956; C. Solomon, *Pharmacology, Materia Medica and Therapeutics*, 1952; and F. K. Oldham, F. E. Kelsey and E. M. Geiling, *Essentials of Pharmacology*, 1955; *The Extra Pharmacopoeia* (Martindale) (24th ed.), 1958.

Pharmacopoeia, book containing formulae for the preparation of compound medicines, especially such a book recognised as a standard. Hist. does not definitely record when the first P. was pub. The first ed. of the Chinese *Materia Medica* is said to have been prepared about 2000 BC by the emperor Shen Nung. The Ebers papyrus was written some 1500 years later. Books on *materia medica* were produced by Theophrastus (380-286 BC), Scribonius Largus (AD 45), Dioscorides (c. AD 60), Galen (AD 130-200), and others. Some authorities aver that the first real P. was the *Nuovo receptario composito*, which was made official in Florence at the close of the 15th cent., or the work prepared by Valerius Cordus which was adopted officially by Nuremberg (in 1546), or that prepared by Adolph Occo in 1564, which was actually called a P. and made official in Augsburg in 1613. But these books were only 'official' in small ters. The Royal College of Physicians was the first body to prepare a P. which became official throughout the whole country. The project was first discussed in 1585 and, after considerable discussion, the first issue of the P. was produced in May 1618. Only 2 copies of this issue are known to exist. This was the first *London Pharmacopoeia*, and the colleges at Edinburgh and Dublin issued similar works, revised periodically, commencing in 1699 and 1807 respectively. The disadvantages and dangers of 2 separate authorities with different names and different standards of strength for their preparations led Parliament to provide, by the Medical Act, 1858, for the pub. of the *British Pharmacopoeia* (new edition, 1958). National P.s are pub. in many countries, of which *The United States Pharmacopoeia*, revised every 10 years, and the *Fr. Codex* are the most widely used.

Pharmacy deals with the sources, preparation, and dispensing of medicines. Persons desiring to practise P. or to use the title chemist or druggist in conjunction with retail business must be registered under the Pharmacy Acts, having passed the examination and satisfied the other conditions of the Pharmaceutical Society (q.v.).

Pharnabazus, satrap of the Persian provs. bordering the Hellespont, who played a prominent part in Gk hist. from 412 to 393 BC. He was a loyal friend to Sparta.

Pharoses: 1. King of Pontus (c. 185-169 BC), grandfather of Mithradates the Great.

2. King of Pontus, or more properly of

Bosporus; son of Mithradates the Great, whom he compelled to put an end to his life in 63 BC. In the civil war he allied himself with Pompey, but was defeated by Caesar at Zela (47). Later in the same year P. was assassinated by one of his officers.

Pharos, see HVAR.

Pharos: 1. A peninsula, formerly an is. off the N. coast of Egypt. On founding Alexandria, Alexander joined it to the mainland by a mole.

DOVER PHAROS

Crown copyright: reproduced with the sanction of the Controller of H.M. Stationery Office

2. A lighthouse, a meaning derived from the lofty tower erected by Ptolemy II on the is. of P., one of the 7 wonders of the anc. world. Ships were guided safely into harbour by the light of torches or fires shown from its upper windows. Another P. is that at Dover, one of the most striking monuments of Rom. Britain. With a second at Dover, and another on the cliffs near Boulogne, France, it fitted into a scheme for assisting the navigation of cross-Channel traffic. Possibly it was part of the estab. of the *Classis Britannica*, the Channel Fleet. See also LIGHTHOUSE.

Pharsalus (modern Pharsala), tn of anc. Thessaly, Greece, 24 m. SW. of Larissa. In the neighbouring plain of

Pharsalia Caesar won his famous victory over Pompey, 48 BC.

Pharynx, cavity situated at the back of the nose and mouth and above the gullet. It therefore serves as a communication between nose and mouth and as part of the air and food. It extends from the base of the skull to the level of the sixth cervical vertebra, where it becomes continuous with the gullet. The interior of the cavity is lined with mucous membrane, which is lined with ciliated columnar epithelium in the naso-P., and stratified squamous epithelium in the

THE PHARYNX
(opened from behind)

A, Oesophagus; B, posterior portion of nostrils; C, Eustachian tube; D, opening to mouth (base of tongue); E, superior opening of larynx; F, uvula; G, tonsil; H, epiglottis; I, thyroid cartilage; J, posterior surface of larynx.

oral P. Outside this is a layer of fibrous tissue, the *pharyngeal aponeurosis*, and outside this, again, is the muscular coat. The upper portion of the cavity or naso-P. belongs to the respiratory tract, and is joined to the lower portion, or bucco-P., which belongs to the digestive tract, by the pharyngeal isthmus. The P. communicates with the middle ear by means of the Eustachian tube, and by this means the middle ear can become infected from the P.

Phase Advancers. In a distribution network with a large load of induction motors or other induction apparatus, and in long transmission lines, the current-lag behind the voltage may lower the power factor (q.v.) to such an extent that the current supplied by the power station becomes excessive, and in the transmission lines the stability is endangered. It is then necessary to generate a certain

amount of reactive power with leading current—to advance the phase of the current. Over-excited synchronous motors running idle supply such leading current. Recently powerful batteries of static capacitors have been employed with success. Sometimes the authorities stipulate that consumers install capacitors in parallel with induction motors when the power factor is below a certain minimum.

Phase-angle. Consider 2 alternating quantities, like a.c. voltages or currents of the same frequency, as sinewaves, then a cycle corresponds to the value 2π or the angle 360° . If one of the quantities is a fraction of a cycle behind the other, that fraction expressed in degrees is the P. or phase difference between the two quantities. See ALTERNATING CURRENT.

Phase Diagrams, see ALLOY; INDUCTION, MAGNETIC; METALLURGY (PHYSICAL METALLURGY); and TRIPLE POINT.

Phase Modulation, see MODULATION.

Phaseolus, a genus of twining ann. or perennial tropical or sub-tropical herbs, family Leguminosae, about 150 species; *P. coccineus* is the parent species of the Scarlet Runner Bean, *P. vulgaris* of the Fr. Beans; *P. lunatus*, the Sieva Bean, is widely grown in tropics; *P. caracalla*, the Snail Flower, is a tropical climber.

Phases, changes in the appearance of the moon and of a planet due to the illuminated part being observed from different angles. P. increase from the dichotomous to the gibbous state till, at opposition, the moon, or planet, is 'full,' when the process is reversed and the moon wanes to 'new.' The 2 inner planets, Mercury and Venus, exhibit P. similar to those of the moon. The P. of the latter can be seen with quite a small instrument, and it was their discovery by Galileo in 1610 that finally estab. the Copernican system. Of the exterior planets only Mars and a few minor planets show P., and these only gibbous.

Phasianidae, see PHEASANT.

Phasis, River, in anct Colchis, see RION. **Phat-Diem**, tn of Nam-dinh (q.v.) prov., Tonking; a Rom. Catholic bishopric, it is noted for its unique 19th-cent. cathedral. Previously the centre of a predominantly Rom. Catholic area of Tonking, it has now been abandoned by most of the Rom. Catholics, who fled to S. Viet Nam.

Phazania, see FEZZAN.

Pheasant, or *Phasianus*, genus of game birds which, according to modern ornithologists, contain 6 species: *P. colchicus*, *P. reevesii*, *P. eliotti*, *P. himiae*, *P. mikado*, and *P. socmerringi*. The genus is distinguished by the very long wedge-shaped tail and the absence of a crest. *P. colchicus*, the common P., was introduced from S. Russia and Asia Minor into W. Europe by the Romans, but in the greater part of Europe a true, pure-bred common P. is rare or even non-existent, because of the introduction of other species with which it has freely interbred. Of *P. colchicus* at least 30 local races are known, including the large and desirable Mongolian P., with rich red flanks, green

gloss on the plumage, and a broad white ring round the neck; the ring-necked P. which, more than any, has hybridised with the common P. in Britain; and the Jap. P., distinguished by its dark green breast. The other P.s hybridise with the varieties of the common P., but the offspring is always infertile. Reeves's P. (*P. reevesii*), a native of China, is over 6 ft in length, and has yellow and brown spangled plumage. *P. mikado* was discovered in central Formosa in 1898; the male is ultramarine blue with a white barred tail. A number of members of other genera of the family Phasianidae are called P.s, including the golden P. (*Chrysolophus pictus*), Lady Amherst's P. (*C. amherstiae*), the pucras P.s, the kallege P.s, the eared P.s, and the impeyan P.s. The smallest member of the P. family is the *Ophrysia superciliosa*, the P.-quail, a native of Nepal.

Pheasant-shooting in Great Britain. The season for this sport begins on 1 Oct. and ends 31 Jan. Until the leaves have fallen in the covert, the birds are shot over pointers or setters on rough ground, or with spaniels in hedgerows and small plantations. From about the middle of Nov. battues are organised: the birds, which prefer to run on the ground rather than take to the air to escape danger, being driven to a point from which they are flushed, and exposed to the fire of a double line of guns. The shooter, who is provided with his own loader, kills cocks in preference to hens, and kills only those birds in front of him. As a rule coverts can only stand 3 battues. See W. B. Tegetmeier, *Pheasants*, 1897, and Hon. Walter Rothschild's article in the *Encyclopaedia of Sport*, 1897-8; also B. Fitzgerald, *British Game*, 1948.

Pheasant's Eye see ADONIS.

Phedias, or **Phidias** (c. 500—after 432 bc), sculptor of ancient Greece. He was the son of Charmides and was b. in Athens. He studied under the Argive Ageladas, or, according to another authority, under Hegias of Athens. Works which have been attributed to him are a colossal figure of Athena Promachos in bronze, the Lemnian Athena, a gilt Athena at Plataea, and the Zeus at Olympia. He had the opportunity of proving his genius when Pericles appointed him to superintend the adornment of Athens. P. planned the erection of temples and public buildings and, chief of all, the Propylaea and the Parthenon. Fragments of the frieze, metopes, and pediment of the Parthenon were brought to England by Lord Elgin, and are preserved under the title of the Elgin Marbles in the Brit. Museum. P. executed the statue of Athena in ivory and gold about 438 bc, and 6 years later was accused of implety in having introduced his own and Pericles's likeness on the shield of the goddess and of stealing the gold entrusted to him. He died either in prison or in exile. P. was regarded by ancient critics as the greatest of sculptors, and the impression of supreme eminence remains, although no single extant masterpiece can certainly be credited to him. See A. S. Murray,

Greek Sculpture, 1880; C. Waldstein, *On the Art of Phidias*, 1886; A. Hekler, *Die Kunst des Phedias*, 1924.

Pheldon, King of Argos. His date is disputed, but the most probable opinion favours the first half of the 7th cent. bc. He introduced the so-called Aeginetan scale of weights and measures.

Phellodendron, an E. Asian genus of deciduous trees, family Rutaceae, 6 species, grown in gardens for their handsome foliage.

Phellogen, a cambium layer of cells, dividing in or just below the epidermis of dicotyledons to form cork. P. and its derivatives are termed the periderm. See CAMBIUM.

Phelps, Samuel (1804-78), actor-manager, b. Devonport. He made his debut at the Haymarket in London as Shylock (1837), and was engaged by Macready. From 1844 to 1862 he and Thomas Greenwood produced at Sadler's Wells, Clerkenwell, over 30 Shakespearian as well as other 'legitimate' plays, which had great influence in raising the taste of theatrical audiences. His chief parts were Lear, Macbeth, Othello, and Sir Giles Overreach, but he also excelled in the comic characters of Bottom, Falstaff, and Shallow. See life by May Phelps and J. Forbes-Robertson, 1886.

Phelps, William Lyon (1865-1943), Amer. scholar and critic, b. New Haven, Connecticut, son of a minister. Educ. at Yale and Harvard, in 1901 he became prof. of Eng. literature at Yale. A gifted and popular teacher, he was the first to give a course of lectures on contemporary writers at an Amer. univ. Among his works are *The Beginnings of the English Romantic Movement*, 1893, *Essays on Modern Novelists*, 1910, *The Advance of the English Novel*, 1916, *The Advance of English Poetry*, 1918, and *The Twentieth Century Theatre*, 1918. In 1939 he pub. his *Autobiography with Letters*.

Phenacetin ($\text{CH}_3\text{CONH}\cdot\text{C}_6\text{H}_4\cdot\text{OC}_6\text{H}_5$), white crystalline substance obtained from para-aminophenol. It is soluble in alcohol and glycerine, but slightly soluble in water. It is used in medicine for neuralgia and headaches.

Phenacodus, genus of extinct ungulates in the order Condylarthra, found in the Eocene of America and Europe.

Phenobarbitone (phenobarbital, gardenal, luminal) is phenyl-ethyl-barbituric acid

i.e. $\text{C}_{12}\text{H}_{11}\text{O}_4\text{N}_2$. It is used extensively as a hypnotic (q.v.) and sedative and in the treatment of epilepsy, for its depressing action on the cortical activity of the brain. The dose is 1-2 gr. (30-120 mg.) by mouth or by subcutaneous injection. It has a more prolonged action than hexobarbitone (evipan) which is rapidly destroyed and excreted by the body. See also BARBITURATES.

Phenocryst, see PORPHYRY.

Phenol, see CARBOLIC ACID.

Phenol-formaldehyde, see PLASTICS.

Phenolphthalein ($C_{20}H_{14}O_4$) is prepared by heating phthalic anhydride (3 parts) with phenol (4 parts) and a little strong sulphuric acid to 115°C . It is a white crystalline substance, slightly soluble in water, but dissolves readily in alcohol. It is used in volumetric analysis as an indicator for weak acids. With alkalis it gives a pink coloration, but the presence of acids destroys this coloration. P. is also used in medicine as a mild purgative.

Phenomenology is the science of phenomena in philosophy, involving a contention that the existence of 'substance' is an illusion, that matter is no more than an indeterminate and unknown something underlying phenomena. Phenomenalism originated in idealism (q.v.) and positivism (q.v.), and later developed into an attack upon the traditional doctrine of substance. Locke and Berkeley in a measure are phenomenologists, Berkeley holding that all objects of knowledge must be phases of mind arising from stages of perception, while Hume argued that if the supposed but unknowable substantial substratum of external sense phenomena is illusory, so is the supposed substantial ego which is stated to underlie the internal phenomena of consciousness. Modern phenomenologists adhere to the theory that there is only one normally 'conscious personality.' The subconscious mental activities of the individual are put together and called the 'subliminal' or subconscious ego or self. In abnormal cases of 'double consciousness' the subliminal self struggles for mastery over the conscious self and is, for a time, successful. P. has a close connection with the science of psychology (q.v.), especially in its bearing upon the 'subliminal self.' Indeed, the connection is close enough to cause confusion between the two. In principle the 2 studies are dissimilar. Briefly P. tries to show that absolute knowledge as an expression of spiritual life is based upon experience, and is the final triumph, as it is the final cause, of the complete process of experience. By P., as may be gathered from the foregoing analysis, we generally understand the descriptive study of phenomena as they are immediately presented to experience. But P. may also be described as a philosophic method which makes use of descriptions which are phenomenological in the usual sense of the word, but which regards them only as a means of seeking something that lies beyond the phenomena. The chief exponent of the phenomenological movement in this latter sense of the word was the Ger. philosopher Edmond Husserl (d. 1938), who taught at Freiburg Univ. The P. of Husserl is indeed a description of the immediate data of consciousness; but whereas ordinary academic psychology allows itself to be monopolised by the object, Husserl considers the thinking subject; his psychology is a reflexive psychology. It is the very 'structures' of conscious activity that he tries to discover, e.g. 'perception,' 'distant recollection,'

'exemplification by analogy.' These structures he calls essences. But there is a radical difference between Husserl and Plato: Husserl's essences do not exist in themselves, in a separate world, as ideal types of possible things; they are factual data resulting from the relationship between objects and consciousness. Other phenomenologists who, like Husserl, see consciousness as without content, are Heidegger (q.v.) and Sartre (q.v.). See G. Hegel, *Phenomenology* (trans.), 1910; P. Coffey, *Ontology*, 1914; K. Stavenhagen, *Absolute Stellungnahmen Erlanger*, 1925; J. Hering, *Phénoménologie et philosophie religieuse*, 1925; W. Reyer, *Einführung in die Phänomenologie*, 1926; and M. Farber, *The Foundation of Phenomenology*, 1943. See also G. Gurwitsch, *Les Tendances actuelles de la philosophie allemande*, 1930, and P. Foulquié, *Existentialism* (trans.), 1947.

Phenomenon (from Greek *phainomai*, I appear), that which appears as distinguished from that which exists. The term was once used to denote the world of sense as opposed to the world of reason, but Kant has given it a more extended connotation. In the *Critique of Pure Reason* he says: 'The undetermined object of an empirical intuition is called phenomenon. The empirical intuition is a mere phenomenon in which nothing that can appertain to a thing in itself, can be found. . . . In the whole range of the sensuous world, investigate as we may, we have to do with nothing but phenomena.' See NOUMENON; also H. Spencer, *First Principles*, 1862.

Phenyl Carbinol, see BENZYL ALCOHOL.

Phenyl-methane, see TOLUENE.

Phenyl Methyl Ketone, see ACETO-PHENONE.

Phenylacrylic Acid, see CINNAMIC.

Pherecydes: 1. (fl. c. 544 B.C.), of Syros, Gk philosopher. Pythagoras is said to have learned from him the doctrine of metempsychosis or transmigration of souls.

2. Of Athens, one of the early Gk logographers, was a contemporary of Herodotus.

Phersala, see PHARSALUS.

Phi Beta Kappa, oldest Amer. college fraternity, founded by undergraduates at William and Mary College, Williamsburg, Virginia, in 1776, apparently in imitation of the Bavarian order of *Illuminati*, whose first head was Adam Weishaupt, prof. of law at Ingolstadt. The name, formed of 3 letters of the Gk alphabet, is generally supposed to signify the initial letters of the Gk motto, 'Philosophy is the guide of life.' Branches of this honorary society were soon estab. at Yale and Harvard, and later in practically all the prin. univs. and colleges of the U.S.A. Since 1876 women have been eligible for membership on the same terms as men. The society, including past and present graduates, is governed by a national council.

Phidias, see PHEDIAS.

Phigalia, anct. in of Arcadia, whose site is now occupied by Pavlitz, 15 m. N.E. of Kyparissia. From its temple of Apollo were brought to the Brit. Museum

the Phigalean Marbles, a frieze representing a contest between Centaurs and Lapithae. The temple was probably built about 430 BC by Ictinus.

Philadelphia (modern Ala-Shehr), city in Lydia, Asia Minor, called in honour of Attalus Philadelphus of Pergamum (159-138 BC).

Philadelphia (the city of brotherly love) is the largest city of Pennsylvania and the third in pop. (2,071,605) in the U.S.A. It lies 130 m. N. of Washington, D.C., and 80 m. SW. of New York City, and is situated on the Delaware R. at the junction with its great trib. the Schuylkill and 100 m. from its mouth. P. was founded by Wm Penn the Quaker in 1682 as a city in which men of all races might live, each following, unpersecuted, his own religion. It is sometimes called the Quaker City, though the Quaker element no longer prevails. The Daughters of the Revolution, a society of great social importance, has a large contingent here. This too is noted, like Boston, for social exclusiveness, and, though equally busy, it is a quieter and more sedate city than New York, and inclined to Conservative ideals. It is known sometimes as the 'city of homes,' and is, unlike many Amer. cities, largely composed of small houses. Its 1600 m. or so of streets are laid out, with few exceptions, with chequerboard regularity. One exception is the wide, tree-lined Benjamin Franklin Parkway, completed in 1924, which runs from City Hall Square in the centre of the city to Fairmount Park, which, the best known and largest of the many open spaces, is nearly 3845 ac. in extent. The city hall, formerly the loftiest building in P., is 548 ft to the top of the statue of Wm Penn which crowns its tower. The city is noted for its private art collections, and it has also a public gallery, housed in the Pennsylvania Academy of Fine Arts (1805). The free public library, founded by Benjamin Franklin in 1731, has 15 branches in the city. Franklin, who was buried in Christ Church cemetery here, founded also, in 1750, the school that grew in 1765 into a college, and in 1779 into the Univ. of Pennsylvania, which now covers 60 ac. and has 9000 students. Its medical, dental, and law schools are particularly noted. P. is celebrated for the efficiency of its elementary schools and for its normal and manual training schools, among which may be mentioned the Drexel Institute and Girard College. Other educational institutions are: Franklin Inst. (1824), Temple Univ., Dropsie College for Hebrew and Cognate Learning, La Salle College, Chestnut Hill College, St Joseph's College, Curtis Institute of Music, Hahnemann Medical College, Jefferson Medical College, and P. Museum School of Art. The Swedish church of Gloria Dei, built in 1700, is the oldest building in the city. Output of manufactured goods is exceeded only by New York and Chicago. Important industries of P. and environs are petroleum and oil refining, metalworking, printing and publishing, shipbuilding, and the manuf. of railroad cars, buses, textiles,

clothing, hats, alcohol, leather products, paper, tobacco products, electrical supplies, machinery, rugs, glass, medicines, and processed foodstuffs. Exports are exceeded only by New York, though the city is so far from the sea. It has a total water frontage of 37 m. on the 2 rivs., about 6 m. on the Delaware being occupied with its harbour, which has some 300 wharves. There is a large gov. navy yard at League Is., just above the tn. It is served by 4 railway lines, sev. airlines, and a highway network. P. is one of the most historic cities in the U.S.A., and has an historical society of its own. Independence Hall Building was completed in 1735, and here the constitution of the U.S.A. was framed, and independence proclaimed, as its name indicates. In this building, too, is housed the famous Liberty Bell revered by all Americans. It was the ringing of this bell which announced to the citizens that the declaration of independence from Great Britain had been adopted. Except for the British occupation (1777-8) P. was the cap. of the Federal states from the Revolution until 1800, and the cap. of Pennsylvania from 1683 until 1799 (Harrisburg is now the cap.). The U.S. mint was founded here in 1792. In colonial days P. was a great political centre, and here assembled the hist.-making Continental Congress of 1774. On 4 July 1776 the Declaration of Independence was promulgated here, and Articles of Federation were signed on 9 July 1778. The first cap. of the U.S.A. and its first metropolis, P. has often been compared with Boston, and, like Boston, it is a kind of mirror to Amer. hist., with a copious intellectual tradition and a social aristocracy. But it is much bigger than Boston and much more heavily industrialised. It is more complex, with marked elements of Pennsylvania Dutch, Germans, and British, including Scots and Irish. Like Boston it has a strong puritanical outlook and there is still no alcohol on Sunday, while the cinemas do not open till the afternoon. In 1948 a project for Independence National Historical Park (20 ac.) was authorised to include Independence Hall, the Custom House, Christ Church, and other historic sites. A great disappointment came to P. in 1946: the city had vainly counted on being the United Nations cap., which might have served to revivify it and renew its ancient distinction. See R. Shackleton, *The Book of Philadelphia*, 1918, and C. Morgan, *The City of Firsts*, 1928.

Philadelphians, sect founded in London in 1652 by Jane Leade and John Pordage, to explain the works of Jacob Boehme (q.v.), the Ger. mystic. They stressed the necessity of contemplation, and were believed in spiritualism (q.v.). They disappeared early in the 18th cent.

Philadelphus, a genus of deciduous shrubs, family Saxifragaceae, about 40 species found in S. Europe, Asia, or N. America; *P. coronarius*, the Mock Orange or Syringa, *P. coulteri*, the Rose Syringa, and *P. microphyllus* are parents of many beautiful garden hybrids, esteemed for their summer flowering.

Philae, islet in the Nile, 5 m. S. of Aswân, in Nubia (q.v.). Length about 1200 ft.; breadth about 450 ft. It is famous for ant temples and ruins, built by the Ptolemies and by the Rom. emperors, chief of which are the temple of Isis, 'Pharaoh's bed' (an incomplete Rom. hall), the shrine of Harendotes, and the Propylon.

Philanthropy, see CHARITIES; CHARITY, ORDERS OF; CHARITY COMMISSIONERS; FAMILY WELFARE ASSOCIATION; POOR LAW; NATIONAL ASSISTANCE ACT (1948).

Philaret (before becoming a monk Drozdov, Vasily Mikhaylovich) (1783-1867), Russian preacher and theologian, from 1826 Metropolitan of Moscow. He wrote 2 catechisms (see Blackmore, *The Doctrine of the Russian Church*, 1845) and began a trans. of the N.T. into Russian. See his *Select Sermons* (Eng. trans., 1873).

Philately. In general usage P. covers both the study and the collecting of postage stamps (q.v.), and thus anybody who is actively interested in stamps, from whatever angle, is known as a philatelist. The word P. is derived from 2 Greek words, *philos*, meaning 'fond of,' and *ateleia*, meaning 'exemption from tax.' It was coined by a Frenchman, M. G. Herpin, in 1866, and has long been universally accepted. Stamp collecting started in a desultory manner not many years after the introduction of the first adhesive postage stamps, the Great Britain 1d. black and 2d. blue of 1840, and though, to begin with, the hobby met with a good deal of derision, being the subject even of some caustic verses in *Punch*, it continued to gain fresh adherents, and by the end of the fifties was fairly well estab. Among the famous pioneer Brit. philatelists may be mentioned the Rev. F. J. Stainforth, Sir David Cooper, Judge Philbrick, Dr C. W. Viner, E. L. Pemberton, J. Overbury Taylor, and W. A. S. Westoby.

As early as 1852 J. B. Moens started dealing in stamps in Brussels, and in 1861 F. G. O. Berger-Levrault issued, for the benefit of his friends, the first stamp list in Strasburg. Three months later A. Potiquet issued, in Paris, a catalogue of stamps for sale, while in 1862 the first jour. devoted entirely to postage stamps, *The Monthly Advertiser*, appeared in Liverpool, to be followed in 1863 by a London pub., *The Stamp Collector's Magazine*. The first Brit. work on stamps, F. Booty's *Aid to Stamp Collectors, being a List of English and Foreign Stamps in Circulation since 1840*, consisting in the main of material previously pub. abroad, came out in 1862. It ran through sev. eds. and was finally reissued with illustrations (the first illustrated work on postage stamps) under the title *The Stamp Collector's Guide*. But the 2 most important of the early catalogues, both pub. later in 1862, were J. E. Gray's *Hand Catalogue of Postage Stamps for the Use of Collectors* and Mount Brown's *Catalogue of British, Colonial, and Foreign Stamps*. The first stamp album was produced by a Frenchman, J. Lallier, in the

same year and was put on sale simultaneously in Paris and London.

To show how the hobby spread, it may be noted that the first stamp auctions were held in Paris in 1865, in New York in 1870, and in London in 1872; while the first philatelic societies were founded in Paris in 1865, in New York in 1867, and in London in 1869. The 2 former have long been defunct, but the last, known originally as the Philatelic Society and now as the Royal Philatelic Society (the 'Royal' was added by warrant of King Edward VII in 1906), is still active and remains unquestionably the leading philatelic society of the world, owning magnificent club rooms and library and publishing its own jour., *The London Philatelist*, since 1892. As stamp collecting grew in popularity the study of stamps became more intense and the desire to read about them more widespread; and if the hobby is recognised as by far the most popular of all hobbies, it may safely be said that the literature concerning stamps is infinitely more extensive than the literature concerning any other hobby. It ranges from elaborate monographs, dealing in minutest detail with the stamps of different countries or even individual issues, to popular books touching upon the romance, the hist., and the interest of stamp collecting in its every aspect. Philatelic jours., running into some 200, of which about a dozen are Brit., are pub. throughout the world, some being highly technical and others consisting mainly of gossip and advertisements. Numerous countries official postal museums, but although the Brit. Post Office has an unrivalled collection, in sheets, of Brit. postage stamps, it is not open to the public, though sections of it are exhibited from time to time. In the Taping collection, left to the nation in 1891 by T. K. Taping and housed in the King's Library in the Brit. Museum, this country owns the finest of all general collections of postage stamps, while the royal collection of empire stamps, started by King George V and continued by his successors, is unique in its range and quality. Portions of this collection are occasionally shown.

In the time of Taping it was possible for one man to form a virtually complete collection of the postage stamps of the world, but that is now impossible, for the market has been flooded for years with issues; the number of stamps produced since 1840 has mounted to sev. hundred thousand, and any serious collector to-day is almost forced to devote his attention to one country or epoch or branch of P. Amongst the reasons which have, of later years, so vastly enhanced the popularity of stamp collecting may be cited the introduction of pictorial and commemorative issues and of air-mail stamps. The first popular commemorative pictorial issue stamps were issued in the U.S.A. in 1893 to celebrate the discovery of America by Columbus, 400 years previously, and it was probably the success of this set of 16 stamps which has led to the immense number of

such sets since that date. Great Britain has never issued a pictorial stamp in the real meaning of the word (although the Queen Elizabeth high values show castles as part of their designs); however of recent years stamps to commemorate the silver jubilee of the reign of King George V, the coronation of King George VI, and other national events have appeared. Great Britain has never issued an air-mail stamp, though some of the most valuable of such stamps, the air-mail stamps of Newfoundland issued in the early days of Atlantic flying, emanated from a Brit. dominion.

The value and saleability of rare stamps depend, apart from their scarcity, upon sev. factors. First, they must belong to those countries and issues which are particularly collected and, secondly, they must be perfect in every respect. There are many fashions in P., but the earlier stamps of such countries as Great Britain, the U.S.A., Canada, Newfoundland, W. Indies, Cape of Good Hope, Ceylon, Brit. Guiana, Mauritius, New S. Wales, Hawaiian Is., France, Spain, and the It. and Ger. states are practically immune from the vagaries of taste. The really classic stamps of these and other countries, having an international appeal, have mostly risen greatly in price during the last few decades, and this, added to the fact they they are such an easily portable form of wealth, has caused many people in troublous times to regard them as a desirable investment. As for condition, this is a point which, ignored by most of the early collectors, has become more and more significant. The difference in value between superb and poorish copies of even the rarest stamps is startling, and where imperforate stamps are concerned only one in 25 or 50 examples has clear margins on all 4 sides. Many stamps are rare and valuable because they contain errors. The observed variety of such errors is very large, but some of them can be mentioned. There may be a mistake in the wording or the type; a wrong paper or colour or perforation or watermark (q.v.) may be used; a surcharge or overprint (a surcharge alters the face-value

of a stamp, while an overprint does not) may be repeated twice or more or may be printed upside down or on the back or omitted altogether; a price label may be missing; a perforate stamp may be printed imperforate; the centre of a stamp or the frame round the centre may appear in an inverted position. To appreciate how such errors arise it would be necessary to explain how stamps are constructed and printed, but basically they are all due to the fact that though man employs machines, he is not a machine himself.

The highest price known to have been paid for a single stamp is £7343. This was paid by Arthur Hind in the U.S.A. for the Brit. Guiana 1 cent of 1856, the only discovered example of the error whereby the normal '4 cents' label was accidentally replaced by a '1 cent' label. After Hind's death the stamp was put up for auction in London, and withdrawn, the reserve not having been reached. It was returned to the U.S.A., where, it is rumoured, it was privately sold for more than Hind had originally paid for it. During the Caspary sale in New York, 1957, \$25,000 was obtained for a letter bearing the 2 cent and 5 cents Hawaiian Missionary stamps. In the same sale a world record price of \$48,000 was paid for a single lot comprising 2 complete sheets of 100 stamps each of the 10 centimes and 20 centimes Belgian 1850. Alfred Lichtenstein, it is said, gave £12,000 for an envelope stamped with two matchless copies of the Mauritius 1d. of 1847, while the absolutely mint copy of the Mauritius 2d. of 1847, which King George V. as Prince of Wales, purchased in 1903 for £1450, would undoubtedly bring nearer £10,000 to-day. These were the first 2 stamps to be issued by any Brit. possession, and through some misunderstanding, had 'Post Office' instead of 'Post Paid' printed on them. Other exceedingly rare and valuable stamps, to mention 6 normal ones and 6 with errors, include Canada 12d. (1850), Brit. Guiana 2 cents (1851), Hawaiian Is. 2 cents (1851), Ceylon 4d. (1857), Moldavia 81 parales (1858), Brit. Columbia 5 cents

SOME FAMOUS POSTAGE STAMPS

1. 1847 *Mauritius*. This 1d., together with a 2d. of the same date, were the first stamps issued by a British colony. They are the most famous stamps in the world.
2. 1851 *Canada*. When this stamp was issued the shilling had a varying value throughout Canada while the penny was constant: hence the curious figure.
3. 1857 *Ceylon*. Only a few copies are known unused.
4. 1854 *India*. With inverted head, this is the most valuable Indian stamp.
5. 1854 *Western Australia*. A very rare stamp with inverted frame.
6. 1851 *British Guiana*. One of the two rarest stamps of the colony, not known to collectors in Europe until 1877.
7. 1851 *Hawaii*. The earliest Hawaiian stamps were mainly used by American missionaries writing home: indeed they are often called "missionaries."
8. 1858 *Moldavia*. A stamp of great rarity. Moldavia is now a republic of the U.S.S.R.
9. 1869 *United States of America*. The centre of this heavily post-marked stamp is inverted, being known as the 'Inverted Flag.' It is a rarity of note.
10. 1902 *Great Britain*. This stamp of Edward VII. is one of the two most valuable stamps of Great Britain.
11. 1860 *Tuscany*. In fine condition, this stamp is a classic rarity.
12. 1920 *Jamaica*. With inverted centre, this is one of the rarest British Empire stamps issued during the reign of George V.

10. 1902

11. 1960

12. 1920

(1865), India 4 annas, with inverted head (1854), New S. Wales 4d., with inverted frame (1854), Cape of Good Hope 1d. and 4d., in the colour of each other (1861), U.S.A. 24 cents air mail, centre inverted (1918), Jamaica 1s., centre inverted (1919). The most valuable Brit. stamps are not Victorian but Edwardian: the 6d. and 10s. of 1902 each overprinted 'I. R. Official.' The 10s., so overprinted, was in use for but a brief period, while the 6d., so overprinted, was in use for only 1 day, 12 May 1904. But some of the early Brit. 'abnormals' (stamps printed from plates which were hardly ever employed) are also very valuable, as are some of the early high face-value stamps, 10s., £1, and £5, particularly if unused. Most stamps, it may be added, are more valuable unused than used, but the rule is by no means universal, especially if it be a bisected stamp, for during sudden shortages of stamps in the early days this practice was occasionally officially sanctioned in some countries and colonies, and it is necessary to make sure that the postmark is genuine.

The forging of stamps began soon after they came into general circulation, and as long ago as 1862 J. B. Moens wrote a pamphlet (the Eng. ed. is a trans. from the Belgian ed. of the same year) entitled *On the Falsification of Postage Stamps*, while in 1863 T. Lewes and E. Pemberton wrote *Forged Stamps: How to Detect Them*. The early forgers aimed at defrauding the revenue rather than the collector, and much of their work was excessively crude, but the later forgers and fakers (and it is the faking of genuine stamps, either by repairing them or by adding some detail to transform a common stamp into a rare variety, which is the prin. danger these days) have often shown remarkable, if misguided, skill. But it is satisfactory to know that even their most finished efforts cannot deceive the real expert.

.. Books and articles on P. dealing with every country and every branch and phase of study and collecting abound. For Great Britain the works of H. B. Wright and A. B. Creeke, J. B. Seymour, Sir E. D. Bacon, S. A. R. Oliver and F. H. Valency, T. Todd, and P. Hamilton are of importance. *Bibliotheca Lindesiana*, 1911, with *Supplement*, 1926, compiled by Sir E. D. Bacon, and *The Standard Index to Philatelic Literature*, ed. by A. H. Harris and analysing books and journals, from 1879 on, are admirable works of world-wide bibliographical reference, but both are now somewhat out of date. Enormous and informative stamp catalogues are issued annually by such firms as Stanley Gibbons in London, Scott in New York, Yvert and Teller-Champion in Paris, Galvez in Madrid, and others. See also *POSTAGE STAMPS*. See T. Todd, *A History of British Stamps*, 1949.

Philby, Harry St John Bridger (1885-), explorer and orientalist, b. Ceylon. Son of a tea-planter, he was educ. at Westminster School and Trinity College, Cambridge. He joined the Indian civil service in 1908, and became political

officer in Amara. He led the Brit. political mission to central Arabia, 1917-18. P. crossed the Arabian Peninsula from Uqair to Jidda, and explored the S. provs. of Nejd, in 1920. He was Brit. representative in Transjordan, 1921-4. He crossed the Rub al' Khali ('Empty Quarter') Desert in 1932, soon after its crossing by Bertram Thomas. His pubs. include *The Heart of Arabia*, 1922, *Arabia of the Wahabis*, 1928, *Arabia*, 1930, *The Empty Quarter*, 1933, *Pilgrim in Arabia*, 1943, and *Arabian Days*, 1948.

Philemon, Gk writer of the New Comedy, b. Soli, Cilicia, according to Strabo, or at Syracuse according to Suidas. P. began to exhibit comedies a little earlier than Menander and before 328 BC, and died in the reign of the second Antigonos, son of Demetrius. He lived nearly 100 years. He is said to have written 97 comedies, of which only fragments exist. These are generally pub. with those of Menander, whose rival he was, and are to be found in T. Kock, *Comicorum Atticorum Fragmenta* II, 1884. See T. B. L. Webster, *Studies in Later Greek Comedy*, 1953.

Philemon, Epistle to, the shortest of St Paul's epistles written during his imprisonment, addressed to P., an hospitable Christian of Colossae, asking him to take back his former slave, Onesimus, who, having first robbed his master, had run away, probably to Rome, where he had been converted to Christianity by Paul. Its authenticity is beyond question. See commentaries by Lightfoot, 1884; Beet, 1890; Hastings's *Dictionary of the Bible*, vol. ix, 1917; Robart, 1933; Crater, *New Commentary*, 1928; and Shearer, *Catholic Commentary*, 1953.

Philemon and Baucis, of Phrygia, a devoted married pair who entertained Zeus and Hermes in disguise when they had been refused hospitality by everyone else. The gods took them to a hill, whence they saw their vil. submerged in flood, their own cottage only rising in the form of a temple above the water. When Zeus asked them to ask a favour they begged to serve in his temple and to die together. At death Philemon became an oak and Baucis a linden.

Philetas of Cos (fl. 4th to 3rd cents. BC), Gk elegiac poet and grammarian of the Alexandrian school. He was tutor to Ptolemy II and wrote a commentary on Homer. See fragments of his poems in G. Kuchenmüller, *Philetas Cui Reliquiae*, 1928.

Philharmonic Societies. The Royal Philharmonic Society was founded in London in 1813 by J. B. Cramer and others, to foster musical ideals by giving concerts on a subscription basis; its career has been most successful. P. S. have been estab. also in New York and elsewhere.

Philidor, François André Danican (1726-95), Fr. composer and chess player, member of a family that included at least 12 musicians of some importance, some mainly as woodwind players at the Fr. court. He was b. at Dreux, the son of André P. the elder (d. 1730), nephew of

Jacques P. (1657-1708) and brother of Anne P. (1681-1728), the 3 most important members of the family apart from himself. Having lost his father early, he became a page at court, where he learnt to play chess, in which he became so proficient that he toured abroad to display his skill, starting at Amsterdam in 1745. He was invited to England by Lord Sandwich and the Duke of Cumberland, and published his treatise, *Analyse du jeu des échecs*, there in 1749. He heard and was influenced by Handel's oratorios, in imitation of which he wrote motets on his return to Paris in 1754. In 1756 he began to write comic operas, and between that year and 1788 he wrote over 30 works for the stage, some very successful. In his last years he was pensioned by the Chess Club in London, lived there a good deal, and *d. there*. Among his best operas are *Blaise le savetier* (after Lafontaine), *Sancho Pança dans son île* (after Cervantes), and *Tom Jones* (after Fielding).

Philip, kings of Macedonia, see PHILIPPOS.

Philip, Saint, one of the first disciples of Jesus Christ and one of the apostles. He was a native of Bethsaida, a tn near the sea of Tiberias. He has been erroneously confounded with Philip the Deacon. P. is said to have suffered martyrdom at Hierapolis, but in what year is not known.

Philip I (1052-1108), King of France son of Henry I. He succeeded to the Fr. throne in 1060. At first the ally, he afterwards became the opponent of William the Conqueror, and they quarrelled principally over the possession of Maine. He quarrelled with the papacy because of his bigamous marriage with the countess of Anjou and was excommunicated in 1094. He considerably extended the boundaries of the Fr. kingdom, however, by his wars with the rulers of Anjou and Flanders.

Philip II (1165-1223), King of France, commonly known as Philip Augustus, *b. Gonesse*. He was crowned king during the lifetime of his father, Louis VII, and succeeded him in 1180. His reign was devoted to his attempt to consolidate the ter. and power of the Fr. crown. With this end in view he supported the sons of Henry II of England in most of their frequent quarrels with their father. He succeeded also in subduing the Count of Flanders and the Duke of Burgundy. He was one of the chief members of the league which did much to crush the power of Henry II in France. He went on crusade with Richard I, but quarrelled with him, and returned from Syria to plot against him. The sudden return of Richard, however, upset the plans of P. and John, and resulted in a war which lasted until 1199. On the accession of John he supported the claim of Arthur of Brittany to the Eng. throne. On the murder of Arthur he summoned, as John's overlord, the Eng. king to answer for the deed in Paris, and when John failed to appear invaded Normandy. The fall of Chateau-Gaillard resulted in the practical conquest of Normandy, and virtually put an end to

the Angevin empire. He gained influence in S. France by intervening against the Albigenses. The height of his however, was the battle of Bouvines in 1214, where he succeeded in defeating the combined forces of England and the empire. The rest of his reign was occupied in administrative reforms. He quarrelled with the papacy on his repudiation of his wife Ingeborg, and subsequent marriage to Agnes Meran, and France was put under an interdict until P. took Ingeborg back. *See A. Luchaire, La Société française au temps de Philippe-Auguste*, 1909, and life by W. Hutton, 1896.

Philip III (Le Hardi) (1245-85), King of France, son of Louis IX (St Louis), *b. Poissy*. He accompanied his father's unfortunate expedition to Tunis, and succeeded him in 1270. He later fought a long and unsuccessful war with Aragon.

Philip IV (1268-1314), commonly called 'Le Bel,' King of France, *b. Fontainebleau*, succeeded Philip III in 1285. He married the Queen of Navarre, Joanna, and by this marriage obtained Champagne, Brixi, and Navarre. Early in his reign a revolt broke out in Flanders, and P. was decisively defeated at Courtrai (1302). His attempt to levy taxation upon the clergy led to Pope Boniface VIII issuing the famous bull, *Unam sanctam*, to which P. replied by a wholesale confiscation of clerical property. The pope retaliated by an excommunication and a threat of interdict. P. had the Pope arrested and so maltreated that he *d.* shortly afterwards. After the brief pontificate of Boniface's successor, Benedict XI, a Fr. pope, Clement V, was elected and, under the influence of P., moved the papal court to Avignon, where it remained for 70 years. In this reign the order of the Knights Templars was abolished, and its wealth confiscated by the Fr. king.

Philip VI (1293-1350), King of France, the first of the Valois kings. He was the son of Charles of Valois, the brother of Philip IV. On the death of Charles IV in 1328 he succeeded to the Fr. throne, the Salic law being pleaded in order to prevent the accession of Charles the Bad of Navarre and Edward III of England, who used his claim as a pretext for invading France in 1337. In a battle with the Eng. off Sluys (1340) the Fr. fleet was entirely destroyed. In 1346, after threatening Paris, Edward retreated towards Flanders, but Philip pursued him and was decisively defeated at Crécy (*see* CRECY, BATTLE OF).

Philip I (1478-1506), King of Castile, surnamed the Handsome, *b. Bruges*. He was the son of Maximilian I, Emperor of Germany, by Mary of Burgundy, in right of whom he inherited and transmitted to his posterity of the house of Austria the 17 provs. of the Netherlands. In 1496 he married Joanna, eldest daughter of Ferdinand the Catholic and Isabella, sovereigns of Aragon and Castile; and in 1504, on the death of Isabella, who bequeathed the kingdom of Castile to her daughter, P., as well as his consort, assumed the regal title. He was crowned at

Burgos with her, and, because of her insanity (said to have been made worse by his constant infidelity) governed on her behalf until his death.

Philip II (1527-98), King of Spain, the only son of the emperor Charles V, b. Valladolid. He married, in 1543, the daughter of the King of Portugal, who bore him before her death, in 1546, a son, Don Carlos (q.v.). P. spent much of his time in his father's favourite prov., the Netherlands, and before the death of his father he married, in 1554, Mary I of England. In 1556 his father abdicated and P. became the most powerful monarch in Europe, although his father's attempt to

PHILIP II

obtain for him the imperial throne failed. He left England at the end of 14 months, dissatisfied also that Mary had failed to bear him a son and after her death married, thirdly, Elizabeth of France. He succeeded in breaking up the formidable league raised against him by the papacy and the French, and set himself up in Europe as the champion of the counter-reformation. He crushed heresy in Spain by means of an energetic use of the Inquisition, but failed in the Netherlands, where his oppressive measures and his heavy taxation led to revolt, civil war, and finally to the breaking away of the United Provs. (Holland). In 1570 he married Anne of Austria, who became the mother of Philip III. In the following year his half-brother won the great victory at Lepanto over the Turks. He annexed Portugal to Spain in 1580, claiming the throne on the extinction of the male line. This was, in fact, his most complete success. After the execution of Mary Queen of Scots, and goaded by the frequent raids of the Eng. privateers on Sp. treasure-ships and settlements, he sent his Armada (q.v.) to England, but it was (1588) badly defeated. His home policy had led to the practical bankruptcy of Spain, and his long war against the Moors led to the extinction of much of the trade of the country. In 1592 he failed in his attempt to drive Henry of Navarre from the throne of France. P.

had great ability, but this was overshadowed by stubborn fanaticism, and by his usual unwillingness to listen to expert advice, or to delegate authority. He raised Spain to a dominant position in Europe, but left her with a governmental system which undermined her prosperity. See W. H. Prescott, *History of the Reign of Philip II*, 1855-8; and lives by M. Philippson, 1882; L. Bertrand, 1929; D. Loth, 1932; L. Pfandl, 1938; and W. T. Walsh, 1938.

Philip III (1578-1621), King of Spain, b. Madrid, the son of Philip II by his third marriage, he succeeded to the throne of Spain in 1598. He left the government of the country almost entirely in the hands of his incompetent minister, Lerma, and the dwindling resources of the country were extravagantly squandered at court. During his reign occurred the attempt to bring about a Sp. marriage with Prince Charles (afterwards Charles I) and the outbreak of the Thirty Years War, in which Spain was very largely involved. In 1609, a treaty was made with the United Provs. which practically assured them of their independence, although this was not officially recognised until 1648. Under P. the whole Moorish pop. excepting Christians and young children was expelled from Spain, a decision which speeded the commercial decline of the country.

Philip IV (1605-65), King of Spain, b. Valladolid. He succeeded his father Philip III in 1621, and during the early part of his reign the country was governed by Olivarez, whose foreign policy was largely disastrous. The Dutch captured many of the Sp. colonial possessions; Portugal recovered her independence in 1641, and 2 years later, by the defeat at Rocroi, the prestige of the Sp. Army was badly shaken. After the Peace of Westphalia was signed in 1648 (under which Spain formally recognised the independence of the United Provs.), the Spaniards and French still continued fighting until by the treaty of the Pyrenees (1659), Spain ceded much ter. to France. In 1665 Portugal defeated Spain at Villa Vicosa. P. is primarily remembered as a patron of art and letters, Velasquez (q.v.) being his court painter.

Philip V (1683-1746), King of Spain, the first of the Bourbon kings of Spain, b. Versailles. He was the second son of the dauphin of France and the grandson of Louis XIV and Maria Theresa of Spain. He succeeded Charles II in 1700, entered Madrid in 1701, and at the end of the War of the Sp. Succession was by the treaty of Utrecht guaranteed the throne of Spain, certain stipulations being made to prevent his obtaining the throne of France as well. He married, as his second wife, Elizabeth Farnese, and as a result of her ambitions in Italy for the sons of her former marriage, was involved in a struggle with the Austrians. P. abdicated for a short time in 1724, but on the death of his son again ascended the throne.

Philip, Prince of the Realm and Duke of Edinburgh (1921-), husband of Queen

Elizabeth II (q.v.), whom he married on 20 Nov. 1947. *B.* Corfu, the son of Prince Andrew of Greece, he was educ. at Cheam and Gordonstoun, and the Royal Naval College, Dartmouth. At 18 he passed into the Royal Navy, serving throughout the Second World War in the Mediterranean and Far E. He renounced his rights of succession to the Gk and Danish thrones, 1947, became a naturalised Brit. subject, adopting the surname of Mountbatten. Before his marriage he was created Baron Greenwich, Earl of Merioneth, and Duke of Edinburgh, and made K.G. For some time after his marriage he continued his active naval

the second and last ducal house of Burgundy, the third son of John II, King of France, *b.* Pontoise. He was present at the battle of Poitiers (1356), and displayed such courage there that he was subsequently known as *le Hardi*, or 'the Bold.' He was made Duke of Burgundy, 1363. On the accession of his brother, Charles V, to the Fr. throne, he married Margaret, the heiress of Flanders. In 1372 he commanded the Fr. army against the Eng. In 1382 he suppressed the Flemish rebellion with extreme ferocity. Flanders Burgundy, Artois, Rethel, and Nevers fell to him by the death of the count in 1384. During the minority and subsequent imbecility of his nephew Charles VI of France, he became regent of the country. Utterly ruthless, he governed his territories with vigour and efficiency, and was one of the best Fr. gens. of the period.

Philip the Deacon, one of the 7 deacons chosen to relieve the 12 apostles of the burden of attending to charitable distribution (Acts vi. 5). He was driven from Jerusalem by the persecutions and went to Samaria to preach, where he had great success. Thence he was sent to baptise the eunuch of the Ethiopian queen Candace (Acts vi. 8). *P.* then went on a preaching tour to Caesarea, and later he entertained St Paul and his company (Acts xxi. 8). Tradition says that later he settled in Asia Minor, but he has been confused with Philip the apostle. His feast is on 6 June.

Philip the Good, third Duke of Burgundy (1396-1467), grandson of Philip the Bold. On the assassination of his father (1419) at the instigation of the dauphin, he succeeded to the duchy. Bent on avenging the murder of his father, he allied with Henry V of England, in 1419, but eventually made peace with Charles VII, 1429. He subsequently rejoined the Eng. side, and captured Joan of Arc (q.v.) at Compiègne. But in 1435 he again made terms with Charles, and helped to expel the English from their Fr. possessions. Later, he helped the dauphin Louis against his father. He was the founder of the Order of the Golden Fleece and a patron of the arts and the univs.

Philiphaugh, battlefield on Yarrow Water, 3 m. WSW. of Selkirk, Scotland, where Sir David Leslie defeated the Royalists under Montrose (1645).

Philippe Egalité, see ORLEANS, DUKES OF.

Philippeville (ancient *Rusicada*), seaport of Algeria, in the dept. of Constantine. It has a fine harbour, and exports cattle, cereals, dates, esparto grass, and minerals. Pop. 70,274.

Philippi, ancient city of Macedonia, on the Gangites, was so called after Philip II of Macedonia. It is celebrated for the victory of Antony and Octavian over Brutus and Cassius in 42 BC. St Paul founded (AD 53) a Christian colony here, to which he addressed his epistle to the Philippians.

Philippians, Epistle to the, probably the last epistle St Paul wrote during his captivity at Rome, during the latter part of this period. Its date would therefore

H.R.H. PRINCE PHILIP

career. Later *P.* and his wife undertook more and more public functions as the king's ill-health increased. They visited Canada in 1951 and had started on the first stage of a Commonwealth tour, 1952, when news of the death of King George VI reached them. Since his wife's accession to the throne *P.* has accompanied her on all the prin. state occasions and has undertaken a considerable number of independent public engagements. In 1956 he opened the Olympic Games in Melbourne. He has shown an especial interest in young people, and in scientific matters, and his friendliness and informality have made him universally popular. He was made a Prince of the Realm in 1957.

Philip Neri, see NERI.

Philip of Greece and Denmark, Prince, see PHILIP, PRINCE OF THE REALM AND DUKE OF EDINBURGH.

Philip of Macedonia, see PHILIPPOS.

Philip the Bold (1342-1404), founder of

be between 62 and 64 according to the ordinary chronology, between 57 and 59 according to that of Harnack. The church in Philippi had been planted some 10 years previously on the second missionary journey (see Acts xvi, etc.), and was composed chiefly of pious Gentiles. The Epistle contains perhaps St Paul's most striking passage on the Divinity of Christ and the Incarnation (ii. 5-11). In the region in which Philippi stood women occupied a higher social position than elsewhere, and the epistle shows us the importance of the feminine element in the Church. See commentaries by M. R. Vincent, 1897; J. D. Lightfoot, 1903; J. H. Michael, 1928; H. G. G. Herklots, 1946; see also H. N. Bate, *Guide to the Epistles of St Paul*, 1928.

Philippics, 3 orations of Demosthenes, the Grecian orator, against Philip, King of Macedon, in which the orator sought to arouse the Athenians from their indolence; hence any discourse or declamation abounding in acrimonious invective, e.g. the 14 orations of Cicero against Mark Antony.

Philippine Islands, or **The Philippines**, archipelago forming the Republic of the Philippines, situated about 550 m. off the S.E. coast of Asia, between 4° 40' and 21° N. They are bounded on the W. by the China Sea, E. by the Pacific Ocean, and S. by the Celebes Sea and the coastal waters of Borneo. The total land area of the P. I. is 114,830 sq. m., and includes the is. of Luzon, 40,420 sq. m., most northerly; Mindanao, 36,537 sq. m., most southerly; Samar, 5050 sq. m.; Negros, 4905 sq. m.; Palawan, 4550 sq. m.; Panay, 4446 sq. m.; Mindoro, 3750 sq. m.; Leyte, 2785 sq. m.; Cebu, 1702 sq. m.; Bohol, 1491 sq. m.; Masbate, 1262 sq. m.; and over 7000 others, mostly very small. The is. are mostly of volcanic origin, and the larger ones have great mountain ranges. On the E. coast of Central and N. Luzon is the Sierra Madre range, on the W. coast is the Caraballos, N. from the Gulf of Lingayen, and the Zambales southward from that gulf to Manila Bay. Mt Mayon (2926 ft), an active volcano, lies at the S.E. extremity of Luzon, and Mt Apo (9690 ft), also an active volcano, on the E. border of the S. portion of the basin of the Rio Grande, Mindanao, is the highest elevation in the archipelago. The Cagayan R., 220 m. long, in N. Luzon is the longest in the archipelago; the Pulangi, or Rio Grande de Mindanao (200 m. long), is second in size. The Pampanga and the Agno are the prin. rvs. in Central Luzon. The Pasig, though short, is of importance. The other is. are drained by many streams, some of which are of considerable size. Laguna de Bay, about 30 m. long and 25 m. wide, the largest body of fresh water in the P. I., is situated in the low-land basin of S. Luzon, 8 m. inland from Manila Bay. The other prin. lakes are: Lake Taal (15 m. long), S.W. of Laguna de Bay; Lake Cagayan in N. Luzon; in Mindanao, Lanao, Liguasan, and Buayan in the W. central portion and Mainit,

Pinaya, Dagun, Dadocum, and Linao in the valley of the Agusan. There are small lakes in some of the other is. Volcanoes in the archipelago are Mt Pangasinan (active, 3569 ft) on Babuyan Is. off the N. coast of Luzon; Cagua or Causa (active, 3800 ft) in N. Luzon; Canlaon (active, 8088 ft) on Negros; Camiguin (active, 4370 ft) on the is. of Camiguin, off the N. coast of Mindanao; Apo (active, 9690 ft) on Mindanao; and Taal and Mayon. Taal has been silent since 1911; 26 eruptions of Mayon occurred in the 19th cent., the most destructive of which was in June 1897, when the tn of San Fernando and many vils. were destroyed. The most recent eruption of Mayon was in 1947. An eruption of Mt Camiguin in 1948 caused evacuation of the is. Earthquakes and typhoons are of frequent occurrence in the is.

The fauna of the is. shows a large degree of specialisation, but the number of species and their respective ranges have not yet been satisfactorily determined. There are about 690 species of birds; crocodiles and fishes, of which there are 500 species, are numerous. Arthropoda are very abundant. The flora, which is essentially Malayan and intermixed with Chinese and Australian elements, is rich and varied. More than half the land surface is covered with forests; trees yielding rubber, quinine, etc., abound, and there are also good timber trees, dye woods, etc. The soil, usually of a reddish colour, is for the most part disintegrated lava mixed with decayed vegetation. The climate, which is more salubrious than most tropical climates, varies little throughout the year, temp. being uniformly high. Agriculture is the prin. industry of the is., and the prin. crops are hemp, sugar, tobacco, coconuts, corn, sweet potatoes, and rice. Many fruits have been introduced, including grapes, blackberries, figs, and strawberries, but bananas, mangoes, and citrus fruits are more generally grown. The P. I. are among the world's foremost producers of coconut oil and copra. During 1955 copra exports totalled 786,449,000 kg. There are also papaya, lanzones, chico, and pill nut (*Carium commune*). In 1953 4,072,992,000 kg. of rice were produced. Maize and maguay are also grown. With the exception of the water-buffalo, which is indispensable for agric. purposes, the domestic animals are few in number, but they are steadily increasing. Amer. horses have been introduced to improve the breed. The neat cattle, which are of Australian and Indian origin, are raised chiefly for beef, hides, and horns. Swine and goats are numerous, but there are few sheep. The is. are potentially rich in economic minerals, and extensive gold-mining operations have been instituted in the provs. of Benguet and Ambos Camarines in Luzon, and on the is. of Masbate. In 1955 the output of gold was 419,112 fine oz. The P. I. are among the first 10 gold producers in the world. Chromite has been discovered; in 1955 598,117 metric tons were exported. Copper is

widely distributed. There are outcrops of lead, with which silver is largely associated, and extensive deposits of iron ore (export in 1955 was 1,432,712 metric tons). Among other minerals are manganese ore, sulphur, mercury, zinc, gypsum, and phosphate; coal has been discovered, asbestos, rock asphalt, and silica deposits have been found, and drilling for oil has been resumed. There are now 32 metal mines and 30 non-metal mines producing, of which 16 yield gold and silver. The first railway, opened in 1892, was built by an Eng. corporation under the guarantee of the Sp. Gov., from Manila to Dagupan (121 m.). The advent of Amer. rule saw a great increase in railways, and in 1955 there were some 741 m. on Luzon and Panay. Roads also have been greatly improved and extended (total length is 24,427 m.), and there are regular steamers to Singapore and Hong Kong, and between the prin. ports of the archipelago. The greatest value of commerce in 1955 was with the U.S.A., totalling 748,405,000 pesos; then came Japan, 86,879,000 pesos, Indonesia, 37,833,000 pesos, Great Britain, 25,557,000 pesos, and the Middle East, 24,264,000 pesos. Total imports in 1953 were valued at 894,700,000 pesos, and exports at 801,200,000 pesos. Before the Jap. invasion there were 46 sugar centrals and 4 refineries, textile mills, coconut oil mills, 92 large cigarette and cigar factories, and 2391 rice mills. Now 25 sugar centrals and 144 cigar and cigarette factories are in operation. In 1955 926,796,000 kg. of sugar were exported. Other important exports in 1955 were: logs and lumber, 685,605,000 kg.; abaca, 111,802,000 kg.; coconut oil, 74,177,000 kg.; desiccated coconut, 48,529,000 kg.; copper concentrates, 30,306,000 kg.; and canned pineapple, 33,353,000 kg. In 1946 free trade was estab. between the U.S.A. and the P. I. for 8 years. There are 206 ports. Manila, the prin. port of entry, with a channel 30 ft deep, has the finest harbour in the entire Far E. At Cavite is a navy yard which still belongs to the Amer. forces. After Manila, former cap. (pop. 983,906), the chief tns are Cebu on Cebu (167,503); Davao on Mindanao (111,263); Iloilo on Panay (110,122); Quezon City on Luzon, cap. since 1948 (107,977); Zamboanga on Mindanao (103,317); and Baguio (29,692) in the Mt Prov., the summer cap. Other tns are Legaspi, Laeang, Vigan, and Naga on Luzon. The total pop. of the archipelago according to the U.N. estimate of 1954 was 21,440,000.

Constitution and Government. The new independent Republic of the Philippines came into being on 4 July 1946, by agreement with the U.S. Gov. embodied in an Act of Congress signed by President Roosevelt on 24 March 1934, accepted by the Philippine Legislature on 1 May 1934, and ratified by the Philippine electorate soon afterwards. This Act estab. a 10-year transitional period designated as that of the 'Philippine Commonwealth,' at the end of which complete independence would become automatically effective.

But owing to the Jap. invasion and occupation this period had to be prolonged. The rep. is governed by a constitution adopted in 1935 and amended in 1940. The president and vice-president are elected for 4 years, and the former may be re-elected for another term. There are 10 cabinet members, heading depts of foreign affairs, justice, national defence, health, education, finance, public works and communications, labour, commerce and industry, and agriculture and national resources. The legislature is bicameral: a Senate of 24, and a House of Representatives of 120 members. The franchise is given to both male and female citizens of 21 years of age or older who can read or write Spanish, English, or a native dialect and who have certain residential qualifications; but rural illiteracy is high, and at the 1953 elections registered voters numbered no more than 5,601,963, of whom 4,325,904 actually voted. The president's powers are wide, including control of the provs. and municipalities, and limited powers of veto. The constitution vests in the rep. all ownership of the natural resources, which, apart from public agric. land, may not be alienated. Exploitation of natural resources is confined to citizens of the P. I. or, for a limited period, of the U.S.A. and to corporations or associations 60 per cent of whose capital is owned by Filipinos (see J. M. Aruego, *The Framing of the Philippine Constitution*, 2 vols., Manila, 1937). Despite the proclamation of the new rep., close relations by agreement between the P. I. and the U.S.A. remain. An agreement of 1946, expiring in 1974, opened to Amer. interests or companies equal trading rights.

The U.S.A. is allowed to develop and maintain strong military, naval, and air bases in the archipelago. The is. fortress of Corregidor in Manila Bay was, however, transferred to the Republic of the Philippines on 11 Oct. 1947. In 1954 it became, with Bataan, a national shrine. The U.S.A. continues to represent Filipino interests abroad where the rep. has not yet estab. representation of its own. Furthermore, the Philippine Trade Act, signed by President Truman on 30 April 1946, assured the continuance of complete free trade between the two countries for 8 years ending 3 July 1954; to the end of 1954 Filipino exports to the U.S.A. paid a duty equal to 5 per cent of the existing Amer. duties, the duty thereafter to increase by 5 per cent a year until the full duty is payable after 3 July 1974.

Religion. Rom. Catholicism is the chief religion, and has some 15,941,422 adherents, or three-quarters of the pop. An independent Filipino Church was founded in 1902 by Gregorio Aglipay, an ex-Catholic priest, who assumed the title of Obispo Maximó. The ritual of this Church resembles that of the Rom. Church, but in doctrine it adheres to modern science and denies the possibility of miracles, and marriage is permissible for its apostles. The following of this Church is 1,456,114. There are 532,616 Protestants, 42,751 Buddhists, 791,817

Muslims (chiefly on Mindanao and Sulu), and 353,842 Pagans.

Education. Education in the public schools is free, secular, and co-educational. Although Tagalog, a Malayan dialect, is the official language, English is the medium of public instruction. In 1955 there were 4,133,725 pupils in the 22,238 public schools. There are a normal school, 6 regional normal schools, trade schools, and agric. and farm-settlement schools. Higher education is provided by the state-supported Univ. of the Philippines, and by many private institutions of higher learning, including the Univ. of Santo Tomas.

Justice. The judiciary is headed by the supreme court, with a chief justice and 10 associate justices appointed by the president; it cannot declare a law or treaty unconstitutional except by a two-thirds vote. The rep. is divided into judicial dists., each with sev. judges of first instance, justices of the peace courts, and municipal courts.

The Filipinos. The word Filipino may be used with the following meanings: (1) a native of the P. I. of Sp. descent; (2) the Christian pop. of the P. I., numbering about 18,000,000; or (3) the native pop. of the P. I. The Filipinos, in the widest sense of the word, are a mingling of many races, speaking perhaps a hundred differing languages or dialects, professing different religions, and living in various grades of civilisation. There are over 80 ethnic groups. About 1,750,000 are of the 'primitive' type, including the 'Negritos' (Negroes of the P. I.), who appear to be a small remnant of the original inhab., and are a dwarfish race, believed to be akin to the Australian 'black' natives. The Sulu Archipelago, W. Mindanao, and W. Palawan are inhabited chiefly by some 300,000 Moros (Spanish for 'Moors'); like most of the natives, they are of Malay stock (mainly from Borneo), and they chiefly differ from the others in their religion, being Muslims, while the others are mostly Christian. They have a native literature, and use a modified Arabic alphabet.

The bulk of the native pop. speak languages belonging to the great Malay-Polynesian family (see LINGUISTIC FAMILIES). In point of number the 3 most important groups are: (1) the Bisayans or Visayans (4,840,708), the most civilised people in the archipelago when it was discovered by the Spaniards, now mainly living in the central part of the P. I. and in N. and E. Mindanao; (2) the Tagalogs or Tagals (7,126,913), now the most advanced people of the P. I., living in Central Luzon, including Manila, and in the greater part of Mindanao; (3) the Iloks or Ilocanos (2,687,861), mainly in NW. Luzon. Other important vernaculars are Pampangan (707,291), mainly in the prov. of Pampanga, to the N. of Manila Bay; Pangasinan (665,342), N. Luzon; and especially Bikol or Bicol (1,535,411), also in Luzon. Spanish and English are much spoken, in spite of the designation of Tagalog as the official language, and a kind of pidgin Spanish

known as Filipino-Spanish or *español de cocina* ('kitchen Spanish') is widely used.

History. Magellan (q.v.) arrived at the P. I. in 1521, and in 1571 Spain took final possession of the archipelago; but after nearly 4 centuries of misgovernment and unrest, and following on the revolt of 1896, in which Rizal (1861-96) and the 'Young Filipino' party played the prominent part, the is. were lost by Spain to the U.S.A. as the result of the war of 1898-1901. After the re-estab. of the civil courts and civil municipal govts. at the conclusion of the Sp.-Amer. war, a Philippine Commission of five members was appointed by the Amer. president in 1900 to determine the legislative functions of the central gov. at Manila. In 1907, after the completion of the census, a popular assembly of Filipinos was opened at Manila. Later the P. I. were governed by a governor-general, appointed by the U.S. president, assisted by a Cabinet of 6, of which 5 had to be Filipinos. After the cession to the U.S.A. the progress of the Filipinos was rapid, and in 1934, as indicated above, the U.S.A. promised to give independence to the is. Then, however, came the Second World War and with it, in 1941, the invasion of the P. I. by the Japanese.

When Guam and Wake Is. were lost by the Amers. in Dec. 1941 their chance of reinforcing the P. I. in the face of Jap. naval and aerial superiority became remote. In any event Amer. experts had, before the war, long been doubtful about their ability to defend the is. in view of their remoteness from the main Amer. bases, and, moreover, the possibility of strengthening their permanent defences before 1937 was prohibited by the treaty of Washington, and the early abandonment of Amer. control was contemplated in the Act of 1934, which provided for full Filipino independence in 1946. The Amer. policy was in fact one of deliberate withdrawal from an advance base, which was generally held to be indefensible. This policy had to some extent been modified after 1935 by Gen. MacArthur (q.v.), who took command of the archipelago in that year and held such pronounced views on the possibilities of defence that 2 years later he retired from the Amer. Army and began to build up a strong Filipino force against the day when the Amer. garrison should be evacuated. As Jap. penetration pressed southward into Fr. Indo-China and Amer. policy began to stiffen against further aggression, the weight of MacArthur's opinions began to make itself felt, and he was recalled to take command of the forces in the Far E., and the garrison of the P. I. was strengthened with considerable reinforcements during 1941. The Japanese attacked the P. I. on 9 Dec. 1941. For details of military and naval operations see PACIFIC CAMPAIGNS IN SECOND WORLD WAR; see also MANILA.

Latourette, *A Short History of the Far East*, 1946; and D. Bernstein, *The Philippine Story*, 1947.

Philippopolis, see PLOVDIV.

Philippos, name of 5 kings of Macedonia. The most famous were: 1. *Philip of Macedon* (382–336 BC). Upon the death of his brother, Philip obtained the gov. of Macedonia, first as guardian to his infant nephew Amyntas, but a few months later he assumed the title of king. Once firmly estab. on the throne he introduced important military reforms, and resolved to obtain possession of the various Gk cities. Demosthenes endeavoured to rouse the Athenians to his danger, but they did not adopt any rigorous efforts to check the progress of the Macedonian king. He subdued the Phocians and was rewarded with the place of the latter in the Amphictyonic Council (346 BC). The Athenians at length became thoroughly alarmed, and they resolved to oppose him. Through the influence of Demosthenes they formed an alliance with the Thebans, but their united army was defeated (Aug. 338) in the decisive battle of Chaeronea, which put an end to the independence of Greece. Philip now determined on war with Persia, but in the midst of his preparations he was murdered by a youth named Pausanias. He was succeeded by Alexander the Great. See D. G. Hogarth, *Philip and Alexander of Macedon*, 1897.

2. Son of Demetrius II (reigned 221–179 BC). During the first 3 years of his reign he conducted a war against the Aetolians, and afterwards engaged in 2 wars with the Romans. The first lasted from 215 BC, when he concluded an alliance with Hannibal, to 205. The second commenced in 200, and was brought to an end by the defeat of P. by the consul Flamininus at the battle of Cynoscephalae in 197.

Philippsburg, Ger. tn in the *Land of Baden-Württemberg* (q.v.), 45 m. NW. of Stuttgart (q.v.). Pop. 4000.

Philippus, Marcus Julius, name of 2 Rom. emperors, father and son, of whom the former reigned AD 244–9. He was an Arabian by birth, and rose to high rank in the Rom. army. He obtained the empire by the assassination of the third M. Antonius Gordianus. He was slain near Verona, either in battle against Decius (q.v.), or by his own soldiers. His son, whom he had proclaimed Augustus 2 years before, perished at the same time.

Philips, Ambrose (c. 1675–1749), poet, b. Shropshire. He was educ. at St John's College, Cambridge, and his first printed work is a copy of Eng. verses in the collection pub. by that univ. in 1695. A performance was given at Drury Lane, in Feb. 1712, of his tragedy *The Distrest Mother*, which, although little more than a trans. of the *Andromaque* of Racine, was

received with great applause, and long continued to be presented. A short time before, P.'s trans. of Sappho's *Ode to Aphrodite* had been printed in the *Spectator* (No. 223). But Pope and others contrived to bring him into ridicule, and the public were taught to call his poetry 'namby-pamby,' a name probably first bestowed by Henry Carey, the author of 'Sally in Our Alley' and *Chrononhotonthologos*. P. produced 2 more tragedies, *The Brilon*, 1722, and *Humfrey, Duke of Gloucester*, 1723. He next engaged in a periodical paper called *The Freethinker*, in which one of his associates was Dr Boulter: he was almost certainly the chief contributor to *The Grumbler*, 1715. See S. Johnson, *The Lives of the Poets*, 1779.

Philips, or **Phillips**, James Orchard, see HALLIWELL-PHILLIPS.

Philips, John (1676–1709), poet, b. Bampton, Oxon., son of an archdeacon. He was educ. at Winchester and Oxford. His poem *The Splendid Shilling*, 1703, is a happy parody of Milton's style. The poem *Cyder*, 1708, is his chief work, but that on the battle of Blenheim, 1705, is of no great merit.

Philips Works, see EINDHOVEN.

Philistia, in anc. geography, the name for a dist. on the Mediterranean coast, stretching from Jaffa to the desert S. of Gaza. It was occupied by the Philistines (q.v.). Gaza, Ashdod, Gath, Ashkelon, and Ekron were 5 centres of gov., each under its own prince.

Philistine, term of contempt or reproach used in England at the beginning of the 17th cent. Later it became applied to persons whom the more enlightened or cultured considered beneath them in taste and intellect. Carlyle and Matthew Arnold in the 19th cent. used it frequently, having taken it from the Germans, with whom it denoted an impenetrable prosaist.

Philistines, people often mentioned in the Bible (*Philistini*), where they are said to be of Hamitic stock (Gen. x. 14). They originated from Caphtor (Amos ix. 7), commonly supposed to denote Crete, but Caphtor (Egyptian, *Kefiu*) included the former Cretan dependencies in the Aegean and Ionia. They are first mentioned (as Peleset or Pulesati or Purasati) in the Egyptian records at Medinet Habu, as the chief tribe of the 'Peoples of the Sea,' who invaded Egypt, but were heavily defeated by the reigning Pharaoh, Rameses III, in 1194 BC. They settled, perhaps before the Israelite invasion, on the SW. maritime plain of Canaan, the Plain of Philistia (q.v., and see Joel iii. 4, etc.). They gave their name to the whole country of Palestine (q.v.). The adjective 'uncircumcised' in the Bible marks them off from their Semitic neighbours. Their language, too, was not Semitic (Neh. xiii. 24). Their chief god, Dagon, was a corn-deity well known in Syria and Palestine. The idea that he was a 'fish-god' is based on a mistaken etymology. The armour of the Philistine giant Goliath, 1 Sam. xvii, was of bronze and iron; the P. managed to maintain monopoly of iron until the reign of Saul (1 Sam. xiii. 19–22). Their power was

broken by David, who formed them into his *élite* guards, the Cherethites and Pelethites (2 Sam. viii. 18). Very little is known of P. culture, since their main cities continued to be occupied in subsequent ages, and have not yet been sufficiently excavated. Their political system was apparently a federation of city states, of which there were 5, the Pentapolis see PHILISTIA.

Phillimore, Sir Robert Joseph (1810-85), jurist and politician, b. London. He wrote *Commentaries on International Law*, a treatise on the law of domicile, and ed. the 9th ed. of Richard Burn's *Ecclesiastical Law*. He was Liberal M.P. for Tavistock and a friend of Gladstone. He became a high court judge.

Phillip, Arthur (1738-1814), naval officer and first governor of Australia, his name being perpetuated in Port Phillip Bay, Victoria; b. London. As Capt. P., in 1786, he took out from England a small fleet carrying about 705 convicts for 1887. But he considered the spot ill-Botany Bay, which he reached in Jan. suited for a settlement and selected a place to the N. of it which seemed to him to have the necessary qualifications, and, on 26 Jan. 1788, the Brit. flag was hoisted at Port Jackson, thus marking the beginning of the Brit. occupation of Australia. With convicts and their guards P. founded New S. Wales colony, the success of which he never doubted. A national memorial on the wall of St Mildred's Church (of which only the tower remains), Bread Street, London, unveiled by the Duke of Kent in 1932, commemorates the fact that P. laid the foundation of the colony which became the commonwealth of Australia.

Phillips, Edward (1630-c. 1696), poet, nephew of John Milton, b. Westminster. His great work is the *Theatrum poetarum*, 1675, a complete collection of ancient and contemporary poets, with observations upon them. The work contains criticisms far above the contemporary national taste. Other works attributed to P. are *Enchiridion linguae latinae*, 1684, and a poem on the coronation of James II.

Phillips, John (1631-1706), Eng. poet and author, brother of Edward P., b. Bampton, Oxon. His chief works, which are remarkable for licentious and coarse wit, pungent satire, and a generally controversial scurrility, are *A Satyr against Hypocrites*, 1655, *Montielon*, or the *Prophetic Almanack*, 1660, *Maronides*, or *Virgil Travesty*, 1673, which like some of his other works is in the style of *Hudibras*, *The Augustus Britannicus*, 1697, and *The Vision of Mons*, 1706, in addition to numerous trans. from Greek, Latin, and French. An early life of Milton, his uncle, is attributed by some to P. See W. Godwin, *The Lives of Edward and John Phillips*, 1815, and Helen Darbishire, *The Early Lives of Milton*, 1932.

Phillips, John (1800-74), one of the most distinguished of early geologists of England, b. Marden, Wilts; nephew of William Smith (q.v.) 'the father of English geology', who brought up P. after the death of his parents. Assisted his uncle

in preparing his geological maps of England. He was prof. of geology at King's College, London, from 1834 to 1840, when he resigned to serve on the geological survey of Great Britain under De la Beche. In 1844 he became prof. of geology in Dublin Univ. and later a reader in geology at Oxford. Was appointed Keeper of the Ashmolean museum 1854-70. In 1864 he was elected president of the Brit. Association. P. made a special study of Liassic crustacea, Oolitic saurians, and Wenlock shales. He wrote numerous works on geology, including *Illustrations of the Geology of Yorkshire*, 1835; *Geology of Oxford and the Thames Valley*, 1871; besides *A Geological Map of the British Isles*, 1842, and *Memoirs of William Smith, the Father of English Geology*, 1844.

Phillips, Morgan Walter (1902-), political organiser, educ. at a S. Wales elementary school, and at the London Labour College. After sev. years administrative experience in the Labour party, he became its general secretary in 1944, and as such has played a leading part in its election re-organisation since that date.

Phillips, Stephen (1864-1915), poet and playwright, b. Summertown, near Oxford. His mother was related to Wordsworth, and Laurence Binyon (q.v.) was his cousin. P. was educ. at King's School, Peterborough, and Oundle. He studied for the Civil Service, but instead became an actor in Frank Benson's company, where he remained from 1885 to 1892, but was not a success. He came into prominence with the striking poem *Christ in Hades*, 1897; and with his *Poems*, 1898, which was awarded the thousand-guinea prize of the Academy, he estab. a reputation which lasted 10 years but has not been sustained since. He revived poetic drama with his *Paolo and Francesca*, 1900, from which at one time he drew royalties of £150 a week. Later verse plays received with acclamation were *Herod*, 1901, *Ulysses*, 1902, and *Nero*, 1906. But his range was very limited, and he now passed into a period of obscurity, from which he emerged only to produce such inferior dramatic work as *The King*, 1912, *Armageddon*, 1915, and *Harold*, 1927. His *New Poems* appeared in 1908 and *Panama* in 1915. From 1913 to his death he ed. the *Poetry Review*.

Phillips, Walter Joseph (1884-), Canadian artist of Brit. descent, b. at Barton-on-Humber, England, and educ. in Birmingham. He first exhibited at the Royal Academy in 1913, and in the same year emigrated to Canada, settling in Winnipeg. Here he began the art of colour-woodcut, and his sense of colour and originality of design and pattern made him well known in Europe and America. He pub. 2 portfolios of his woodcuts, and also *The Technique of Colour Woodcut*, 1927.

Phillips, Wendell (1811-84), Amer. reformer and orator, b. Boston. He gave up a legal practice to devote his time to the abolition of slavery, and he was regarded as the prime orator of the movement. In 1840 he was sent by

Massachusetts to the World's Anti-Slavery Convention. His *Speeches, Lectures, and Letters* were pub. at Boston (1863 and 1891). See lives by G. L. Austin, 1884, and C. Martyn, 1890.

Phillipsburg, tn in Warren co., New Jersey, U.S.A. It manufs. metal products, chemicals, clothing, cement, bobbins, silk, and machinery, and has iron foundries. Pop. 18,920.

Phillipsite, greyish translucent mineral, the primary form of which is a right rhombic prism. It consists chiefly of silica and alumina.

Phillipotts, Eden (1862-), Brit. novelist and playwright, b. Mount Abou, India; eldest son of Capt. Henry P. (15th Native Infantry), political agent for the states of Harrowec, Rajputana. Educ. at Plymouth, P. became a clerk in the Sun Fire Insurance Office, 1880-90; and then, after studying for a time for the stage, adopted literature as a profession. In his novels P. gives a vivid and often depressing picture of Devonshire life. His books, which number over 150, include *Lying Prophets*, 1896, *The Human Boy*, 1899, *The Good Red Earth*, 1901, reissued as *Johnny Fortnight*, 1904, *My Devon Year*, 1903, *The American Prisoner*, 1904, *The Secret Woman*, 1905, dramatised 1912, but banned by censor, *Portreeve*, 1906, *The Folk Afield*, 1907, *The Mother*, 1908, dramatised 1913, *Widcombe Fair*, 1913, *The Judge's Chair*, 1914, *A Shadow Passes*, 1918, *The Bronze Venus*, 1921, *Redcliff*, 1924, *Tryphena*, 1929, *Essays in Little*, 1931, *Bred in the Bone*, 1932, *Portrait of a Gentleman*, 1934, *Woodnymph*, 1936, *Portrait of a Scoundrel*, 1938, *Goldcross*, 1940, and *Pilgrims of the Night*, 1942, *The Farmer's Wife*, 1917, *Yellow Sands*, 1926, in which his daughter Adelaide collaborated, and *Buy a Broom*, 1929, are plays. The novels of P. are mostly of Devonian life and character, and the local atmosphere in them is detailed and true, so that they have been compared with Hardy's Wessex tales. But he reached the zenith of his career with the play *The Farmer's Wife*, a somewhat old-fashioned comedy with a simple plot and homely scenes which enjoyed a phenomenal run in London and in the Provs.

Philo, Quintus Publius, Rom. gen. During his consulship (339 bc) he defeated the Latins, and was appointed in the same year dictator, when he passed the *Leges Publilianae* according to which one consul must be a plebeian. During his second consulship (327) he carried on war in S. Italy, and during this third (320) he fought against the Samnites.

Philo Judaeus, or **Philo** (Philon) the Jew (b. c. 20-10 bc), Graeco-Jewish philosopher, exegete, and apologist; a native of Alexandria. Though a Jew by birth, his studies were mainly in Gk philosophy. He was especially familiar with the writings of Plato, upon whose language his own is closely modelled; and it is for his attempt to reconcile Platonic philosophy with the Mosaic revelation that he is particularly famed. P. adapted the pantheistic form of the Logos as taught

by the Stoics, drawing a sharper distinction between the Logos and the world; and his influence is manifest in such scriptural Books as Wisdom, the fourth gospel, and Heb. The only event in P.'s life to which it is possible to attach a date is his membership of the embassy to Galus in AD 40. The best ed. of P.'s collected works is that of L. Cohn and P. Wendland, 8 vols. (1930). There is also a text with trans. by F. H. Colson and G. H. Whittaker (Loeb Library, 1929-50). See E. R. Goodenough, *By Light, Light: the Mystic Gospel of Hellenistic Judaism*, 1935; *The Politics of Philo Judaeus*, 1938; *An Introduction to Philo Judaeus*, 1940.

Philoctetes, friend and armour-bearer of Heracles, who left him his bow and poisoned arrows. On his way to the Trojan war, P. stayed at the is. of Chryse, where he was either bitten in the foot by a snake or wounded by one of the poisoned arrows. At all events, the wound gave off so intolerable a stench that P. was abandoned by the Greeks on the coast of Lemnos. There he remained until the tenth year of the war, when Ulysses and Diomedes came to fetch him to Troy, as an oracle had declared that the city could not be taken without the arrows of Heracles. On arrival he was cured by Aesculapius. See the *Philoctetes* of Sophocles; family *Araceae*.

Philodendron, ornamental climbing shrubs with ovate, oblong, heart- or arrow-shaped leaves; natives of tropical America, of which *P. andreanum*, *P. erubescens*, *P. fragrantissimum*, *P. serpens*, and *P. verrucosum*, a dwarf plant, are exceptional for humid, heated green-houses.

Philology (Greek and Latin *Philologia*) may have various meanings. In classical times it could have either a comprehensive meaning (this included linguistics, historical and ethnic conditions, etc.) or the meaning 'love of discussion.' The term had a different meaning in the Middle Ages and in the Renaissance period. In the present time its meaning in England is not the same as that on the Continent. Here the term is taken as indicating the origin, growth, and relation of literary languages. In this respect it is strictly related to 'linguistics' (q.v.), and has a wide range of meaning. In a strict sense, P. may indicate the study of written documents and literary works, and particularly of their language, its aim being to obtain from all these documents all possible information regarding the development of the language in question, and of its relationship with other languages: this special field is known as Comparative P.

Gk and Lat. P. was developed to a high degree of excellence in the 14th and 15th cents. in Italy; in the 16th cent. in Holland, France, Germany, and Spain; in the 18th cent. in England (with R. Bentley at Trinity College, Cambridge, R. Porson, and R. Wood). In the 19th cent. Germany became the centre of P. Ger. P., one may say, arose in the 16th cent. in Holland; in the 17th cent.,

in England, George Hickes (1642-1752) became the 'father' of A.-S. P. Semitic scholars followed a similar method in dealing with the Semitic languages then known, such as Hebrew, Arabic, Ethiopic. However, until about 150 years ago P. as an exact science was still in its infancy. During the second half of the 18th cent. Sanskrit (q.v.) began for the first time to attract the attention of European scholars: the Fr. Jesuit Cœurdoux, in 1767, and Sir Wm Jones, in 1786, pointed out certain resemblances between Sanskrit and some European languages, especially anct Greek and Latin. At the time it was no more than a brilliant conjecture, but in 1816 the Ger. prof Franz Ropp pub. a comparative grammar of the Sanskrit, Gk, Lat., Persian, and Ger. languages; with it comparative P. may be said to have begun.

A century ago, 'when the archaeology of the Near and Middle E. was still in its swaddling clothes,' there were already good dictionaries and grammars of various Indo-European, Semitic, and other languages. After the discovery and decipherment of the numerous Egyptian, Assyro-Babylonian, Hittite, Phoenician, S. Arabian, and other inscriptions, philologists began to apply scientific methods in the compilation of grammars and dictionaries of these anct tongues. To-day many extinct languages, belonging to different linguistic families (q.v.), are nearly as well understood by competent scholars as archaic Greek, Latin, or anct Hebrew. Others, however, such as Hurrian, are still little known because there are not sufficient written documents. See also LANGUAGE; LANGUAGE, ORIGIN OF; LANGUAGES, CLASSIFICATION OF; LINGUISTIC FAMILIES; LINGUISTIC SCIENCE; INDO-EUROPEAN LANGUAGES.

Philomela, mythical daughter of Pandion, King of Athens. She was dishonoured by Tereus, King of Thrace, the husband of her sister, Procne, and had her tongue cut out so that she could not reveal the fact. But P. wove words into cloth, and Procne, learning the truth, slew her son Itys and served him up as a meal to the king. Tereus pursued the sisters, who were changed, one into a swallow, and the other a nightingale, while Tereus became a hoopoe.

Philomena, Saint, young woman whose cult had much vogue in the 19th cent. after the discovery in 1802 of relics, in the catacomb of St Priscilla, with a broken tablet inscribed *Philomena, Pax tecum*, leading to the belief that the body was that of an unknown martyr. It would seem, however, that the church of St Praxedes in Rome already contained the relics of the real St P. Her feast is on 11 Aug.

Philon the Jew, see PHILO JUDAEUS.

Philopoemen (252-182 BC), Gk statesman and patriot, b. Megalopolis, Arcadia. He defended his native city against the Spartans (222), and, joining the Macedonian king, Antigonus, defeated the enemy at Sellasia (221). In 210 he was appointed gen. of the Achaean horse, and in 208 was raised to the position

of *strategos*. After his victory over the Spartans at Mantinea (208) he was proclaimed liberator of Greece, and in 192 again defeated the Spartan army under Nabis. In 182 he was taken prisoner by the Messenians and compelled to drink poison.

Philosopher's Stone, see ALCHEMY.

Philosophy, term of which the meaning has in the course of cents. undergone considerable modifications. Pythagoras is reputed to have been the first to use it, replying to Leon's question as to his vocation that he was a 'philosopher,' that is, a lover of wisdom (*philos* and *sophia*). No kind of knowledge was in those early days outside the scope of P., which comprehended the whole range of human interests. This is seen in the Stoic definition of P. as the endeavour after theoretical and practical perfection in the depths of logic, physics, and ethics. Plato, in the *Euthydemus*, declares that P. is concerned with the ideal alone, and is identical with wisdom, whilst Aristotle uses the word sometimes to embrace all science, and sometimes as equivalent to the science of being (ontology). In the days when it was possible for the great minds of the world to be pre-eminent, not only in one or two but in most of the depths of science, the philosopher could formulate his system of P. from his own first-hand knowledge and experience. All knowledge was thus taken by P. to be her prov., and a philosopher, so called, was very often an expert in the various sciences. Such a state of things was only possible while science was in a very rudimentary condition, and with the growth of specialised knowledge P. could no longer include, though it still retained the claim to transcend in importance, all knowledge. In this sense the scholastics and neo-scholastics define P. as 'the knowledge of things through their highest (i.e. most universal and independent) causes.'

Before the more modern definitions of P. are mentioned, a brief answer may be given to the old query, 'What is the good of P.?' From the time of Aristophanes onwards the philosopher has been represented as unpractical, immersed in useless and chimerical speculations. But as Aristotle remarked, in order to prove that P. is vain and illusory we are compelled to philosophise. The sceptic is as much a philosopher as the idealist. There are experts in the special sciences who sometimes decry P., yet tread upon philosophical ground while pursuing their most abstruse inquiries. Mathematics is ultimately concerned with the questions of time and space, physics with matter and energy, art with beauty, ethics with virtue, etc. P. is thus seen to be a necessity of human nature; the pursuit of speculative truth has always engaged men's minds, although there have ever been those to say that the end was unattainable. It is not so much the end as the pursuit that is important. An understanding of what is meant by the term P. in present-day usage is a necessity to a thorough study thereof, but unfortunately this is by no means an easy matter.

Hardly any two writers are agreed as to the definition and boundaries of P., and the word has different connotations in different countries. Kant defined philosophical knowledge as knowledge through conceptions, as such; Herbart defined P. as the working out of concepts, and divided it into 3 depts, logic, metaphysics, and aesthetics (including ethics). Comte and Spencer regarded P. as the unification and classification of the various sciences with a view to merely material ends. In the Eng. language, until very recently, P. meant almost anything, as evidenced by the term 'natural philosophy,' used by physicists. When properly used in the wider sense, P. may be taken to include logic, ethics, aesthetics, metaphysics, ontology, cosmology, and psychology; political economy and the 'philosophies' of law and hist. are often included. All these subjects are closely related to P. although not included in the narrower use of the word.

The most noteworthy advance in modern times has been that of psychology, which is now generally studied separately from P., and which, it is claimed by some, should be treated entirely as a physical science. The bearing on psychological investigations of the theory of knowledge, and the peculiar characteristics of 'mind' as a study, render it desirable for psychology to be retained as a dept of P., although distinct from and subordinate to the higher branches. Logic, ethics, and aesthetics, whilst also forming part of P., differ from the other depts in being 'normative' sciences, having reference to the 'norms,' or standards, respectively of truth, virtue, and beauty. For the purposes of this general outline of the progress of philosophical thought, P. will be taken to include epistemology, or the theory of knowledge, metaphysics, and ontology. The ultimate task of P. is to show the interconnection of the sciences and their ramifications as part of an organic whole, which constitutes the totality of knowledge. Some idea of the steps in the fulfilling of this task may be gained from a knowledge not only of the philosophers themselves, but of their indebtedness to and connection with one another.

The beginnings of P. are as a rule attributed to the Greeks, but the Indian ideas of the 6th cent. BC and later form an interesting parallel philosophic development. The Upanishads, whose main thesis is the monistic idea of the one true Absolute (Brahman or Paramatman), preceded the 6 philosophical systems. These are the *Nyaya*, the *Vaisheshika*, the *Sāṅkhya*, the *Yoga*, the *Mīmāṃsā*, and the *Vedānta*; they all are based upon a monism, expressed in a more or less poetical manner. In contrast to these declining oriental civilisations, the culture of the Greeks was only in process of formation.

Gk P. may be divided into 3 sections: a physical or cosmological period, dealing with questions of being (c. 600-450 BC); a humanistic or ethical period, dealing with the ethical and social relations

of man (450-400 BC); and a systematic period, during which all human problems were first connected in thought into a whole (400-300 BC). The problem of the early Gk philosophers was to find the ultimate form of the objects of external perception. Thales thought that water was the source of all things; Anaximenes that it was air; and Anaximander, chaos. The Pythagorean P. had for its general principle number: the organisation of the universe in its various relations is a harmonious system of numbers. The Eleatic school, of which Parmenides was the real head, asserted that there was in reality no change or movement in the universe. The riddles of movement of Zeno (Achilles and the tortoise, etc.) had much influence on the conclusions of the Eleatic school. These conclusions were challenged by Heraclitus, who taught that 'everything is in a state of flux' (*panta rhei*) and that the permanence of things is only apparent. Empedocles attempted to combine the Eleatic principle of 'being' with the 'becoming' of Heraclitus. Democritus, the main author of the atomist theory, was the next noteworthy philosopher of Greece; he may be said to have laid the foundations of modern physics and cognate sciences, and is the earliest philosopher who attempted to give a scientific explanation of the world. Anaxagoras was the last philosopher of the early period; and his doctrine of *nous*, mind, as the omnipotent, omniscient, and harmonising power is the first teleological explanation of the universe. The Sophists were the first philosophers of the second Gk period, although they were in reality a professional class who came forward to meet the growing demand in Greece for knowledge. The founder of the school is usually considered to be Protagoras, whose fundamental thesis consisted, in modern language, of the denial of all objectivity, and the restriction of knowledge to the impressions of the individual. His famous dictum was 'Man is the measure of all things,' and he may be called the first of the individualists. Other prominent names among the Sophists are Gorgias of Leontini, Prodicus, Hippias, Polus, Thrasymachus, etc. The Sophists were generally teachers of rhetoric and eloquence, and during this period P. underwent a change in character. Problems of an ethical nature were discussed more, and, as a result of the prevalent doubts of the existence of any universally valid truth, scepticism (q.v.) was the prevailing note. Hence the title Sophist is still used in a disparaging sense, but there is no doubt that they did some good in fostering culture and promoting intellectual activity. The philosopher who was instrumental in refuting the arguments of the Sophists and rehabilitating P. was Socrates. Of his P. we possess no record written by himself, as he never left any; his life and P., as revealed in the *Dialogues* of Plato, are inseparable. He based conduct on knowledge; to know oneself is the sum of all P.; and the only pursuit worthy of man. He founded no special

school of P., though he gave the starting-point to sev. lines of thought. The minor or imperfect Socratic schools, as they are termed, are 3: the Megarian, the Cyrenaic, and the Cynic. The originator of the first was Euclid of Megara, and his system combined Socratic ethics with the 'One-being' doctrine of Parmenides. The Cyrenaic school, founded by Aristippus, was the forerunner of the Epicureans, and held that pleasure was the only good, though not such pleasure as would be followed by pain. The sect of the Cynics was founded by Antisthenes, who declared virtue to be the only thing worth living for; virtue was, however, defined as abstinence and asceticism. Diogenes of Sinope is the famous example of a Cynic philosopher. The last epoch in Gk P. is a landmark in the hist. of human thought. In the two great names of this period, Plato and Aristotle, the thought of all preceding ages reached its culmination. In their union and contrast they form the two poles of thought around which the human search for truth still revolves. Plato is occupied mainly with an inquiry as to the necessary and universal element in experience: he represents the synthesis of pre-Socratism and of Socratism. We are indebted to Plato for 2 great truths: that, in order to direct human knowledge aright, reason must be the starting-point, and that all human thinking is accomplished by means of universal concepts. The doctrine of universal ideas has had a great influence on the hist. of P., and is now an important factor in every philosophical system. Aristotle may be called the founder of empiricism in the anc. world. Plato placed P. in an idealistic antithesis to actuality, and a more realistic conception of things was supplied by Aristotle. There are 2 essential elements to be considered in a rational examination of the world, the *hulē*, or matter, and the form which may be given to it by human intelligence. Aristotle was called the philosopher by medieval schoolmen, and his work certainly far surpasses, both in character and amount, that of his predecessors. His logical treatises, his ethics, and his psychology served for ages as standard treatises on the various depts of P.

During the Rom. period there were, from a philosophical point of view, 2 main periods, a moral and a religious. The 3 main systems of the first period are Stoicism, Epicureanism, and Scepticism. The first teaches that happiness is to be found not in outward things, but in power over 'all thoughts, all passions, all desires.' Epicureanism declares the supreme good to be personal pleasure, consisting not in self-indulgence, but in tranquillity and peace of mind. Total submission is advocated by Scepticism, which declares definite knowledge to be unattainable. The chief names in Stoicism are Zeno, the founder, Panaetius, Posidonius, Seneca, Epictetus, and Marcus Aurelius; in Epicureanism, Epicurus, Metrodorus, Hermarchus, Polystratus, and Apollodorus may be mentioned; Pyrrho of Elis founded the Sceptical

school, of which Arcesilaus and Carneades were the prin. adherents. The religious P. of the Rom. period is known as neo-Platonism. The germ of this teaching is found in the writings of Philo, but the title of founder of neo-Platonism properly belongs to Plotinus, a pupil of Ammonius Saccas. Neo-Platonism is a religious P. with strongly marked mystical tendencies and has more in common with religion than with P. proper. The Gnostics and the Christian Fathers were representatives of faiths which formed the transition from anc. to medieval P. The chief of the Gnostics were Basilides, Carpocrates, Valentinus (Alexandrian Gnostics), and Menander, Saturninus, Tatian, and Bardesanes (Syrian Gnostics); among the Fathers may be mentioned Justin Martyr, Athenagoras, Theophilus, Clement of Alexandria, Origen, Athanasius, and St Augustine. The latter based their P. on Platonic illumination as the most 'spiritual' of the Gk P.s, but they had some trouble with those elements of Plato's system which seemed to conflict with Christian dogma, e.g. the eternal existence of matter. It was St Augustine who really 'christened' Platonism.

The first representative of medieval or scholastic P. was John Scotus Erigena. The great problem over which the battles of the Schoolmen were waged was Nominalism versus Realism. The Nominalists, who followed Aristotle, maintained that universal notions are mere abstractions of the mind, having no objective reality. The Realists, following Plato's teaching, contended that universal notions have a real existence prior to the concrete things which embodied them. An intermediate theory, which sought to unite the two systems, was called Conceptualism, which was finally superseded by the moderate realism of the Thomists. The chief figures among the earlier scholastics are Roscelin, the nominalist; Abelard, the dialectician who foreshadows the moderate realism mentioned above; Anselm, his adversary, a pioneer in medieval psychology; and William of Champeaux, the extreme realist. Albertus Magnus, 'the Universal Doctor,' introduces the urge to thorough-going synthesis, which found its perfection in the writings of St Thomas Aquinas and was continued by the Thomists. In contradistinction to these a Franciscan school, headed by Alexander of Hales and St Bonaventure, continued the 'mystic' (neo-Platonic) tendencies of the Victorian school of the 12th cent. A veneer of Aristotelian logic was given to their doctrines by Duns Scotus, after whom the Scotists are named. Thereafter came the slow decline of Scholasticism, which by the time of the Reformation had ceased to be a vital force in the world of P. During the period of the Renaissance, the intellectual movement which marked the transition from the Middle Ages to the modern world, nearly every system of anc. P. was revived, and the resulting intellectual activity found expression in the writings of the philosophers of the 'transition period.' Chief among these was Giordano Bruno, the

Italian, whose system is a pantheism which had much influence on Spinoza. Jakob Boehme and Montaigne represent respectively mystical theosophy and scepticism, whilst Bacon and Hobbes showed the defects of the existing methods of research and inquiry, the latter emphasising the importance in science of deduction, to which Bacon did not ascribe any importance.

Modern P. is generally regarded as commencing with Descartes. The first phase of modern thought is scientific Rationalism, which appealed to the reason, by which such mighty results were being obtained in natural science. From Descartes to Leibnitz there is a period of metaphysical systems which have a close connection with science. This Rationalism, however, assumed a harsh, narrow aspect. Reason was deified, and represented as the all in all, and Deism took the place of religion. The gradual undermining of Rationalism was due to the efforts of the Empiricist school, which argued that experience is the source of all knowledge. Scepticism succeeded Empiricism, but was itself discredited by the new movement, started by Rousseau, Lessing, and Herder, which grew into what is known as Ger. Idealism. This in its turn was supplemented by the theories of Schopenhauer, Spencer, and others. Descartes's system was idealistic and dualistic: the world falls into two completely separated realms, the one of body and the other of mind. Behind this dualism, however, is the conception of deity, the one perfect substance in which both realms meet. The manner in which this union is brought about was not satisfactorily explained by the parallelism of Descartes. Goulinx attempted to overcome the difficulty by his theory of Occasionalism, which attributes all movements, both mental and physical, directly to God; Malbranche is closely connected with this position. Hobbes held that the end of P. was social, and that theology and transcendentalism did not come within its sphere. Spinoza declared the unity of all things in God, mind and matter being equal, both being attributes of the infinite, eternal, and all-comprehending substance which he calls God. Leibnitz was the chief representative of Pluralism in metaphysics, regarding individuation as an irrefragable truth. His system was in all respects the logical antithesis of Spinoza's, and made an immediate and widely extended impression on the culture of Europe, which it dominated until the time of Kant. Wolff was the first follower of Leibnitz who erected an independent system on his principles; he attempted to combine the teaching of Leibnitz with the older Aristotelian doctrines of the schools. Among the pupils of Wolff who influenced Kant were Baumgarten and Crusius. Locke may be called one of the founders of modern psychology; his P. is a study of ideas. The influence of his writings on the subsequent course of philosophic thought has been very great, and his principles were developed in the hands of Berkeley,

Hume, Reid, and the so-called Scottish psychological school, and afterwards in those of the Fr. sensationalist and materialist school, including such names as Condillac, Helvétius, Diderot, and d'Holbach.

Kant was the pioneer of a line of thought leading away to those wider issues as to the meaning and constitution of reality treated of by Plato and Aristotle. He created a new dualism between the phenomenon and the noumenon. The development of Idealism was carried on by Fichte and Schelling. The line of thought pursued by Kant, Fichte, and Schelling culminates in Hegel. The diverse elements of thought, subject and object, individualism and pantheism, which previous P.s only partially reconciled, are now taken up and fused into one system. The two elements of knowledge which Kant had left unreconciled, and which Fichte and Schelling harmonised only by suppressing one of the sides, were brought into a synthesis. The ultimate principle of all knowledge is the unity of consciousness. Hegel's system must be regarded as the culmination of Ger. Idealism. 'Mountains of dust and rubble and millions of graves testify to-day to the fatal character of such one-sided historical thinking as that of Hegel' (Douglas Jerrold). Of the philosophers since Hegel, Schopenhauer was a pessimist who regarded life as essentially evil; his chief tenet is that the inner essence of man's nature is will. The Positivism of Auguste Comte is in reality a denial of the utility of P., save as a classification of the different sciences. In its later form Humanity as a whole was worshipped as the mediator between the outer world and man. The Utilitarianism of the Benthamites and J. S. Mill, though based on an individualistic and hedonistic theory, was at bottom social in its nature. The theory known as psycho-physical parallelism was taught by Fechner and Paulsen. The doctrine of evolution inspired by the P. of Spencer may be described as the creed of the Unknowable. Among other modern systems of P. that of Lotze is teleological in nature, combining the monadology of Leibnitz with the pantheism of Spinoza, and has had much influence on Amer. thinkers.

It may be said that modern P. is divided into two main sections, of which the one maintains and the other denies that matter and spirit can be reconciled in a manner comprehensible to the human reason. On the latter side are the Positivist, the Kantian, the theolo-
nistic, and all the allied schools. — on the former side are the Theist, the Idealist, the Spiritualist, and their followers and allies.

One of the chief tendencies of present-day P. is to seek to establish a closer relationship between P. and the sciences. But in order to complete this movement, it is necessary to define more clearly just where the physical conception of the universe stops and the philosophical perception of the universe as a whole begins. Students to-day already recognise that the

physical conception of the universe does not allow for the degree that time relations as well as space relations affect it. Indeed, physical science is not to be regarded as an attempted interpretation of reality, but only as a means of conducting tests and investigations to support theories of reality. Conscious behaviour and life elude the physical scientist, as was the case with Newton, and a perception of the universe is dependent on life and consciousness. For that very reason different scientific interpretations reveal inconsistencies, and it is precisely these variations that P. must endeavour to interpret and bring to agreement. Thus P. confines itself to actual experience, including not only present, but past and future, in any aspect which may reveal some new postulation in its endeavours to interpret reality, and this in part explains the growing return to realism as opposed to a materialistic theory founded on physical interpretations. A valuable contribution to the philosophical literature of the present time has been made by Prof. S. Alexander. It may perhaps be described as the first system of P. yet propounded by a Brit. philosopher. Alexander declares that space and time are real, and that the physical world arises from space and time. He denies that idealism can provide the base upon which reality rests, holding that ideas are merely abstractions from reality, and that with a certain complex element in physical structure life is evolved, or, as he puts it, is 'emergent.' He makes no attempt to explain life away as an elaborate system of mechanism. Similarly a further complex development in the physical structure produces mind. Besides the work of Alexander, the work of J. S. Haldane deserves mention. Haldane thinks that the universe as it is assumed to be in physical science is only an idealised world, while the real universe is the spiritual universe, in which spiritual values count for everything. The group of workers who are in agreement with Haldane include Bradley and Bosanquet of Great Britain, Royce of America, Croce and Gentile of Italy, and Volkelt of Germany. Opposed to their teaching is a school which includes W. James, Dewey, and Schiller, who, from a pragmatic standpoint, propound that experience in conduct gives us 'right,' while experience in thought is 'truth.' They demand that the practical consequences of an idea should be its true measure of value, involving a criticism of a monistic universe, and their demand imports a belief in pluralism (q.v.). In America there is a tendency to refute the idealism of Kant as developed by Hegel, and Bertrand Russell and G. E. Moore have written from that standpoint. In France the P. of Bergson (q.v.) has had a wide following. He is opposed to absolutists, and offers in support of his criticism his doctrine of change as the answer to the riddles of the philosophical world. Croce and James in many respects subscribe to this theory. Bergson's attitude towards evolution is expressed as the universe

being a mind functioning both theoretically and practically; the practical operations produce the materialistic world, while the theoretical manifestations result in the spiritual world. Prominent among Ger. philosophers is Wundt, who died in 1921. His theory is that the body is part of an experience of which the soul is subjective. He proclaims the 'will to believe,' and up to this point is supported by W. James. Impulsive will is imputed to all organisms, and activity is will, and the highest will he calls God. Fr. P. reveals a decided sociological trend, and is conducted rather by way of attempts to solve separate problems than by the formulation of any complete system. It may be that the earlier mathematical studies of some of the leading philosophers like Cournot and Renouvier and the scientific investigations of Bergson and Le Roy produced a more precise method of inquiry, and modern Fr. thought appears to withdraw from the consideration of individualistic systems, declaring that reality is too rich and complex to support that contention. P., it is said, is a manifestation of life itself which blossoms to self-consciousness through grades of increasing harmony.

In France, after 1944, Existentialism (q.v.) gained much attention, its chief exponent being Jean-Paul Sartre. Based on his view that 'all human activities are equivalent, all are destined by principle to defeat,' it conceives of the absolute inanity of existence and negation of all creation, and offers no dogmatic solutions to questions of ultimate origins and destinies. It is not entirely a novel P., and its distinctive features are borrowed from Kierkegaard (q.v.), amongst them that God and exceptional individuals are above moral categories, and that subjectivity is truth, i.e. 'consciousness creates out of itself what is true.' Karl Jaspers (q.v.) upholds the Existentialist contrast between mere existence and significant existing, but stresses the experience of *another* person as a separate other person. Whereas Martin Heidegger (q.v.), whom Sartre follows (but who denies any connection with Existentialism), holds that there is no other, that existence is somehow born from nothing, and also that the possibility of a God and of man's dignity reside in being as such.

The relationship between P. and sociology has a particular interest in these days when the study of social questions appeals to a rapidly growing number of students. Bosanquet suggests that the philosopher reads in society the wider expression of what individual man really is. He investigates the social whole in order to discover in its progress what the mind of society really is and what are its powers of self-assertion or self-effacement in human and natural environment. The state is merely an expression of certain needs and ambitions of man. Bosanquet's theory is based upon Plato's assertion that politics is a science, and that political forms correspond to types of mind, and, further, that the central

inspiration of all science is good, and, finally, in a glorious climax, that no one who has not comprehended the connection that links the order of the universe and its influence upon society is competent to be a ruler of men.

An Aristotelian reaction has shown itself in the neo-Scholastic movement among Rom. Catholic philosophers, fostered by the work of Cardinal Mercier at Louvain, and the study of the works of Aquinas imposed by recent popes upon seminary students. The chief leaders of the movement are Dr Grabmann of Munich, J. Maritain in France, and F. Aveling, M. C. d'Arcy, P. Coffey, and others in Great Britain. The current interest in psychology (q.v.), and its ever-widening appeal to a class of student with little or no previous acquaintance with P. as a science, call for a word of warning. There is a tendency to include all questions associated with the study of the mind under the heading psychology. In most cases the classification is wholly unjustified, and it is only too easy for the student to examine some question which is purely philosophical under the delusion that he is studying psychology. Psychology knows only causes and effects of mental life; it has nothing to do with ideals, values, purposes, and ends except as mere facts. P. is an attempt to get at the deeper reality of things; the significance of human life, the nature of the soul, human destiny, immortality, and God are purely philosophical problems. Psychology examines phenomena. P. seeks to explain.

The large number of philosophical works that followed the break-up of the Hegelian school are alike in that they consist, not in any enthusiasm in speculation for its own sake, but rather in the desire to see how others have speculated, or, in other words, in the hist. of P. Thus many writers of a philosophical bent have acquired a reputation exclusively for their criticisms rather than for any system of P. Among independent philosophers who are better known for their chapters on the hist. of P. are Zeller, Prantl, Sigwart, and also Kuno Fischer, the last-named being no mean constructive philosopher. Even such philosophers as Ernst Reinhold and Chalybæus are known as historians of P. more widely than as expositors of systems of P.; while Trendelenburg's *History of the Doctrine of Categories* is read in Germany far more than his *Logical Investigations*. Indeed, it is remarked by Erdmann that this preponderance of the historical element is seen even in the speculations themselves, especially in the form of critical discussions contained in historical introductions. The only exceptions would appear to be Lotze and Weisse; for such well-known works as Hillebrandt's *Organum of the Philosophical Idea* and Wirth's *Idea of the Godhead* are really sketches of the hist. of P. In this connection it is pointed out by Erdmann that Ulrich has received many compliments for his criticism of the Hegelian P., but that as regards his theory of distinguishing activity he seems to

stand alone; yet he does not think that this marked preference is any indication of philosophical decrepitude and sees an almost conclusive parallel in the effect on the study of the law of the brilliant historical writings of Savigny. There is clearly much gain in having the hist. of P. presented in a philosophical manner; for, just as the study of legal hist. paved the way ultimately for increased study of the law for its own sake, so the study of the hist. of P. may give an impetus to a wider study of P. Philosophy, Social, see SOCIAL PHILOSOPHY.

Philostatus (d. 224/9), Gk sophist and rhetorician. After teaching at Athens he came to Rome in the train of the empress Julia Domna, at whose request he wrote the *Life of Apollonius of Tyana*. Other works certainly by P. are *Lives of the Sophists* and the first collection of *Imagines* (descriptions of pictures). There is an ed. with trans. of these works by F. C. Conybear, W. C. Wright, and A. Fairbanks (Loeb Library), 4 vols., 1912-31.

Philotas (d. 330 BC), Macedonian soldier, son of Parmenion (q.v.). While P. was serving in Media he was accused of treason, and his action having implicated Parmenion, father and son were executed.

Philoxenus: 1. (436-380 BC) Gk dithyrambic poet, b. Cythera. He spent part of his life at Syracuse, where he lived at the court of Dionysius the Elder. Only

a few fragments of his poems have come down to us. See J. M. Edmonds, *Lyra Graeca* (with trans.), 1922.

2. (fl. 316 BC) Eretrian painter remarkable for the rapidity with which he worked. His greatest work was a picture of the battle between Alexander and Darius, painted by order of Cassander, King of Macedon.

Phintias, see LICATA.

Phips, or Phipps, Sir William (1651-95), first royal governor of Massachusetts, b. Pemmaquid, Maine. In 1687 he rescued treasure to the value of £300,000 from a Sp. wreck, and was rewarded for his services with a knighthood and appointed a sheriff of New England. He captured Port Royal in 1690, but failed in his attack on Quebec (1691). He was appointed governor of Massachusetts in 1692. See life by Bowen in Spark's *American Biography*, 1834-7, and lives by H. O. Thayer, 1927, and Alice Lounsberry, 1941.

Phiz, see BROWNE, HABIOT KNIGHT.

Phlebitis, inflammation of a vein. It is generally caused by the extension of inflammatory processes from neighbouring tissues, and results in the formation of a thrombus or clot in the course of the vein. This clotting is attended with particular danger, as if it becomes detached from any cause, septic emboli or masses of infected fibrin are carried away in the bloodstream and may lodge in an important organ. Here they may cause dangerous inflammation through an infectious process, or obstruct the circulation. Thus an embolus may reach the brain and cause sufficient vascular disturbance in the cerebral region to produce paralysis and death, or it may lodge in the lung and cause a pulmonary embolism. The symptoms of P. are pain, tenderness, swelling, and oedema of the affected part and a cordy appearance of the vein itself.

P. is often associated with varicose veins of the leg.

Phlebotomy, see BLEEDING and VENE-SECTION.

Phlegethon (Greek for flaming), a riv. of fire encircling the infernal regions and emptying into Lake Acheron.

Phlegm, mucous secretion, with impurities such as dust and bacteria, expelled by coughing from the lower air passages.

Phloem, see BAST.

Phlogiston Theory, in chem., a theory of combustion elaborated by J. J. Becher (1635-82) and G. E. Stahl (1660-1734). According to this theory, all combustible bodies contained a 'principle of combustion,' *phlogiston*, which they gave up to the air or to other bodies when burnt. Though the P. T. was enthusiastically supported by Eng., Ger., and Fr. chemists in the 18th cent., it was overthrown by the work of Lavoisier (q.v.), who showed that on combustion a burning body combined with atmospheric oxygen and that the products weighed more than the original substance. See E. J. Holm- yard, *Makers of Chemistry*, 1931.

Phlorizin (Greek *phloios*, bark; *rhiza*, root), glucoside found in the bark of the roots of sev. allied plants, such as the apple, pear, and cherry.

Phloroglucinol, or symmetrical trihydroxybenzene, $C_6H_3(OH)_3$, colourless crystalline solid (melting point $218^\circ C.$), formed by fusing resorcinol (q.v.) with caustic potash in the presence of air. It gives a dark violet colour when treated with ferric chloride solution. It is used as an analytical reagent.

Phlox, family Polemoniaceae, genus of herbs, chiefly Amer.; of which *P. drummondii* and varieties are grown as half-hardy anns.; *P. paniculata* and hybrids as border plants; and *P. subulata* as a dwarf species; in gardens.
